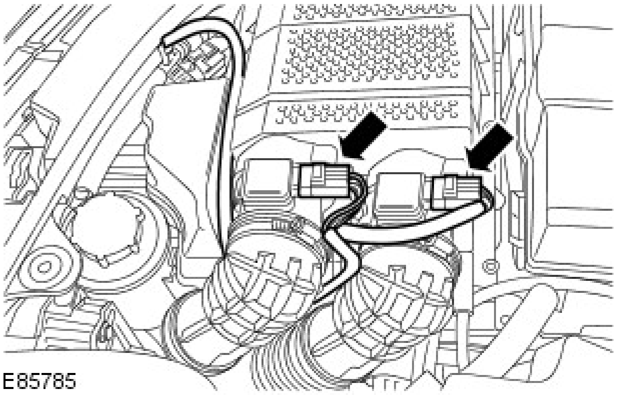
Intake Air Distribution and Filtering - TDV8 3.6L Diesel - Air Cleaner

Removal and Installation

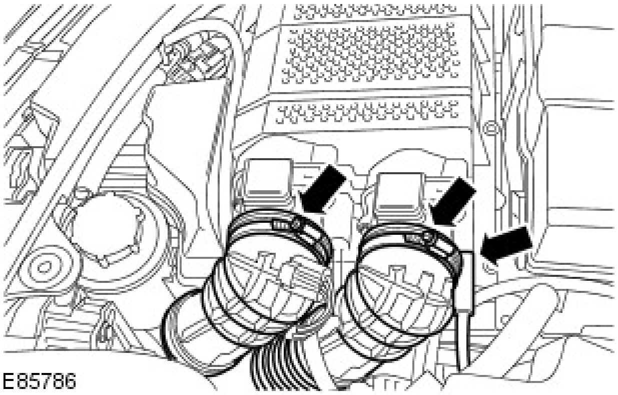
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



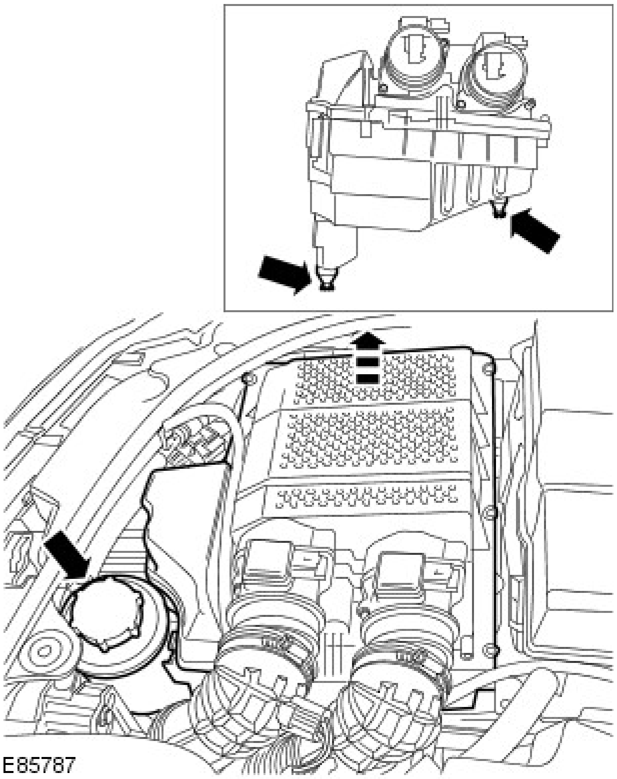
2. Disconnect both mass air flow (MAF) sensor electrical connectors.

- Release and reposition the wiring harness.



3. Release both MAF sensor outlet pipes.

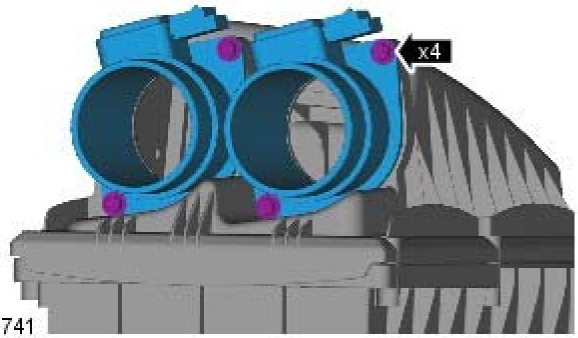
- Release the 2 clips.
- Release the port deactivation valve hose.



E85787

4. Remove the air cleaner.

- Release the air cleaner from the 2 rubber grommets.
- Release the active cornering enhancement (ACE) reservoir.



E76741

5. NOTE: Do not disassemble further if the component is removed for access only.

Remove the MAF sensors.

- Remove the 4 screws.
- Remove and discard the 2 O-ring seals.

Installation

1. NOTE: When installing the air cleaner, make sure the locating pegs fit securely into the grommets.

To install, reverse the removal procedure.

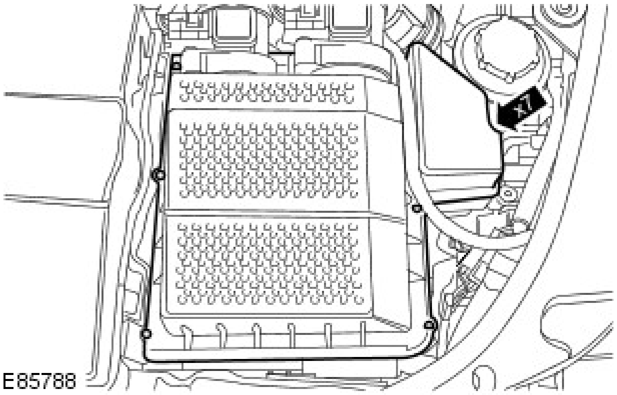
Published: 11-May-2011

Intake Air Distribution and Filtering - TDV8 3.6L Diesel - Air Cleaner Element

Removal and Installation

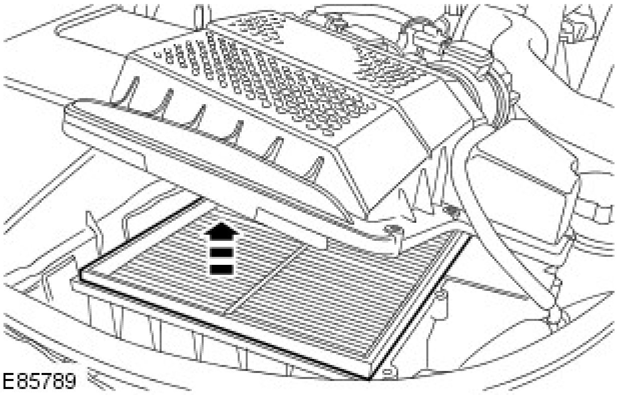
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



2. Release the air cleaner housing cover.

- Fully loosen the 7 screws.



3. Remove the air cleaner element.

Installation

1. Clean the base of the air cleaner.

2. To install, reverse the removal procedure.

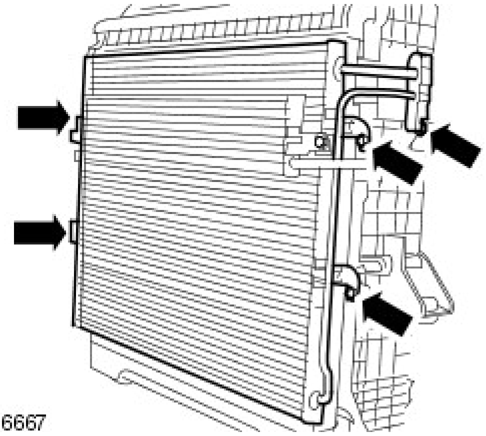
Published: 11-May-2011

Intake Air Distribution and Filtering - TDV8 3.6L Diesel - Charge Air Cooler

Removal and Installation

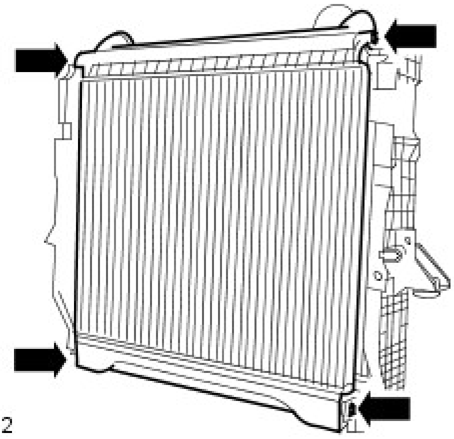
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Raise and support the vehicle.
3. Remove the cooling module.
   For additional information, refer to: Cooling Module (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).



E86667

4. Remove the condenser core and auxiliary radiator.
   - Remove the 5 bolts.



E86672

5. Remove the charge air cooler.
   - Remove the 4 screws.

Installation

1. Install the charge air cooler.
   - Tighten the screws.
2. Install the condenser core and auxiliary radiator.
   - Tighten the bolts to 8 Nm (6 lb.ft).
3. Install the cooling module.
   For additional information, refer to: Cooling Module (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).
4. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

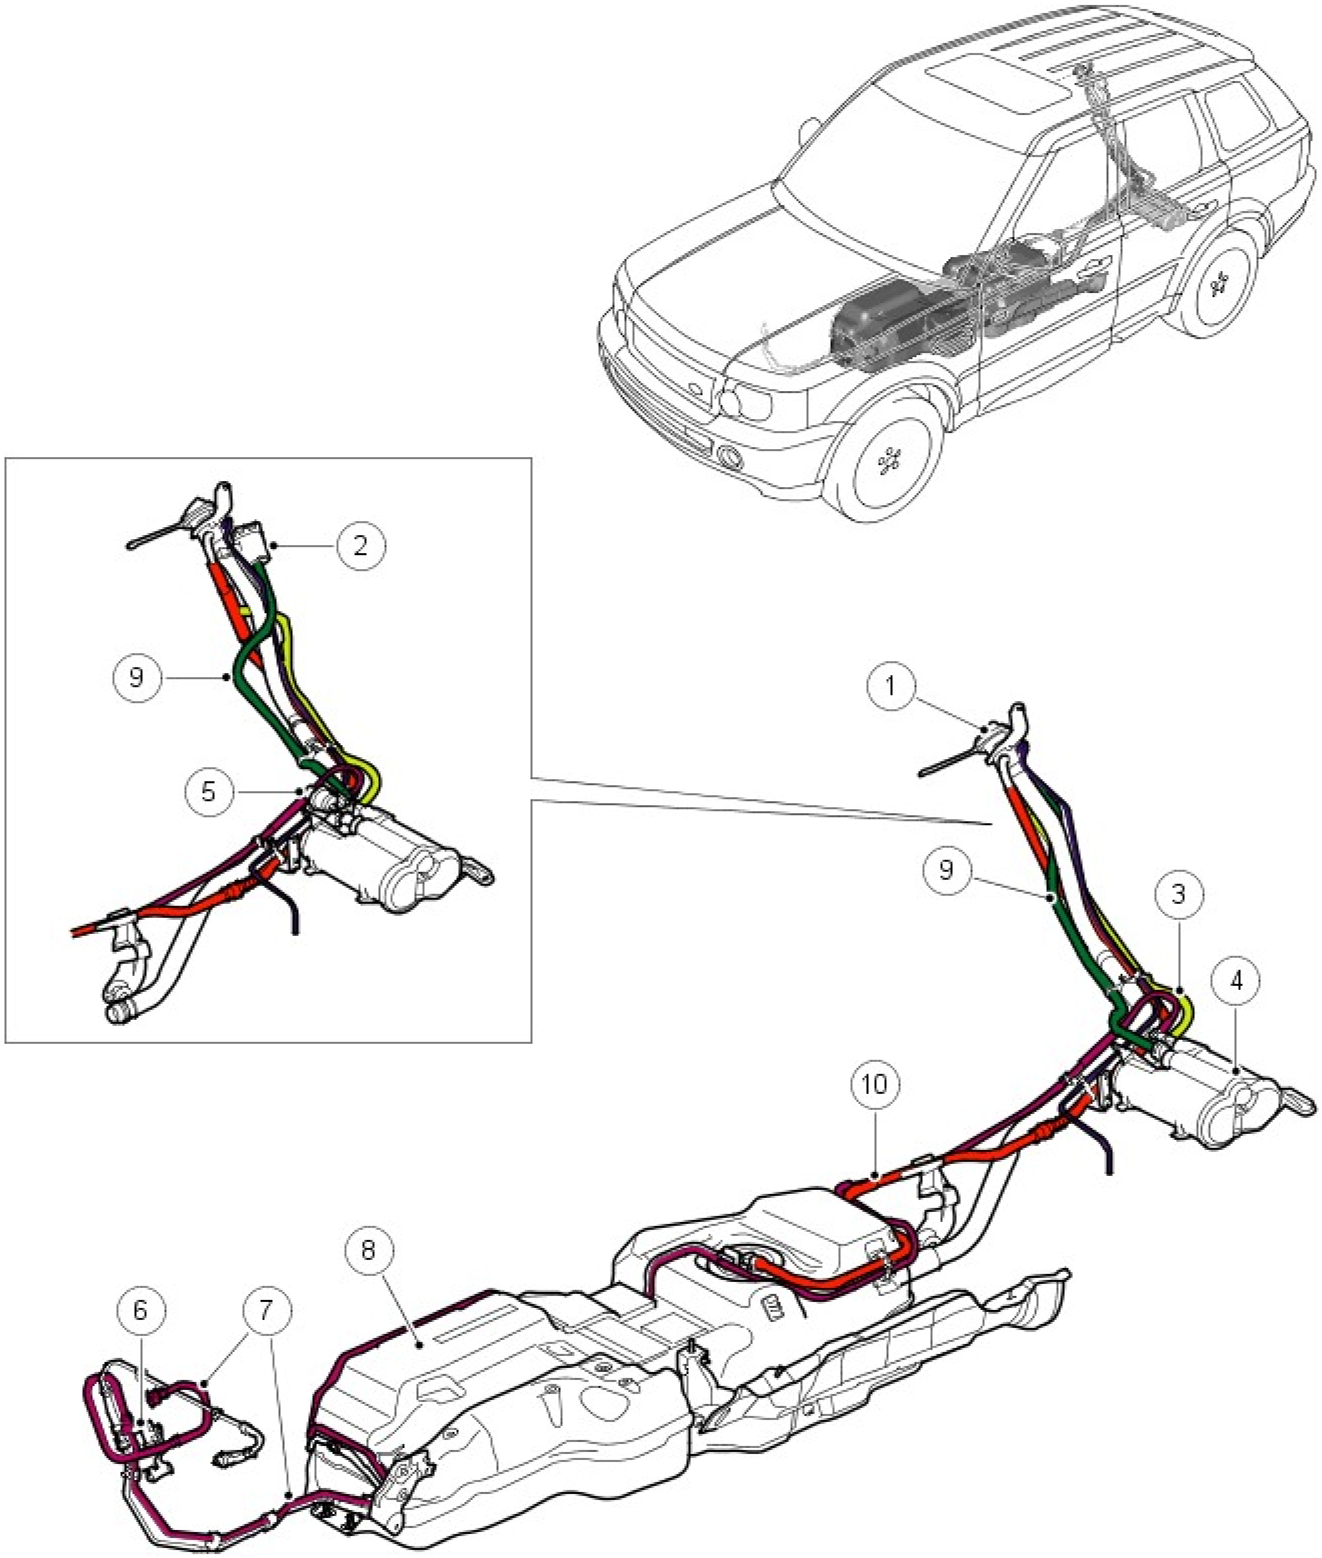
Evaporative Emissions - V8 S/C 4.2L Petrol - Evaporative Emissions

Description and Operation

Evaporative Emissions Component Layout - 4.2L V8 Supercharged



E57468

Item	Part Number	Description
1	-	Fuel filler pipe/cap
2	-	DMTL pump filter (NAS only)
3	-	Fuel tank vent hose to canister
4	-	Charcoal canister
5	-	DMTL pump (NAS only)
6	-	Purge valve
7	-	Purge hose
8	-	Fuel tank
9	-	Charcoal canister vent hose (All except NAS) or DMTL pump vent hose (NAS)
10	-	Fuel tank breather hose from tank

GENERAL

The evaporative emission (EVAP) control system reduces the level of hydrocarbons released into the atmosphere by fuel vapor venting from the fuel tank. The system comprises a charcoal canister, purge valve and interconnecting vent pipes and hoses. The vent pipes are connected to the system components using quick release connectors.

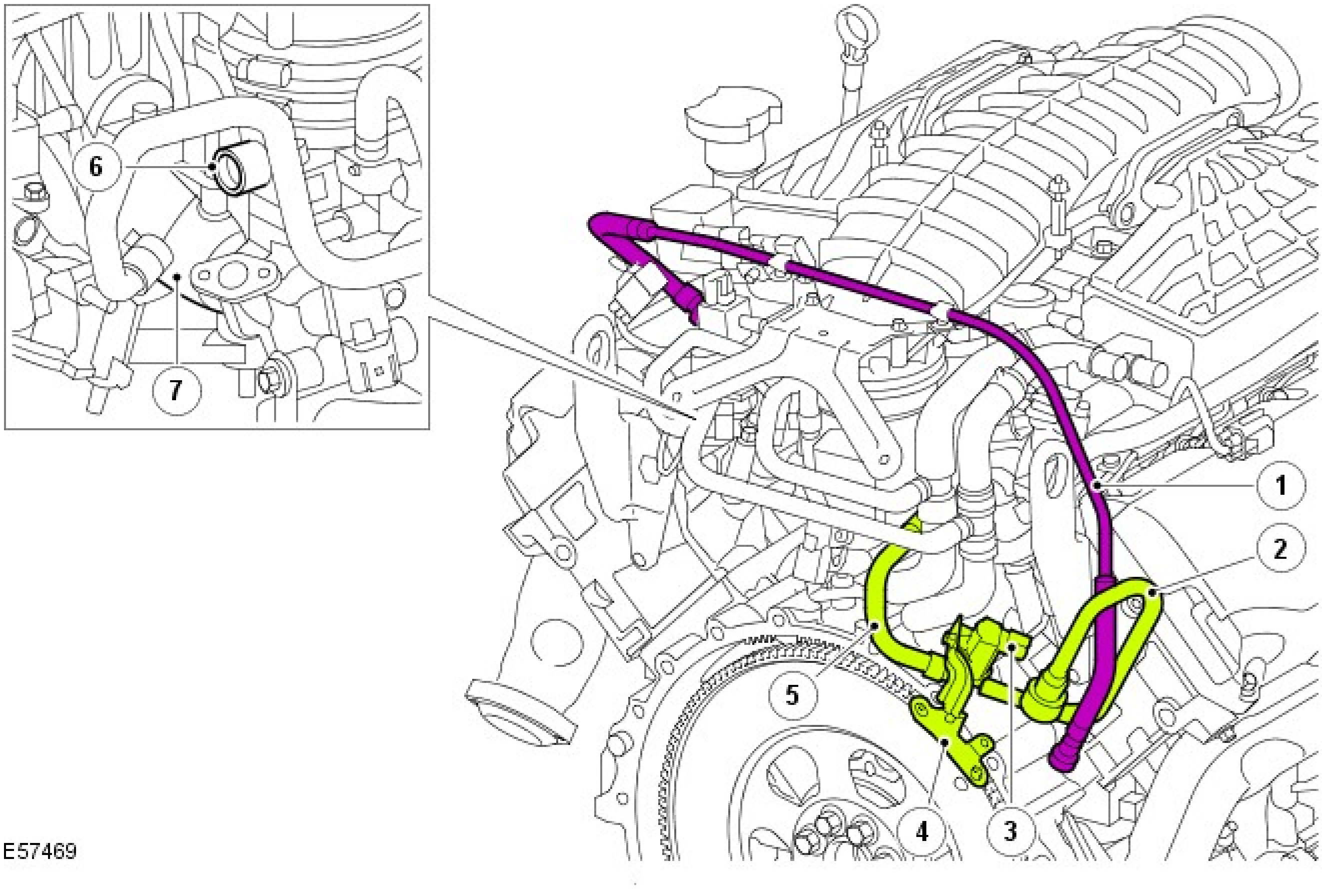
Fuel vapor is generated by the fuel in the tank and the amount of vapor produced increases as the fuel heats up. Fuel vapor can flow freely to the charcoal canister via the tank venting system. The venting system consists of roll over valves and a liquid vapor separator mounted internally in the tank and then externally via a breather hose. The breather line allows the fuel vapor to flow to the charcoal canister via a 'Y' piece mounted on the filler pipe.

On NAS vehicles the vapor generated in the fuel tank during refueling flows without restriction to the charcoal canister.

On all vehicles except NAS, the vapor is restricted in its path to the charcoal canister but can flow freely during the fuel filling operation to atmosphere, via the filler opening.

The vapor passes into the charcoal canister where it is absorbed and stored by the charcoal. Because there is a limit to the amount of vapor the canister can contain, the fuel vapor is purged from the canister when the engine is running and burned in the engine.

PURGE VALVE AND HOSES



Item	Part Number	Description

1	-	Fuel feed jump hose (Ref. only)
2	-	Purge hose connector
3	-	Purge valve
4	-	Bracket
5	-	Purge hose
6	-	Electronic throttle
7	-	Induction elbow

The purge valve is located at the rear of the engine, on a bracket which is attached to the transmission bell housing. The purge hose is routed from the purge valve, into the induction elbow and is secured with a quick fit conector.

The purge hose is connected, at the right hand rear of the engine, with a quick release coupling to the purge line which runs parallel with the fuel feed line along the top of the fuel tank to the charcoal canister.

The purge hose continues from the purge valve and is routed to a connection on the air intake elbow assembly. The hose is connected to the elbow with a quick release connector.

The purge valve is located on a bracket on the bell housing and is secured with a single bolt. The purge valve is a solenoid operated valve which is closed when de-energized. The valve is controlled by the Engine Control Module (ECM) and is operated when engine operating conditions are correct to allow purging of the charcoal canister.

The purge valve is Pulse Width Modulated (PWM) at 10Hz by the ECM. At this high frequency, the pulses of purge gas flow into the induction elbow in an almost a continuous flow. The valve operates between 7% and 100% duty or mark space ratio (% open time).

The atmospheric pressure at the air intake vent of the system is higher than the inlet manifold pressure under all throttled engine running conditions. It is this pressure differential across the system that causes the air to flow through the air intake, through the purge system, and in to the engine. The operation of the supercharger does not affect the purging process.

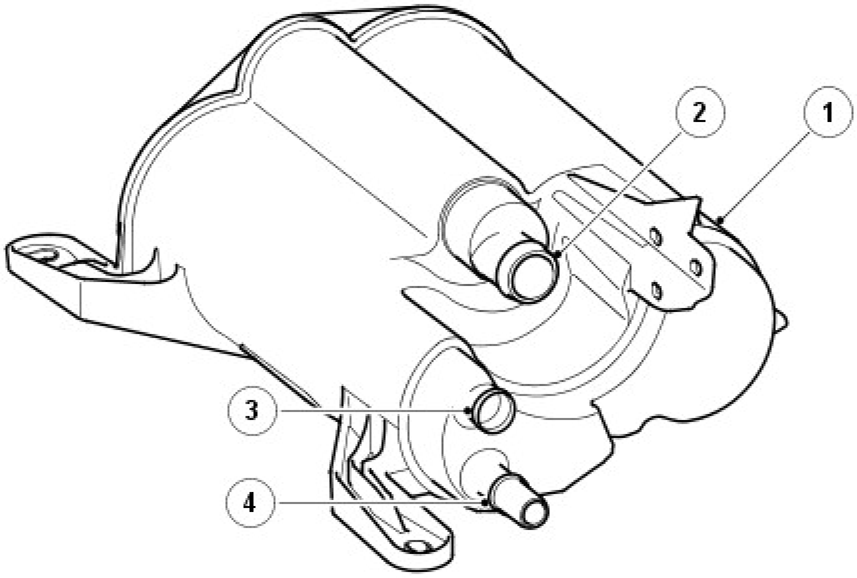
The ECM waits until the engine is running above 40°C (104°F) coolant temperature with closed loop fuel operational before the purging process is activated. Under these conditions the engine should be running smoothly with no warm up enrichment. The purge valve duty (and flow) is initially ramped slowly because the vapour concentration is unknown (a sudden increase in purge could cause the engine to flood). The concentration is then determined from the amount of adjustment that the closed loop fuelling is required to make to achieve the target Air Fuel Ratio (AFR). Once the concentration has been determined, the purge flow can be increased rapidly and the injected fuel can be proactively adjusted to compensate for the known purge vapour and the target AFR control is maintained.

When the purging process is active, fresh air is drawn into the charcoal canister via the DMTL valve atmospheric vent connection and its filter on NAS vehicles or, via the vent hose connection and the spider trap on non NAS vehicles.

On NAS vehicles the system does not include a pressure test point. Pressure testing of the purge valve hose is achieved by disconnecting the purge valve joint on the underside of the vehicle, forward of the fuel tank and connecting a special tool to allow the system to be pressure tested. The test performs a pressure test on the purge hose connection forward of the fuel tank back to the charcoal canister. The special tool is then connected to the purge hose connection forward of the fuel tank to perform a pressure test on the purge hose to the purge valve.

CHARCOAL CANISTER

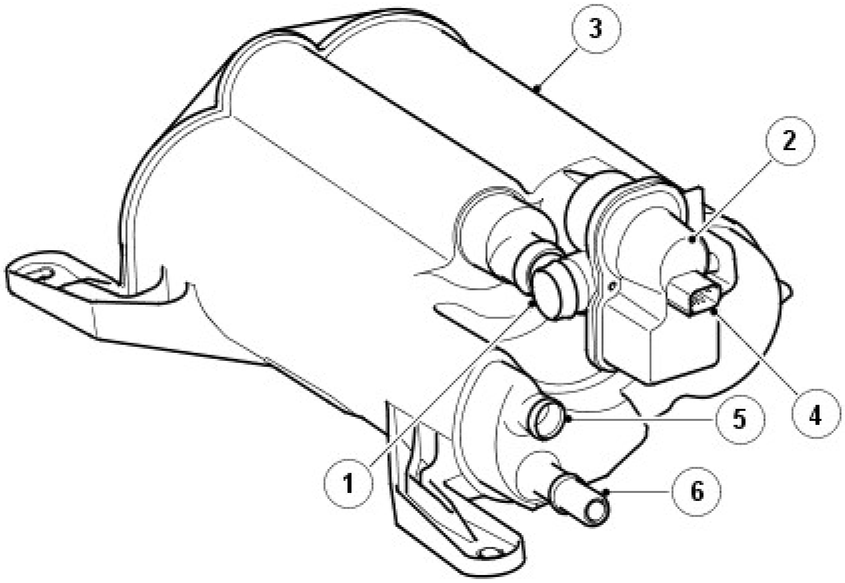
Charcoal Canister - All except NAS



E44560

Item	Part Number	Description
1	-	Charcoal canister
2	-	Charcoal canister atmospheric vent connection
3	-	Purge hose connection
4	-	Charcoal canister tank vent connection

Charcoal Canister - NAS



E44561

Item	Part Number	Description
1	-	Charcoal canister atmospheric vent connection (via DMTL pump)
2	-	DMTL pump
3	-	Charcoal canister
4	-	Electrical connector
5	-	Purge hose connection
6	-	Charcoal canister tank vent hose connection

The charcoal canister is located in a central position, forward of the spare wheel. It is attached at the rear with two bolts which screw into the spare wheel carrier. At the front, the canister has two lugs which locate in the parking brake module support bracket.

The canister on ROW vehicles has a capacity of 1400cc (85.4 in^3).

The canister on NAS vehicles has a capacity of 3000cc (183 in^3).

The canister has three ports which allow for the attachment of the atmospheric vent hose, the purge hose and the tank vent hose. On NAS vehicles the atmospheric vent hose connection allows for the attachment of the DMTL pump.

The canister contains a bed of activated charcoal or carbon. The charcoal is produced using special manufacturing techniques to treat the charcoal with oxygen. The oxygen treatment opens up millions of pores between the carbon atoms resulting in a highly porous charcoal with a very large effective surface area which is capable of absorbing large quantities of fuel vapor. Once treated the charcoal is known as 'activated' carbon or charcoal. The charcoal canister on NAS vehicles uses a higher grade charcoal to meet the requirements of LEV2 emission regulations.

DIAGNOSTIC MONITORING OF TANK LEAKAGE (DMTL) - NAS ONLY

The DMTL system is a legislative requirement for NAS vehicles. The DMTL system periodically checks the EVAP system and the fuel tank for leaks when the ignition is switched off.

The DMTL system comprises the previously described components of the EVAP system with the following additional components; a DMTL pump and a DMTL filter.

The DMTL pump is connected to the atmospheric vent of the charcoal canister and incorporates a Positive Temperature Co-efficient (PTC) heating element, a normally open valve and a reference orifice. The DMTL pump is only operated when the ignition is switched off and is controlled by the ECM. The ECM also monitors the electric air pump operation and the normally open valve for faults.

The DMTL filter protects the pump from dust being drawn into the system when the pump is being operated. The filter is located on the fuel filler pipe and is connected to the DMTL pump by a hose.

DMTL Operation

To check the fuel tank and the EVAP system for leaks, the ECM operates the DMTL pump and monitors the current draw. Initially, the ECM establishes a reference current by pumping air through the reference orifice and back to atmosphere. Once the reference current is determined, the ECM closes the normally open valve which seals the EVAP system. The purge valve remains de-energized and is therefore closed. The output from the air pump is diverted from the reference orifice and into the EVAP system.

When the normally open valve is closed, the load on the air pump falls to zero. Providing there are no leaks, the air pump will begin to pressurise the EVAP system and the load and current draw in the pump increases. By monitoring the rate and level of the current increase, the ECM can determine if there is a leak in the EVAP system.

During normal vehicle operation, the ECM energizes the heating element in the pump to prevent condensation formation and possible incorrect current readings.

Leaks are classified as:

- Minor - equivalent to a hole diameter of 0.5 to 1.0 mm (0.02 to 0.04 in)
- Major - equivalent to hole diameter of 1.0 mm (0.04 in) or greater.

The ECM performs a check for major leaks each time the ignition is switched off, providing the following conditions are met:

- The vehicle speed is zero
- The engine speed is zero
- The pressure altitude (70 kPa (10.15 lbf/in^2) derived from engine load calculations) is below 3047 m (10000 feet)
- The ambient temperature is between 0 and 40°C (32 and 104°F)
- The charcoal canister load factor is 2 or less (where the load factor is a measure, between -1 and +30, of the fuel vapor stored in the charcoal canister. Where -1 is 0% fuel vapor, 0 is stoichiometric fuel vapor level and +30 is 100% saturated with fuel vapor.
- The fuel tank level is valid and between 15 and 85% of nominal capacity
- The engine running time during the previous cycle was more than 10 minutes
- The battery voltage is between 10 and 15 volts
- The last engine off time was more than 180 minutes
- No errors are detected with the EVAP components, the ambient air temperature and the fuel level
- High range must be selected on the transfer box.

• NOTE: A leak test can be performed using T4. This overrides the above conditions and is useful for checking correct system and component operation.

The ECM performs a check for minor leaks after every 2nd major leak check or after refuelling is detected.

When the leak check is complete, the ECM stops the DMTL pump and opens (de-energizes) the normally open valve.

If the fuel filler cap is opened or refuelling is detected during the leak check, by a sudden drop in the current draw or a rise in the fuel level, the ECM aborts the leak check.

If a leak is detected during the check, the ECM stores an appropriate fault code in its memory. If a leak is detected on two consecutive checks, the ECM illuminates the Malfunction Indicator Lamp (MIL) in the instrument cluster on the next drive cycle.

The duration of a leak check can be between 60 and 600 seconds depending on the results and fuel tank level.

Evaporative Emissions - V8 S/C 4.2L Petrol - Evaporative Emission Canister

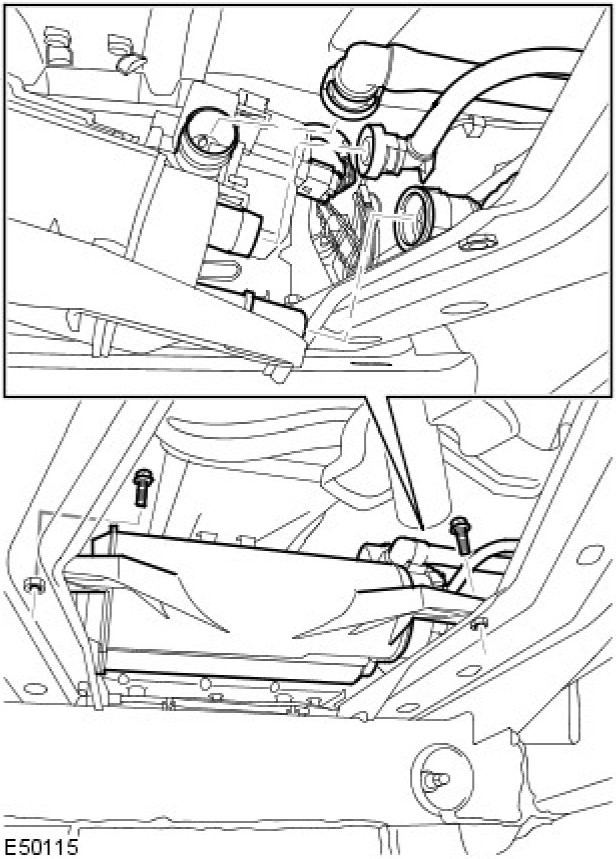
Removal and Installation

Removal

1. Remove the spare wheel and tire.

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

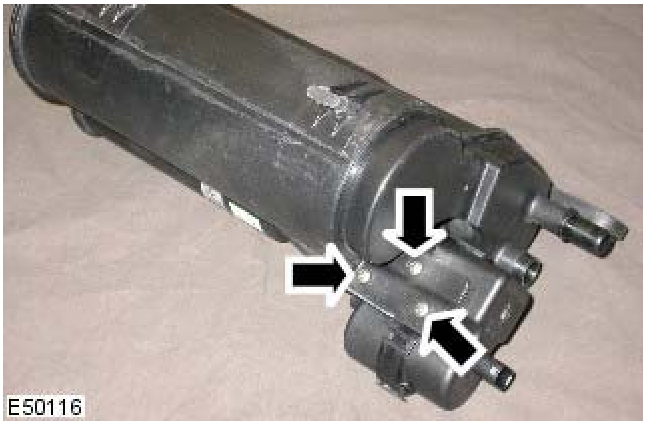
Raise and support the vehicle.



E50115

3. Remove the evaporative emissions canister.

- Remove the 2 bolts.
- Disconnect the 3 lines.
- Disconnect the electrical connector.



E50116

4. NOTE: Do not disassemble further if the component is removed for access only.

NAS vehicles: Remove the fuel tank leakage detection module.

- Remove the 3 screws.

Installation

1. NAS vehicles: Install the fuel tank leakage detection module.

- Install the screws.

2. Install the evaporative emissions canister.

- Connect the electrical connector.
- Connect the lines.
- Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the spare wheel and tire.

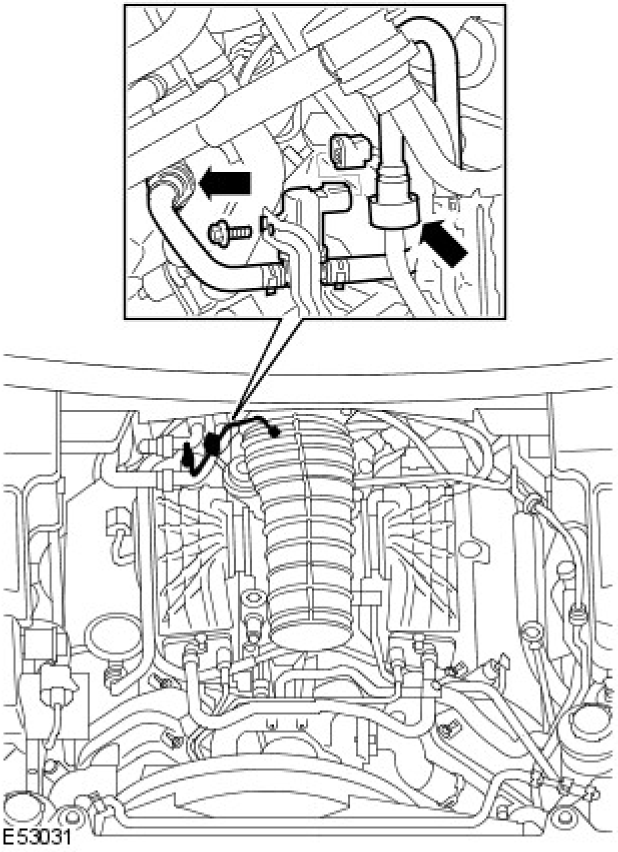
Published: 11-May-2011

Evaporative Emissions - V8 S/C 4.2L Petrol - Evaporative Emission Canister Vent Solenoid

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00, Specifications).
2. Remove the throttle body.
   For additional information, refer to: Throttle Body Gasket (303-04, Removal and Installation).
3. Remove the exhaust system.
   For additional information, refer to: Exhaust System (309-00, Removal and Installation).
4. Disconnect the purge hose at the intake elbow.
   - Release the clip.
5. Raise the vehicle on the lift.
6. Remove the emission canister vent solenoid.
   - Release and disconnect the electrical connector.
   - Release the clip and disconnect the purge line.
   - Remove the bolt.



Installation

1. Install the purge valve.
   - Install the bolt.
   - Connect the hose.
   - Connect and secure the electrical connector.
2. Connect the purge line to the intake elbow.

3. Install the exhaust system.
For additional information, refer to: Exhaust System (309-00, Removal and Installation).

4. Install the throttle body.
For additional information, refer to: Throttle Body Gasket (303-04, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00, Specifications).

Evaporative Emissions - V8 S/C 4.2L Petrol - Evaporative Emission Canister Ventilation Filter

Removal and Installation

Removal

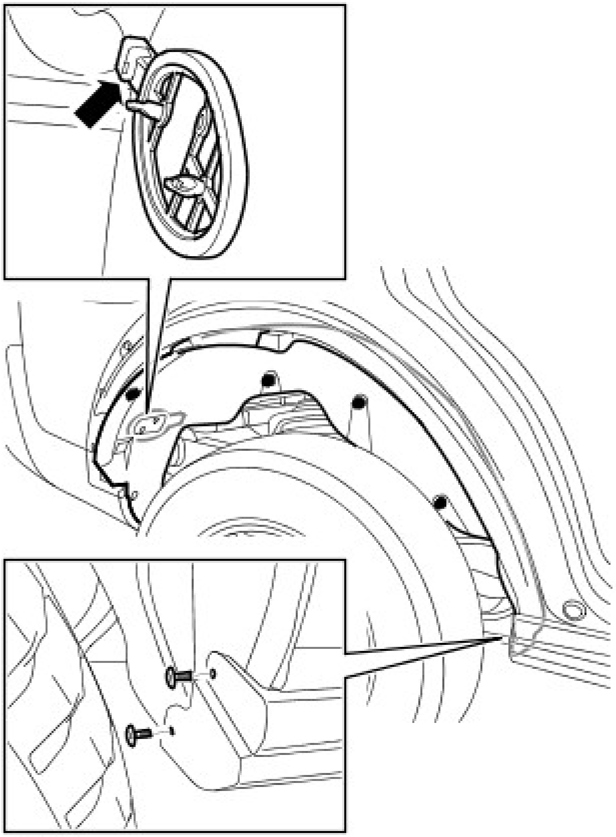
⚠ WARNING: Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the RH rear wheel and tire.

3. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.



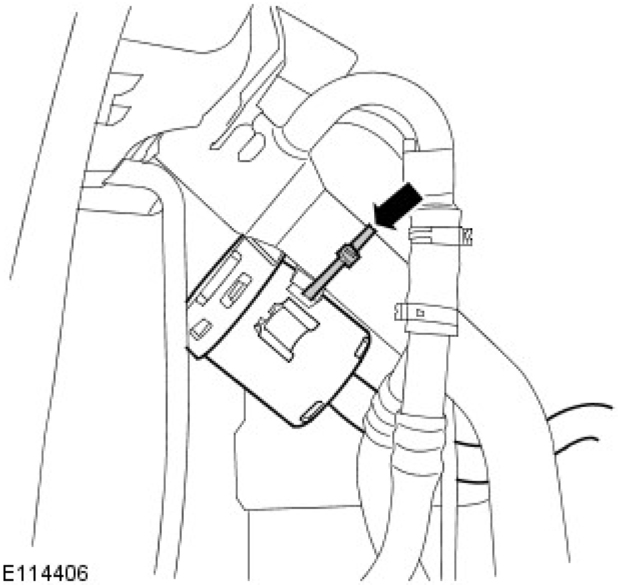
E48478

Remove the RH rear fender splash shield.

- Remove the 2 screws.
- Remove the 6 retainers.
- Disconnect the electrical connector.

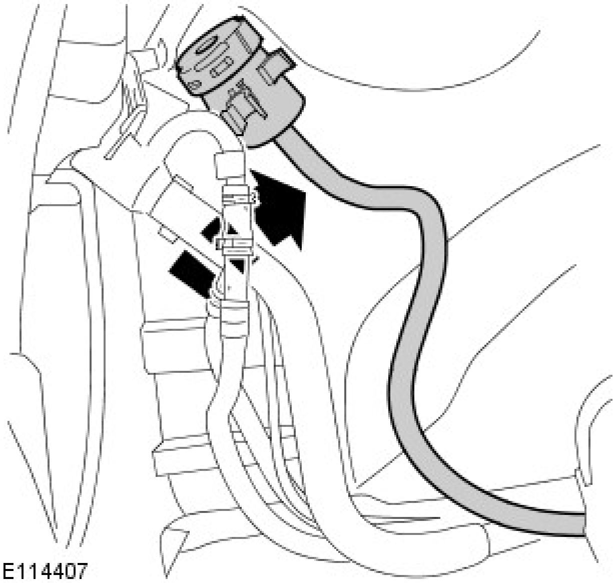
4. Release the evaporative emission canister ventilation filter from the fuel filler pipe.

- Cut the cable tie.



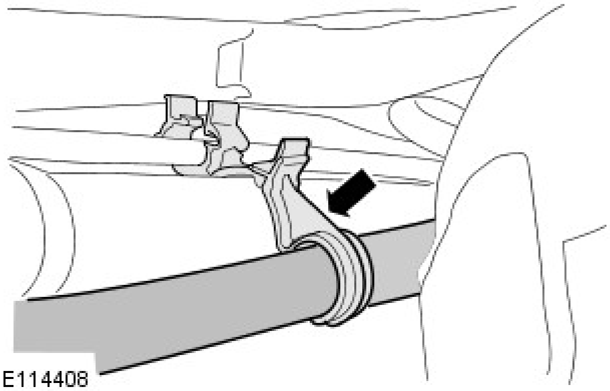
E114406

5. Position the evaporative emission canister ventilation filter to one side.

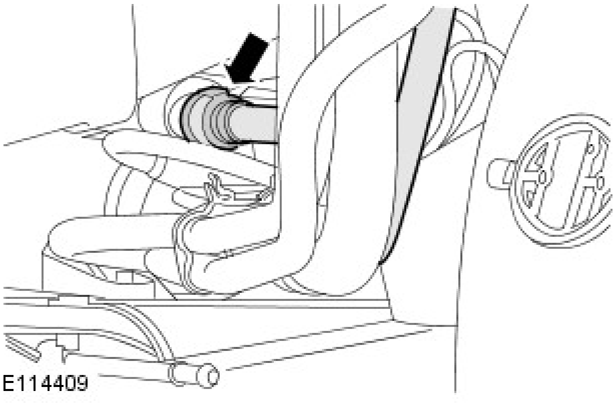


E114407

6. Release the evaporative emission ventilation filter from the clip.



E114408



7. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the evaporative emission canister ventilation filter.

- Release the evaporative emission canister ventilation filter from the evaporative emission canister.

Installation

1. To install, reverse the removal procedure.

Evaporative Emissions - V8 S/C 4.2L Petrol - Evaporative Emissions

Diagnosis and Testing

Principles of Operation

For a detailed description of the evaporative emission system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Evaporative Emissions (303-13 Evaporative Emissions - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Description and Operation).

Inspection and Verification

⚠CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
• Fuel filler cap and seal • Fuel filler neck • DMTL fresh air filter (restriction, etc) • Fuel tank (leaks, damage, etc) • Fuel lines and joints, etc • Carbon canister • Purge valve • Diagnostic module fuel tank leak (DMTL) pump module	• Fuses • Connectors • Harness • Purge valve • Diagnostic module fuel tank leak (DMTL) pump

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.
5. **5.** Where K-Line, Vacutec or other proprietary smoke test equipment is available, it should be utilized to assist with Evaporative Emissions System leak diagnosis.

Symptom Chart

Symptom	Possible Causes	Action
Difficulty in filling fuel tank	• Restriction in the vapour line between the fuel tank and the carbon canister outlet/atmospheric port	Check for restrictions/damage, etc (see visual inspection)
Fuel smell	• System leak • Purge valve inoperative	Check for leaks, check the purge valve operation
'Check Fuel Filler Cap' displayed on Message Center	• Fuel filler cap missing/not tightened after refuelling	Check the fuel filler cap and seal

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Evaporative Leak OBD Fault Rectification Guide

Determine Which DTC Has Been Stored

Using the manufacturer approved diagnostic system, choose **diagnostic session**, then choose the following symptom paths : **Powertrain / engine system / fuel vapour and odor, Powertrain / engine system / fuel tank, Electrical / instruments / warning lamps / engine malfunction lamp / lamp illuminated, Powertrain / engine system / engine performance / fuel consumption high**

• NOTE: This guide covers DTCs that relate to evaporative leak monitoring, as listed in the table below

DTC	Description
P0442-00	DMTL small leak
P0447-00	DMTL COV electrical low (open)
P0448-00	DMTL COV electrical high
P0455-00	DMTL rough leak
P2401-00	DMTL pump electrical low (open)
P2402-00	DMTL pump electrical high
P2404-2F	DMTL noise fault
P2404-29	DMTL reference leak
P2405-00	DMTL reference current low
P2406-00	DMTL reference current high
P2450-00	DMTL COV stuck open
P2451-00	DMTL COV stuck closed
P240B-00	DMTL heater electrical low (open)
P240C-00	DMTL heater electrical high

Attempt To Replicate The Fault Using The "Fuel Leak Check" Forced Test

1. **1.** Record any DTCs that has been logged
2. **2.** Using the manufacturer approved diagnostic system, in the **Recommendations** tab run the **Fuel Leak Check** forced test
3. **3.** For the test to run the fuel level must be between 15% and 85%
4. **4.** During this procedure the engine must be off
5. **5.** The possible responses from the test and the associated DTCs are listed below
6. **6.** If again no fault is found it could suggest that the failure mode is a borderline condition (refer to section 3) or that it was caused by incorrect fitment of the fuel cap or the fuel filler neck is at fault therefore it is important not disturb the fuel cap
7. **7.** Disconnect purge pipe from the purge valve, observe the condition of connection (the seating and condition of the "O" ring) and then reconnect. Using the manufacturer approved diagnostic system, run **Purge Valve Self Test** (to clean the purge valve) then run the **Fuel Leak Check**
8. **8.** If the test failed, a smoke test is required to determine the cause of the leak

• NOTE: P240B & P240C are not included in the **Fuel Leak Check** forced test (these monitors run at every ignition on and complete within 30 seconds)

Response Description	ID	Equivalent DTC
Function running: Reference leak measurement	1	
Function running: Rough leak measurement	2	
Function running: Small leak measurement	3	
Function running: 2nd ref leak measurement	4	
Function running: COV Cleaning	5	
Function aborted due to conditions: Vbatt conditions not correct (too high/ low)	11	
Function aborted due to conditions: Variation Ref. I (reference current) too high	12	P2404-29
Function aborted due to conditions: DMTL electrical fault	13	P0447, P0448
Function aborted due to conditions: Maximum diagnostic time exceeded	14	
Function aborted due to conditions: Crash detected	15	
Function aborted due to conditions: Refuel detected	20	
Function aborted due to conditions: Filler cap opened	21	
Function aborted due to conditions: Engine start	23	
Function aborted due to conditions: Noisy current measurement	24	P2404-2F
Function aborted due to conditions: Ambient temp outside range	26	
Function aborted due to conditions: Ambient pressure outside range	27	
Function aborted due to conditions: Other conditions	29	
Function complete - Tight system, fault free	30	
Function complete - Fine leak detected	31	P0442
Function complete - Rough leak detected	32	P0455
Function complete - Module error	33	P2401, P2402, P2450, P2451, P2405, P2406, P2404-29
Function complete - Medium leak detected	34	P0442, P0455

Read The "Ranking values" To Determine How Far Away The Result Is From The Failure Threshold

9. **9.** When the **Fuel Leak Check** forced test has completed the test results (known as ranking values) will be displayed
10. **10.** These should be compared against the limits shown in the table below
11. **11.** If the test result is borderline then there is a risk that a failure will occur at a later date (during customer usage of the vehicle)
12. **12.** To avoid this the vehicle should be carefully checked for any small leaks

Ranking Value	Normal Result For Tight System	Leak Failure Condition
Rough Leak (40 thou+)	0 > = 50	>= 128
Small Leak (20 thou+)	0 > = 60	>= 128

TRACE THE ROOT CAUSE OF THE FAULT

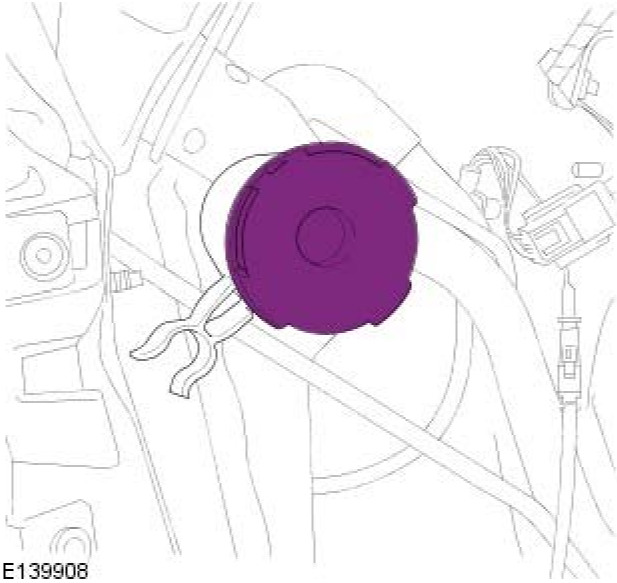
The list below provides some suggested actions to help trace the root cause of the fault

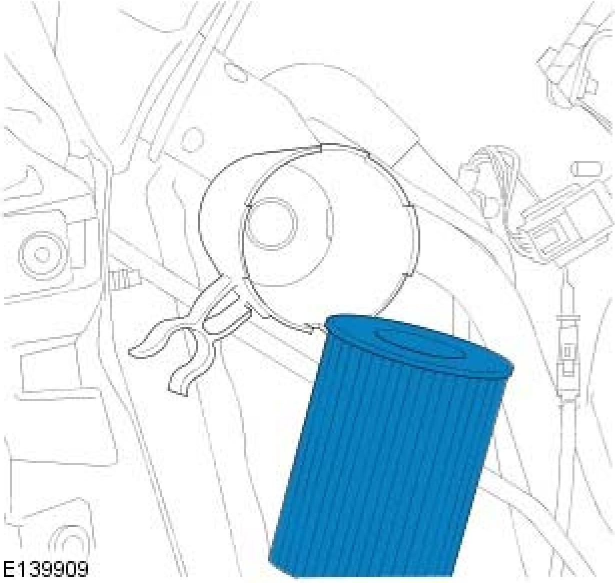
Each action should be followed up with a **Fuel Leak Check** forced test (and ranking value check) in order to determine if any improvement has been made

DTC	Fault Description	Fault Rectification Actions after smoke test
P0442-00	DMTL small leak	● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filer neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run **Purge Valve Self Test** (to clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace the DMTL module
P0447-00	DMTL COV electrical low (open)	● 1. Check fuse ● 2. Check that fuse fits tightly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P0448-00	DMTL COV electrical high	● 1. Check wiring ● 2. Replace DMTL module
P0455-00	DMTL rough leak	● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filer neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run "Purge Valve Self Test" (to help clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition (surprisingly, this is a potential leakage path!) ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace DMTL module
P2401-00	DMTL pump electrical low (open)	● 1. Check fuse ● 2. Check that fuse fits correctly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P2402-00	DMTL pump electrical high	● 1. Check wiring ● 2. Replace DMTL module
P2404-2F	DMTL noise fault	● Replace DMTL module
P2404-29	DMTL reference leak	● Replace DMTL module

DTC	Fault Description	Fault Rectification Actions after smoke test
P2405-00	DMTL reference current low	● Replace DMTL module
P2406-00	DMTL reference current high	● 1. Check for any blockages in the DMTL ventilation pipe & filter ● 2. Replace DMTL module
P2450-00	DMTL COV stuck open	● Replace DMTL module
P2451-00	DMTL COV stuck close	● Replace DMTL module
P240B-00	DMTL heater electrical low (open)	● 1. Check fuse ● 2. Check that fuse fits tightly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P240C-00	DMTL heater electrical high	● 1. Check wiring ● 2. Replace DMTL module

Pre and 10MY Denso/Bosch PCM Systems

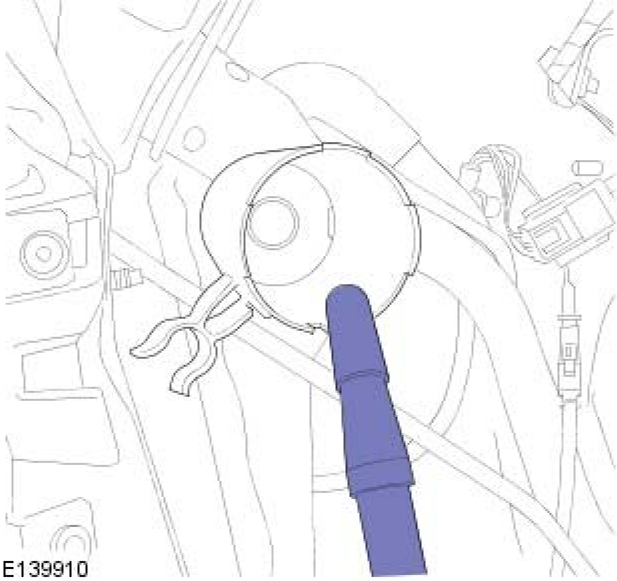




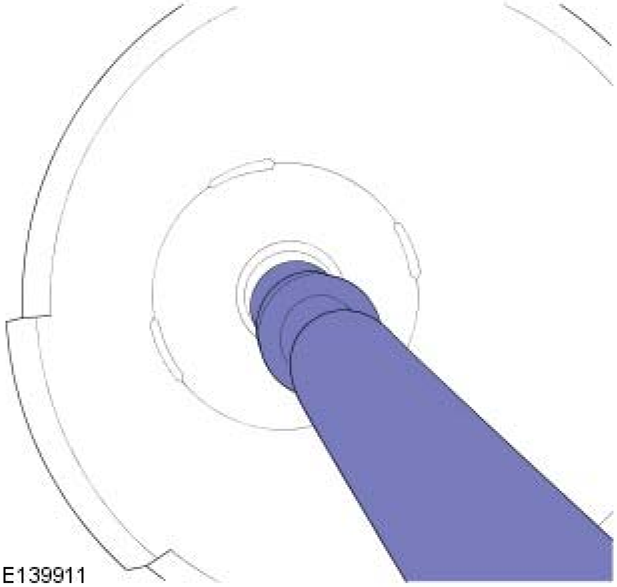
⚠ CAUTION: The Maximum pressure of the EVAP system is 0.07 bar **do not exceed**

• NOTE: Apart from the purge valve connection, it is recommended to smoke test the EVAP system without disturbing any joints associated with the system, this will determine the leak more accurately and quickly

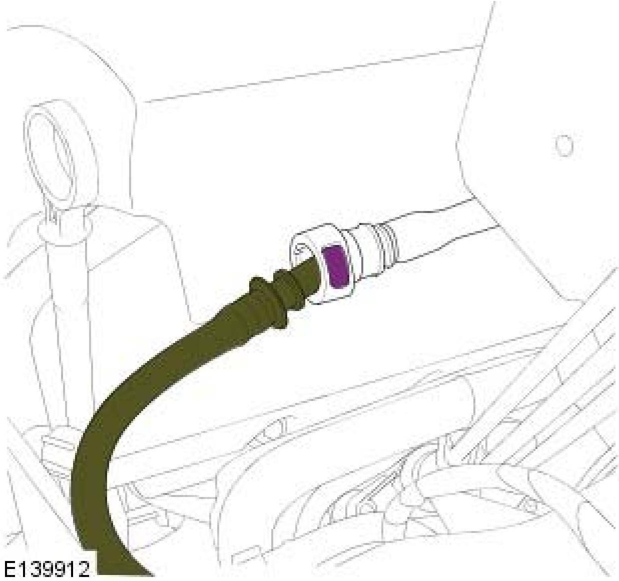
- 1. Remove rear wheel arch liner to access fuel filler neck
- 2. On the fuel filler neck the DMTL filter will be visible as shown in picture. Unclip filter housing from fuel filler neck to gain better access to DMTL filter
- 3. Remove carefully the top of filter to expose filter and remove
- 4. Attach rubber adapter to tip of smoke machine nozzle to ensure tight seal to filter housing. Disconnect the purge pipe from purge valve; this will be an escape point for the smoke to exit
- 5. Allow tester to complete self-test and green READY light to turn ON 2. For best Tester performance; completely unwind Tester’s supply hose
- 6. Press **Smoke** on control panel to fill EVAP system with smoke vapour. The control panel **Smoke** light will light indicating smoke production. The smoke setting is on a 15 minute timer. Pressing the **Smoke** button again turns Tester off. It is normal for the flow meter ball, while in the smoke mode, not to be as steady as when it is in the **Test** mode. Note: The pressure gauge is active only after smoke cycle is complete
- 7. Continue introducing smoke into the EVAP System until the flow meter’s ball stops descending and this assures the system test pressure is met and smoke will appear from the purge pipe, then close off purge pipe with special tool (Test Adapter Hose/EVAP Port 310-142)



E139910



E139911



E139912

⚠CAUTION: On some vehicles, the DMTL filter can not be removed, in these instances fill the system through the purge valve and smoke will appear from the filter

Pre 10MY Vehicles

On pre 10MY DMTL systems, Using the manufacturer approved diagnostic system, select **Measurement application** session then select the **Recommendations** tab which will give you access to **Datalogger**. Then select **Engine systems** then select the **Output state control** data-logger signal **Engine output 1 – diagnostic module – tank leakage -change over valve active** which will close the system. Then select **Engine output 1 – diagnostic module – tank leakage – pump active** this will pressurize the EVAP system

10MY vehicles

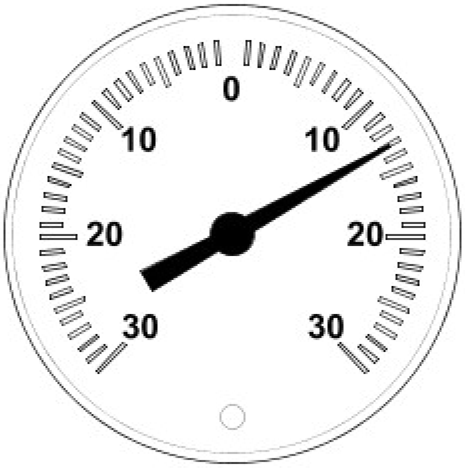
On 10MY vehicles a smoke test application is available so therefore only smoke fill the system and then run the application

- 8. Follow the EVAP system path with the halogen light provided and looks for the smoke exiting the leak(s) or use the UV light provided and look for the dye deposited at the exact location of the leak(s)
- 9. Repair the leak(s) and perform the **Fuel Leak Check** application again or smoke test to verify repair, as well as to make sure there are no additional leaks in the EVAP system

The UltraTraceUV® smoke solution’s dye feature is especially helpful when the leak is in an area that is not readily visible, as on the top of the fuel tank or behind a panel. Once you gain access to the area of the leak, wear the yellow UV glasses and shine the UV light provided to identify the exact location of the leak(s). Smoke exiting a very small leak is even easier to see with lower pressure. If you encounter smoke leaking out of an area but find it difficult to pinpoint exactly where the source of the leak is; try reducing the pressure in the system being tested by turning the Tester OFF and allow the pressure to dissipate. The longer a particular leak is allowed to leak, the more fluorescent dye material will be deposited at that leak. With some vapour system leaks, the leak may only present itself under vacuum and not under pressure. If equipment permits, test the system in both states. Purge valve faults [P0441, P0444, P0458 and P0459] should all inhibit DMTL leak test and therefore need to be resolved prior to any DMTL issues. For this reason, when smoke testing the vapour system, it should be sufficient to enter the system at the connection up stream of the purge valve. If no leak is found then testing the remainder of the system up to the purge valve is recommended

• NOTE: It may be possible to search for small leaks using a gas analyzer and looking for HC (hydro carbon) spikes. This should enable leaks to be detected in areas of the vapor system that our out of sight of the technician. The solenoid should be deactivated after five minutes to prevent potential damage. Check that connector and individual terminals are sealed correctly

Phase-One – (quantifying the leak)



E139914

- 1. Connect the tester supply hose to vehicle EVAP system. > Refer to appropriate vehicle application
- 2. Determine if the vehicle's EVAP system you are testing is governed by a .020" (0.5 mm) or .040" (1 mm) acceptable leak standard. Press the appropriate calibration standard on the tester's control panel and observe the position of the flow meter ball. > This function automatically turns off in 10 seconds
- 3. Position the flow meter's pointer flag so that it aligns with the measurement observed in step 2 above. > This sets PASS / FAIL mark
- 4. Close vehicle's EVAP Vent Solenoid. > Refer to appropriate vehicle application

- 5. Press TEST on control panel and fill EVAP system. > This introduces 5-minutes of nitrogen gas
- 6. Look for flow meter ball to stop descending indicating that the vehicle system is full. > Fill time 1-4 minutes depending on system volume
- 7. Compare flow meter ball reading to pointer flag. > ABOVE flag = FAIL (go to Phase-Two). > BELOW flag = PASS (test complete)

Testing With Pressure and Vacuum Decay

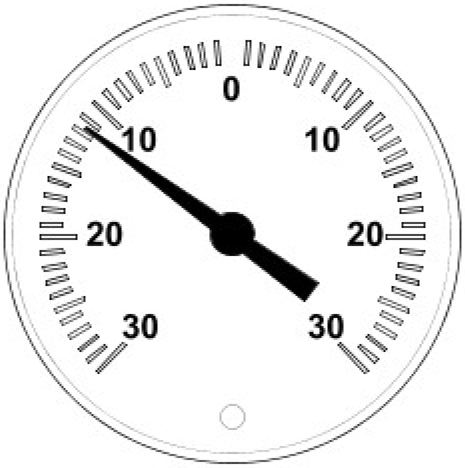
In addition to quantifying the leak with the Phase-One flow test, the Tester allows you the flexibility of testing the vehicle's EVAP system by using either **Pressure Decay** or **Vacuum Decay** methods. Below are instructions for performing both decay tests

Pressure-Decay Test

• NOTE: The Pressure Decay test is best performed immediately after the Phase-one flow test, since the system has already built up pressure

At the completion of the Phase-one flow test, the EVAP system is fully pressurized, since the Phase-one test uses pressure to perform its flow test. Testing pressure decay with the Vacutec® 522B-J/LR is very simple. All you need to do is the following:

- 1. Allow tester to complete self-test and green **READY** light to turn ON
- 2. Connect Tester supply hose to vehicle EVAP system
- 3. Close vehicle's EVAP Vent solenoid > Refer to appropriate vehicle application
- 4. Press **VACUUM** switch on the tester control panel
  - NOTE: The vacuum switch is on a 30-second timer, which should be sufficient time to draw the appropriate vacuum from the EVAP system. Press VACUUM switch again if additional time is required
- 5. After vacuum timer turns off, observe the vacuum gauge for any decay (loss of vacuum) indicating a leak in the EVAP system



E139915

• NOTE: Disconnect the Tester from the vehicle after the Vacuum Decay Test. The fuel pressure in the vehicle’s fuel tank is constantly changing due to the vehicle’s fuel volatility and that could cause the Tester’s pressure gauge to exceed its maximum reading limits

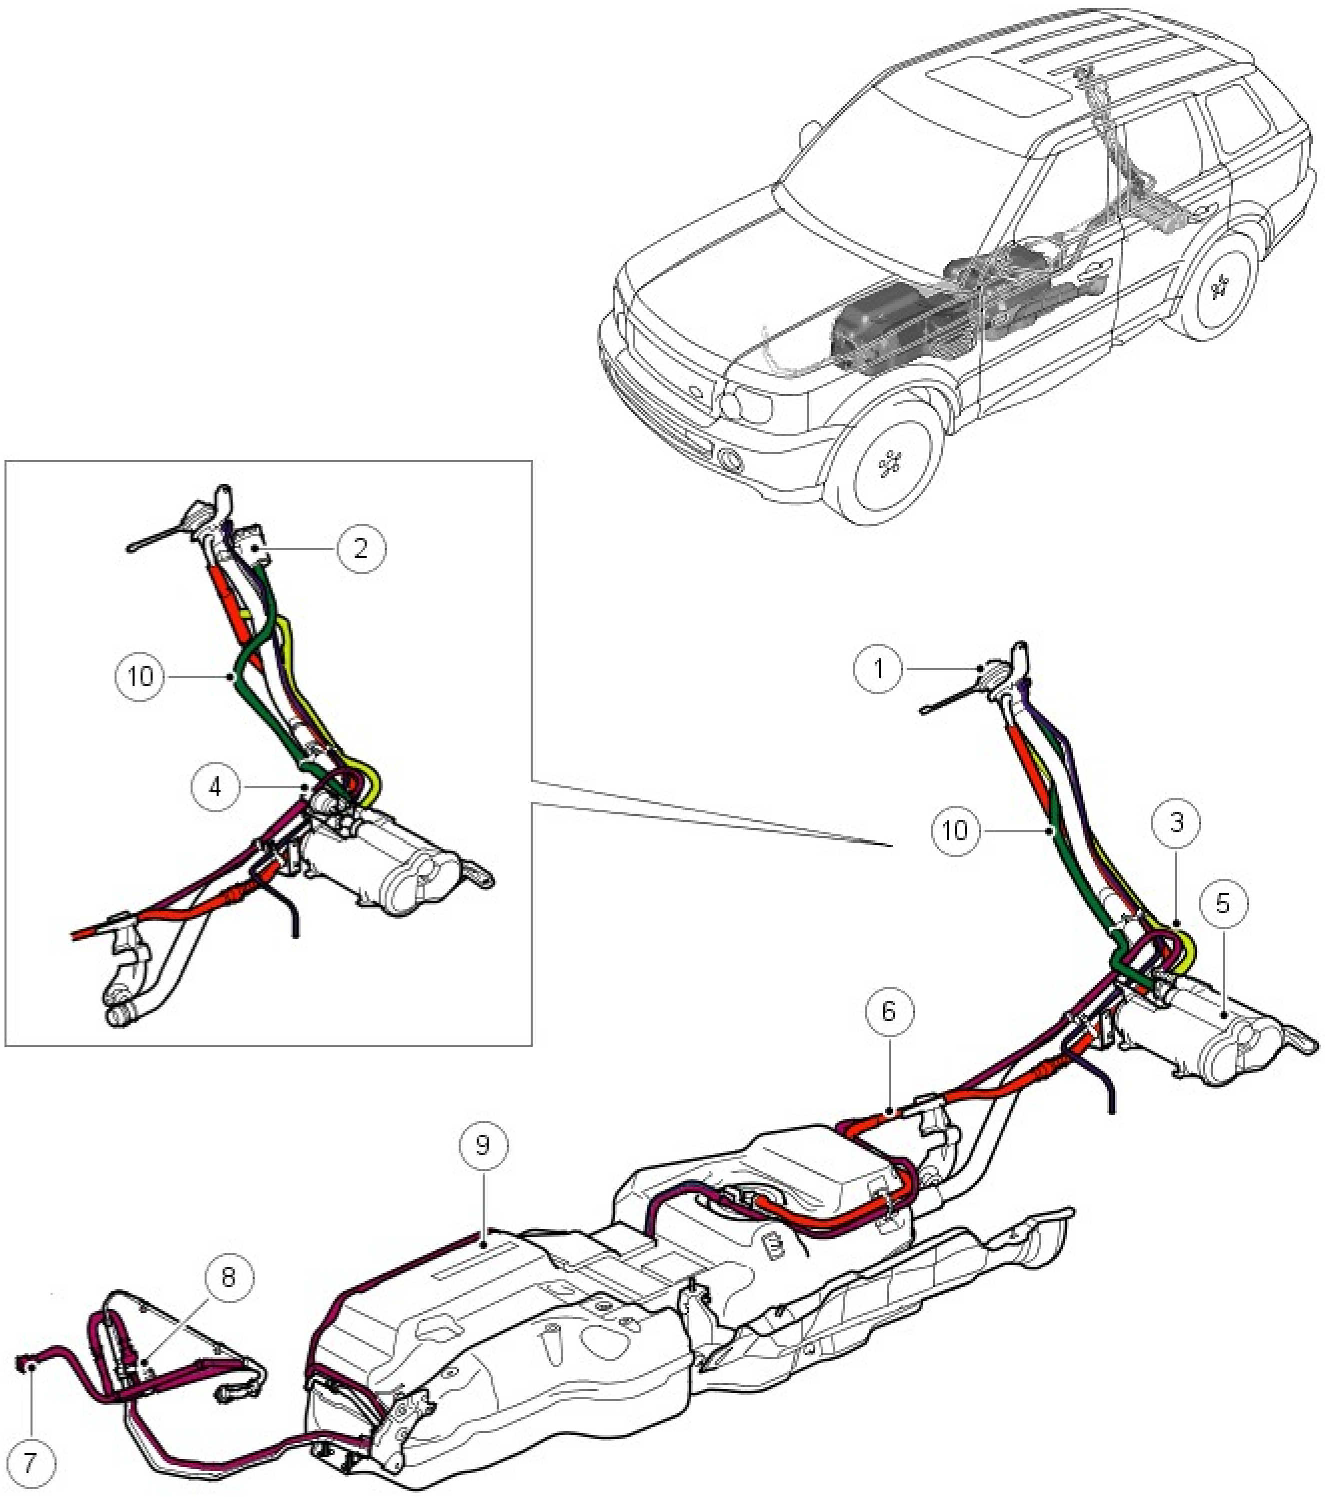
Evaporative Emissions - V8 4.4L Petrol - Evaporative Emissions

Description and Operation

Evaporative Emissions Component Layout - 4.4L V8



E57486

Item	Part Number	Description
1	-	Fuel filler pipe/cap
2	-	DMTL pump filter (NAS only)
3	-	Fuel tank vent hose to canister
4	-	DMTL pump (NAS only)
5	-	Charcoal canister
6	-	Fuel tank breather hose from tank
7	-	Purge hose
8	-	Purge valve
9	-	Fuel tank
10	-	Charcoal canister vent hose (All except NAS) or DMTL pump vent hose (NAS)

GENERAL

The evaporative emission (EVAP) control system reduces the level of hydrocarbons released into the atmosphere by fuel vapor venting from the fuel tank. The system comprises a charcoal canister, purge valve and interconnecting vent pipes and hoses. The vent pipes are connected to the system components using quick release connectors.

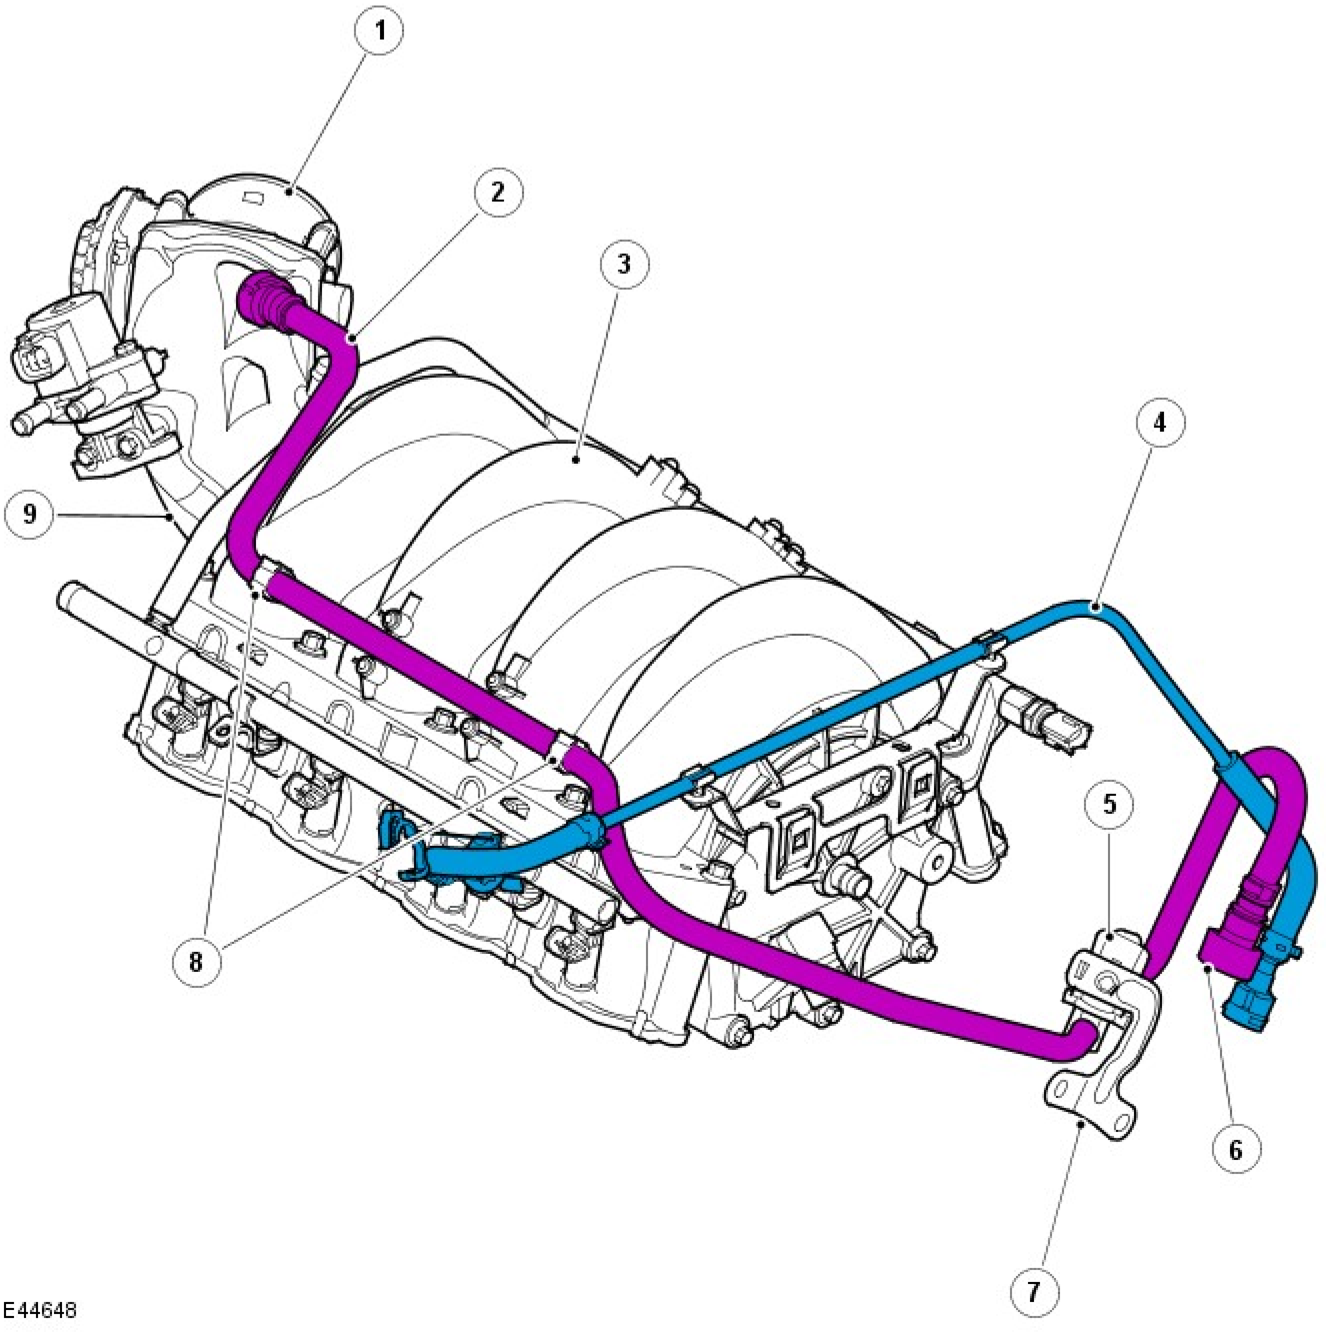
Fuel vapor is generated by the fuel in the tank and the amount of vapor produced increases as the fuel heats up. Fuel vapor can flow freely to the charcoal canister via the tank venting system. The venting system consists of roll over valves and a liquid vapor separator mounted internally in the tank and then externally via a breather line. The breather line allows the fuel vapor to flow to the charcoal canister via a 'Y' piece mounted on the filler pipe.

On NAS vehicles the vapor generated in the fuel tank during refueling flows without restriction to the charcoal canister.

On all vehicles except NAS, the vapor is restricted in its path to the charcoal canister but can flow freely during the refueling operation to atmosphere, via the filler opening.

The vapor passes into the charcoal canister where it is absorbed and stored by the charcoal. Because there is a limit to the amount of vapor the canister can contain, the fuel vapor is purged from the canister when the engine is running and burned in the engine.

PURGE VALVE AND HOSES



Item	Part Number	Description
1	-	Electric throttle
2	-	Purge hose
3	-	Intake manifold
4	-	Fuel feed jump hose (Ref. only)
5	-	Purge valve
6	-	Purge hose connector
7	-	Bracket
8	-	Hose clamps
9	-	Elbow assembly

The purge valve is located at the rear of the engine, on a bracket which is attached to the transmission bell housing. The purge hose is routed from the purge valve, along the left hand side of the air intake manifold, to the elbow assembly which locates the electric throttle.

The purge hose is connected, at the right hand rear of the engine, with a quick release coupling to the purge line which runs parallel with the fuel feed line along the top of the fuel tank to the charcoal canister.

The purge hose continues from the purge valve and is routed to a connection on the air intake elbow assembly. The hose is connected to the elbow with a quick release connector.

The purge valve is located on a bracket on the bell housing and is secured with a single bolt. The purge valve is a solenoid operated valve which is closed when de-energized. The valve is controlled by the Engine Control Module (ECM) and is operated when engine operating conditions are correct to allow purging of the charcoal canister.

The purge valve is Pulse Width Modulated (PWM) at 10Hz by the ECM. At this high frequency, the pulses of purge gas flow into the inlet manifold in an almost a continuous flow. The valve operates between 7% and 100% duty or mark space ratio (% open time).

The atmospheric pressure at the air intake vent of the system is higher than the inlet manifold pressure under all throttled engine running conditions. It is this pressure differential across the system that causes the air to flow through the air intake, through the purge system, and in to the engine.

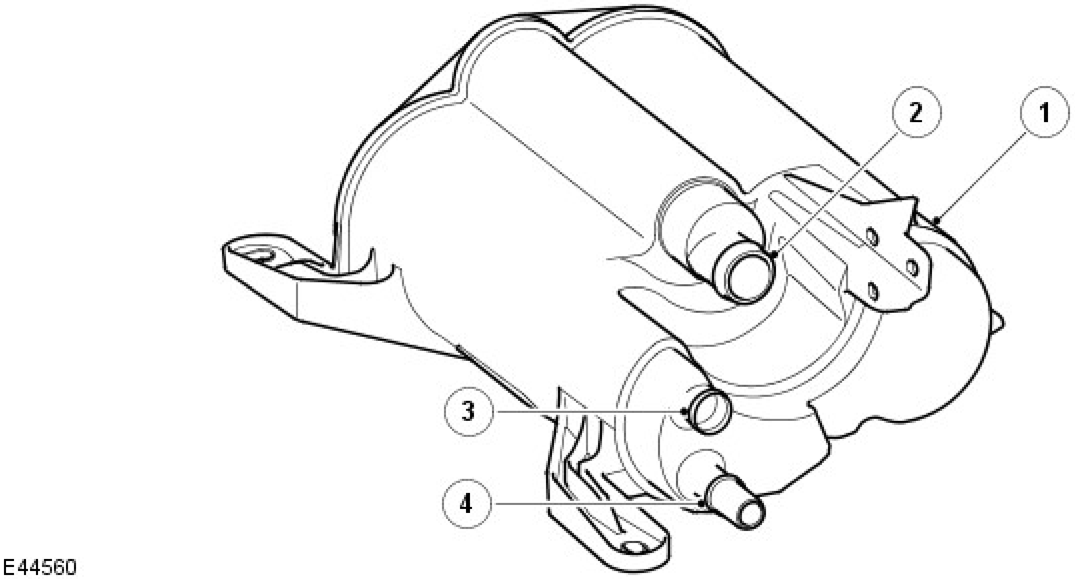
The ECM waits until the engine is running above 40°C (104°F) coolant temperature with closed loop fuel operational before the purging process is activated. Under these conditions the engine should be running smoothly with no warm up enrichment. The purge valve duty (and flow) is initially ramped slowly because the vapour concentration is unknown (a sudden increase in purge could cause the engine to flood). The concentration is then determined from the amount of adjustment that the closed loop fuelling is required to make to achieve the target Air Fuel Ratio (AFR). Once the concentration has been determined, the purge flow can be increased rapidly and the injected fuel can be proactively adjusted to compensate for the known purge vapour and the target AFR control is maintained.

When the purging process is active, fresh air is drawn into the charcoal canister via the DMTL valve atmospheric vent connection and its filter on NAS vehicles or, via the vent hose connection and the spider trap on non NAS vehicles.

On NAS vehicles the system does not include a pressure test point. Pressure testing of the purge valve hose is achieved by disconnecting the purge valve joint on the underside of the vehicle, forward of the fuel tank and connecting a special tool to allow the system to be pressure tested. The test performs a pressure test on the purge hose connection forward of the fuel tank back to the charcoal canister. The special tool is then connected to the purge hose connection forward of the fuel tank to perform a pressure test on the purge hose to the purge valve.

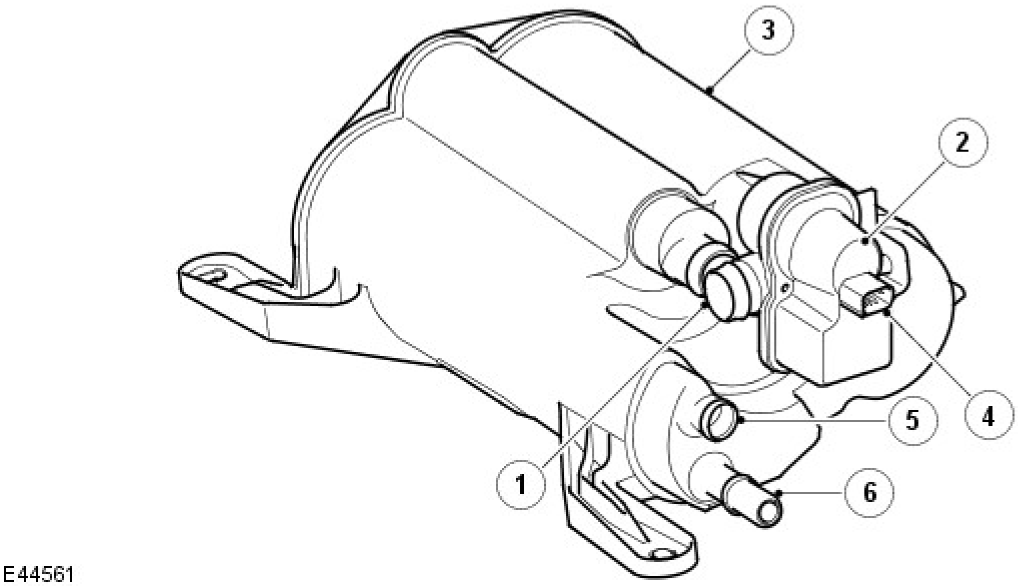
CHARCOAL CANISTER

Charcoal Canister - All except NAS



Item	Part Number	Description
1	-	Charcoal canister
2	-	Charcoal canister atmospheric vent connection
3	-	Purge hose connection
4	-	Charcoal canister tank vent connection

Charcoal Canister - NAS



Item	Part Number	Description
1	-	Charcoal canister atmospheric vent connection (via DMTL pump)
2	-	DMTL pump
3	-	Charcoal canister
4	-	Electrical connector
5	-	Purge hose connection
6	-	Charcoal canister tank vent hose connection

The charcoal canister is located in a central position, forward of the spare wheel. It is attached at the rear with two bolts which screw into the spare wheel carrier. At the front, the canister has two lugs which locate in the parking brake module support bracket.

The canister on ROW vehicles has a capacity of 1400cc (85.4 in^3).

The canister on NAS vehicles has a capacity of 3000cc (183 in^3).

The canister has three ports which allow for the attachment of the atmospheric vent hose, the purge hose and the tank vent hose. On NAS vehicles the atmospheric vent hose connection allows for the attachment of the DMTL pump.

The canister contains a bed of activated charcoal or carbon. The charcoal is produced using special manufacturing techniques to treat the charcoal with oxygen. The oxygen treatment opens up millions of pores between the carbon atoms resulting in a highly porous charcoal with a very large effective surface area which is capable of absorbing large quantities of fuel vapor. Once treated the charcoal is known as 'activated' carbon or charcoal. The charcoal canister on NAS vehicles uses a higher grade charcoal to meet the requirements of LEV2 emission regulations.

DIAGNOSTIC MONITORING OF TANK LEAKAGE (DMTL) - NAS ONLY

The DMTL system is a legislative requirement for NAS vehicles. The DMTL system periodically checks the EVAP system and the fuel tank for leaks when the ignition is switched off.

The DMTL system comprises the previously described components of the EVAP system with the following additional components; a DMTL pump and a DMTL filter.

The DMTL pump is connected to the atmospheric vent of the charcoal canister and incorporates a Positive Temperature Co-efficient (PTC) heating element, a normally open valve and a reference orifice. The DMTL pump is only operated when the ignition is switched off and is controlled by the ECM. The ECM also monitors the electric air pump operation and the normally open valve for faults.

The DMTL filter protects the pump from dust being drawn into the system when the pump is being operated. The filter is located on the fuel filler head and is connected to the DMTL pump by a hose.

DMTL Operation

To check the fuel tank and the EVAP system for leaks, the ECM operates the DMTL pump and monitors the current draw. Initially, the ECM establishes a reference current by pumping air through the reference orifice and back to atmosphere. Once the reference current is determined, the ECM closes the normally open valve which seals the EVAP system. The purge valve remains de-energized and is therefore closed. The output from the air pump is diverted from the reference orifice and into the EVAP system.

When the normally open valve is closed, the load on the air pump falls to zero. Providing there are no leaks, the air pump will begin to pressurise the EVAP system and the load and current draw in the pump increases. By monitoring the rate and level of the current increase, the ECM can determine if there is a leak in the EVAP system.

During normal vehicle operation, the ECM energizes the heating element in the pump to prevent condensation formation and possible incorrect current readings.

Leaks are classified as:

- Minor - equivalent to a hole diameter of 0.5 to 1.0 mm (0.02 to 0.04 in)
- Major - equivalent to hole diameter of 1.0 mm (0.04 in) or greater.

The ECM performs a check for major leaks each time the ignition is switched off, providing the following conditions are met:

- The vehicle speed is zero
- The engine speed is zero
- The pressure altitude (70 kPa (10.15 lbf/in^2) derived from engine load calculations) is below 3047 m (10000 feet)
- The ambient temperature is between 0 and 40°C (32 and 104°F)
- The charcoal canister load factor is 2 or less (where the load factor is a measure, between -1 and +30, of the fuel vapor stored in the charcoal canister. Where -1 is 0% fuel vapor, 0 is stoichiometric fuel vapor level and +30 is 100% saturated with fuel vapor.
- The fuel tank level is valid and between 15 and 85% of nominal capacity
- The engine running time during the previous cycle was more than 10 minutes
- The battery voltage is between 10 and 15 volts
- The last engine off time was more than 180 minutes
- No errors are detected with the EVAP components, the ambient air temperature and the fuel level
- High range must be engaged on the transfer box.

• NOTE: A leak test can be performed using T4. This overrides the above conditions and is useful for checking correct system and component operation.

The ECM performs a check for minor leaks after every 2nd major leak check or after refueling is detected.

When the leak check is complete, the ECM stops the DMTL pump and opens (de-energizes) the normally open valve.

If the fuel filler cap is opened or refuelling is detected during the leak check, by a sudden drop in the current draw or a rise in the fuel level, the ECM aborts the leak check.

If a leak is detected during the check, the ECM stores an appropriate fault code in its memory. If a leak is detected on two consecutive checks, the ECM illuminates the Malfunction Indicator Lamp (MIL) in the instrument cluster on the next drive cycle.

The duration of a leak check can be between 60 and 600 seconds depending on the results and fuel tank level.

Evaporative Emissions - V8 4.4L Petrol - Evaporative Emission System Leak Test

General Procedures

Special Tool(s)	
 E67117	EVAP tool 310-142

• NOTE: The following procedure allows a fuel leak, indicated by the Malfunction Indicator Lamp (MIL), to be accurately located. The test must only be carried out once it has been established that there are no obvious faults with any of the fuel system components.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Position the vehicle on a lift.

2. Check the components in the fuel and EVAP system for obvious damage. Make sure all the connections are secure.

3. Connect T4 to the vehicle.

- Run the DMTL test.
- Follow the on-screen prompts and force the DMTL to close.

4. WARNINGS:

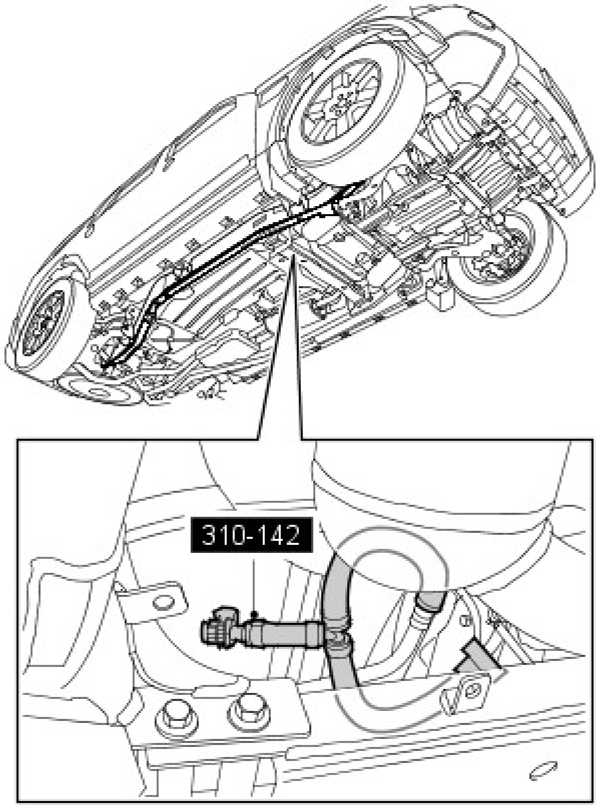
⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Install the special tool to the purge line.

- Release the clip and disconnect the purge line.
- Clean the component mating faces.
- Connect the special tool.



E67118

5. ⚠CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

   Disconnect the purge line at the emission canister line.

   - Release the clip.

6. Carry out the procedures in order, from the instruction sheet supplied with the EVAPS diagnostic testing station 310-115 (LRA-19-004) or (LRA-19-005A).
7. When a leak is detected, replace the component as necessary and repeat the test to validate the repair.
8. Connect the purge line to the emission canister line.

   - Clean the component mating faces.
   - Secure with the clip.

9. Disconnect the special tool from the purge line.

   - Clean the component mating faces.
   - Connect the purge line.

10. Disconnect T4 from the vehicle.

Published: 11-May-2011

Evaporative Emissions - V8 4.4L Petrol - Evaporative Emission Canister

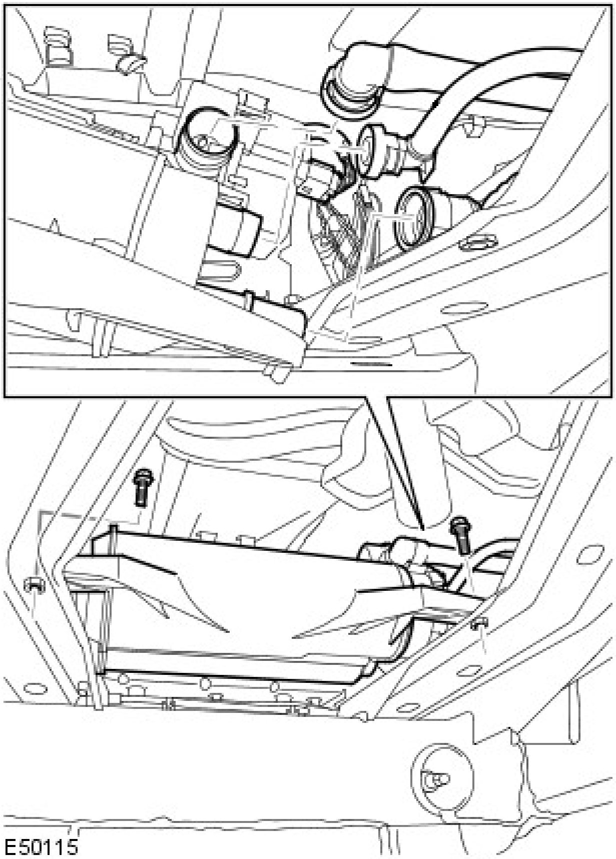
Removal and Installation

Removal

1. Remove the spare wheel and tire.

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

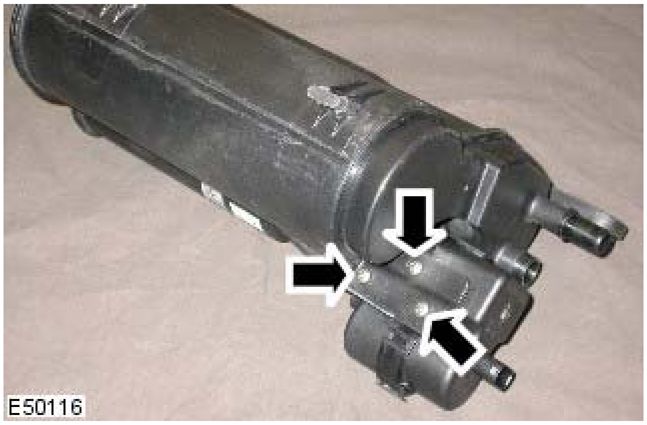
Raise and support the vehicle.



E50115

3. Remove the evaporative emissions canister.

- Remove the 2 bolts.
- Disconnect the 3 lines.
- Disconnect the electrical connector.



E50116

4. NOTE: Do not disassemble further if the component is removed for access only.

NAS vehicles: Remove the fuel tank leakage detection module.

- Remove the 3 screws.

Installation

1. NAS vehicles: Install the fuel tank leakage detection module.

- Install the screws.

2. Install the evaporative emissions canister.

- Connect the electrical connector.
- Connect the lines.
- Tighten the bolts to 23 Nm (17 lb.ft).

3. Install the spare wheel and tire.

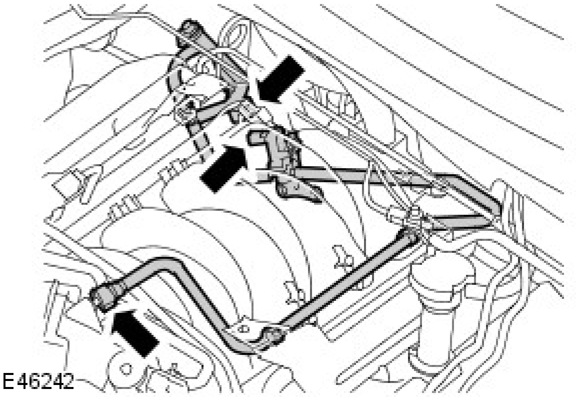
Evaporative Emissions - V8 4.4L Petrol - Evaporative Emission Canister Purge Valve

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the emission canister vent solenoid electrical connector.
4. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

   Disconnect the emission canister vent line from the intake manifold.
5. Disconnect and remove the solenoid valve from the emission canister vent line.



6. Remove the solenoid vent valve from the mounting bracket
   - Remove the bolt.

Installation

1. Clean the component mating faces.
2. To install, reverse the removal procedure.
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

Evaporative Emissions - V8 4.4L Petrol - Evaporative Emission Canister Ventilation Filter

Removal and Installation

Removal

⚠ WARNING: Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

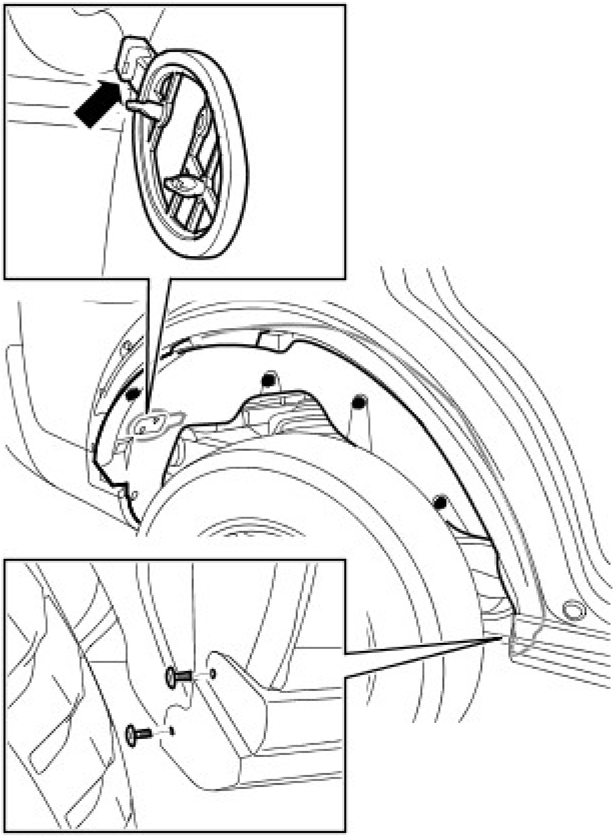
Raise and support the vehicle.

2. Remove the RH rear wheel and tire.

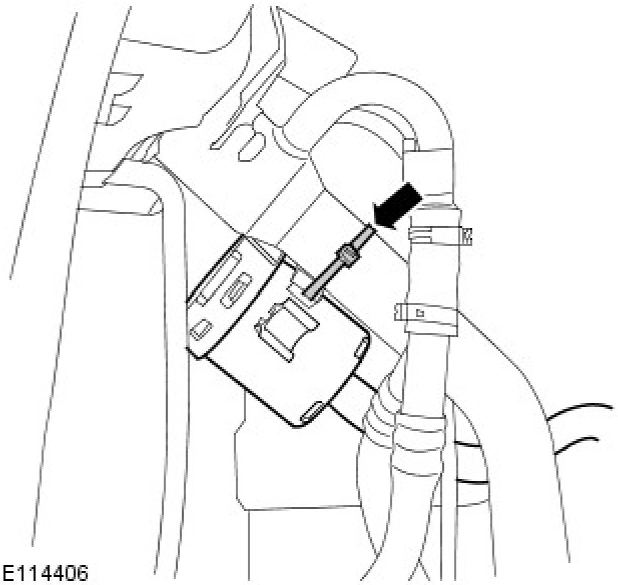
3. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the RH rear fender splash shield.

- Remove the 2 screws.
- Remove the 6 retainers.
- Disconnect the electrical connector.



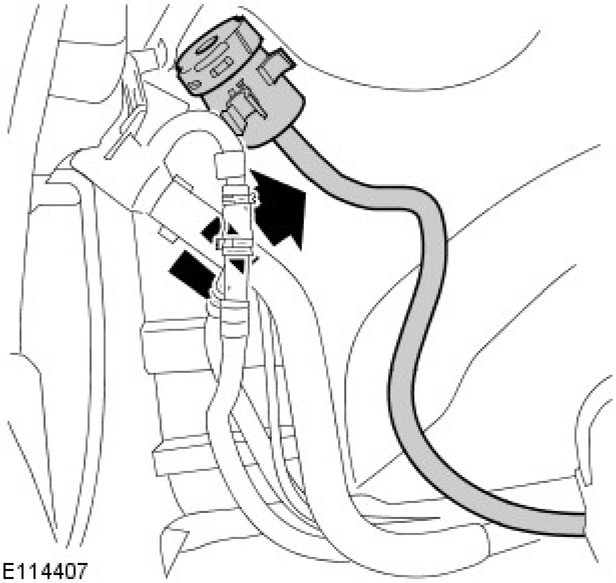
E48478



E114406

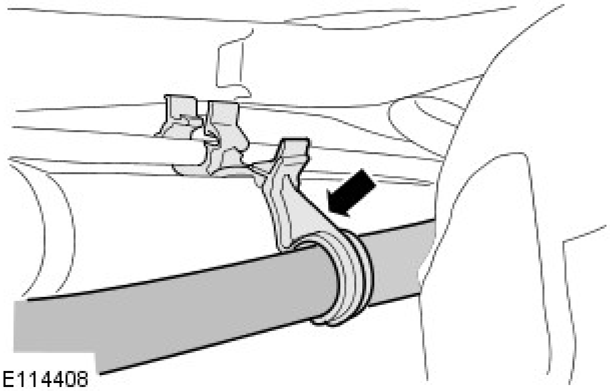
4. Release the evaporative emission canister ventilation filter from the fuel filler pipe.

- Cut the cable tie.



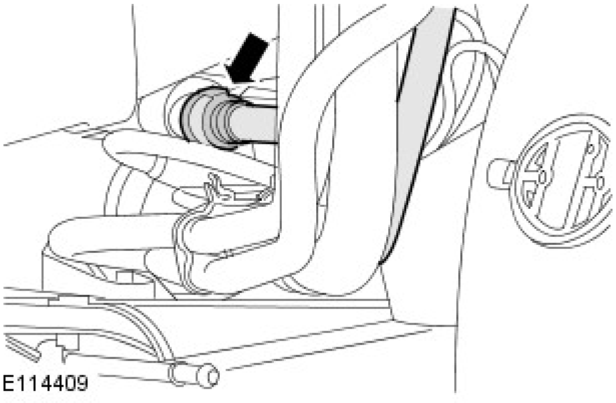
E114407

5. Position the evaporative emission canister ventilation filter to one side.



E114408

6. Release the evaporative emission ventilation filter from the clip.



7. NOTE: Some variation in the illustrations may occur, but the essential information is always correct.

Remove the evaporative emission canister ventilation filter.

- Release the evaporative emission canister ventilation filter from the evaporative emission canister.

Installation

1. To install, reverse the removal procedure.

Published: 26-Oct-2011

Evaporative Emissions - V8 4.4L Petrol - Evaporative Emissions

Diagnosis and Testing

Principles of Operation

For a detailed description of the evaporative emission system and operation, refer to the relevant Description and Operation section of the workshop manual. REFER to: Evaporative Emissions (303-13 Evaporative Emissions - V8 5.0L Petrol/V8 S/C 5.0L Petrol, Description and Operation).

Inspection and Verification

CAUTION: Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault and may also cause additional faults in the vehicle being checked and/or the donor vehicle.

• NOTE: Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection

Mechanical	Electrical
• Fuel filler cap and seal • Fuel filler neck • DMTL fresh air filter (restriction, etc) • Fuel tank (leaks, damage, etc) • Fuel lines and joints, etc • Carbon canister • Purge valve • Diagnostic module fuel tank leak (DMTL) pump module	• Fuses • Connectors • Harness • Purge valve • Diagnostic module fuel tank leak (DMTL) pump

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** If the cause is not visually evident, verify the symptom and refer to the Symptom Chart, alternatively check for Diagnostic Trouble Codes (DTCs) and refer to the DTC Index.
5. **5.** Where K-Line, Vacutec or other proprietary smoke test equipment is available, it should be utilized to assist with Evaporative Emissions System leak diagnosis.

Symptom Chart

Symptom	Possible Causes	Action
Difficulty in filling fuel tank	• Restriction in the vapour line between the fuel tank and the carbon canister outlet/atmospheric port	Check for restrictions/damage, etc (see visual inspection)
Fuel smell	• System leak • Purge valve inoperative	Check for leaks, check the purge valve operation
'Check Fuel Filler Cap' displayed on Message Center	• Fuel filler cap missing/not tightened after refuelling	Check the fuel filler cap and seal

DTC Index

For a list of Diagnostic Trouble Codes (DTCs) that could be logged on this vehicle, please refer to Section 100-00.

Evaporative Leak OBD Fault Rectification Guide

Determine Which DTC Has Been Stored

Using the manufacturer approved diagnostic system, choose **diagnostic session**, then choose the following symptom paths : **Powertrain/engine system/fuel vapour and odor, Powertrain/engine system/fuel tank, Electrical/instruments/warning lamps/engine malfunction lamp/lamp illuminated, Powertrain/engine system/engine performance/fuel consumption high**

• NOTE: This guide covers DTCs that relate to evaporative leak monitoring, as listed in the table below

DTC	Description
P0442-00	DMTL small leak
P0447-00	DMTL COV electrical low (open)
P0448-00	DMTL COV electrical high
P0455-00	DMTL rough leak
P2401-00	DMTL pump electrical low (open)
P2402-00	DMTL pump electrical high
P2404-2F	DMTL noise fault
P2404-29	DMTL reference leak
P2405-00	DMTL reference current low
P2406-00	DMTL reference current high
P2450-00	DMTL COV stuck open
P2451-00	DMTL COV stuck closed
P240B-00	DMTL heater electrical low (open)
P240C-00	DMTL heater electrical high

Attempt To Replicate The Fault Using The "Fuel Leak Check" Forced Test

1. **1.** Record any DTCs that has been logged
2. **2.** Using the manufacturer approved diagnostic system, in the **Recommendations** tab run the **Fuel Leak Check** forced test
3. **3.** For the test to run the fuel level must be between 15% and 85%
4. **4.** During this procedure the engine must be off
5. **5.** The possible responses from the test and the associated DTCs are listed below
6. **6.** If again no fault is found it could suggest that the failure mode is a borderline condition (refer to section 3) or that it was caused by incorrect fitment of the fuel cap or the fuel filler neck is at fault therefore it is important not disturb the fuel cap
7. **7.** Disconnect purge pipe from the purge valve, observe the condition of connection (the seating and condition of the "O" ring) and then reconnect. Using the manufacturer approved diagnostic system, run **Purge Valve Self Test** (to clean the purge valve) then run the **Fuel Leak Check**
8. **8.** If the test failed, a smoke test is required to determine the cause of the leak

• NOTE: P240B & P240C are not included in the **Fuel Leak Check** forced test (these monitors run at every ignition on and complete within 30 seconds)

Response Description	ID	Equivalent DTC
Function running: Reference leak measurement	1	
Function running: Rough leak measurement	2	
Function running: Small leak measurement	3	
Function running: 2nd ref leak measurement	4	
Function running: COV Cleaning	5	
Function aborted due to conditions: Vbatt conditions not correct (too high/ low)	11	
Function aborted due to conditions: Variation Ref. I (reference current) too high	12	P2404-29
Function aborted due to conditions: DMTL electrical fault	13	P0447, P0448
Function aborted due to conditions: Maximum diagnostic time exceeded	14	
Function aborted due to conditions: Crash detected	15	
Function aborted due to conditions: Refuel detected	20	
Function aborted due to conditions: Filler cap opened	21	
Function aborted due to conditions: Engine start	23	
Function aborted due to conditions: Noisy current measurement	24	P2404-2F
Function aborted due to conditions: Ambient temp outside range	26	
Function aborted due to conditions: Ambient pressure outside range	27	
Function aborted due to conditions: Other conditions	29	
Function complete - Tight system, fault free	30	
Function complete - Fine leak detected	31	P0442
Function complete - Rough leak detected	32	P0455
Function complete - Module error	33	P2401, P2402, P2450, P2451, P2405, P2406, P2404-29
Function complete - Medium leak detected	34	P0442, P0455

Read The "Ranking values" To Determine How Far Away The Result Is From The Failure Threshold

9. **9.** When the **Fuel Leak Check** forced test has completed the test results (known as ranking values) will be displayed
10. **10.** These should be compared against the limits shown in the table below
11. **11.** If the test result is borderline then there is a risk that a failure will occur at a later date (during customer usage of the vehicle)
12. **12.** To avoid this the vehicle should be carefully checked for any small leaks

Ranking Value	Normal Result For Tight System	Leak Failure Condition
Rough Leak (40 thou+)	0 > = 50	>= 128
Small Leak (20 thou+)	0 > = 60	>= 128

TRACE THE ROOT CAUSE OF THE FAULT

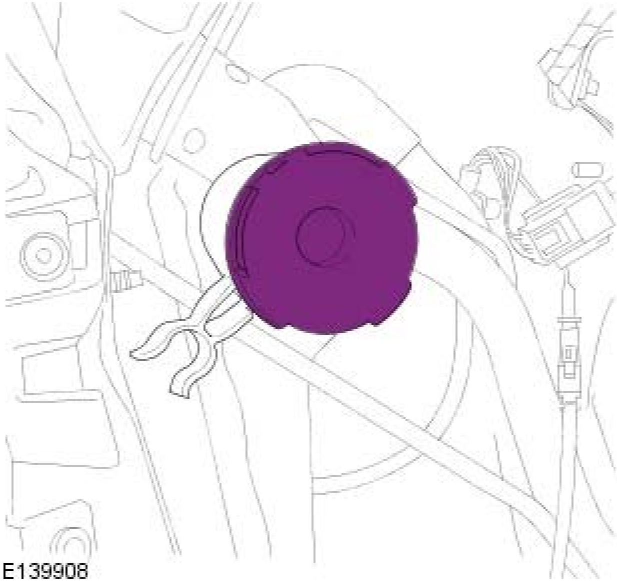
The list below provides some suggested actions to help trace the root cause of the fault

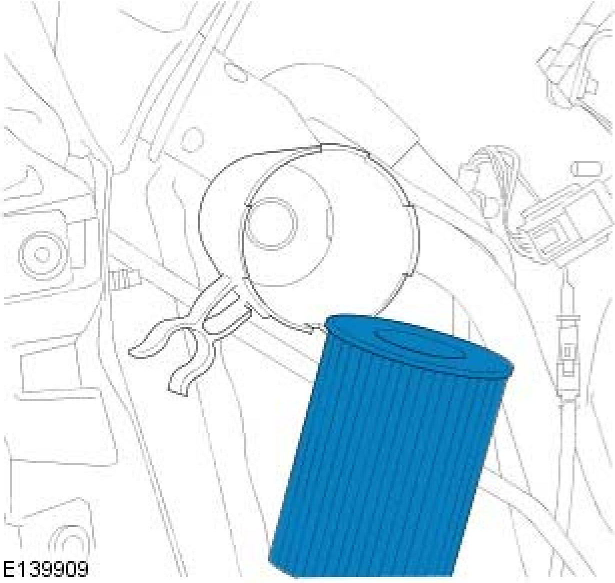
Each action should be followed up with a **Fuel Leak Check** forced test (and ranking value check) in order to determine if any improvement has been made

DTC	Fault Description	Fault Rectification Actions after smoke test
P0442-00	DMTL small leak	● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filer neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run **Purge Valve Self Test** (to clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace the DMTL module
P0447-00	DMTL COV electrical low (open)	● 1. Check fuse ● 2. Check that fuse fits tightly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P0448-00	DMTL COV electrical high	● 1. Check wiring ● 2. Replace DMTL module
P0455-00	DMTL rough leak	● 1. Inspect / refit filler cap after smoke test (inspect filler neck for correct fitment to pocket so that filer neck protrudes) ● 2. Run engine at idle; Using the manufacturer approved diagnostic system, run "Purge Valve Self Test" (to help clean the purge valve) ● 3. Check that the DMTL module wiring connector has been installed correctly and that the seals around the connector body and individual wires are in good condition (surprisingly, this is a potential leakage path!) ● 4. Check all fuel system connections are correctly installed and secure ● 5. Visually inspect purge canister, purge pipes, fuel tank and filler neck for any obvious damage ● 6. Try isolating the purge valve by fitting a blanking plug to the purge pipe ● 7. Carry out a smoke test ● 8. Replace DMTL module
P2401-00	DMTL pump electrical low (open)	● 1. Check fuse ● 2. Check that fuse fits correctly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P2402-00	DMTL pump electrical high	● 1. Check wiring ● 2. Replace DMTL module
P2404-2F	DMTL noise fault	● Replace DMTL module
P2404-29	DMTL reference leak	● Replace DMTL module

DTC	Fault Description	Fault Rectification Actions after smoke test
P2405-00	DMTL reference current low	● Replace DMTL module
P2406-00	DMTL reference current high	● 1. Check for any blockages in the DMTL ventilation pipe & filter ● 2. Replace DMTL module
P2450-00	DMTL COV stuck open	● Replace DMTL module
P2451-00	DMTL COV stuck close	● Replace DMTL module
P240B-00	DMTL heater electrical low (open)	● 1. Check fuse ● 2. Check that fuse fits tightly into the fuse holder ● 3. Check that the DMTL module wiring connector has been fitted correctly ● 4. Check wiring harness continuity between DMTL module and ECU connectors ● 5. Replace DMTL module
P240C-00	DMTL heater electrical high	● 1. Check wiring ● 2. Replace DMTL module

Pre and 10MY Denso/Bosch PCM Systems

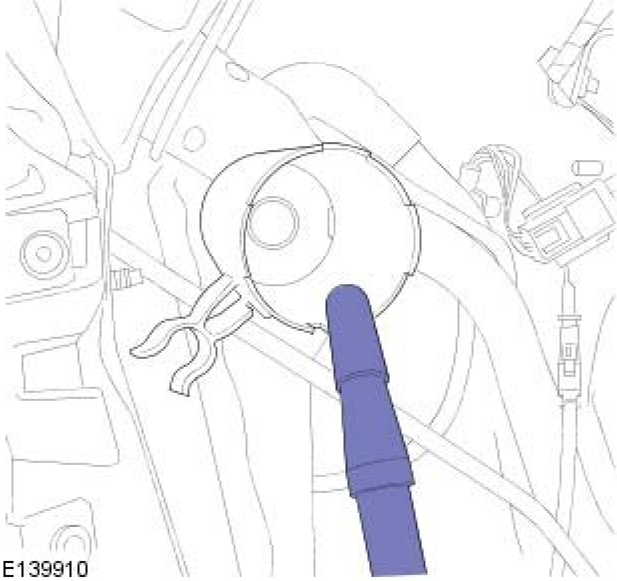




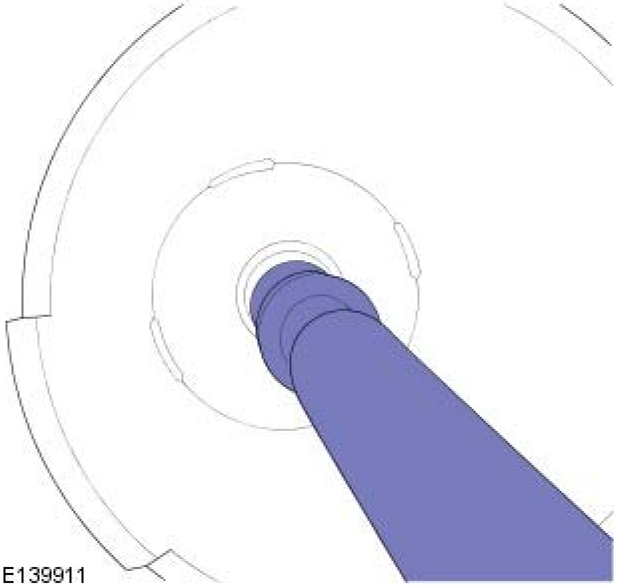
⚠ CAUTION: The Maximum pressure of the EVAP system is 0.07 bar **do not exceed**

• NOTE: Apart from the purge valve connection, it is recommended to smoke test the EVAP system without disturbing any joints associated with the system, this will determine the leak more accurately and quickly

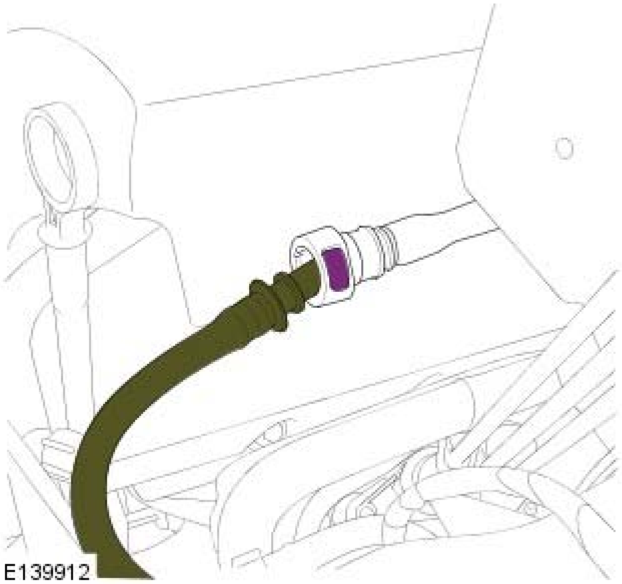
- 1. Remove rear wheel arch liner to access fuel filler neck
- 2. On the fuel filler neck the DMTL filter will be visible as shown in picture. Unclip filter housing from fuel filler neck to gain better access to DMTL filter
- 3. Remove carefully the top of filter to expose filter and remove
- 4. Attach rubber adapter to tip of smoke machine nozzle to ensure tight seal to filter housing. Disconnect the purge pipe from purge valve; this will be an escape point for the smoke to exit
- 5. Allow tester to complete self-test and green READY light to turn ON 2. For best Tester performance; completely unwind Tester's supply hose
- 6. Press **Smoke** on control panel to fill EVAP system with smoke vapour. The control panel **Smoke** light will light indicating smoke production. The smoke setting is on a 15 minute timer. Pressing the **Smoke** button again turns Tester off. It is normal for the flow meter ball, while in the smoke mode, not to be as steady as when it is in the **Test** mode. Note: The pressure gauge is active only after smoke cycle is complete
- 7. Continue introducing smoke into the EVAP System until the flow meter's ball stops descending and this assures the system test pressure is met and smoke will appear from the purge pipe, then close off purge pipe with special tool (Test Adapter Hose/EVAP Port 310-142)



E139910



E139911

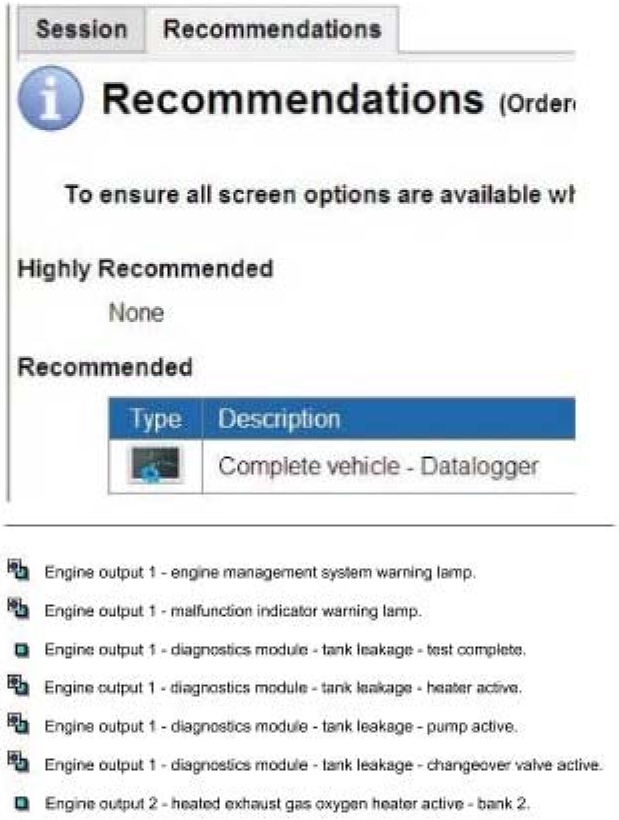


E139912

⚠ CAUTION: On some vehicles, the DMTL filter can not be removed, in these instances fill the system through the purge valve and smoke will appear from the filter

Pre 10MY Vehicles

On pre 10MY DMTL systems, Using the manufacturer approved diagnostic system, select **Measurement application** session then select the **Recommendations** tab which will give you access to **Datalogger**. Then select **Engine systems** then select the **Output state control** data-logger signal **Engine output 1 – diagnostic module – tank leakage -change over valve active** which will close the system. Then select **Engine output 1 – diagnostic module – tank leakage – pump active** this will pressurize the EVAP system



Recommendations (Order

To ensure all screen options are available wh

Highly Recommended

None

Recommended

Type	Description
	Complete vehicle - Datalogger

Engine output 1 - engine management system warning lamp.

Engine output 1 - malfunction indicator warning lamp.

Engine output 1 - diagnostics module - tank leakage - test complete.

Engine output 1 - diagnostics module - tank leakage - heater active.

Engine output 1 - diagnostics module - tank leakage - pump active.

Engine output 1 - diagnostics module - tank leakage - changeover valve active.

Engine output 2 - heated exhaust gas oxygen heater active - bank 2.

E139913

10MY vehicles

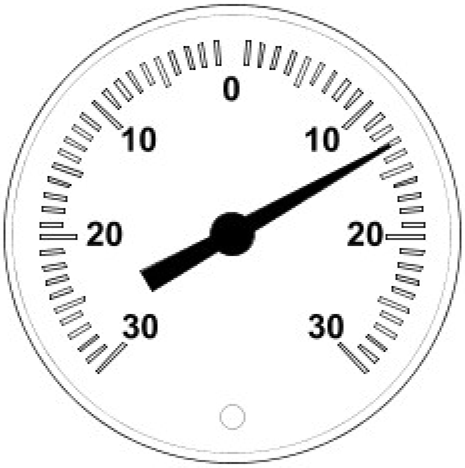
On 10MY vehicles a smoke test application is available so therefore only smoke fill the system and then run the application

- 8. Follow the EVAP system path with the halogen light provided and looks for the smoke exiting the leak(s) or use the UV light provided and look for the dye deposited at the exact location of the leak(s)
- 9. Repair the leak(s) and perform the **Fuel Leak Check** application again or smoke test to verify repair, as well as to make sure there are no additional leaks in the EVAP system

The UltraTraceUV® smoke solution's dye feature is especially helpful when the leak is in an area that is not readily visible, as on the top of the fuel tank or behind a panel. Once you gain access to the area of the leak, wear the yellow UV glasses and shine the UV light provided to identify the exact location of the leak(s). Smoke exiting a very small leak is even easier to see with lower pressure. If you encounter smoke leaking out of an area but find it difficult to pinpoint exactly where the source of the leak is; try reducing the pressure in the system being tested by turning the Tester OFF and allow the pressure to dissipate. The longer a particular leak is allowed to leak, the more fluorescent dye material will be deposited at that leak. With some vapour system leaks, the leak may only present itself under vacuum and not under pressure. If equipment permits, test the system in both states. Purge valve faults [P0441, P0444, P0458 and P0459] should all inhibit DMTL leak test and therefore need to be resolved prior to any DMTL issues. For this reason, when smoke testing the vapour system, it should be sufficient to enter the system at the connection up stream of the purge valve. If no leak is found then testing the remainder of the system up to the purge valve is recommended

• NOTE: It may be possible to search for small leaks using a gas analyzer and looking for HC (hydro carbon) spikes. This should enable leaks to be detected in areas of the vapor system that our out of sight of the technician. The solenoid should be deactivated after five minutes to prevent potential damage. Check that connector and individual terminals are sealed correctly

Phase-One – (quantifying the leak)



E139914

- 1. Connect the tester supply hose to vehicle EVAP system. > Refer to appropriate vehicle application
- 2. Determine if the vehicle’s EVAP system you are testing is governed by a .020” (0.5 mm) or .040” (1 mm) acceptable leak standard. Press the appropriate calibration standard on the tester’s control panel and observe the position of the flow meter ball. > This function automatically turns off in 10 seconds
- 3. Position the flow meter's pointer flag so that it aligns with the measurement observed in step 2 above. > This sets PASS / FAIL mark
- 4. Close vehicle’s EVAP Vent Solenoid. > Refer to appropriate vehicle application

- 5. Press TEST on control panel and fill EVAP system. > This introduces 5-minutes of nitrogen gas
- 6. Look for flow meter ball to stop descending indicating that the vehicle system is full. > Fill time 1-4 minutes depending on system volume
- 7. Compare flow meter ball reading to pointer flag. > ABOVE flag = FAIL (go to Phase-Two). > BELOW flag = PASS (test complete)

Testing With Pressure and Vacuum Decay

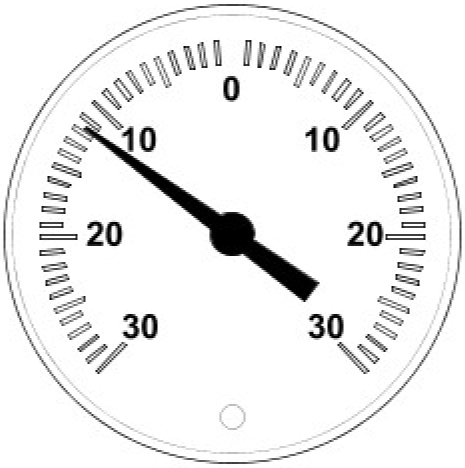
In addition to quantifying the leak with the Phase-One flow test, the Tester allows you the flexibility of testing the vehicle’s EVAP system by using either **Pressure Decay** or **Vacuum Decay** methods. Below are instructions for performing both decay tests

Pressure-Decay Test

• NOTE: The Pressure Decay test is best performed immediately after the Phase-one flow test, since the system has already built up pressure

At the completion of the Phase-one flow test, the EVAP system is fully pressurized, since the Phase-one test uses pressure to perform its flow test. Testing pressure decay with the Vacutec® 522B-J/LR is very simple. All you need to do is the following:

- 1. Allow tester to complete self-test and green **READY** light to turn ON
- 2. Connect Tester supply hose to vehicle EVAP system
- 3. Close vehicle’s EVAP Vent solenoid > Refer to appropriate vehicle application
- 4. Press **VACUUM** switch on the tester control panel
  - NOTE: The vacuum switch is on a 30-second timer, which should be sufficient time to draw the appropriate vacuum from the EVAP system. Press VACUUM switch again if additional time is required
- 5. After vacuum timer turns off, observe the vacuum gauge for any decay (loss of vacuum) indicating a leak in the EVAP system



E139915

- NOTE: Disconnect the Tester from the vehicle after the Vacuum Decay Test. The fuel pressure in the vehicle’s fuel tank is constantly changing due to the vehicle’s fuel volatility and that could cause the Tester’s pressure gauge to exceed its maximum reading limits

Electronic Engine Controls - V8 S/C 4.2L Petrol - Powertrain Control Module (PCM) Long Drive Cycle Self-Test

General Procedures

WARNING: Where possible, all road tests should be on well surfaced and dry roads. Always comply with speed limits and local traffic regulations.

- NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

- NOTE: The vehicle must exceed 50mph (80 km/h) during the road test.

1. Connect the diagnostic equipment to the vehicle.

2. Follow on screen prompts and check for engine management fault codes.

3. Clear the fault codes following the on screen procedure.

4. Disconnect the diagnostic equipment from the vehicle.

5. NOTE: Make sure cruise control is not engaged.

Make sure the engine temperature is above 60 ºC (140 ºF).

Carry out a road test and perform the following operations.

1. Accelerate to 55 mph (88 km/h) in 5th gear and cruise for 2 minutes with the engine speed at or above 1800rpm.
2. Lift off the throttle and allow the vehicle to decelerate until the engine speed is less than 1000 rpm.
3. Stop the vehicle.
4. Release brake, allow the vehicle to move with no throttle for 1 minute.
5. Road test is now complete.

6. Connect the diagnostic equipment to the vehicle.

7. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.

8. Disconnect the diagnostic equipment from the vehicle.

Electronic Engine Controls - V8 S/C 4.2L Petrol - Powertrain Control Module (PCM) Short Drive Cycle Self-Test

General Procedures

• NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

1. Connect the diagnostic equipment to the vehicle.

2. Follow on screen prompts and check for engine management fault codes.

3. Clear the fault codes following the on screen procedure.

4. Start the engine.

- Allow the engine to idle for 30 seconds.
- Raise the engine speed to 1500 rpm and hold for 3 minutes until a temperature of 70ºC (158 ºF) is achieved.
- Allow the engine to idle for 30 seconds.
- Switch off the engine.

5. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.

6. Disconnect the diagnostic equipment from the vehicle.

Electronic Engine Controls - V8 S/C 4.2L Petrol - Brake Pedal Position (BPP) Switch Adjustment

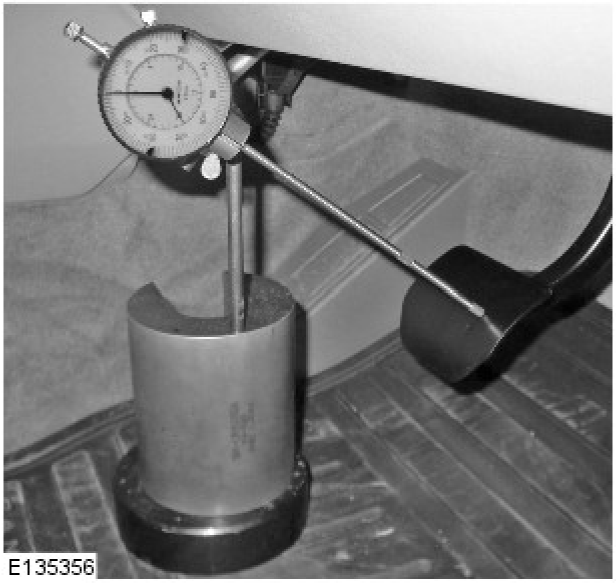
General Procedures

Check

1. Remove the brake pedal rubber.

2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.

Position the DTI gauge on a suitable mounting block, as illustrated.



E135356

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.

4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠

Remove the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠ Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.

For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

OVERVIEW

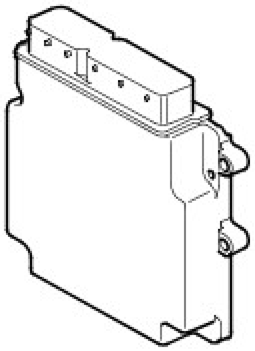
The V8 4.2 Liter supercharged engine is controlled by an ECM manufactured by DENSO. The Engine Management System (EMS) controls the following:

- Engine fueling
- Ignition timing
- Closed loop fueling
- Knock control
- Idle speed control
- Emission control
- on-board diagnostic (OBD)
- Interface with the immobilization system
- Speed control

The ECM controls the engine fueling by providing sequential fuel injection to all cylinders. Ignition is controlled by a direct ignition system, provided by eight plug top coils. The ECM is able to detect and correct for ignition knock on each cylinder and adjust the ignition timing for each cylinder to achieve optimum performance.

The ECM uses a torque-based strategy to generate the torque required by the driver and other vehicle control modules. The EMS uses various sensors to determine the torque required from the engine. The EMS also interfaces with other vehicle electronic control modules's, via the controller area network (CAN) bus, to obtain additional information (e.g. road speed from the ABS control module). The EMS processes these signals and decides how much torque to generate. Torque is then generated by using various actuators to supply air, fuel and spark to the engine (electronic throttle, injectors, coils, etc.).

ENGINE CONTROL MODULE (ECM)



E46330

The ECMis located in the E-Box in the plenum area on the passenger side of the engine compartment attached to the bulkhead.

System ECM has the following inputs:

- RCM
- Park/neutral switch
- Ignition coil feedback x2
- Fuel rail temperature
- Fuel rail pressure
- Supercharger inlet pressure
- Mass air flow
- Engine speed
- Camshaft position x2
- Driver demand
- Brake pedal position switch
- Speed control switches
- Generator load
- Oxygen sensors pre catalyst x2
- Oxygen sensors post catalyst x2
- Throttle position
- Cooling fan speed
- Ignition switch position
- Knock sensors x2
- MAP
- Intercooler temperature
- Coolant temperature
- Engine oil temperature

The ECM outputs to the following:

- Throttle Actuator
- Brake vacuum pump relay
- Ignition coils (x8)
- Oxygen sensor heaters (4)
- Fuel injectors (8)
- Purge Valve
- Engine Cooling Fan
- Fuel pump relay
- Starter Relay
- EMS Main Relay
- Viscous Fan Control
- Generator Control
- Diagnostic Module Tank Leakage (DMTL) (NAS Only)
- E box fan
- FPDM

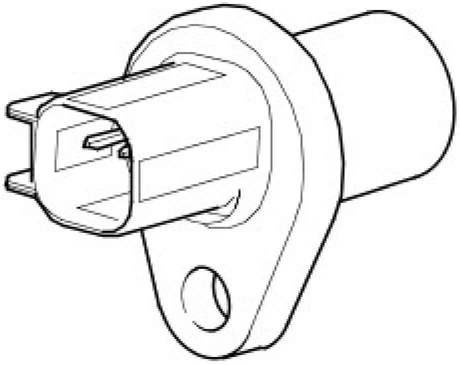
CRANKSHAFT POSITION (CKP) SENSOR



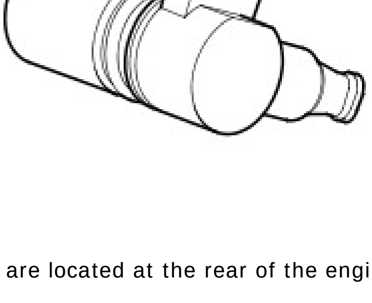
E46331

The crankshaft position sensor is mounted at the rear underside of the engine near the transmission bell housing. Connection between the sensor and the harness is via a link harness and a two-way connector. Both wires go directly to the ECM. The sensor produces the signal which enables the ECM to determine the angle of the crankshaft, and the engine rpm. From this, the point of ignition, fuel injection, etc. is calculated. If the signal wires are reversed a 3 degrees advance in timing will occur, as the electronics within the ECM uses the falling edge of the signal waveform as its reference / timing point for each tooth.

The reluctor is pressed into the flywheel and has a "tooth" pattern based on 36 teeth at 10° intervals and approximately 5° wide: one of the teeth is removed to provide a hardware reference mark which is 30 degrees before top dead center (BTDC) No.1 cylinder. Because of the crankshaft sensor's orientation, the target wheel uses windows stamped into the face, rather than actual teeth.

The sensor operates by generating an output voltage caused by the change in magnetic field that occurs as the windows pass in front of the sensor. The output voltage varies with the speed of the windows passing the sensor, the higher the engine speed, the higher the output voltage. Note that the output is also dependent on the air gap between the sensor and the teeth (the larger the gap, the weaker the signal, the lower the output voltage). The ECM transmits the engine speed to other vehicle control modules on CAN.

CAMSHAFT POSITION (CMP) SENSOR



E46332

Two sensors are located at the rear of the engine, in the cylinder head (one per bank), above the rear cylinders. The sensors are

Variable Reluctor Sensor (VRS) type, producing four pulses for every two engine crankshaft revolutions. The sensing element is positioned between 0 and 2mm from the side of the cam gear wheel.

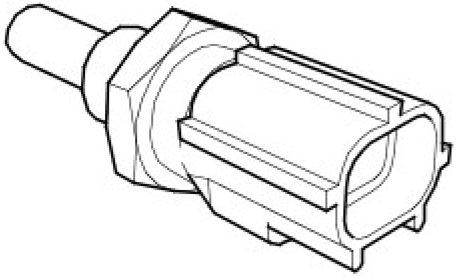
The camshaft timing wheel is a sintered component which has four teeth on it to enable the EMS to detect cylinder identification. The signal is used for:

- Cylinder recognition
- Enabling sequential fuel injection
- Knock control
- Cylinder identification for diagnostic purposes.

Failure symptoms include:

- Ignition timing reverting to the base mapping, with no cylinder correction.
- Active knock control is disabled, along with its diagnostic (Safe ignition map - loss of performance).
- Quick cam/crank synchronisation on start disabled.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

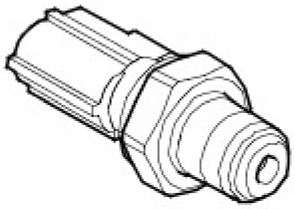


E47309

The ECT sensor is located at the front of the engine at the rear of the thermostat housing. The ECT sensor is a thermistor used to monitor the engine coolant temperature. The engine coolant temperature sensor is vital to the correct running of the engine as a richer mixture is required at lower block temperatures for good quality starts and smooth running, leaning off as the temperature rises to maintain emissions and performance.

The sensor has an operating temperature range of -30 Degrees Celsius to 125 Degrees Celsius. The maximum engine coolant temperature the ECM outputs on the CAN is the 119 Degrees Celsius. When a defective coolant sensor is detected, the ECM uses the oil temperature sensor value.

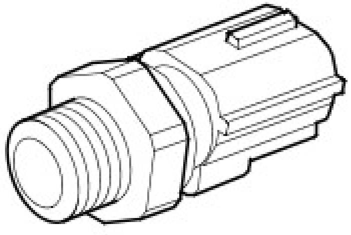
ENGINE OIL TEMPERATURE SENSOR



E46333

Oil temperature is monitored through a temperature sensor mounted in the oil system. This component is a negative temperature coefficient (NTC). The sensor is mounted next to the oil pressure sensor at the front of the engine and locates into the oil filter bracket.

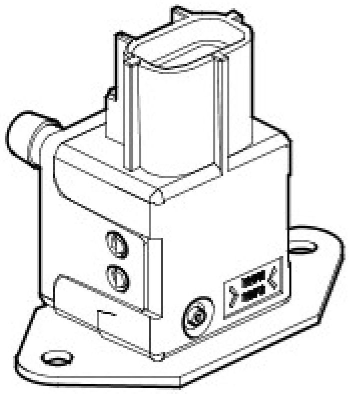
FUEL RAIL TEMPERATURE SENSOR



E47606

The fuel rail temperature sensor measures the temperature of the fuel in the fuel rail. This input is then used to deliver the correct quantity of fuel to the engine. The sensors operating range is -40 Degrees Celsius to 150 Degrees Celsius. The fuel rail temperature sensor is fitted on the rear of the right hand bank (bank A) fuel rail.

FUEL RAIL PRESSURE SENSOR

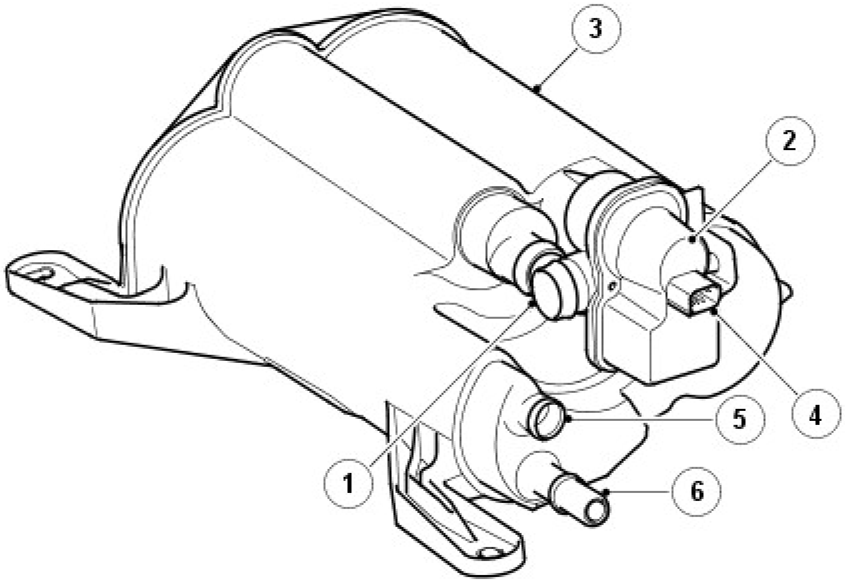


E58945

The fuel rail pressure sensor is located on top of the fuel rail adjacent to the fuel inlet. The fuel rail pressure sensor measures the pressure of the fuel in the fuel rail. This input is then used by the fuel pump driver module to control the amount of fuel delivered to the fuel rail.

DIAGNOSTIC MONITORING OF TANK LEAKAGE (DMTL) - NAS ONLY

Charcoal Canister with DMTL Pump (NAS only)



E44561

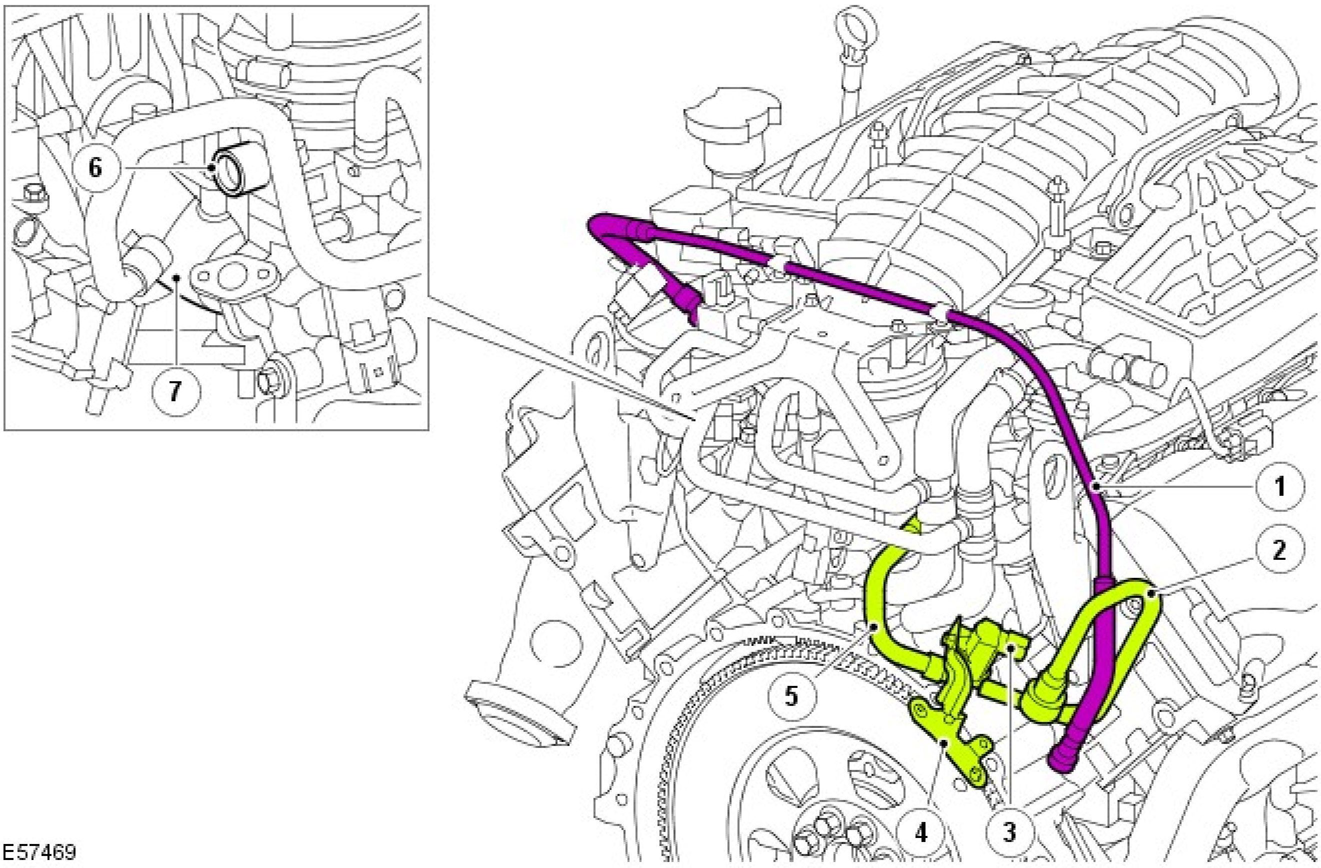
Item	Part Number	Description
1	-	Charcoal canister atmospheric pressure vent connection (via DMTL pump)
2	-	DMTL pump
3	-	Charcoal canister
4	-	Electrical connector
5	-	Purge hose connection
6	-	Charcoal canister tank vent hose connection

The DMTL system periodically checks the evaporative system and the fuel tank for leaks when the ignition is switched off. The DMTL pump is connected to the atmospheric vent of the charcoal cannister and incorporates a positive temperature coefficient (PTC) heating element a normally open valve and a reference orifice. The DMTL pump is only operated when the ignition is switched off and is controlled by the ECM. The ECM also monitors the electric air pump operation and the normally open valve for faults. To check the fuel tank and EVAP system for leaks the ECM operates the DMTL pump and monitors the current draw. This is compared to a referenced figure established from the current draw when air is pumped through the reference orifice.

For additional information, refer to: Evaporative Emissions (303-13A Evaporative Emissions - V8 S/C 4.2L Petrol, Description and Operation).

PURGE VALVE

Purge Valve and Hoses location



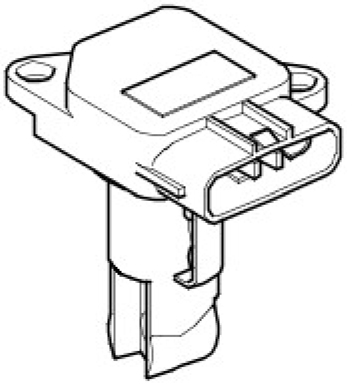
Item	Part Number	Description
1	-	Fuel feed jump hose (ref only)
2	-	Purge hose connector
3	-	Purge valve
4	-	Bracket
5	-	Purge hose
6	-	Electronic throttle
7	-	Induction elbow

The purge valve is located at the rear of the engine on a bracket which is attached to the transmission bell housing. The purge valve is a solenoid operated valve which is closed when de-energized. The purge valve is controlled by a 10Hz pulse width modulation (PWM) signal from the ECM. When the engine operating conditions are correct, the ECM opens the purge valve which causes fuel vapor and fresh air to be drawn through the charcoal cannister. The fresh air is drawn through the charcoal cannister via the DMTL pump fresh air vent.

For additional information, refer to: Evaporative Emissions (303-13A Evaporative Emissions - V8 S/C 4.2L Petrol, Description and

Operation).

MASS AIR FLOW / INLET AIR TEMPERATURE (MAF / AT) SENSOR



E47308

The MAF/IATis located in the clean air duct immediately after the air filter box.

The air mass flow is determined by the cooling effect of inlet air passing over a “hot film” element contained within the device. The higher the air flow the greater the cooling effect and the lower the electrical resistance of the “hot film” element. The ECM then uses this signal from the MAF to calculate the air mass flowing into the engine.

The measured air mass flow is used in determining the fuel quantity to be injected in order to maintain the stichometric air/fuel mixture required for correct operation of the engine and exhaust catalysts. Should the device fail there is a software backup strategy that will be evoked once a fault has been diagnosed.

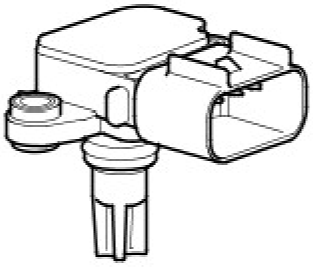
The following symptoms may be observed if the sensor fails:

- During driving the engine RPM might dip, before recovering.
- Difficulty in starting or start - stall.
- Poor throttle response / engine performance.
- Lambda control and idle speed control halted.
- Emissions incorrect.
- AFM signal offset

The IAT sensor is integrated into the MAF meter. It is a temperature dependent resistor (thermistor), i.e. the resistance of the sensor varies with temperature. This thermistor is a NTC type element meaning that the sensor resistance decreases as the sensor temperature increases. The sensor forms part of a voltage divider chain with an additional resistor in the ECM. The voltage from this sensor changes as the sensor resistance changes, thus relating the air temperature to the voltage measured by the ECM.

The ECM stores a 25 Degrees Celsius default value for air temperature in the event of a sensor failure.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR- SUPERCHARGER INLET PRESSURE



E47588

The MAP sensor provides a voltage proportional to the absolute pressure in the supercharger intake. This signal allows the load on the engine to be calculated and used within the internal calculations of the ECM. The sensor is located below the electric throttle on the induction elbow.

MAP Pin Out Table

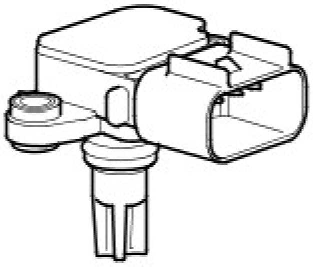
Pin No	Description
1	MAPsignal
2	Sensor supply
3	Not used
4	Sensor ground

The output signal from the MAP sensor, together with the CKP and IAT sensors, is used by the ECM to calculate the amount of air induced into the cylinders. This enables the ECM to determine ignition timing and fuel injection duration values.

The MAP sensor receives a 5V supply voltage from pin 48 of ECM connector C0634 and provides an analogue signal to pin 38 of ECM connector C0634, which relates to the absolute manifold pressure and allows the ECM to calculate engine load. The ECM provides a ground for the sensor via pin 11 of ECM connector C0634.

If the MAP signal is missing, the ECM will substitute a default manifold pressure reading based on crankshaft speed and throttle angle. The engine will continue to run with reduced drivability and increased emissions, although this may not be immediately apparent to the driver. The ECM will store fault codes which can be retrieved using T4.

MANIFOLD ABSOLUTE PRESSURE AND TEMPERATURE (MAPT) SENSOR



E47588

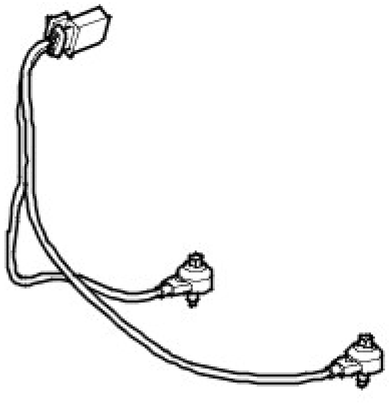
The MAPT is located to the rear of the right-hand (RH) engine bank intercooler outlet. The sensor measures the pressure and temperature of the inducted air prior to it entering the cylinders.

The sensor fits and seals using a radial ‘O’ ring seal directly to the inlet manifold.

The MAPT signal is used to retard the ignition timing relative to boost pressure. The intercooler temperature is used for air charge density calculations and for intercooler diagnostic purposes.

Pin No	Description	Input/Output
1	Boost pressure	Output
2	Sensor supply	Input
3	Intercooler outlet temperature	Output
4	Sensor ground	-

KNOCK SENSORS



E47296

The V8 EMS has two knock sensors located in the V of the engine, one per cylinder bank. The sensors are connected to the ECM via a twisted pair.

The knock sensors produce a voltage signal in proportion to the amount of mechanical vibration generated at each ignition point. Each sensor monitors the related cylinder bank.

The knock sensors incorporate a piezo-ceramic crystal. This crystal produces a voltage whenever an outside force tries to deflect it, (i.e. exerts a mechanical load on it). When the engine is running, the compression waves in the material of the cylinder block, caused by the combustion of the fuel/air mixture within the cylinders, deflect the crystal and produce an output voltage signal. The signals are supplied to the ECM, which compares them with `mapped' signals stored in memory. From this, the ECM can determine when detonation occurs on individual cylinders. When detonation is detected, the ECM retards the ignition timing on that cylinder for a number of engine cycles, then gradually returns it to the original setting.

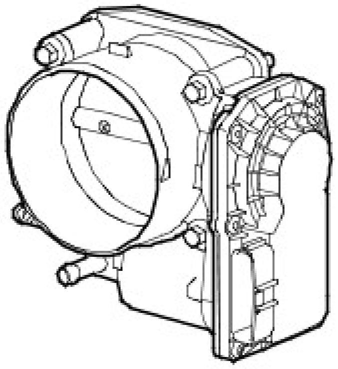
Care must be taken at all times to avoid damaging the knock sensors, but particularly during removal and fitting procedures. The recommendations regarding torque and surface preparation must be adhered to. The torque applied to the sensor and the quality of the surface preparation both have an influence over the transfer of mechanical noise from the cylinder block to the crystal.

The ECM uses the signals supplied by the knock sensors, in conjunction with the signal it receives from the camshaft sensor, to determine the optimum ignition point for each cylinder. The ignition point is set according to preprogrammed ignition maps stored within the ECM. The ECM is programmed to use ignition maps for 98 research octane number (RON) premium specification fuel. It will also function on 91 RON regular specification fuel and learn new adaptions. If the only fuel available is of poor quality, or the customer switches to a lower grade of fuel after using a high grade for a period of time, the engine may suffer slight pre-ignition for a short period. This amount of pre-ignition will not damage the engine. This situation will be evident while the ECM learns and then modifies its internal mapping to compensate for the variation in fuel quality. This feature is called adaption. The ECM has the capability of adapting its fuel and ignition control outputs in response to several sensor inputs.

The ECM will cancel closed loop control of the ignition system if the signal received from either knock sensor becomes implausible. In these circumstances the ECM will default to a safe ignition map. This measure ensures the engine will not become damaged if low quality fuel is used. The malfunction indicator lamp (MIL) will not illuminate, although the driver may notice that the engine 'pinks' in some driving conditions and displays a drop in performance and smoothness.

When a knock sensor fault is stored, the ECM will also store details of the engine speed, engine load and the coolant temperature.

ELECTRONIC THROTTLE



E47298

The V8 EMS incorporates an electric throttle control system. The electronic throttle body is located on the air intake manifold in the engine compartment. The system comprises three main components:

- Electronic throttle control valve
- APP
- ECM

When the accelerator pedal is depressed the APP sensor provides a change in the monitored signals. The ECM compares this against an electronic “map” and moves the electronic throttle valve via a PWM control signal which is in proportion to the APP angle signal. The system is required to:

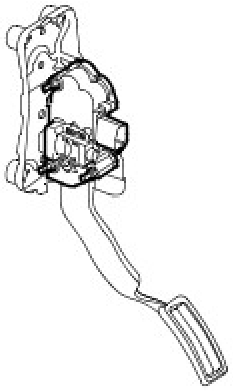
- Regulate the calculated intake air load based on the accelerator pedal sensor input signals and programmed mapping.
- Monitor the drivers input request for cruise control operation.
- Automatically position the electronic throttle for accurate cruise control.
- Perform all dynamic stability control throttle control interventions.
- Monitor and carry out maximum engine and road speed cut out.
- Provide differing responses for differing Terrain response modes.

A software strategy within the ECM enables the throttle position to be calibrated each ignition cycle. When the ignition is turned ON, the ECM performs a self test and calibration routine on the electronic throttle by closing the throttle full, then opening again. This tests the default position springs.

Electronic Throttle Pin Out Table

Pin No	Description
1	Motor +
2	Motor -
3	Sensor ground
4	Sensor 2 signal
5	5 volt supply
6	Sensor 1 signal

ACCELERATOR PEDAL POSITION (APP) SENSOR



E47297

The APP sensors are located on the accelerator pedal assembly.

The APP sensors are used to determine the driver's request for vehicle speed, acceleration and deceleration. This value is used by the ECM and the throttle is opened to the correct angle by an electric motor integrated into the throttle body.

The APP Sensor signals are checked for range and plausibility. Two separate reference voltages are supplied to the pedal. Should one sensor fail, the other is used as a 'limp – home' input. In limp home mode due to an APP signal failure the ECM will limit the maximum engine speed to 2000 rpm.

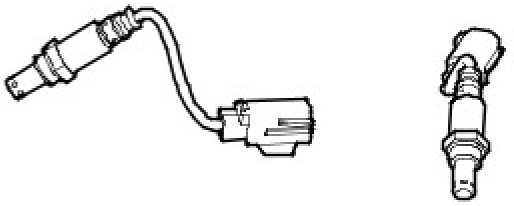
APP Pin Out Table

Pin No	Description
1	APP 1 ground
2	APP 1 demand
3	APP2 ground
4	Not used
5	APP 2 demand
6	Supply 2, 5 volt
7	Supply 1, 5 volt
8	Not used

OXYGEN SENSORS

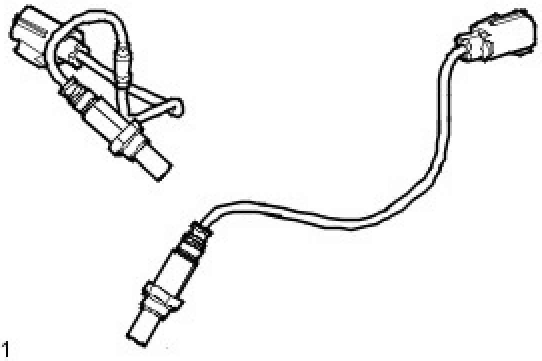
There are four oxygen sensors located in the exhaust system. Two upstream before the catalytic converter and two down stream after the catalytic converter. The sensor monitors the level of oxygen in the exhaust gases and is used to control the fuel/air mixture. Positioning a sensor in the stream of exhaust gasses from each bank enables the ECM to control the fueling on each bank independently of the other, allowing much closer control of the air / fuel ratio and catalyst conversion efficiency.

Upstream Oxygen Sensors



E47300

Downstream Oxygen Sensors



E47301

The oxygen sensors need to operate at high temperatures in order to function correctly. To achieve the high temperatures required, the sensors are fitted with heater elements that are controlled by a PWM signal from the ECM. The heater elements are operated immediately following engine start and also during low load conditions when the temperature of the exhaust gases is insufficient to maintain the required sensor temperatures. A non-functioning heater delays the sensor's readiness for closed loop control and influences emissions. The PWM duty cycle is carefully controlled to prevent thermal shock to cold sensors.

UHEGO (Universal Heated Exhaust Gas Oxygen) sensors also known as Linear or "Wide Band" sensors produces a constant voltage, with a variable current that is proportional to the oxygen content. This allows closed loop fueling control to a target lambda, i.e. during engine warm up (after the sensor has reached operating temperature and is ready for operation). This improves emission control.

The HEGO sensor uses Zirconium technology that produces an output voltage dependant upon the ratio of exhaust gas oxygen to the ambient oxygen. The device contains a Galvanic cell surrounded by a gas permeable ceramic, the voltage of which depends upon the level of O2 defusing through. Nominal output voltage of the device for l =1 is 300 to 500m volts. As the fuel mixture becomes richer (l<1) the voltage tends towards 900m volts and as it becomes leaner (l>1) the voltage tends towards 0 volts. Maximum tip temperature is 1,000 Degrees Celsius for a maximum of 100 hours.

Sensors age with mileage, increasing their response time to switch from rich to lean and lean to rich. This increase in response time influences the ECM closed loop control and leads to progressively increased emissions. Measuring the period of rich to lean and lean to rich switching monitors the response rate of the upstream sensors.

Diagnosis of electrical faults is continually monitored in both the upstream and downstream sensors. This is achieved by checking the signal against maximum and minimum threshold, for open and short circuit conditions.

Oxygen sensors must be treated with the utmost care before and during the fitting process. The sensors have ceramic material within them that can easily crack if dropped / banged or over-torqued. The sensors must be torqued to the required figure, (40-50Nm), with a calibrated torque wrench. Care should be taken not to contaminate the sensor tip when anti-seize compound is used on the thread. Heated sensor signal pins are tinned and universal are gold plated. Mixing up sensors could contaminate the connectors and affect system performance.

Failure Modes

- Mechanical fitting & integrity of the sensor.
- Sensor open circuit / disconnected.
- Short circuit to vehicle supply or ground.
- Lambda ratio outside operating band.

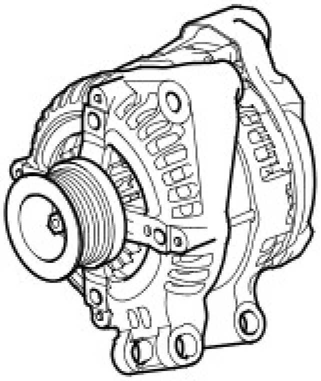
- Crossed sensors bank A & B.
- Contamination from leaded fuel or other sources.
- Change in sensor characteristic.
- Harness damage.
- Air leak into exhaust system.

Failure Symptoms

- Default to Open Loop fueling for the particular cylinder bank
- High CO reading.
- Strong smell of H02S (rotten eggs) till default condition.
- Excess Emissions.

It is possible to fit front and rear sensors in their opposite location. However the harness connections are of different gender and color to ensure that the sensors cannot be incorrectly connected. In addition to this the upstream sensors have two holes in the shroud, whereas the down stream sensors have four holes in the shroud for the gas to pass through.

GENERATOR



E47591

The Generator has a multifunction voltage regulator for use in a 14V charging system with 6÷12 zener diode bridge rectifiers.

The ECM monitors the load on the electrical system via PWM signal and adjusts the generator output to match the required load. The ECM also monitors the battery temperature to determine the generator regulator set point. This characteristic is necessary to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximize any rechargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing of the battery with consequent water loss.

The generator has a smart charge capability that will reduce the electrical load on the generator reducing torque requirements, this is implemented to utilize the engine torque for other purposes. This is achieved by monitoring three signals to the ECM:

- Generator sense (A sense), measures the battery voltage at the central junction box (CJB).
- Generator communication (Alt Com) communicates desired generator voltage set point from ECM to Generator.
- Generator monitor (Alt Mon) communicates the extent of generator current draw to ECM. This signal also transmits faults to the ECM which will then sends a message to the instrument cluster on the CAN bus to illuminate the charge warning lamp.
  For additional information, refer to: Generator (414-02A Generator and Regulator - V8 S/C 4.2L Petrol, Description and Operation).

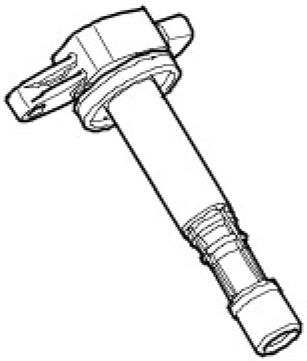
FUEL INJECTORS

E47305

The engine has 8 fuel injectors (one per cylinder), each injector is directly driven by the ECM. The injectors are fed by a common fuel rail as part of a 'return less' fuel system. The fuel rail pressure is regulated to 4.5 bar by a fuel pressure regulator which is integral to the fuel pump module, within the fuel tank. The injectors can be checked by resistance checks. There is a fuel pressure test Schrader valve attached to the fuel rail on the front left-hand (LH). The ECM monitors the output power stages of the injector drivers for electrical faults.

The injectors have a resistance of 13.8 Ohms ± 0.7 Ohms @ 20 Degrees Celsius
For additional information, refer to: Fuel Charging and Controls (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Description and Operation).

IGNITION COILS



E47306

The V8 engine is fitted with eight plug-top coils that are driven directly by the ECM. This means that the ECM, at the point where sufficient charge has built up, switches the primary circuit of each coil and a spark is produced in the spark plug. The positive supply to the coil is fed from a common fuse. Each coil contains a power stage to trigger the primary current. The ECM sends a signal to each of the coils power stage to trigger the power stage switching. Each bank has a feedback signal that is connected to each power stage. If the coil power stage has a failure the feedback signal is not sent, causing the ECM to store a fault code appropriate to the failure.

The ECM calculates the dwell time depending on battery voltage and engine speed to ensure constant secondary energy. This ensures sufficient secondary (spark) energy is always available, without excessive primary current flow thus avoiding overheating or damage to the coils.

The individual cylinder spark timing is calculated from a variety of inputs:

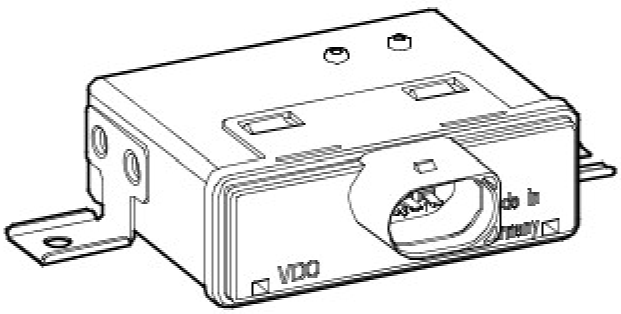
- Engine speed and load.
- Engine temperature.
- Knock control.
- Auto gearbox shift control.
- Idle speed control.

For additional information, refer to: Engine Ignition (303-07A Engine Ignition - V8 S/C 4.2L Petrol, Description and Operation).

FUEL PUMP RELAY

The ECM controls the fuel pump relay which in turn controls the power supply to the fuel pump driver module. The ECM energizes the relay ON with ignition ON, via pin A95 of the ECM.

FUEL PUMP DRIVER MODULE (FPDM)



E58398

The fuel pump driver module is located in the rear LH quarter, adjacent to the parking aid control module.

The fuel pump is controlled by the ECM. The ECM sends a PWM signal to the fuel pump driver module from pin B20 of the ECM, the frequency of the signal determines the duty cycle of the pump. The PWM signal to the pump represents half the ON time of the pump. If the ECM transmits a 50% on time, the fuel pump driver module drives the pump at 100%. If the ECM transmits a 5% ON time, the fuel pump driver module drives the pump at 10%. The fuel pump driver module will only turn the fuel pump ON if it receives a valid signal between 4% and 50%. When The ECM requires the fuel pump to be turned OFF, the ECM transmits a duty cycle signal of 75%.

The status of the fuel pump driver module is monitored by the ECM on pin B21. Any errors can be retrieved from the ECM. The fuel pump driver module cannot be interrogated for diagnostic purposes.

The MAP sensor controls the fuel pump driver module in response to inputs from the fuel rail pressure sensor, the MAP sensor and the MAF/IAT sensor.

Harness Connector C2369 pin out details

Pin No	Description	Input/Output
1	Pump +	Output
2	Pump -	-
3	ECMPWM signal	Input
4	Diagnostic signal	Output
5	Battery voltage	Input
6	GND	-

VISCOUS FAN CONTROL

The ECM controls a viscous coupled fan to provide engine cooling. The ECM supplies the fan with a PWM signal that controls the amount of slippage of the fan, thus providing the correct amount of cooling fan speed and airflow. The EMS uses a Hall effect sensor to determine the fan speed.
For additional information, refer to: Engine Cooling (303-03A Engine Cooling - V8 S/C 4.2L Petrol, Description and Operation).

ECM ADAPTIONS

The ECM has the ability to adapt the values it uses to control certain outputs. This capability ensures the EMS can meet emissions legislation and improve the refinement of the engine throughout its operating range.

The components which have adaptions associated with them are:

- The APP sensor
- The oxygen sensors
- The MAF/IAT sensor
- The CKP sensor
- The Electric throttle body.

UHEGO/HEGO and MAF/AT Sensor

There are several adaptive maps associated with the fueling strategy. Within the fueling strategy the ECM calculates short-term adaptions and long term adaptions. The ECM will monitor the deterioration of the oxygen sensors (HEGO and UHEGO) over a period of time. It will also monitor the current correction associated with the sensors.

The ECM will store a fault code in circumstances where an adaption is forced to exceed its operating parameters. At the same time, the ECM will record the engine speed, engine load and intake air temperature.

Crankshaft Position Sensor

The characteristics of the signal supplied by the CKP sensor is learnt by the ECM. This enables the ECM to set an adaption and support the engine misfire detection function. Due to the small variation between different flywheels and different CKP sensors, the adaption must be reset if either component is renewed, or removed and refitted. It is also necessary to reset the flywheel adaption if the ECM is renewed or replaced. The ECM supports four flywheel adaptions for the CKP sensor. Each adaption relates to a specific engine speed range. The engine speed ranges are detailed in the table below:

Adaptions	Engine Speed, rev/min
1	1800 - 3000
2	3001 - 3800
3	3801 - 4600
4	4601 - 5400

Misfire Detection

Legislation requires that the ECM must be able to detect the presence of an engine misfire. It must be able to detect misfires at two separate levels. The first level is a misfire that could lead to the vehicle emissions exceeding 1.5 times the Federal Test Procedure (FTP) requirements for the engine. The second level is a misfire that may cause catalyst damage.

The ECM monitors the number of misfire occurrences within two engine speed ranges. If the ECM detects more than a predetermined number of misfire occurrences within either of these two ranges, over two consecutive journeys, the ECM will record a fault code and details of the engine speed, engine load and engine coolant temperature. In addition, the ECM monitors the number of misfire occurrences that happen in a 'window' of 200 engine revolutions. The misfire occurrences are assigned a weighting according to their likely impact on the catalysts. If the number of misfires exceeds a certain value, the ECM stores catalyst-damaging fault codes, along with the engine speed, engine load and engine coolant temperature.

The signal from the crankshaft position sensor indicates how fast the poles on the flywheel are passing the sensor tip. A sine wave is generated each time a pole passes the sensor tip. The ECM can detect variations in flywheel speed by monitoring the sine wave signal supplied by the crankshaft position sensor.

By assessing this signal, the ECM can detect the presence of an engine misfire. At this time, the ECM will assess the amount of variation in the signal received from the CKP and assigns a roughness value to it. This roughness value can be viewed within the real time monitoring feature, using a Land Rover approved diagnostic system. The ECM will evaluate the signal against a number of factors and will decide whether to count the occurrence or ignore it. The ECM can assign a roughness and misfire signal for each cylinder, (i.e. identify which cylinder is misfiring).

Diagnostics

The ECM stores faults as diagnostic trouble code (DTC), referred to as 'P' codes. The 'P' codes are defined by OBD legislation and, together with their associated environmental and freeze frame data, can be read using a third party scan tool or a Land Rover approved diagnostic system. A Land Rover approved diagnostic system can also read real time data from each sensor, the adaptive values currently being employed and the current fueling, ignition and idle settings.

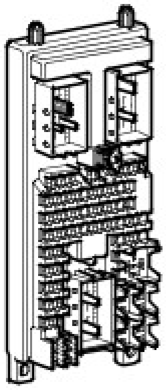
TERRAIN RESPONSE™

Terrain Response™ system allows the driver to select a program which will provide the optimum settings for traction and performance for prevailing terrain conditions.

As part of Terrain Response™ there will be different throttle pedal progression maps associated with different Terrain Response™ modes. The two extremes are likely to be a sand map (quick build up of torque with pedal travel) and grass/gravel/snow (very cautious build up of torque).

The V8 Super Charged implementation of throttle progression is based on a fixed blend time. The torque will blend from that on one map to that on the new map (for the same pedal position) over a fixed time. This means blending will always take the same amount of time but when the torque change is small the torque increase over time will be small, whilst if the torque change is greater then the torque increase over time will be steeper. The resulting acceleration of the vehicle will depend on the torque difference between the two maps as well as on the gear and range selected.
For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

CENTRAL JUNCTION BOX



E47607

The ECM is connected to ignition switch positions I and II. When the ignition is turned ON, 12V is applied to the ignition sense input. The ECM then starts its power up routines and turns ON the ECM main relay, the main power to the ECM and it's associated system components. When the ignition is turned OFF the ECM will maintain its powered up state for up to 20 minutes while it initiates its power down routine and on completion will turn OFF the ECM main relay. The ECM will normally power down in approximately 60 seconds, do not disconcert the battery until the ECM is completely powered down.

Diagnosis and Testing

Principle of Operation

This section covers the sensors and units for the engine management system.

For more information on the system, refer to section 303-14A - Electronic Engine Controls - 4.2L workshop manual section.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection chart

Mechanical	Electrical
● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Sensor installation/condition ● Viscous fan and solenoid	● Fuses ● Wiring harness ● Electrical connector(s) ● Sensor(s) ● Engine control module (ECM) ● Transmission control module (TCM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared **following** rectification.

Symptom chart

Symptom (general)	Symptom (specific)	Possible causes	Action
Non-Start	Engine does not crank	● Security system /Immobilizer engaged ● ECM relay ● Battery ● Starting system ● Harness ● Engine seized	Check that the security system is disarmed. Check the ECM relay operation. Check the battery condition and state of charge. For starting system tests, refer to the relevant workshop manual section. Check that the engine turns by hand.
	Engine cranks, but does not fire	● Low/Contaminated fuel ● Ignition system ● Fuel system ● Crankshaft position (CKP) sensor ● Harness ● ECM fault	Check the fuel level and condition. For ignition system tests and fuel system tests, refer to the relevant workshop manual section. For CKP and harness tests refer to the guided diagnostic routine on the approved diagnostic system. Refer to the warranty policy and procedures manual if an ECM is suspect.
	Engine cranks and fires, but will not start	● Evaporative emissions purge valve ● Fuel system ● Spark plugs ● Ignition coil failure(s) ● Harness	For purge valve tests, fuel system tests and ignition system tests, refer to the relevant workshop manual section.
Difficult to start	Difficult to start cold	● Check coolant anti-freeze content ● Battery ● Crankshaft position (CKP) sensor ● Fuel system ● Evaporative emissions purge valve	Check the coolant condition. Check the battery condition and state of charge, refer to the relevant workshop manual section. For CKP sensor tests refer to the guided diagnostic routine on the approved diagnostic system. For fuel system tests and purge valve tests, refer to the relevant workshop manual section.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
C003100	Left Front Wheel Speed Sensor	● Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003400	Right Front Wheel Speed Sensor	● Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003700	Left Rear Wheel Speed Sensor	● Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003A00	Right Rear Wheel Speed Sensor	● Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
P003100	HO2S Heater Control Circuit Low (Bank 1, Sensor 1)	● Heated 0² sensor heater power supply circuit high resistance ● Heated 0² sensor heater control circuit high resistance ● Heated 0² sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P003200	HO2S Heater Control Circuit High (Bank 1, Sensor 1)	● Heated 0² sensor heater power supply circuit high resistance ● Heated 0² sensor heater control circuit high resistance ● Heated 0² sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P003600	HO2S Heater Control Circuit (Bank 1, Sensor 2)	● Catalyst monitor sensor heater control circuit short circuit to ground ● Catalyst monitor sensor heater control circuit high resistance ● Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005100	HO2S Heater Control Circuit Low (Bank 2, Sensor 1)	● Heated 0² sensor heater power supply circuit high resistance ● Heated 0² sensor heater control circuit high resistance ● Heated 0² sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005200	HO2S Heater Control Circuit High (Bank 2, Sensor 1)	● Heated 0² sensor heater power supply circuit high resistance ● Heated 0² sensor heater control circuit high resistance ● Heated 0² sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005600	HO2S Heater Control Circuit (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) heater control circuit short circuit to ground ● Catalyst monitor sensor heater control circuit high resistance ● Catalyst monitor sensor heater failure	For left-hand catalyst monitor sensor heater circuit tests. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P006900	(MAP) - Barometric pressure correlation	• Manifold absolute pressure (MAP) sensor failure • BARO sensor failure (internal ECM fault)	Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if an ECM is suspect.
P007100	Ambient Air Temperature Sensor Range/Performance	• Ambient temperature sensor range performance (stuck)	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P007200	Ambient Air Temperature Sensor Circuit Low	• Ambient temperature sensor circuit low input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P007300	Ambient Air Temperature Sensor Circuit High	• Ambient temperature sensor circuit high input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P008700	Fuel rail/system pressure too low	• Fuel rail pressure (FRP) sensor disconnected • FRP sensor to ECM sensing circuit short circuit to ground • FRP sensor supply circuit high resistance • FRP sensor failure • Fuel line leak • Restricted fuel line • Fuel pump module circuit high resistance • Fuel pump module circuit short circuit to ground • Fuel pump module failure	For FRP sensor tests, refer to the relevant workshop manual section. Check the fuel lines, check the fuel pressure and the fuel pump module circuits. Refer to the electrical guides.
P008800	Fuel rail/system pressure too high	• Fuel rail pressure (FRP) sensor to ECM wiring (supply/sense) short circuit to each other • FRP sensor to ECM sense circuit short circuit to power • FRP sensor failure • Fuel pressure control valve (FPCV) fault • Fuel pump module circuit short circuit to power • Fuel pump module failure	For FRP sensor tests, refer to the relevant workshop manual section. Check the fuel lines, check the fuel pressure and the fuel pump module circuits. Refer to the electrical guides.
P009300	Fuel System Leak Detected - Large Leak	• Fuel rail pressure (FRP) sensor disconnected • FRP sensor to ECM sensing circuit short circuit to ground • FRP sensor supply circuit high resistance • FRP sensor failure • Fuel line leak • Restricted fuel line • Fuel pump module circuit high resistance • Fuel pump module circuit short circuit to ground • Fuel pump module failure	For FRP sensor tests, refer to the relevant workshop manual section. Check the fuel lines, check the fuel pressure and the fuel pump module circuits.
P009623	Intake Air Temperature Sensor 2 Circuit Range/Performance (Bank 1)	• Air charge temperature (ACT) sensor circuit short circuit to power • ACT sensor failure • ECM failure	Check the ACT sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P009624	Intake Air Temperature Sensor 2 Circuit Range/Performance (Bank 1)	• Air charge temperature (ACT) sensor circuit short circuit to power • ACT sensor failure • ECM failure	Check the ACT sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P009629	Intake Air Temperature Sensor 2 Circuit Range/Performance (Bank 1)	● Air charge temperature (ACT) sensor circuit short circuit to power ● ACT sensor failure ● ECM failure	Check the ACT sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P009700	Intake Air Temperature Sensor 2 Circuit Low (Bank 1)	● Air charge temperature (ACT) sensor circuit high resistance ● ACT sensor circuit short circuit to ground ● ACT sensor failure ● ECM failure	Check the ACT sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P009800	Intake Air Temperature Sensor 2 Circuit High (Bank 1)	● Air charge temperature (ACT) sensor circuit short circuit to power ● ACT sensor failure ● ECM failure	Check the ACT sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P010100	Mass or Volume Air Flow A Circuit	● Blocked air cleaner ● Air intake leak ● Engine breather leak ● Mass air flow (MAF) sensor sensing circuit high resistance, intermittent short circuit to ground ● MAF sensor supply circuit high resistance	Check the air cleaner for blockage, etc. Check the air intake system for leaks. Check the engine breather system. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010200	Mass or Volume Air Flow A Circuit Low	● MAF sensor supply circuit high resistance, short circuit to ground ● MAF sensor ground circuit high resistance ● MAF sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010300	Mass or Volume Air Flow A Circuit High	● MAF sensor sensing circuit short circuit to battery ● MAF sensor return circuit high resistance ● MAF sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010600	Manifold Absolute Pressure/BARO Sensor Range/Performance	● Intake manifold air leak (loose or missing component) ● MAP sensor circuit(s) fault ● MAP sensor failure	Check the intake manifold for security, etc. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010700	Manifold Absolute Pressure/BARO Sensor Low	● MAP sensor circuit high resistance, short circuit to ground ● MAP sensor supply circuit high resistance ● MAP sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010800	Manifold Absolute Pressure/BARO Sensor High	● MAP sensor return circuit high resistance ● MAP sensor sense circuit short circuit to power ● MAP sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011123	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1)	● Signal stuck low at engine start ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P011124	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1)	● Signal stuck high at engine start ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011129	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1)	● Signal invalid ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011200	Intake Air Temperature Sensor 1 Circuit Low (Bank 1)	● Intake air temperature IAT sensor disconnected ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011300	Intake Air Temperature Sensor 1 Circuit High (Bank 1)	● IAT sensor circuit(s) short circuit to ground ● IAT sensor sensing circuit short circuit to power ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011623	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011624	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck closed). Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011629	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011700	Engine Coolant Temperature Sensor 1 Circuit Low	● ECT sensor disconnected ● Engine coolant temperature (ECT) sensor sensing circuit high resistance, short circuit to power ● ECT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011800	Engine Coolant Temperature Sensor 1 Circuit High	● Engine overheat condition/cooling fan failure ● ECT sensor wiring short circuit to ground ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck closed). Check for cooling fan DTCs. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P012100	Throttle/Pedal Position Sensor A Circuit Range/Performance	● Throttle position sensor wiring high resistance ● Throttle position sensor sensing circuits (Throttle position 1 or Throttle position 2) short circuit to power ● Throttle position sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P012200	Throttle/Pedal Position Sensor A Circuit Low	● Throttle position sensor sensing circuit 1 short circuit to ground, high resistance ● Throttle position sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

Electronic Engine Controls - V8 S/C 4.2L Petrol - Engine Oil Pressure (EOP) Sensor

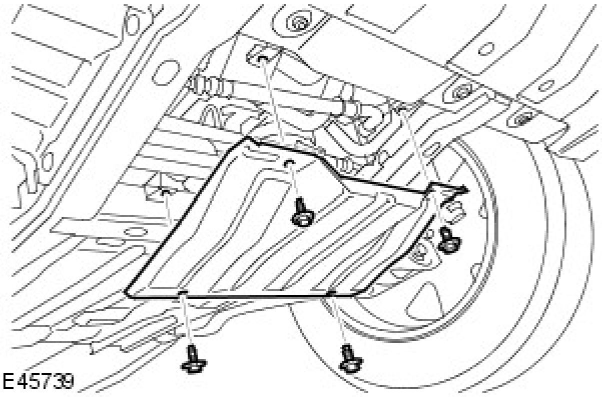
Removal and Installation

Removal

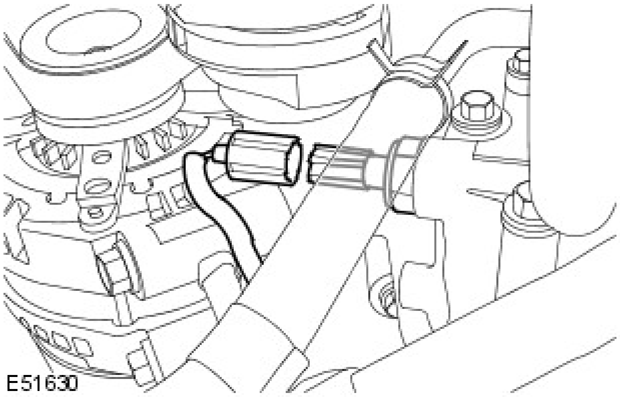
1. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

   Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the radiator access panel.
   - Remove the 4 bolts.



3. Remove the oil pressure sensor.
   - Disconnect the electrical connector.
   - Position a container to collect the fluid.



Installation

1. To install, reverse the removal procedure.
   - Tighten the oil pressure sensor to 12 Nm (9 lb.ft).
   - Tighten the 4 bolts to 10 Nm (7 lb.ft).

2. Check and top-up the engine oil.

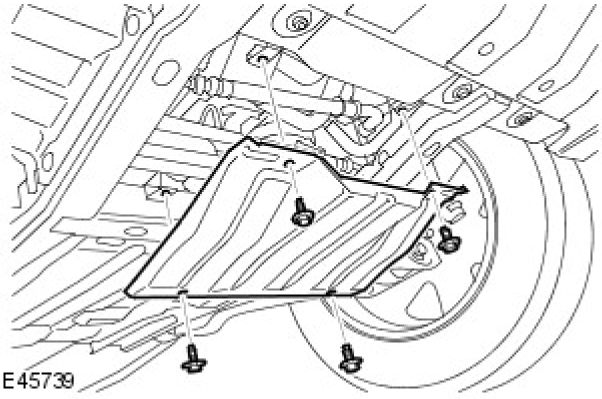
Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Oil Temperature Sensor

Removal and Installation

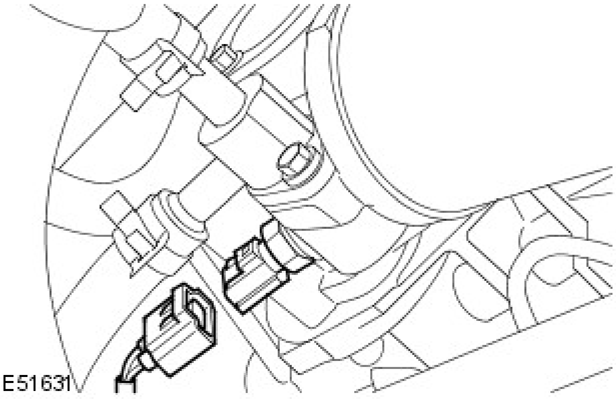
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



2. Remove the radiator access panel.

- Remove the 4 bolts.



3. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the oil temperature sensor.

- Disconnect the electrical connector.
- Position a container to collect the fluid.

Installation

1. To install, reverse the removal procedure.

- Tighten the oil temperature sensor to 20 Nm (15 lb.ft).
- Tighten the bolts to 10 Nm (7 lb.ft).

2. Check and top-up the engine oil.

Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the ECT sensor.

   - Position an absorbent cloth to collect fluid spillage.
   - Disconnect the electrical connector.
   - Release the clip.
   - Remove the sensor and discard the seal.

Installation

1. To install, reverse the removal procedure.
   - Clean the component mating faces.
   - Check and top-up the coolant if required.

Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Engine Control Module (ECM)

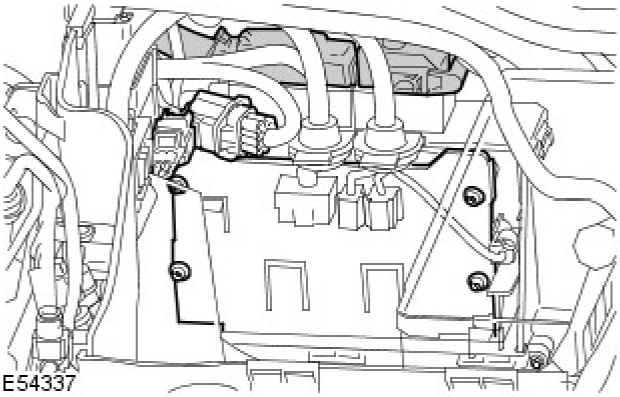
Removal and Installation

Removal

• NOTE: If the ECM is to be replaced, the T4 must be connected prior to battery disconnection and on-screen instructions must be followed.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

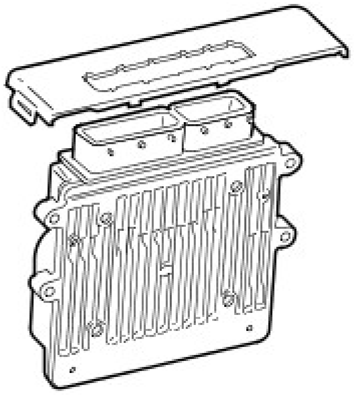
2. Remove the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).



E54337

3. Remove the ECM cover.

- Disconnect 2 electrical connectors for access.
- Disconnect the 2 ECM electrical connectors.
- Remove the 4 Torx screws.



E54338

4. Remove the ECM.

- Remove the ECM top cover.

Installation

1. Install the ECM.

- Install the ECM cover and secure with Torx screws.
- Install the ECM upper cover.

2. Connect the ECM electrical connectors.

3. Connect the 2 electrical connectors disconnected for access.

4. Install the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

5. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

6. Connect T4 to calibrate a new ECM.

Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Crankshaft Position (CKP) Sensor

Removal and Installation

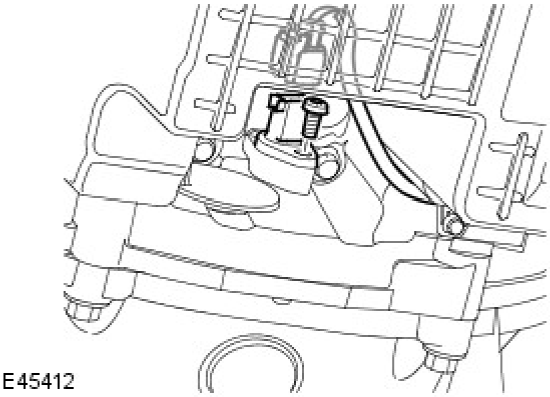
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



4. ⚠ CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the crankshaft position (CKP) sensor.

- Disconnect the electrical connector.
- Remove the Torx screw.

Installation

1. To install, reverse the removal procedure.

- Tighten the Torx screw to 8 Nm (6 lb.ft).

2. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

Electronic Engine Controls - V8 S/C 4.2L Petrol - Throttle Position (TP) Sensor

Removal and Installation

Removal

- NOTE: NOTE: The TP sensor is part of the throttle body assembly and cannot be serviced separately.

1. Remove the throttle body.
For additional information, refer to: Throttle Body Gasket (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Removal and Installation).

Installation

1. Install the throttle body.
For additional information, refer to: Throttle Body Gasket (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Removal and Installation).

Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Camshaft Position (CMP) Sensor

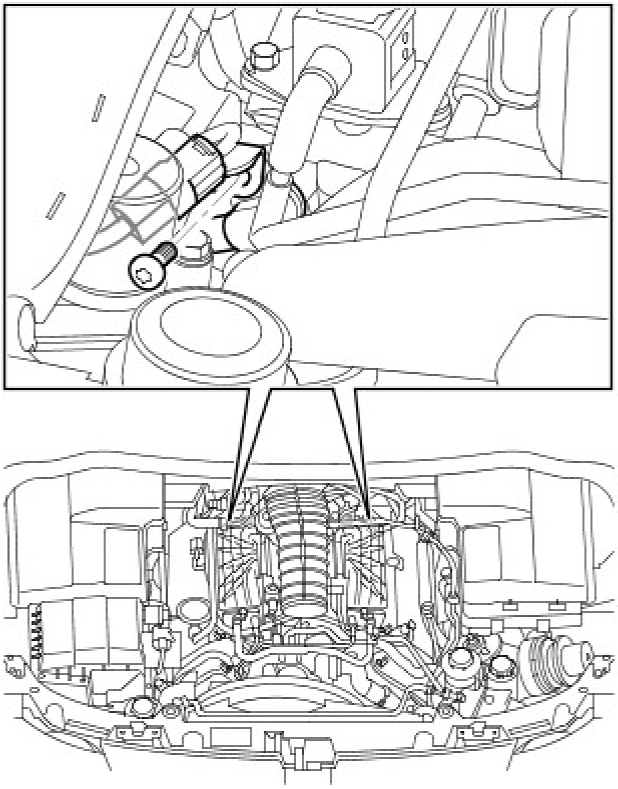
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the throttle body gasket.
For additional information, refer to: Throttle Body Gasket (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Removal and Installation).

3. NOTE: Removal of the RH sensor is similar to this procedure.



E52435

Remove the camshaft position (CMP) sensor.

- Disconnect the electrical connector.
- Remove the Torx screw.
- Discard the O-ring seal.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the Torx screw to 7 Nm (5 lb.ft).

Published: 11-May-2011

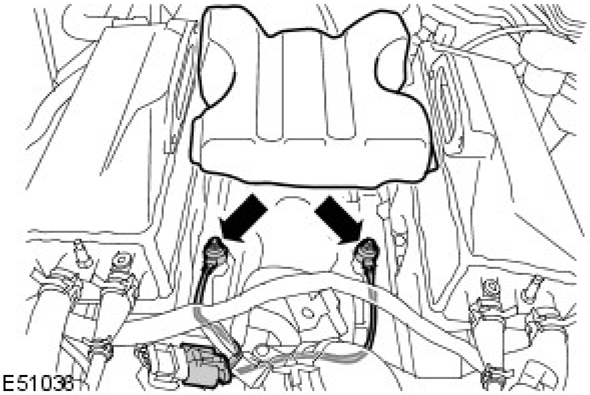
Electronic Engine Controls - V8 S/C 4.2L Petrol - Knock Sensor (KS)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the supercharger.
For additional information, refer to: Supercharger (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).



3. Remove the knock sensors (KS).

- Disconnect the electrical connector.
- Remove the acoustic pad.
- Remove the 2 bolts.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Tighten the bolts to 20 Nm (15 lb.ft).
- Install the acoustic pad.

Published: 11-May-2011

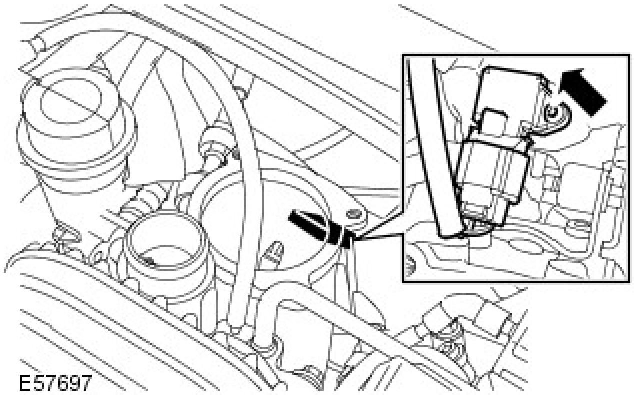
Electronic Engine Controls - V8 S/C 4.2L Petrol - Manifold Absolute Pressure (MAP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the throttle body gasket.
For additional information, refer to: Throttle Body Gasket (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Removal and Installation).



3. Remove the manifold absolute pressure (MAP) sensor.

- Disconnect the electrical connector.
- Remove the Allen screw.
- Discard the O-ring seal.

Installation

1. Install the MAP sensor.

- Clean the components.
- Install a new O-ring seal.
- Tighten the Allen screw to 3 Nm (2 lb.ft).
- Connect the electrical connector.

2. Install the throttle body gasket.
For additional information, refer to: Throttle Body Gasket (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Removal and Installation).

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

4. NOTE: For NAS vehicles only.

If required, carry out a short drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).

Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Fuel Temperature Sensor

Removal and Installation

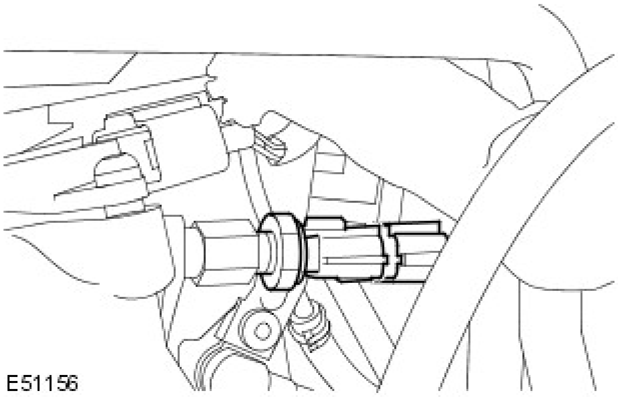
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the throttle body gasket.
   For additional information, refer to: Throttle Body Gasket (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Removal and Installation).
3. WARNING: The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

• CAUTIONS:

To prevent damage to components, use an additional wrench when loosening or tightening unions.

Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.



Remove the fuel temperature sensor.

- Disconnect the electrical connector.

Installation

1. Install the fuel temperature sensor.
   - Clean the component mating faces.
   - Apply sealant to the sensor thread.
   - Tighten the sensor to 7 Nm (5 lb.ft).
   - Connect the electrical connector.
2. Install the throttle body gasket.
   For additional information, refer to: Throttle Body Gasket (303-04A Fuel Charging and Controls - V8 S/C 4.2L Petrol, Removal and Installation).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - V8 S/C 4.2L Petrol - Heated Oxygen Sensor (HO2S) LH

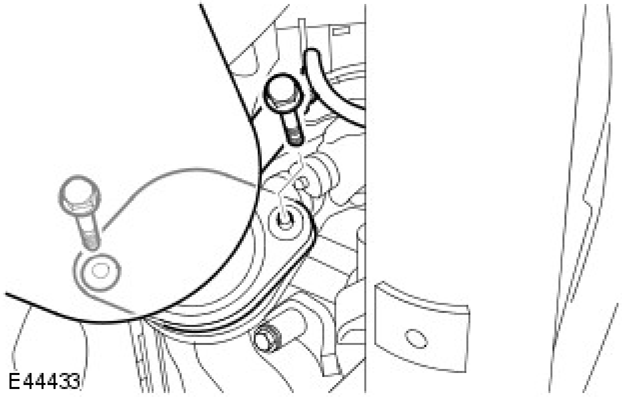
Removal and Installation

Special Tool(s)	
	Wrench, HO2S 310-121(LRT-19-014)

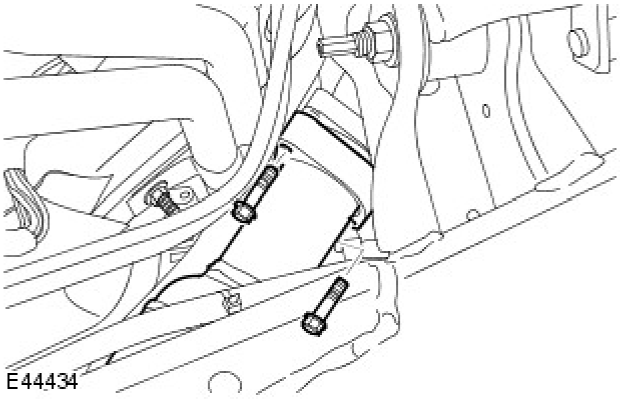
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

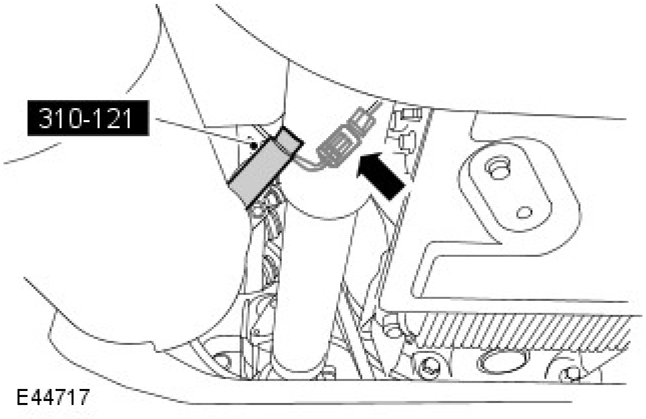
   Raise and support the vehicle.



2. Disconnect the LH catalytic converter from the exhaust manifold.
   - Remove and discard the 2 bolts.



3. Disconnect the RH catalytic converter from the exhaust manifold.
   - Remove and discard the 2 bolts.



4. Using the special tool, remove the HO2S.

- Release the wiring harness.
- Disconnect the electrical connector.

Installation

1. CAUTIONS:

⚠ Make sure the anti-seize compound does not contact the HO2S tip.

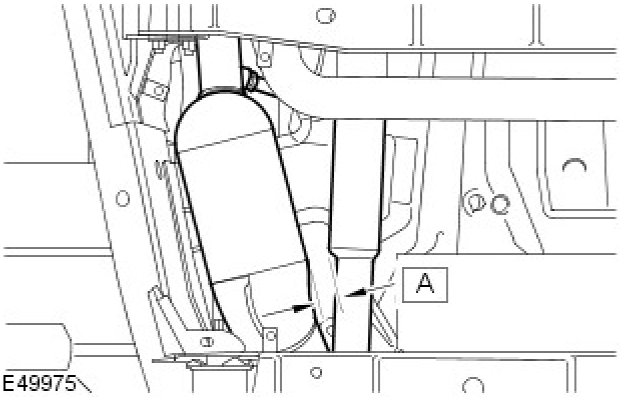
⚠ Make sure the H02S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Using the special tool, install the HO2S.

- Clean the components.
- Apply an anti-seize compound to the thread of the sensor.
- Tighten the HO2S to 45 Nm (33 lb.ft).
- Connect the electrical connector.
- Attach the wiring harness.

2. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).



3. ⚠ CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

4. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Catalyst Monitor Sensor LH

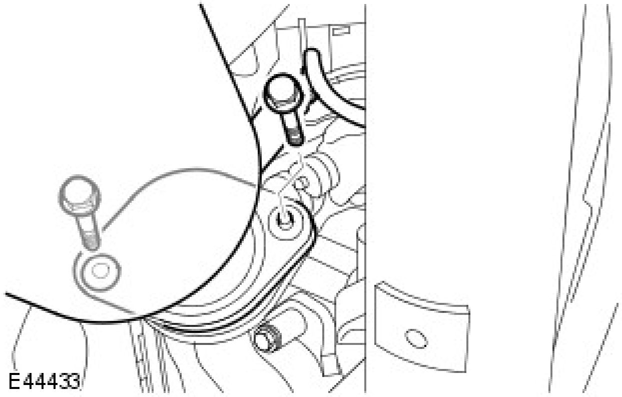
Removal and Installation

Special Tool(s)	
	Wrench, HO2S 310-121 (LRT-19-014)

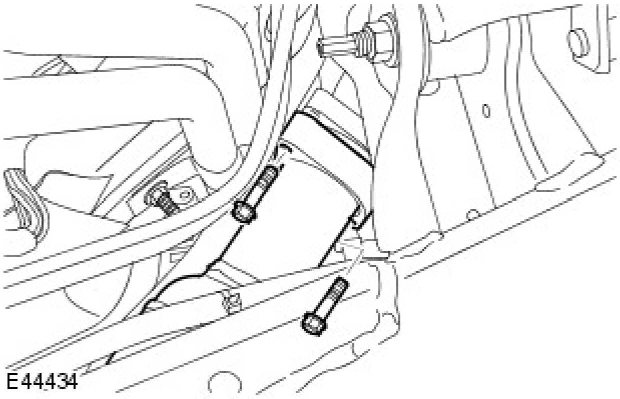
Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

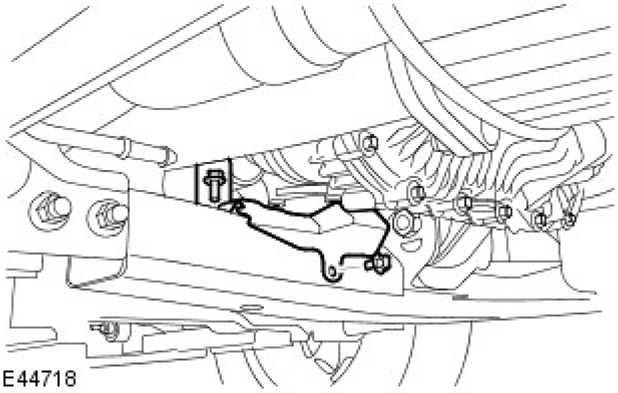
   Raise and support the vehicle.



2. Disconnect the LH catalytic converter from the exhaust manifold.
   - Remove and discard the 2 bolts.



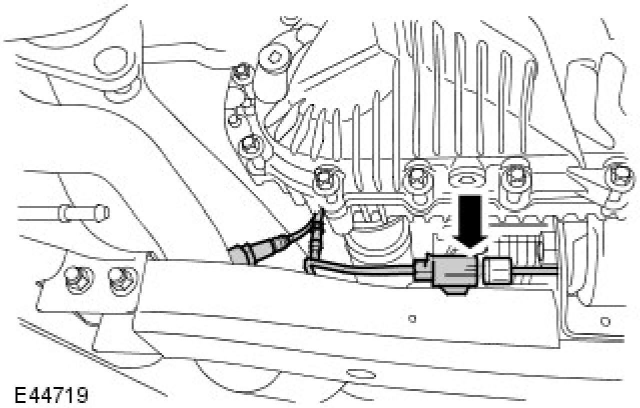
3. Disconnect the RH catalytic converter from the exhaust manifold.
   - Remove and discard the 2 bolts.



E44718

4. Remove the catalyst monitor sensor electrical connector heat shield.

- Remove the 2 bolts.



E44719

5. Using the special tool, remove the catalyst monitor sensor.

- Release the wiring harness.
- Disconnect the electrical connector.

Installation

1. CAUTIONS:

⚠ Make sure the anti-seize compound does not contact the catalyst monitor sensor tip.

⚠ Make sure the catalyst monitor sensor wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Using the special tool, install the catalyst monitor sensor.

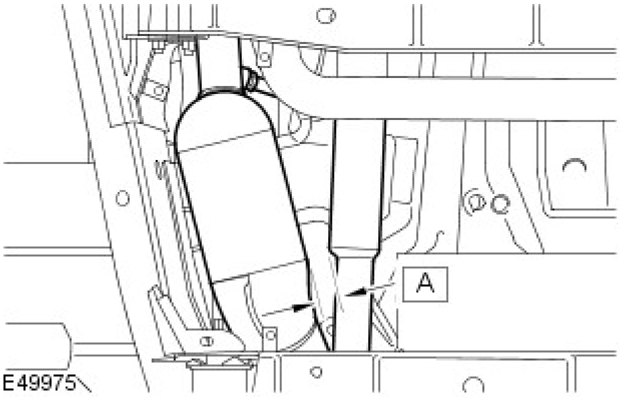
- Clean the components.
- Apply an anti-seize compound to the thread of the sensor.
- Tighten the catalyst monitor sensor to 45 Nm (33 lb.ft).
- Connect the electrical connector.
- Attach the wiring harness.

2. Install the heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

3. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).



4. ⚠ CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

5. NOTE: For NAS vehicles only.

If required, carry out a long drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).

Published: 11-May-2011

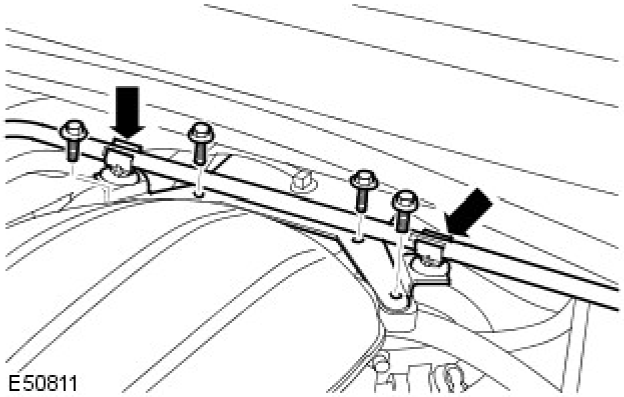
Electronic Engine Controls - V8 S/C 4.2L Petrol - Intake Air Temperature (IAT) Sensor

Removal and Installation

Removal

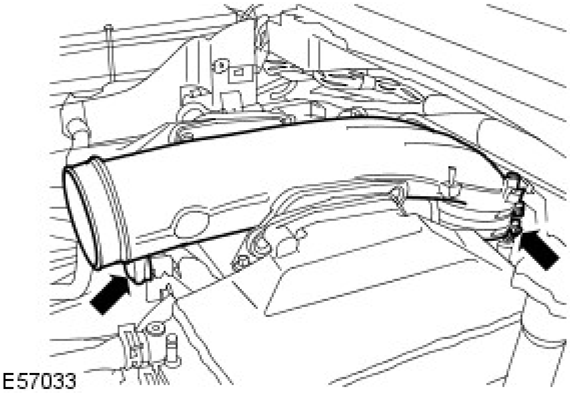
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the air intake resonator.
For additional information, refer to: Intake Air Resonator (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).



3. Position the wiring harness support bracket aside.

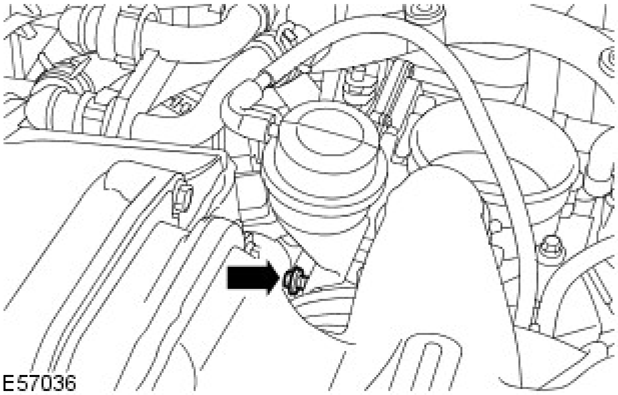
- Release the 2 fuel pipe clips.
- Remove the 4 bolts.



4. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

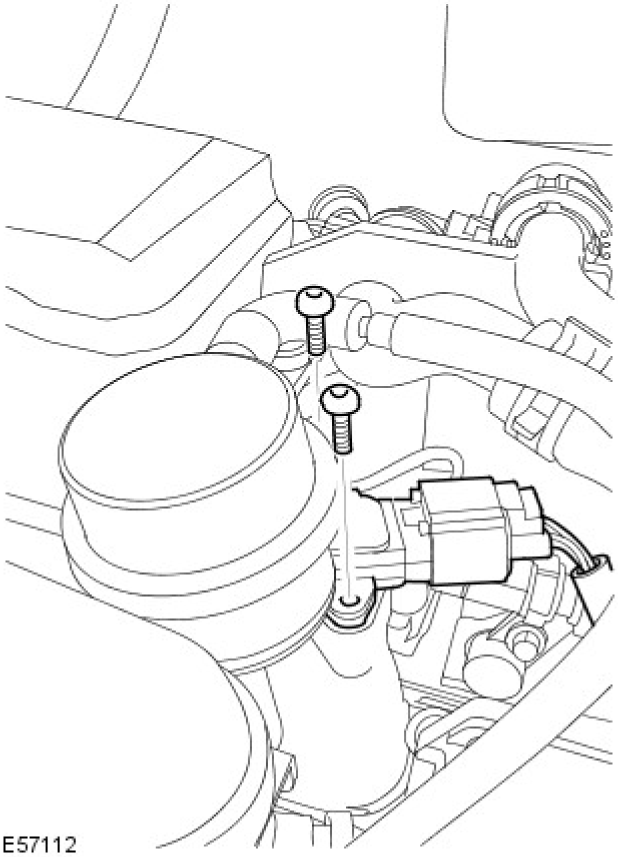
Remove the throttle body intake.

- Release the clip.
- Release the bushing.



5. Position the supercharger pressure relief actuator aside for access.

- Remove the bolt.



6. Remove the intake air temperature (IAT) sensor.

- Disconnect the electrical connector.
- Remove the 2 Torx screws.
- Remove and discard the O-ring seal.

Installation

1. Install the IAT sensor.

- Clean the components.
- Install a new O-ring seal.
- Tighten the Torx screws to 6 Nm (4 lb.ft).
- Connect the electrical connector.

2. Secure the supercharger pressure relief actuator.

- Tighten the bolt to 10 Nm (7 lb.ft).

3. Install the throttle body intake.

- Align the bushing.
- Secure the clip.

4. Install the wiring harness support bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).

5. Install the air intake resonator.
For additional information, refer to: Intake Air Resonator (303-12A Intake Air Distribution and Filtering - V8 S/C 4.2L Petrol, Removal and Installation).

6. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

7. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

Published: 11-May-2011

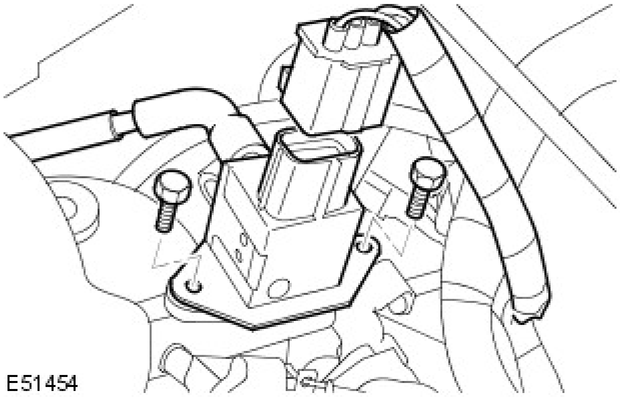
Electronic Engine Controls - V8 S/C 4.2L Petrol - Fuel Rail Pressure (FRP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).



3. ⚠ WARNING: The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

Remove the FRP sensor.

- Disconnect the vacuum line.
- Disconnect the electrical connector.
- Position an absorbent cloth to collect fluid spillage.
- Remove the 2 bolts.
- Discard the O-ring seals.

Installation

1. Install the FRP sensor.

- Clean the component mating faces.
- Install the new O-ring seals.
- Tighten the bolts to 6 Nm (4 lb.ft).
- Connect the electrical connector.
- Connect the vacuum line.

2. Install the engine cover.
For additional information, refer to: Engine Cover - V8 S/C 4.2L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

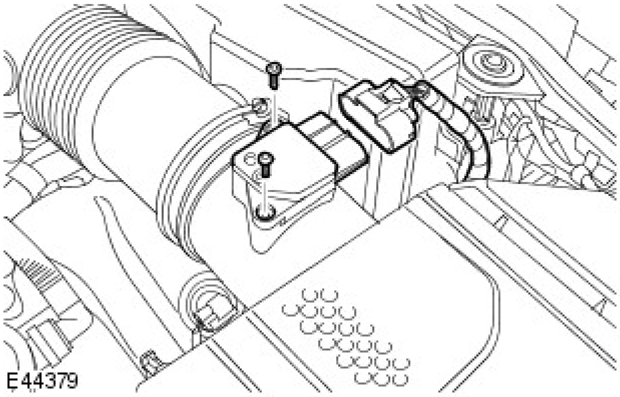
Published: 11-May-2011

Electronic Engine Controls - V8 S/C 4.2L Petrol - Mass Air Flow (MAF) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the MAF sensor.
   - Disconnect the electrical connector.
   - Remove the 2 screws.



Installation

1. To install, reverse the removal procedure.
   - Tighten Torx screws to 2 Nm (1.5 lb.ft).
2. NOTE: Federal market vehicles only.

   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).
3. NOTE: Non federal market vehicles only.

   Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Powertrain Control Module (PCM) Long Drive Cycle Self-Test

General Procedures

⚠WARNING: Where possible, all road tests should be on well surfaced and dry roads. Always comply with speed limits and local traffic regulations.

- NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.
- NOTE: The vehicle must exceed 50mph (80 km/h) during the road test.

1. Connect the diagnostic equipment to the vehicle.

2. Follow on screen prompts and check for engine management fault codes.

3. Clear the fault codes following the on screen procedure.

4. Disconnect the diagnostic equipment from the vehicle.

5. NOTE: Make sure cruise control is not engaged.

Make sure the engine temperature is above 60 ºC (140 ºF).

Carry out a road test and perform the following operations.

1. Accelerate to 55 mph (88 km/h) in 5th gear and cruise for 2 minutes with the engine speed at or above 1800rpm.
2. Lift off the throttle and allow the vehicle to decelerate until the engine speed is less than 1000 rpm.
3. Stop the vehicle.
4. Release brake, allow the vehicle to move with no throttle for 1 minute.
5. Road test is now complete.

6. Connect the diagnostic equipment to the vehicle.

7. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.

8. Disconnect the diagnostic equipment from the vehicle.

Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Powertrain Control Module (PCM) Short Drive Cycle Self-Test

General Procedures

• NOTE: This procedure is an overcheck only. If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

1. Connect the diagnostic equipment to the vehicle.

2. Follow on screen prompts and check for engine management fault codes.

3. Clear the fault codes following the on screen procedure.

4. Start the engine.

- Allow the engine to idle for 30 seconds.
- Raise the engine speed to 1500 rpm and hold for 3 minutes until a temperature of 70ºC (158 ºF) is achieved.
- Allow the engine to idle for 30 seconds.
- Switch off the engine.

5. NOTE: If fault codes are found, interrogation of the relevant system must be carried out and claimed against.

Follow on screen prompts and check for engine management fault codes.

6. Disconnect the diagnostic equipment from the vehicle.

Published: 09-Mar-2011

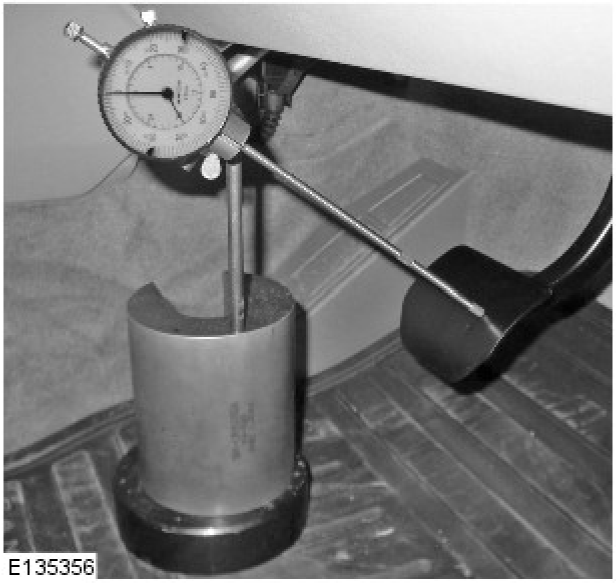
Electronic Engine Controls - V8 4.4L Petrol - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

Check

1. Remove the brake pedal rubber.

2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.



E135356

Position the DTI gauge on a suitable mounting block, as illustrated.

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.

4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠

Remove the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠ Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.

For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

GENERAL

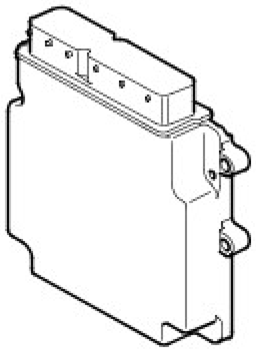
The V8 4.4 Liter engine is controlled by a ECM manufactured by DENSO. The Engine Management System (EMS) controls the following:

- Engine fueling
- Ignition timing
- Closed loop fueling
- Knock control
- Idle speed control
- Emission control
- On Board Diagnostic
- Interface with the immobilization system
- Speed control

The ECM controls the engine fueling by providing sequential fuel injection to all cylinders. Ignition is controlled by a direct ignition system, provided by eight plug top coils. The ECM is able to detect and correct for ignition knock on each cylinder and adjust the ignition timing for each cylinder to achieve optimum performance.

The ECM uses a torque-based strategy to generate the torque required by the driver and other vehicle control modules. The EMS uses various sensors to determine the torque required from the engine. The EMS also interfaces with other vehicle electronic control modules's, via the CAN bus, to obtain additional information (e.g. road speed from the ABS control module). The EMS processes these signals and decides how much torque to generate. Torque is then generated by using various actuators to supply air, fuel and spark to the engine (electronic throttle, injectors, coils, etc.).

ENGINE CONTROL MODULE (ECM)



E46330

The ECMis located in the E-Box in the plenum area on the passenger side of the engine compartment attached to the bulkhead.

The ECM has the following inputs:

- RCM
- Park/neutral switch
- Ignition coil feedback x2
- Fuel rail temperature
- Mass air flow

- Engine speed
- Camshaft position x2
- Driver demand
- Brake pedal position switch
- Speed control switches
- Generator load
- Oxygen sensors pre catalyst x2
- Oxygen sensors post catalyst x2
- Throttle position
- Cooling fan speed
- Ignition switch position
- Knock sensors x2
- MAP
- Coolant temperature
- Engine oil temperature

The ECM outputs to the following:

- Throttle Actuator
- Brake vacuum pump relay
- Ignition coils (x8)
- Oxygen sensor heaters (4)
- Fuel injectors (8)
- Purge Valve
- Engine Cooling Fan
- Fuel pump relay
- Starter Relay
- EMS Main Relay
- Viscous Fan Control
- Generator Control
- Diagnostic Module Tank Leakage (DMTL) (NAS Only)
- E box fan

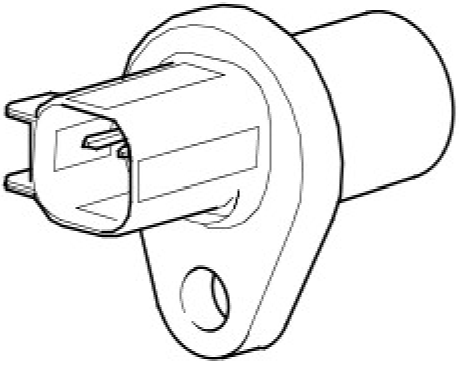
CRANKSHAFT POSITION SENSOR (CKP)



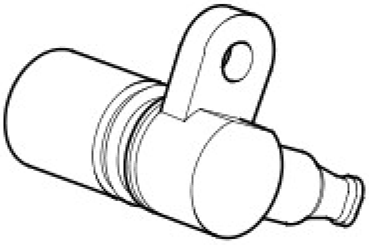
E46331

The crankshaft position sensor is mounted at the rear underside of the engine near the transmission bell housing. Connection between the sensor and the harness is via a link harness and a two-way connector. Both wires go directly to the ECM. The sensor produces the signal which enables the ECM to determine the angle of the crankshaft, and the engine rpm. From this, the point of ignition, fuel injection, etc. is calculated. If the signal wires are reversed a 3 degrees advance in timing will occur, as the electronics within the ECM uses the falling edge of the signal waveform as its reference / timing point for each tooth.

The reluctor is pressed into the flywheel and has a "tooth" pattern based on 36 teeth at 10° intervals and approximately 5° wide: one of the teeth is removed to provide a hardware reference mark which is 30 degrees before top dead center (BTDC) No.1 cylinder. Because of the crankshaft sensor's orientation, the target wheel uses windows stamped into the face, rather than actual teeth.

The sensor operates by generating an output voltage caused by the change in magnetic field that occurs as the windows pass in front of the sensor. The output voltage varies with the speed of the windows passing the sensor, the higher the engine speed, the higher the output voltage. Note that the output is also dependent on the air gap between the sensor and the teeth (the larger the gap, the weaker the signal, the lower the output voltage). The ECM transmits the engine speed to other vehicle control modules on CAN.

CAMSHAFT POSITION SENSOR (CMP)



E46332

Two sensors are located at the rear of the engine, in the cylinder head (one per bank), above the rear cylinders. The sensors are Variable Reluctor Sensor (VRS) type, producing four pulses for every two engine revolutions. The sensing element is positioned between 0 and 2mm from the side of the cam gear wheel.

The camshaft timing wheel is a sintered component which has four teeth on it to enable the EMS to detect cylinder identification. The signal is used for:

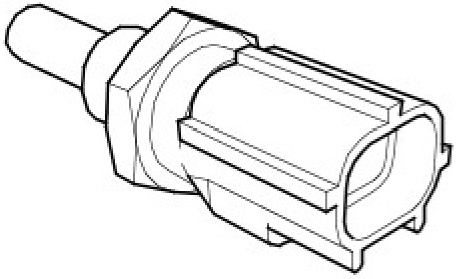
- Cylinder recognition
- Enabling sequential fuel injection
- Knock control

- Cylinder identification for diagnostic purposes.

Failure symptoms include:

- Ignition timing reverting to the base mapping, with no cylinder correction.
- Active knock control is disabled, along with its diagnostic (Safe ignition map - loss of performance).
- Quick cam/crank synchronisation on start disabled.

ENGINE COOLANT TEMPERATURE SENSOR (ECT)

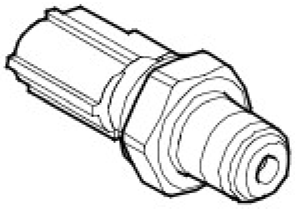


E47309

The sensor is located at the front of the engine in the water pipe below the throttle body. The ECT sensor is a thermistor used to monitor the engine coolant temperature. The engine coolant temperature sensor is vital to the correct running of the engine as a richer mixture is required at lower block temperatures for good quality starts and smooth running, leaning off as the temperature rises to maintain emissions and performance.

The sensor has an operating temperature range of -30 Degrees Celsius to 125 Degrees Celsius. When a defective coolant sensor is detected, the ECM uses the oil temperature sensor value.

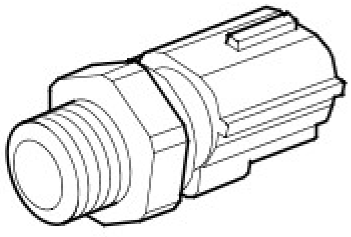
ENGINE OIL TEMPERATURE SENSOR



E46333

Oil temperature is monitored through a temperature sensor mounted in the oil system. This component is a negative temperature coefficient (NTC). The sensor is mounted next to the oil pressure sensor at the front of the engine and locates into the oil filter bracket.

FUEL RAIL TEMPERATURE SENSOR

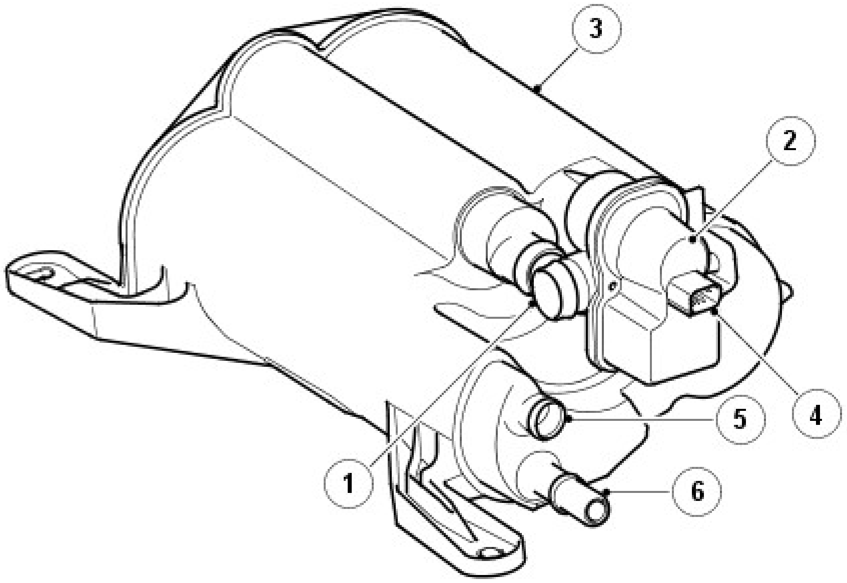


E47606

The fuel rail temperature sensor measures the temperature of the fuel in the fuel rail. This input is then used to deliver the correct quantity of fuel to the engine. Operating Range -40 Degrees Celsius to 150 Degrees Celsius. The fuel rail temperature sensor is fitted on the rear of the right hand bank (bank A) fuel rail.

DIAGNOSTIC MONITORING OF TANK LEAKAGE (DMTL) - NAS ONLY

Charcoal Canister with DMTL Pump (NAS only)



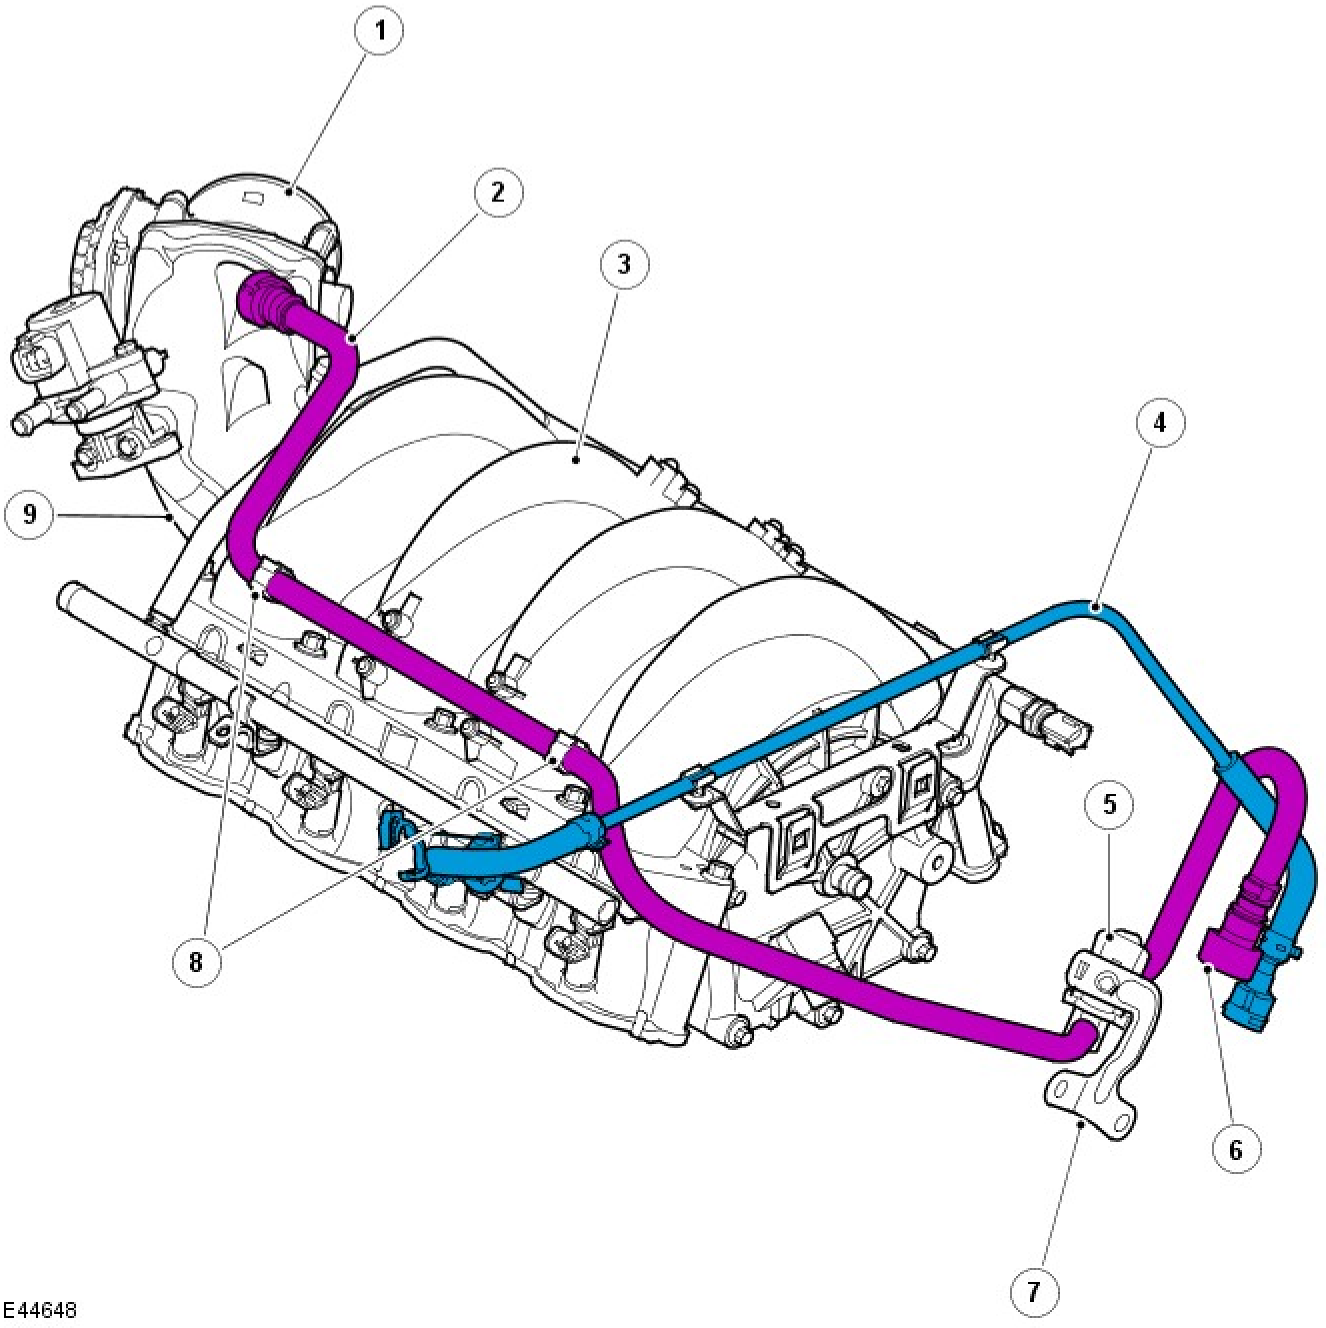
E44561

Item	Part Number	Description
1	-	Charcoal canister atmospheric pressure vent connection (via DMTL pump)
2	-	DMTL pump
3	-	Charcoal canister
4	-	Electrical connector
5	-	Purge hose connection
6	-	Charcoal canister tank vent hose connection

The DMTL system periodically checks the evaporative system and the fuel tank for leaks when the ignition is switched off. The DMTL pump is connected to the atmospheric vent of the charcoal cannister and incorporates a positive temperature coefficient (PTC) heating element a normally open valve and a reference orifice. The DMTL pump is only operated when the ignition is switched off and is controlled by the ECM. The ECM also monitors the electric air pump operation and the normally open valve for faults. To check the fuel tank and EVAP system for leaks the ECM operates the DMTL pump and monitors the current draw. This is compared to a referenced figure established from the current draw when air is pumped through the reference orifice.
For additional information, refer to: Evaporative Emissions (303-13A Evaporative Emissions - V8 S/C 4.2L Petrol, Description and Operation).

PURGE VALVE

Purge Valve and Hoses location



Item	Part Number	Description
1	-	Electric throttle
2	-	Purge hose
3	-	Intake manifold
4	-	Fuel feed jump hose (Ref. only)
5	-	Purge valve
6	-	Purge hose connector
7	-	Bracket
8	-	Hose clamps
9	-	Elbow assembly

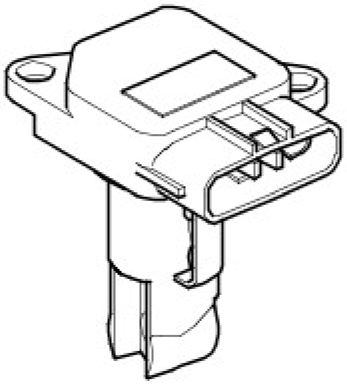
The purge valve is located at the rear of the engine, on a bracket which is attached to the transmission bell housing. The purge hose is routed from the purge valve, along the left hand side of the air intake manifold, to the elbow assembly which locates the electric throttle.

The purge hose is connected, at the right hand rear of the engine, with a quick release coupling to the purge line which runs parallel with the fuel feed line along the top of the fuel tank to the charcoal canister.

The purge hose continues from the purge valve and is routed to a connection on the air intake elbow assembly. The hose is connected to the elbow with a quick release connector.

The purge valve is a solenoid operated valve which is closed when de-energized. The purge valve is controlled by a 10Hz pulse width modulation (PWM) signal from the ECM. When the engine operating conditions are correct, the ECM opens the purge valve which causes fuel vapor and fresh air to be drawn through the charcoal cannister. The fresh air is drawn through the charcoal cannister via the DMTL pump fresh air vent.
For additional information, refer to: Evaporative Emissions (303-13A Evaporative Emissions - V8 S/C 4.2L Petrol, Description and Operation).

MASS AIR FLOW / INLET AIR TEMPERATURE SENSOR (MAF / IAT)



E47308

The air flow meter is located in the clean air duct immediately after the air filter box.

The air mass flow is determined by the cooling effect of inlet air passing over a “hot film” element contained within the device. The higher the air flow the greater the cooling effect and the lower the electrical resistance of the “hot film” element. The ECM then uses this signal from the MAF meter to calculate the air mass flowing into the engine.

The measured air mass flow is used in determining the fuel quantity to be injected in order to maintain the stichometric air/fuel mixture required for correct operation of the engine and exhaust catalysts. Should the device fail there is a software backup strategy that will be evoked once a fault has been diagnosed.

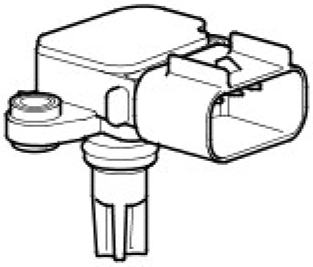
The following symptoms may be observed if the sensor fails:

- During driving the engine RPM might dip, before recovering.
- Difficulty in starting or start - stall.
- Poor throttle response / engine performance.
- Lambda control and idle speed control halted.
- Emissions incorrect.
- AFM signal offset

The IAT sensor is integrated into the MAF meter. It is a temperature dependent resistor (thermistor), i.e. the resistance of the sensor varies with temperature. This thermistor is a NTC type element meaning that the sensor resistance decreases as the sensor temperature increases. The sensor forms part of a voltage divider chain with an additional resistor in the ECM. The voltage from this sensor changes as the sensor resistance changes, thus relating the air temperature to the voltage measured by the ECM.

The ECM stores a 25°C default value for air temperature in the event of a sensor failure.

MANIFOLD ABSOLUTE PRESSURE SENSOR (MAP)



E47588

The MAPsensor provides a voltage proportional to the absolute pressure in the intake manifold. This signal allows the load on the engine to be calculated and used within the internal calculations of the ECM. The sensor is located on the rear of the air intake manifold.

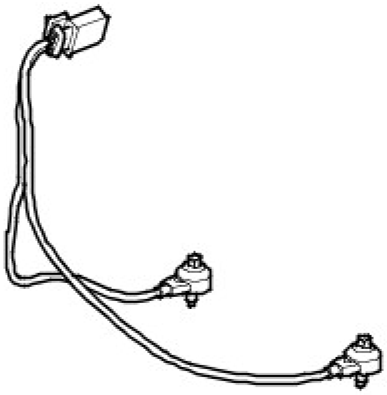
Pin No	Description
1	MAP signal
2	Sensor supply
3	Not used
4	Sensor ground

The output signal from the MAP sensor, together with the CKP and IAT sensors, is used by the ECM to calculate the amount of air induced into the cylinders. This enables the ECM to determine ignition timing and fuel injection duration values.

The MAP sensor receives a 5V supply voltage from pin 48 of ECM connector C0634 and provides an analogue signal to pin 69 of ECM connector C0634, which relates to the absolute manifold pressure and allows the ECM to calculate engine load. The ECM provides a ground for the sensor via pin 11 of ECM connector C0634.

If the MAP signal is missing, the ECM will substitute a default manifold pressure reading based on crankshaft speed and throttle angle. The engine will continue to run with reduced drivability and increased emissions, although this may not be immediately apparent to the driver. The ECM will store fault codes which can be retrieved using T4.

KNOCK SENSORS



E47296

The V8 EMS has two knock sensors located in the V of the engine, one per cylinder bank. The sensors are connected to the ECM via a twisted pair.

The knock sensors produce a voltage signal in proportion to the amount of mechanical vibration generated at each ignition point. Each sensor monitors the related cylinder bank.

The knock sensors incorporate a piezo-ceramic crystal. This crystal produces a voltage whenever an outside force tries to deflect it, (i.e. exerts a mechanical load on it). When the engine is running, the compression waves in the material of the cylinder block, caused by the combustion of the fuel/air mixture within the cylinders, deflect the crystal and produce an output voltage signal. The signals are supplied to the ECM, which compares them with `mapped' signals stored in memory. From this, the ECM can determine when detonation occurs on individual cylinders. When detonation is detected, the ECM retards the ignition timing on that cylinder for a number of engine cycles, then gradually returns it to the original setting.

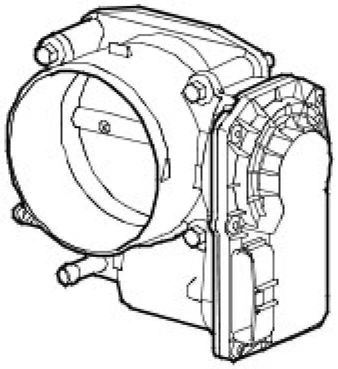
Care must be taken at all times to avoid damaging the knock sensors, but particularly during removal and fitting procedures. The recommendations regarding torque and surface preparation must be adhered to. The torque applied to the sensor and the quality of the surface preparation both have an influence over the transfer of mechanical noise from the cylinder block to the crystal.

The ECM uses the signals supplied by the knock sensors, in conjunction with the signal it receives from the camshaft sensor, to determine the optimum ignition point for each cylinder. The ignition point is set according to preprogrammed ignition maps stored within the ECM. The ECM is programmed to use ignition maps for 98 RON premium specification fuel. It will also function on 91 research octane number (RON) regular specification fuel and learn new adaptions. If the only fuel available is of poor quality, or the customer switches to a lower grade of fuel after using a high grade for a period of time, the engine may suffer slight pre-ignition for a short period. This amount of pre-ignition will not damage the engine. This situation will be evident while the ECM learns and then modifies its internal mapping to compensate for the variation in fuel quality. This feature is called adaption. The ECM has the capability of adapting its fuel and ignition control outputs in response to several sensor inputs.

The ECM will cancel closed loop control of the ignition system if the signal received from either knock sensor becomes implausible. In these circumstances the ECM will default to a safe ignition map. This measure ensures the engine will not become damaged if low quality fuel is used. The malfunction indicator lamp (MIL) will not illuminate, although the driver may notice that the engine 'pinks' in some driving conditions and displays a drop in performance and smoothness.

When a knock sensor fault is stored, the ECM will also store details of the engine speed, engine load and the coolant temperature.

ELECTRONIC THROTTLE



E47298

The V8 EMS incorporates an electric throttle control system. The electronic throttle body is located on the air intake manifold in the engine compartment. The system comprises three main components:

- Electronic throttle control valve
- APP sensor
- ECM

When the accelerator pedal is depressed the APP sensor provides a change in the monitored signals. The ECM compares this against an electronic “map” and moves the electronic throttle valve via a PWM control signal which is in proportion to the APP angle signal. The system is required to:

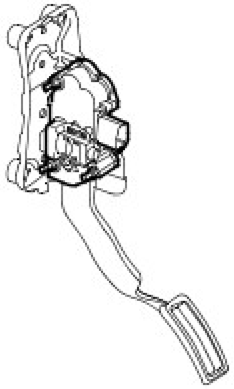
- Regulate the calculated intake air load based on the accelerator pedal sensor input signals and programmed mapping.
- Monitor the drivers input request for cruise control operation.
- Automatically position the electronic throttle for accurate cruise control.
- Perform all dynamic stability control throttle control interventions.
- Monitor and carry out maximum engine and road speed cut out.
- Provide differing responses for differing Terrain response modes.

A software strategy within the ECM enables the throttle position to be calibrated each ignition cycle. When the ignition is turned ON, the ECM performs a self test and calibration routine on the electronic throttle by closing the throttle full, then opening again. This tests the default position springs.

Electronic Throttle Pin Out Table

Pin No	Description
1	Motor +
2	Motor -
3	Sensor ground
4	Sensor 2 signal
5	5 volt supply
6	Sensor 1 signal

ACCELERATOR PEDAL POSITION SENSOR (APP)



E47297

The APP sensors are located on the accelerator pedal assembly.

The APP sensors are used to determine the driver's request for vehicle speed, acceleration and deceleration. This value is used by the ECM and the throttle is opened to the correct angle by an electric motor integrated into the throttle body.

The APP sensor signals are checked for range and plausibility. Two separate reference voltages are supplied to the pedal. Should one sensor fail, the other is used as a 'limp – home' input. In limp home mode due to an APP signal failure the ECM will limit the maximum engine speed to 2000 rpm.

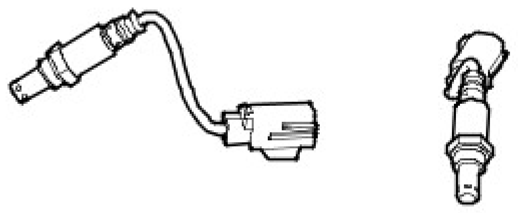
APP Pin Out Table

Pin No	Description
1	APP 1 ground
2	APP 1 demand
3	APP2 ground
4	Not used
5	APP 2 demand
6	Supply 2, 5 volt
7	Supply 1, 5 volt
8	Not used

OXYGEN SENSORS

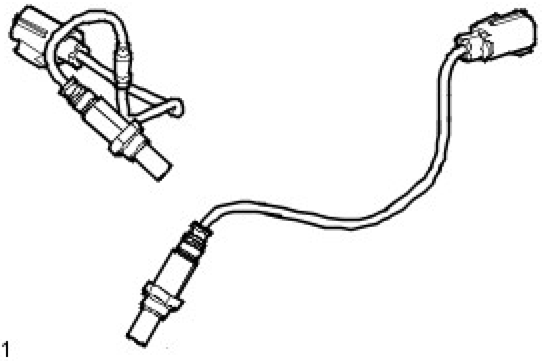
There are four oxygen sensors located in the exhaust system. Two upstream before the catalytic converter and two down stream after the catalytic converter. The sensor monitors the level of oxygen in the exhaust gases and is used to control the fuel/air mixture. Positioning a sensor in the stream of exhaust gasses from each bank enables the ECM to control the fueling on each bank independently of the other, allowing much closer control of the air / fuel ratio and catalyst conversion efficiency.

Upstream Oxygen Sensors



E47300

Downstream Oxygen Sensors



E47301

The oxygen sensors need to operate at high temperatures in order to function correctly. To achieve the high temperatures required, the sensors are fitted with heater elements that are controlled by a PWM signal from the ECM. The heater elements are operated immediately following engine start and also during low load conditions when the temperature of the exhaust gases is insufficient to maintain the required sensor temperatures. A non-functioning heater delays the sensor’s readiness for closed loop control and influences emissions. The PWM duty cycle is carefully controlled to prevent thermal shock to cold sensors.

UHEGO (Universal Heated Exhaust Gas Oxygen) sensors also known as Linear or "Wide Band" sensors produces a constant voltage, with a variable current that is proportional to the oxygen content. This allows closed loop fueling control to a target lambda, i.e. during engine warm up (after the sensor has reached operating temperature and is ready for operation). This improves emission control.

The HEGO sensor uses Zirconium technology that produces an output voltage dependant upon the ratio of exhaust gas oxygen to the ambient oxygen. The device contains a Galvanic cell surrounded by a gas permeable ceramic, the voltage of which depends upon the level of O2 defusing through. Nominal output voltage of the device for l =1 is 300 to 500m volts. As the fuel mixture becomes richer (l<1) the voltage tends towards 900m volts and as it becomes leaner (l>1) the voltage tends towards 0 volts. Maximum tip temperature is 1,000 Degrees Celsius for a maximum of 100 hours.

Sensors age with mileage, increasing their response time to switch from rich to lean and lean to rich. This increase in response time influences the ECM closed loop control and leads to progressively increased emissions. Measuring the period of rich to lean and lean to rich switching monitors the response rate of the upstream sensors.

Diagnosis of electrical faults is continually monitored in both the upstream and downstream sensors. This is achieved by checking the signal against maximum and minimum threshold, for open and short circuit conditions.

Oxygen sensors must be treated with the utmost care before and during the fitting process. The sensors have ceramic material within them that can easily crack if dropped / banged or over-torqued. The sensors must be torqued to the required figure, (40-50Nm), with a calibrated torque wrench. Care should be taken not to contaminate the sensor tip when anti-seize compound is used on the thread. Heated sensor signal pins are tinned and universal are gold plated. Mixing up sensors could contaminate the connectors and affect system performance.

Failure Modes

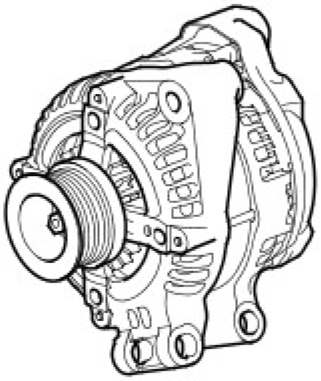
- Mechanical fitting & integrity of the sensor.
- Sensor open circuit / disconnected.
- Short circuit to vehicle supply or ground.
- Lambda ratio outside operating band.
- Crossed sensors bank A & B.
- Contamination from leaded fuel or other sources.
- Change in sensor characteristic.
- Harness damage.
- Air leak into exhaust system.

Failure Symptoms

- Default to Open Loop fueling for the particular cylinder bank
- High CO reading.
- Strong smell of H02S (rotten eggs) till default condition.
- Excess Emissions.

It is possible to fit front and rear sensors in their opposite location. However the harness connections are of different gender and color to ensure that the sensors cannot be incorrectly connected. In addition to this the upstream sensors have two holes in the shroud, whereas the down stream sensors have four holes in the shroud for the gas to pass through.

GENERATOR



E47591

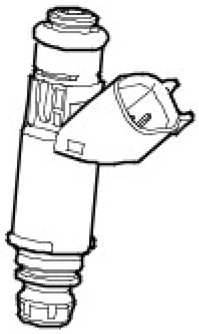
The Generator has a multifunction voltage regulator for use in a 14V charging system with 6÷12 zener diode bridge rectifiers.

The ECM monitors the load on the electrical system via PWM signal and adjusts the generator output to match the required load. The ECM also monitors the battery temperature to determine the generator regulator set point. This characteristic is necessary to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximize any rechargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing of the battery with consequent water loss.

The Generator has a smart charge capability that will reduce the electrical load on the Generator reducing torque requirements, this is implemented to utilize the engine torque for other purposes. This is achieved by monitoring three signals to the ECM:

- Generator sense (A sense), measures the battery voltage at the central junction box (CJB).
- Generator communication (Alt Com) communicates desired Generator voltage set point from ECM to Generator.
- Generator monitor (Alt Mon) communicates the extent of Generator current draw to ECM. This signal also transmits faults to the ECM which will then sends a message to the instrument pack on the CAN bus to illuminate the charge warning lamp. For additional information, refer to: Generator (414-02B Generator and Regulator - V8 4.4L Petrol, Description and Operation).

FUEL INJECTORS

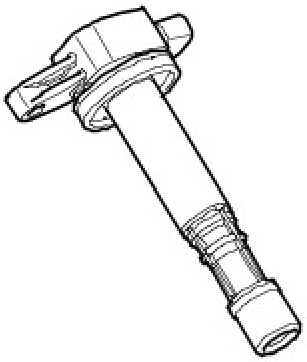


E47305

The engine has 8 fuel injectors (one per cylinder), each injector is directly driven by the ECM. The injectors are fed by a common fuel rail as part of a ‘returnless’ fuel system. The fuel rail pressure is regulated to 4.5 bar by a fuel pressure regulator which is integral to the fuel pump module, within the fuel tank. The injectors can be checked by resistance checks. There is a fuel pressure test Schrader valve attached to the fuel rail on the front left-hand (LH) side for fuel pressure testing purposes. The ECM monitors the output power stages of the injector drivers for electrical faults.

The injectors have a resistance of 13.8 Ohms ± 0.7 Ohms @ 20 Degrees Celsius
For additional information, refer to: Fuel Charging and Controls (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Description and Operation).

IGNITION COILS



E47306

The V8 engine is fitted with eight plug-top coils that are driven directly by the ECM. This means that the ECM, at the point where sufficient charge has built up, switches the primary circuit of each coil and a spark is produced in the spark plug. The positive supply to the coil is fed from a common fuse. Each coil contains a power stage to trigger the primary current. The ECM sends a signal to each of the coils power stage to trigger the power stage switching. Each bank has a feedback signal that is connected to each power stage. If the coil power stage has a failure the feedback signal is not sent, causing the ECM to store a fault code appropriate to the failure.

The ECM calculates the dwell time depending on battery voltage and engine speed to ensure constant secondary energy. This ensures sufficient secondary (spark) energy is always available, without excessive primary current flow thus avoiding overheating or damage to the coils.

The individual cylinder spark timing is calculated from a variety of inputs:

- Engine speed and load.

- Engine temperature.
- Knock control.
- Auto gearbox shift control.
- Idle speed control.

For additional information, refer to: Engine Ignition (303-07B Engine Ignition - V8 4.4L Petrol, Description and Operation).

FUEL PUMP RELAY

The V8 engine has a returnless fuel system. The system pressure is maintained at a constant 4 bar (59 Psi), with no reference to intake manifold pressure. The fuel is supplied to the injectors from a fuel pump fitted within the fuel tank. The electrical supply to this fuel pump is controlled by the ECM via a relay and an Inertia Switch which will turn the fuel off upon a vehicle impact. The fuel system is pressurized as soon as the ECM is powered up, the pump is then switched off until engine start has been achieved.

VISCOUS FAN CONTROL

The ECM controls a viscous coupled fan to provide engine cooling. The ECM supplies the fan with a PWM signal that controls the amount of slippage of the fan, thus providing the correct amount of cooling fan speed and airflow. The EMS uses a Hall effect sensor to determine the fan speed.
For additional information, refer to: Fuel Charging and Controls (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Description and Operation).

VARIABLE VALVE TIMING (VVT)

Variable valve timing is used on the V8 engine to enhance low and high speed engine performance and idle speed quality.

For each inlet camshaft the VVT system comprises:

- VVT unit
- Valve timing solenoid

The VVT system alters the phase of the intake valves relative to the fixed timing of the exhaust valves, to alter:

- The mass of air flow to the cylinders.
- The engine torque response.
- Emissions.

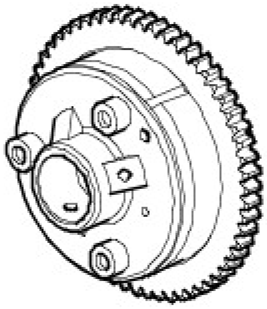
The VVT unit uses a vane type device to control the camshaft angle. The system operates over a range of 48 degrees and is advanced or retarded to its optimum position within this range.

The VVT system is controlled by the ECM based on engine load and speed along with engine oil temperature to calculate the appropriate camshaft position.

The VVT system provides the following advantages:

- Reduced engine emissions and improved fuel consumption which in turn improves the engines internal EGR effect over a wider operating range.
- Enhanced full load torque characteristics.
- Improved fuel economy through optimized torque over the engine speed range.

Variable Valve Timing Unit



E47303

The VVT unit is a hydraulic actuator mounted on the end of the inlet camshaft. The unit advances or retards the camshaft timing to alter the camshaft to crankshaft phase. The ECM controls the VVT timing unit via a oil control solenoid. The oil control solenoid routes oil pressure to the advance or retard chambers either side of the vanes within the VVT unit.

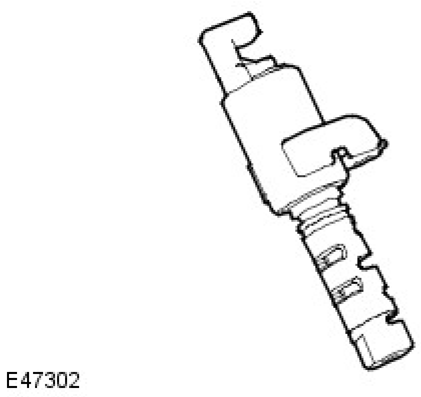
The VVT unit is driven by the primary drive chain and rotates relative to the exhaust camshaft. When the ECM requests a retard in camshaft timing the oil control solenoid is energized which moves the shuttle valve in the solenoid to the relevant position allowing oil pressure to flow out of the advance chambers in the VVT unit whilst simultaneously allowing oil pressure into the retard chambers.

The ECM controls the advancing and retarding of the VVT unit based on engine load and speed. The ECM sends an energize signal to the oil control solenoid until the desired VVT position is achieved. When the desired VVT position is reached, the energizing signal is reduced to hold the oil control solenoid position and consequently desired VVT position. This function is under closed loop control and the ECM can sense any variance in shuttle valve oil pressure via the camshaft position sensor and can adjust the energizing signal to maintain the shuttle valve hold position.

VVT operation can be affected by engine oil temperature and properties. At very low oil temperatures the movement of the VVT mechanism will be slow due to the high viscosity of the oil. While at high oil temperatures the low oil viscosity may impair the VVT operation at low oil pressures. The oil pump has the capacity to cope with these variations in oil pressure while an oil temperature sensor is monitored by the ECM to provide oil temperature feedback. At extremely high oil temperatures the ECM may limit the amount of VVT advance in order to prevent the engine from stalling when returning to idle speed.

VVT does not operate when engine oil pressure is below 1.25 bar. This is because there is insufficient pressure to release the VVT units internal stopper pin. This occurs when the engine is shut down and the VVT unit has returned to the retarded position. The stopper pin locks the VVT unit to the camshaft to ensure camshaft stability during the next start up.
For additional information, refer to: Engine (303-01B Engine - V8 4.4L Petrol, Description and Operation).

Valve Timing Solenoid

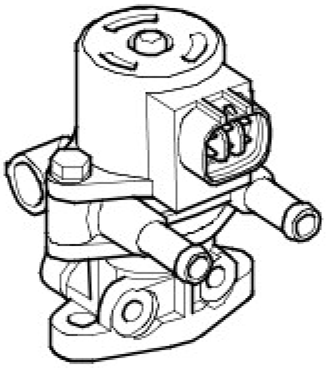


Valve Timing Solenoid

The valve timing solenoid controls the position of the shuttle valve in the bush carrier. A plunger on the solenoid extends when the solenoid is energized and retracts when the solenoid is de-energized.

When the valve timing solenoids are de-energized, the coil springs in the bush carriers position the shuttle valves to connect the valve timing units to drain. In the valve timing units, the return springs hold the ring pistons and gears in the retarded position. When the valve timing solenoids are energized by the ECM, the solenoid plungers position the shuttle valves to direct engine oil to the valve timing units. In the valve timing units, the oil pressure overcomes the force of the return springs and moves the gears and ring pistons to the advanced position. System response times are 1.0 second maximum for advancing and 0.7 second maximum for retarding. While the valve timing is in the retarded mode, the ECM produces a periodic lubrication pulse. This momentarily energizes the valve timing solenoids to allow a spurt of oil into the valve timing units. The lubrication pulse occurs once every 5 minutes.

EXHAUST GAS RECIRCULATION (EGR) VALVE



E47299

The EGR valve is an electrically controlled valve that allows burned exhaust gas to be recirculated back into the engine. The EGR valve consists of a stepper motor that opens and closes the valve in steps. Since exhaust gas has much less oxygen than air, it is basically inert. It takes the place of air in the cylinder and reduces combustion temperature. As the combustion temperature is reduced, so are the oxides of nitrogen (NOx).

The EGR valve is located on the intake manifold with a pipe connecting the exhaust manifold to the valve. Connection between the sensor and the harness is via a six-way connector.
For additional information, refer to: Engine Emission Control (303-08B Engine Emission Control - V8 4.4L Petrol, Description and Operation).

ECM ADAPTIONS

The ECM has the ability to adapt the values it uses to control certain outputs. This capability ensures the EMS can meet emissions legislation and improve the refinement of the engine throughout its operating range.

The components which have adaptions associated with them are:

- The APP sensor
- The heated oxygen sensor (HO2S)
- The MAF/IAT sensor
- The CKP sensor
- Electric throttle body.

UHEGO/HEGO and MAF/IAT Sensor

There are several adaptive maps associated with the fueling strategy. Within the fueling strategy the ECM calculates short-term adaptions and long term adaptions. The ECM will monitor the deterioration of the oxygen sensors (HEGO and UHEGO) over a period of time. It will also monitor the current correction associated with the sensors.

The ECM will store a fault code in circumstances where an adaption is forced to exceed its operating parameters. At the same time, the ECM will record the engine speed, engine load and intake air temperature.

CKP Sensor

The characteristics of the signal supplied by the CKP sensor are learned by the ECM. This enables the ECM to set an adaption and support the engine misfire detection function. Due to the small variation between different flywheels and different CKP sensors, the adaption must be reset if either component is renewed, or removed and refitted. It is also necessary to reset the flywheel adaption if the ECM is renewed or replaced. The ECM supports four flywheel adaptions for the CKP sensor. Each adaption relates to a specific engine speed range. The engine speed ranges are detailed in the table below:

Adaptions	Engine Speed, rev/min
1	1800 - 3000
2	3001 - 3800
3	3801 - 4600
4	4601 - 5400

Misfire Detection

Legislation requires that the ECM must be able to detect the presence of an engine misfire. It must be able to detect misfires at two separate levels. The first level is a misfire that could lead to the vehicle emissions exceeding 1.5 times the Federal Test Procedure (FTP) requirements for the engine. The second level is a misfire that may cause catalyst damage.

The ECM monitors the number of misfire occurrences within two engine speed ranges. If the ECM detects more than a predetermined number of misfire occurrences within either of these two ranges, over two consecutive journeys, the ECM will record a fault code and details of the engine speed, engine load and engine coolant temperature. In addition, the ECM monitors the number of misfire occurrences that happen in a 'window' of 200 engine revolutions. The misfire occurrences are assigned a weighting according to their likely impact on the catalysts. If the number of misfires exceeds a certain value, the ECM stores catalyst-damaging fault codes, along with the engine speed, engine load and engine coolant temperature.

The signal from the crankshaft position sensor indicates how fast the poles on the flywheel are passing the sensor tip. A sine wave is generated each time a pole passes the sensor tip. The ECM can detect variations in flywheel speed by monitoring the sine wave signal supplied by the crankshaft position sensor.

By assessing this signal, the ECM can detect the presence of an engine misfire. At this time, the ECM will assess the amount of variation in the signal received from the CKP and assigns a roughness value to it. This roughness value can be viewed within the real time monitoring feature, using T4. The ECM will evaluate the signal against a number of factors and will decide whether to count the occurrence or ignore it. The ECM can assign a roughness and misfire signal for each cylinder, (i.e. identify which cylinder is misfiring).

T4 Diagnostics

The ECM stores faults as diagnostic trouble code (DTC), referred to as 'P' codes. The 'P' codes are defined by on-board diagnostic (OBD) legislation and, together with their associated environmental and freeze frame data, can be read using a third party scan tool or T4. T4 can also read real time data from each sensor, the adaptive values currently being employed and the current fueling, ignition and idle settings.

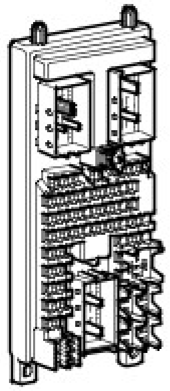
TERRAIN RESPONSE ™

Terrain Response ™ system allows the driver to select a program which will provide the optimum settings for traction and performance for prevailing terrain conditions.

As part of Terrain Response ™ there will be different throttle pedal progression maps associated with different Terrain Response ™ modes. The two extremes are likely to be a sand map (quick build up of torque with pedal travel) and grass/gravel/snow (very cautious build up of torque).

The TdV6 implementation of throttle progression is based on a fixed blend time. The torque will blend from that on one map to that on the new map (for the same pedal position) over a fixed time. This means blending will always take the same amount of time but when the torque change is small the torque increase over time will be small, whilst if the torque change is greater then the torque increase over time will be steeper. The resulting acceleration of the vehicle will depend on the torque difference between the two maps as well as on the gear and range selected. The worst case blending that could ever occur has been calibrated to match the blend rate for petrol derivatives as closely as possible, so as to give a transparent behavior to customers. For additional information, refer to: Specifications (204-06 Ride and Handling Optimization, Specifications).

CENTRAL JUNCTION BOX



E47607

The ECM is connected to ignition switch I and II. When the ignition is turned on 12V is applied to the Ignition Sense input. The ECM then starts its power up routines and turns on the ECM main relay; the main power to the ECM and it's associated system components. When the ignition is turned OFF the ECM will maintain its powered up state for up to 20 minutes while it initiates its power down routine and on completion will turn off the ECM main relay. The ECM will normally power down in approximately 60 seconds, do not disconcert the battery until the ECM is completely powered down.

Diagnosis and Testing

Overview

This section covers the sensors and units for the engine management system.

For more information on the system, refer to section 303-14B - Electronic Engine Controls - 4.4L workshop manual section.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection chart

Mechanical	Electrical
● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Sensor installation/condition ● Viscous fan and solenoid	● Fuses ● Wiring harness ● Electrical connector(s) ● Sensor(s) ● Engine control module (ECM) ● Transmission control module (TCM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom (general)	Symptom (specific)	Possible causes	Action
Non-Start	Engine does not crank	● Security system /Immobilizer engaged ● ECM relay ● Battery ● Starting system ● Harness ● Engine seized	Check that the security system is disarmed. Check the ECM relay operation. For battery information and starting system tests, refer to the relevant workshop manual section. Check that the engine turns by hand.
	Engine cranks, but does not fire	● Low/Contaminated fuel ● Ignition system ● Fuel system ● Crankshaft position (CKP) sensor ● Harness ● ECM fault	Check the fuel level and condition. For ignition system tests and fuel system tests, refer to the relevant workshop manual section. For CKP and harness tests refer to the guided diagnostic routine on the approved diagnostic system. Refer to the warranty policy and procedures manual if an ECM is suspect.
	Engine cranks and fires, but will not start	● Evaporative emissions purge valve ● Fuel system ● Spark plugs ● Ignition coil failure(s) ● Harness	For purge valve tests, fuel system tests and ignition system tests, refer to the relevant workshop manual section.
Difficult to start	Difficult to start cold	● Check coolant anti-freeze content ● Battery ● Crankshaft position (CKP) sensor ● Exhaust gas recirculation (EGR) valve stuck open ● Fuel system	For battery information, refer to the relevant workshop manual section. For CKP and harness tests refer to the guided diagnostic routine on the approved diagnostic system. For EGR system tests, fuel system tests and purge valve tests, refer to the relevant workshop manual section.

Symptom (general)	Symptom (specific)	Possible causes	Action
		● Evaporative emissions purge valve	
	Difficult to start hot	● Injector leak ● Fuel system ● Fuel temperature sensor ● Intake air temperature (IAT) sensor ● Mass air flow (MAF) sensor ● Evaporative emissions purge valve ● Ignition system	For injector and fuel system tests, refer to the relevant workshop manual section. For fuel temperature sensor, IAT sensor, MAF sensor and purge valve tests refer to the guided diagnostic routines on the approved diagnostic system. For ignition system tests, refer to the relevant workshop manual section.
	Difficult to start after hot soak (vehicle standing after engine has reached operating temperature)	● Injector leak ● Fuel system ● Fuel temperature sensor ● IAT sensor ● MAF sensor ● Evaporative emissions purge valve ● Ignition system	For injector and fuel system tests, refer to the relevant workshop manual section. For fuel temperature sensor, IAT sensor, MAF sensor and purge valve tests refer to the guided diagnostic routines on the approved diagnostic system. For ignition system tests, refer to the relevant workshop manual section.
	Engine cranks too fast/slow	● Compressions high/low ● Battery ● Starting system	Check compressions. For battery information and starting system tests, refer to the relevant workshop manual section.
Engine stalls	Engine stalls soon after start	● Breather system disconnected/restricted ● ECM relay ● MAF sensor ● Ignition system ● Air filter restricted ● Air leakage ● Fuel lines	Check the engine breather system. Check the ECM relay operation. For MAF sensor tests refer to the guided diagnostic routines on the approved diagnostic system. For ignition system test, air intake information and fuel line information, refer to the relevant workshop manual section.
	Engine stalls on overrun	● ECM relay ● Throttle position (TP) sensors	Check the ECM relay operation. For TP sensor tests refer to the guided diagnostic routines on the approved diagnostic system.
	Engine stalls at steady speed	● ECM relay ● CKP sensor ● TP sensors	Check the ECM relay operation. For CKP sensor and TP sensor tests refer to the guided diagnostic routines on the approved diagnostic system.
	Engine stalls with speed control enabled	● ECM relay	Check the ECM relay operation.
	Engine stalls when maneuvering	● ECM relay ● TP sensors ● Additional engine loads (PAS, air conditioning, etc) ● Transmission malfunction ● CAN malfunction	Check the ECM relay operation. For TP sensor tests refer to the guided diagnostic routines on the approved diagnostic system. For accessory drive and transmission information, refer to the relevant workshop manual section. Check for CAN fault codes.
Poor driveability	Engine hesitates/poor acceleration	● Fuel pump ● Fuel lines ● Injector leak ● Fuel pressure ● Air leakage ● TP sensors ● Throttle motor ● Ignition system ● EGR valve stuck ● HO2 sensors ● Transmission malfunction ● Restricted pedal travel (carpet, etc)	For fuel pump and fuel line information, injector tests and intake system checks, refer to the relevant workshop manual section. For TP sensor and throttle motor tests refer to the guided diagnostic routines on the approved diagnostic system. For ignition system tests and EGR tests, refer to the relevant workshop manual section. Check for DTCs relating to HO2 sensors, refer to the DTC index. For transmission information, refer to the relevant workshop manual section. Check the accelerator pedal travel. For APP sensor tests refer to the guided diagnostic routines on the approved diagnostic system.

Symptom (general)	Symptom (specific)	Possible causes	Action
		- Accelerator pedal position (APP) sensor	
	Engine backfires	- Fuel pump - Fuel lines - Air leakage - MAF sensor - HO2 sensors - Ignition system - Sticking variable camshaft timing (VCT) hub - APP sensor	For fuel pump and fuel line information and intake system, refer to the relevant workshop manual section. For MAF sensor tests refer to the guided diagnostic routines on the approved diagnostic system. Check for DTCs relating to HO2 sensors, refer to the DTC index. For ignition system tests, refer to the relevant workshop manual section. For VCT and APP sensor tests refer to the guided diagnostic routines on the approved diagnostic system.
	Engine surges	- Fuel pump - Fuel lines - MAF sensor - Harness - TP sensors - Throttle motor - Ignition system	For fuel pump and fuel line information, refer to the relevant workshop manual section. For MAF sensor, TP sensor and throttle motor tests refer to the guided diagnostic routines on the approved diagnostic system. For ignition system tests, refer to the relevant workshop manual section.
	Engine detonates/knocks	- Knock sensor (KS)/circuit malfunction - Fuel pump - Fuel lines - Fuel quality - MAF sensor - HO2 sensors - Air leakage - Sticking VCT hub - BARO sensor malfunction (internal ECM fault)	For KS circuit tests refer to the guided diagnostic routines on the approved diagnostic system. For fuel pump and fuel line information, refer to the relevant workshop manual section. For MAF sensor tests refer to the guided diagnostic routine on the approved diagnostic system. Check for DTCs relating to HO2 sensors, refer to the DTC index. For intake system, refer to the relevant workshop manual section. For VCT tests refer to the guided diagnostic routines on the approved diagnostic system. Refer to the warranty policy and procedures manual if an ECM is suspect.
	No throttle response	- APP sensor malfunction - TP sensors - Throttle motor	For APP sensor, TP sensor and throttle motor tests refer to the guided diagnostic routines on the approved diagnostic system.
	Speed control inhibited or disabled	- Default mode enabled - Speed control switch(es) - TP sensors - CAN fault	Check message center for default message. For speed control switch information, refer to the relevant workshop manual section. For TP sensor tests refer to the guided diagnostic routine on the approved diagnostic system. Check for CAN fault codes.
	Poor throttle response	- APP sensor malfunction - TP sensors - ECT sensor - MAF sensor - Transmission malfunction - Traction control event - Air leakage - Breather system disconnected/restricted	For APP sensor, TP sensor, ECT sensor and MAF sensor tests refer to the guided diagnostic routines on the approved diagnostic system. For transmission information, intake system checks and breather system checks, refer to the relevant workshop manual section.
	Engine defaults, warning lamp and messages. Refer to the owner handbook	- TP sensors - MAF sensor - ECT sensor - Harness	For TP sensor, MAF sensor and ECT sensor tests refer to the guided diagnostic routines on the approved diagnostic system.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
C003100	Left Front Wheel Speed	- Invalid data received from ABS	Check for ABS DTCs. Refer to the relevant workshop

DTC	Description	Possible causes	Action
	Sensor	wheel speed signal	manual section.
C003400	Right Front Wheel Speed Sensor	● Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003700	Left Rear Wheel Speed Sensor	● Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003A00	Right Rear Wheel Speed Sensor	● Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
P001100	Intake (A) Camshaft Position Timing - Over-Advanced (Bank 1)	● Cam timing (right-hand bank) has not been set up correctly ● Timing chain has slipped	Check the engine timing. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P001200	Intake (A) Camshaft Position Timing - Over-Retarded (Bank 1)	● Cam timing (right-hand bank) has not been set up correctly ● Timing chain has slipped	Check the engine timing. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P002100	Intake (A) Camshaft Position Timing - Over-Advanced (Bank 2)	● Cam timing (left-hand bank) has not been set up correctly ● Timing chain has slipped	Check the engine timing. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P002200	Intake (A) Camshaft Position Timing - Over-Retarded (Bank 2)	● Cam timing (left-hand bank) has not been set up correctly ● Timing chain has slipped	Check the engine timing. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P002671	Intake Valve Control Solenoid Circuit Range/Performance (Bank 1)	● Variable camshaft timing (VCT) control solenoid circuit range/performance (right-hand bank) - actuator stuck open ● Oil contamination ● VCT oil flow fault ● VCT solenoid fault ● VCT/Camshaft mechanical failure	Check the oil level and condition, check for adequate oil flow. Check the camshaft and VCT hub. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P002677	Intake Valve Control Solenoid Circuit Range/Performance (Bank 1)	● Variable camshaft timing (VCT) control solenoid circuit range/performance (right-hand bank) - commanded position not reachable ● Oil contamination ● VCT oil flow fault ● VCT solenoid fault ● VCT/Camshaft mechanical failure	Check the oil level and condition, check for adequate oil flow. Check the camshaft and VCT hub. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P002871	Intake Valve Control Solenoid Circuit Range/Performance (Bank 2)	● Variable camshaft timing (VCT) control solenoid circuit range/performance (left-hand bank) - actuator stuck open ● Oil contamination ● VCT oil flow fault ● VCT solenoid fault ● VCT/Camshaft mechanical failure	Check the oil level and condition, check for adequate oil flow. Check the camshaft and VCT hub. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P002877	Intake Valve Control Solenoid Circuit Range/Performance (Bank 2)	● Variable camshaft timing (VCT) control solenoid circuit range/performance (left-hand bank) - commanded position not reachable ● Oil contamination ● VCT oil flow fault ● VCT solenoid fault ● VCT/Camshaft mechanical failure	Check the oil level and condition, check for adequate oil flow. Check the camshaft and VCT hub. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P003100	HO2S Heater Control Circuit Low (Bank 1, Sensor 1)	• Heated 0^2 sensor heater power supply circuit high resistance • Heated 0^2 sensor heater control circuit high resistance • Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P003200	HO2S Heater Control Circuit High (Bank 1, Sensor 1)	• Heated 0^2 sensor heater power supply circuit high resistance • Heated 0^2 sensor heater control circuit high resistance • Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P003600	HO2S Heater Control Circuit (Bank 1, Sensor 2)	• Catalyst monitor sensor heater control circuit short circuit to ground • Catalyst monitor sensor heater control circuit high resistance • Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005100	HO2S Heater Control Circuit Low (Bank 2, Sensor 1)	• Heated 0^2 sensor heater power supply circuit high resistance • Heated 0^2 sensor heater control circuit high resistance • Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005200	HO2S Heater Control Circuit High (Bank 2, Sensor 1)	• Heated 0^2 sensor heater power supply circuit high resistance • Heated 0^2 sensor heater control circuit high resistance • Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005600	HO2S Heater Control Circuit (Bank 2, Sensor 2)	• Catalyst monitor sensor (left-hand bank) heater control circuit short circuit to ground • Catalyst monitor sensor heater control circuit high resistance • Catalyst monitor sensor heater failure	For left-hand catalyst monitor sensor heater circuit tests. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P006900	(MAP) - Barometric pressure correlation	• Manifold absolute pressure (MAP) sensor failure • BARO sensor failure (internal ECM fault)	Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if an ECM is suspect.
P007100	Ambient Air Temperature Sensor Range/Performance	• Ambient temperature sensor range performance (stuck)	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P007200	Ambient Air Temperature Sensor Circuit Low	• Ambient temperature sensor circuit low input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P007300	Ambient Air Temperature Sensor Circuit High	• Ambient temperature sensor circuit high input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P007500	Intake Valve Control Circuit (Bank 1)	• Variable camshaft timing (VCT) control circuit (right-hand bank) • VCT solenoid valve PWM drive circuit: high resistance • VCT solenoid failure	For right-hand VCT circuit tests. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P007600	Intake Valve Control Circuit Low (Bank 1)	• Variable camshaft timing (VCT) control circuit low (right-hand bank) • VCT solenoid valve PWM drive circuit; short circuit to ground • VCT solenoid failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P007700	Intake Valve Control Circuit High (Bank 1)	● Variable camshaft timing (VCT) control circuit high (right-hand bank) ● VCT solenoid valve PWM drive circuit; short circuit to power ● VCT solenoid failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P008100	Intake Valve Control Circuit (Bank 2)	● Variable camshaft timing (VCT) control circuit (left-hand bank) ● VCT solenoid valve PWM drive circuit: high resistance ● VCT solenoid failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P008200	Intake Valve Control Circuit Low (Bank 2)	● Variable camshaft timing (VCT) control circuit low (left-hand bank) ● VCT solenoid valve PWM drive circuit; short circuit to ground ● VCT solenoid failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P008300	Intake Valve Control Circuit High (Bank 2)	● Variable camshaft timing (VCT) control circuit high (left-hand bank) ● VCT solenoid valve PWM drive circuit; short circuit to power ● VCT solenoid failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010100	Mass or Volume Air Flow A Circuit	● Blocked air cleaner ● Air intake leak ● Engine breather leak ● Mass air flow (MAF) sensor sensing circuit: high resistance, intermittent short circuit to ground ● MAF sensor supply circuit: high resistance	Check the air cleaner for blockage, etc. Check the air intake system for leaks. Check the engine breather system. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the relevant workshop manual section.
P010200	Mass or Volume Air Flow A Circuit Low	● MAF sensor supply circuit high resistance, short circuit to ground ● MAF sensor ground circuit high resistance ● MAF sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010300	Mass or Volume Air Flow A Circuit High	● MAF sensor sensing circuit short circuit to battery ● MAF sensor return circuit high resistance ● MAF sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010600	Manifold Absolute Pressure/BARO Sensor Range/Performance	● Intake manifold air leak (loose or missing component) ● MAP sensor circuit(s) fault ● MAP sensor failure	Check the intake manifold for security, etc. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010700	Manifold Absolute Pressure/BARO Sensor Low	● MAP sensor circuit: high resistance, short circuit to ground ● MAP sensor supply circuit: high resistance ● MAP sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P010800	Manifold Absolute Pressure/BARO Sensor High	● MAP sensor return circuit: high resistance ● MAP sensor sense circuit; short circuit to power ● MAP sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P011123	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1)	● Signal stuck low at engine start ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011124	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1)	● Signal stuck high at engine start ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011129	Intake Air Temperature Sensor 1 Circuit Range/Performance (Bank 1)	● Signal invalid ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011200	Intake Air Temperature Sensor 1 Circuit Low (Bank 1)	● Intake air temperature IAT sensor disconnected ● IAT sensor circuit(s) high resistance ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011300	Intake Air Temperature Sensor 1 Circuit High (Bank 1)	● IAT sensor circuit(s) short circuit to ground ● IAT sensor sensing circuit short circuit to power ● IAT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011623	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the relevant section of the workshop manual. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011624	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the relevant section of the workshop manual. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011629	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Low coolant level ● Engine coolant thermostat failure ● ECT sensor sensing circuit intermittent high resistance ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck open). Refer to the relevant section of the workshop manual. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011700	Engine Coolant Temperature Sensor 1 Circuit Low	● ECT sensor disconnected ● Engine coolant temperature (ECT) sensor sensing circuit high resistance, short circuit to power ● ECT sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P011800	Engine Coolant Temperature Sensor 1 Circuit High	● Engine overheat condition/cooling fan failure ● ECT sensor wiring short circuit to ground ● ECT sensor failure	Check the coolant level and the thermostat operation (stuck closed). Check for cooling fan DTCs. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P012100	Throttle/Pedal Position Sensor A Circuit Range/Performance	● Throttle position sensor wiring high resistance ● Throttle position sensor sensing circuits (Throttle position 1 or Throttle position 2) short circuit to power ● Throttle position sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P012200	Throttle/Pedal Position Sensor A Circuit Low	• Throttle position sensor sensing circuit 1 short circuit to ground, high resistance • Throttle position sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P012300	Throttle/Pedal Position Sensor A Circuit High	• Throttle position sensor sensing circuit (Throttle position1) short circuit to power • Throttle position sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P012500	Insufficient Coolant Temp For Closed Loop Fuel Control	• Low coolant level • Engine thermostat failure • ECT sensor sensing circuit intermittent high resistance • ECT sensor failure	Check the coolant level and thermostat operation. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P012800	Coolant Thermostat (Coolant Temp Below Thermostat Regulating Temperature)	• Contaminated coolant • Engine coolant thermostat failure • ECT sensor failure - ECT sensor DTC may also be flagged	Check the coolant level/condition and thermostat operation. Check for ECT sensor DTCs.
P01301A	O2 Circuit (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) element impedance low • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01301B	O2 Circuit (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) element impedance low • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013100	O2 Circuit (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) element impedance high • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013200	O2 Circuit High Voltage (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) signal circuit short circuit to power • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013300	O2 Circuit Slow Response (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) to ECM wiring high resistance • Exhaust leak • HO2 sensor failure	Check the exhaust system for leaks. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013400	O2 Circuit No Activity Detected (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) slow activation	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013700	O2 Circuit Low Voltage (Bank 1, Sensor 2)	• Catalyst monitor sensor (right-hand bank) to ECM wiring high resistance • Catalyst monitor sensor short circuit to ground • Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013800	O2 Circuit High Voltage (Bank 1, Sensor 2)	• Catalyst monitor sensor (right-hand bank) sensing circuit short circuit to power • Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013900	O2 Circuit Slow Response (Bank 1, Sensor 2)	• Catalyst monitor sensor (right-hand bank) slow response	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P014000	O2 Circuit Slow Response (Bank 1, Sensor 2)	• Catalyst monitor (right-hand bank) to ECM wiring high resistance • Catalyst monitor sensing circuit	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		short circuit to power ● Catalyst monitor short circuit to ground	
P014100	O2 Heater Circuit (Bank 1, Sensor 2)	● Catalyst monitor sensor (right-hand bank) heater control circuit high resistance ● Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01501A	O2 Circuit (Bank 2, Sensor 1)	● Circuit (left-hand bank) resistance below threshold ● Element impedance low ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01501B	O2 Circuit (Bank 2, Sensor 1)	● Circuit (left-hand bank) resistance above threshold ● Element impedance high ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015100	O2 Circuit Low Voltage (Bank 2, Sensor 1)	● Heated 0^2 sensor (left-hand bank) signal circuit high resistance ● Heated 0^2 sensor signal circuit short circuit to ground ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015200	O2 Circuit High Voltage (Bank 2, Sensor 1)	● Heated 0^2 sensor (left-hand bank) signal circuit short circuit to power ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015300	O2 Circuit Slow Response (Bank 2, Sensor 1)	● Heated 0^2 sensor (left-hand bank) to ECM wiring high resistance ● Exhaust leak ● Heated 0^2 sensor failure	Check the exhaust system for leaks. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015400	O2 Circuit No Activity Detected (Bank 2, Sensor 1)	● Heated 0^2 sensor (left-hand bank) slow activation	Check the HO2S and circuits. Refer to the electrical guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015700	O2 Circuit Low Voltage (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) to ECM wiring high resistance ● Catalyst monitor sensor short circuit to ground ● Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015800	O2 Circuit High Voltage (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) sensing circuit short circuit to power ● Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015900	O2 Circuit Slow Response (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) slow response	Check the catalyst monitor sensor and circuits. Refer to the electrical guides.
P016000	O2 Circuit No Activity Detected (Bank 2, Sensor 2)	● Catalyst monitor (left-hand bank) to ECM wiring high resistance ● Catalyst monitor sensing (left-hand bank) circuit short circuit to power ● Catalyst monitor short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P016100	O2 Heater Circuit (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) heater control circuit malfunction	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P017000	Fuel Trim (Bank 1)	● Fuel adaption Bank 1 exceeds threshold	Check for other DTCs and rectify as necessary. Clear DTC and retest.
P017100	System Too Lean (Bank 1)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks, etc. refer to the relevant workshop manual section. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Check for evaporative emission DTCS.
P017200	System Too Rich (Bank 1)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions. Check the fuel system for leaks and check the fuel pressure. Check the fuel injectors. Check for fuel system DTCs. Check the oil for contamination/grade/quality. Refer to the relevant section of the workshop manual. Check for MAF sensor and evaporative emission DTCs.
P017300	Fuel Trim (Bank 2)	● Fuel adaption Bank 1 exceeds threshold	Check for other DTCs and rectify as necessary. Clear DTC and retest.
P017400	System Too Lean (Bank 2)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks, etc. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Refer to the relevant section of the workshop manual. Check for evaporative emission DTCS.
P017500	System too Rich (Bank 2)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions, etc. Check the fuel system for leaks, DTCs, etc. Check the oil condition. Refer to the relevant section of the workshop manual. Check for MAF sensor and evaporative emission DTCs.
P019623	Engine Oil Temperature Sensor Range/Performance	● Oil temperature sensor sensing circuit intermittent high resistance ● Oil temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P019624	Engine Oil Temperature Sensor Range/Performance	● Oil temperature sensor sensing circuit intermittent high resistance ● Oil temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P018124	Fuel Temperature Sensor A Circuit Range/Performance	● Fuel temperature sensor sensing circuit high resistance, short circuit to power ● Fuel temperature sensor ground circuit high resistance ● Fuel temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P018129	Fuel Temperature Sensor A Circuit Range/Performance	● Fuel temperature sensor sensing circuit high resistance, short circuit to ground, short circuit to power ● Fuel temperature sensor ground circuit high resistance ● Fuel temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P018200	Fuel Temperature Sensor A Circuit Low	● Fuel temperature sensor sensing circuit short circuit to ground ● Fuel temperature sensor ground circuit short circuit ● Fuel temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P018300	Fuel Temperature Sensor A Circuit High	● Fuel temperature sensor sensing circuit high resistance, short circuit to power ● Fuel temperature sensor ground circuit high resistance ● Fuel temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P019623	Engine Oil Temperature Sensor Range/Performance	● Oil temperature sensor sensing circuit intermittent high resistance ● Oil temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P019624	Engine Oil Temperature Sensor Range/Performance	● Oil temperature sensor sensing circuit intermittent high resistance ● Oil temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P019629	Oil temperature sensor circuit range/performance - signal invalid	● Oil temperature sensor sensing circuit intermittent high resistance ● Oil temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P019700	Engine Oil Temperature Sensor Circuit Low	● Oil temperature sensor sensing circuit short circuit to ground ● Oil temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P019800	Engine Oil Temperature Sensor Circuit High	● Oil temperature sensor sensing circuit high resistance, short circuit to power ● Oil temperature sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P020100	Cylinder 1 Injector Circuit / Open	● Injector disconnected ● Injector harness wiring high resistance, short circuit to ground ● Injector failure	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P020200	Cylinder 2 Injector Circuit / Open	● Injector disconnected ● Injector harness wiring high resistance, short circuit to ground ● Injector failure	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P020300	Cylinder 3 Injector Circuit / Open	● Injector disconnected ● Injector harness wiring high resistance, short circuit to ground ● Injector failure	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P020400	Cylinder 4 Injector Circuit / Open	● Injector disconnected ● Injector harness wiring high resistance, short circuit to ground	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		- Injector failure	
P020500	Cylinder 5 Injector Circuit / Open	- Injector disconnected - Injector harness wiring high resistance, short circuit to ground - Injector failure	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P020600	Cylinder 6 Injector Circuit / Open	- Injector disconnected - Injector harness wiring high resistance, short circuit to ground - Injector failure	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P020700	Cylinder 7 Injector Circuit/Open	- Injector disconnected - Injector harness wiring high resistance, short circuit to ground - Injector failure	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P020800	Cylinder 8 Injector Circuit/Open	- Injector disconnected - Injector harness wiring high resistance, short circuit to ground - Injector failure	For fuel system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P022200	Throttle/Pedal Position Sensor/Switch B Circuit Low	- Throttle position sensor circuit 2 low input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P022300	Throttle/Pedal Position Sensor/Switch B Circuit High	- Throttle position sensor circuit 2 high input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P022628	Throttle/Pedal Position Sensor/Switch C Circuit Range/Performance	- Throttle position sensor circuit range monitoring error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P022662	Throttle/Pedal Position Sensor/Switch C Circuit Range/Performance	- Throttle position sensor circuit range monitoring error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P022700	Throttle/Pedal Position Sensor/Switch C Circuit Low	- Throttle position sensor circuit 1 short circuit to ground - Throttle position sensor circuit 1 high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P022800	Throttle/Pedal Position Sensor/Switch C Circuit High	- Throttle position sensor circuit 1 short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P030000	Random Misfire Detected	- ECM to ignition coil primary circuit faults (cylinder misfire detected DTCs also logged) - Ignition coil failure - Spark plug failure/fouled /incorrect gap - Fuel delivery pressure (low/high) - Fuel injector circuit fault(s) (injector DTCs also logged) - Fuel injectors restricted/leaking - Fuel injectors continuously open - Fuel contamination - Cylinder compression low - Worn camshaft/broken valve springs - Valve clearance adjustment	Check for ignition coil DTCs. Check the condition of the spark plugs and the gaps. Check the fuel pressure. Check for fuel injector DTCs. Check the fuel for contamination/grade/quality. Check the cylinder compressions, check the valve clearances, check the condition of the camshaft and valve springs. Refer to the relevant section of the workshop manual.
P030100	Cylinder 1 Misfire Detected	- Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap.

DTC	Description	Possible causes	Action
			Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P030200	Cylinder 2 Misfire Detected	● Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P030300	Cylinder 3 Misfire Detected	● Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P030400	Cylinder 4 misfire detected	● Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P030500	Cylinder 5 misfire detected	● Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P030600	Cylinder 6 misfire detected	● Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P030700	Cylinder 7 misfire detected	● Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P030800	Cylinder 8 misfire detected	● Refer to P030000 possible sources	For ignition coil tests, refer to the guided diagnostic routine for this code on the approved diagnostic system. Check the spark plug condition and gap. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P031300	Misfire Detected With Low Fuel	● Misfire detected during low fuel level condition	Add fuel, clear the DTC and test for normal operation.
P031600	Misfire Detected On Startup (First 1000 Revolutions)	● Misfire detected on first 1000 revs ● Refer to P030000 possible sources	Carry out the tests indicated for a normal misfire code, but on a cold engine.
P032700	Knock Sensor 1 Circuit Low (Bank1)	● Poor right-hand sensor contact with the cylinder block ● Knock sensor to ECM sense circuit short circuit to ground ● Knock sensor failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P032800	Knock Sensor 1 Circuit High (Bank 1)	● Poor right-hand sensor contact with the cylinder block ● Knock sensor sense circuit high resistance, short circuit to power ● Knock sensor failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P033200	Knock Sensor 2 Circuit Low (Bank 2)	● Poor left-hand sensor contact with the cylinder block ● Knock sensor sense circuit short circuit to ground ● Knock sensor failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P033300	Knock Sensor 2 Circuit High (Bank 2)	● Poor left-hand sensor contact with the cylinder block ● Knock sensor sense circuit high resistance, short circuit to power ● Knock sensor failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P033592	Crankshaft Position Sensor A Circuit	● Crankshaft position (CKP) sensor gap incorrect/foreign matter on sensor face or damaged teeth on rotor ● CKP sensor sensing circuit high resistance, short circuit to ground, short circuit to power ● CKP sensor failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P033594	Crankshaft Position Sensor A Circuit	● Crankshaft position (CKP) sensor gap incorrect/foreign matter on sensor face or damaged teeth on rotor ● CKP sensor sensing circuit high resistance, short circuit to ground, short circuit to power ● CKP sensor failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P033600	Crankshaft position (CKP) sensor A circuit range/performance	● CKP sensor gap incorrect/ foreign matter on sensor face /damaged teeth on rotor ● CKP sensor sensing circuit intermittent high resistance, short circuit to ground, short circuit to power ● CKP sensor failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P034092	Camshaft Position Sensor A Circuit (Bank 1 or single sensor)	● Camshaft position sensor (CMP) sensor gap incorrect/ foreign matter on sensor face /damaged rotor ● CMP sensor sensing circuit high resistance, short circuit to ground, short circuit to power ● CMP sensor 1 failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P034094	Camshaft Position Sensor A Circuit (Bank 1 or single sensor)	● Camshaft position sensor (CMP) sensor gap incorrect/ foreign matter on sensor face /damaged rotor ● CMP sensor sensing circuit high resistance, short circuit to ground, short circuit to power ● CMP sensor 1 failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P034100	Camshaft Position Sensor A Circuit Range/Performance (Bank 1 or single sensor)	● Camshaft position sensor (CMP) sensor gap incorrect/ foreign matter on sensor face /damaged rotor ● CMP sensor sensing circuit high resistance, short circuit to ground, short circuit to power ● CMP sensor 1 failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P034592	Camshaft Position Sensor A Circuit (Bank 2)	● Camshaft position sensor (CMP) sensor gap incorrect/ foreign matter on sensor face /damaged rotor ● CMP sensor sensing circuit high resistance, short circuit to ground, short circuit to power	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		● CMP sensor 2 failure	
P034594	Camshaft Position Sensor A Circuit (Bank 2)	● Camshaft position sensor (CMP) sensor gap incorrect/ foreign matter on sensor face /damaged rotor ● CMP sensor sensing circuit high resistance short circuit to ground, short circuit to power ● CMP sensor 2 failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P034600	Camshaft Position Sensor A Circuit Range/Performance (Bank 2)	● Camshaft position sensor (CMP) sensor gap incorrect/ foreign matter on sensor face /damaged rotor ● CMP sensor sensing circuit high resistance, short circuit to ground, short circuit to power ● CMP sensor 2 failure	Check the installation of the sensor. Refer to the relevant workshop manual section. Check for debris/damage on the sensor face and rotor. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P035100	Ignition Coil A Primary/Secondary Circuit	● ECM to ignition module/coil drive circuit high resistance, short circuit to ground ● Ignition module/coil ground circuit high resistance ● Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P035200	Ignition Coil B Primary/Secondary Circuit	● ECM to ignition module/coil drive circuit short circuit to ground, high resistance ● Ignition module/coil ground circuit high resistance ● Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P035300	Ignition Coil C Primary/Secondary Circuit	● ECM to ignition module/coil drive circuit short circuit to ground, high resistance ● Ignition module/coil ground circuit high resistance ● Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P035400	Ignition Coil D Primary/Secondary Circuit	● ECM to ignition module/coil drive circuit short circuit to ground, high resistance ● Ignition module/coil ground circuit high resistance ● Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P035500	Ignition Coil E Primary/Secondary Circuit	● ECM to ignition module/coil drive circuit short circuit to ground, high resistance ● Ignition module/coil ground circuit high resistance ● Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P035600	Ignition Coil F Primary/Secondary Circuit	- ECM to ignition module/coil drive circuit short circuit to ground, high resistance - Ignition module/coil ground circuit high resistance - Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P035700	Ignition Coil G Primary/Secondary Circuit	- ECM to ignition module/coil drive circuit short circuit to ground, high resistance - Ignition module/coil ground circuit high resistance - Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P035800	Ignition Coil H Primary/Secondary Circuit	- ECM to ignition module/coil drive circuit short circuit to ground, high resistance - Ignition module/coil ground circuit high resistance - Ignition module/coil battery supply circuit high resistance (including relay, if installed)	Refer to the electrical guides and check the ignition coil circuits. For ignition system tests, refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P040100	Exhaust Gas Recirculation A Flow Insufficient Detected	- EGR pipe blocked - EGR valve incorrectly installed or loose - EGR valve stuck closed/blocked - EGR valve failure	Check the EGR pipes. Check the EGR valve installation. For emission system tests. Refer to the relevant workshop manual section.
P042000	Catalyst System Efficiency Below Threshold (Bank 1)	- Catalyst failure due to overheating damage caused by misfire and/or lean combustion - Catalyst failure due to poisoning caused by excessive oil consumption and/or contaminated fuel	Check the catalyst condition. Refer to the warranty policy and procedures manual if the catalyst is suspect.
P043000	Catalyst System Efficiency Below Threshold (Bank 2)	- Catalyst failure due to overheating damage caused by misfire and/or lean combustion - Catalyst failure due to poisoning caused by excessive oil consumption and/or contaminated fuel	Check the catalyst condition. Refer to the warranty policy and procedures manual if the catalyst is suspect.
P044100	Evaporative Emission System Incorrect Purge Flow	- Evaporative emission (EVAP) canister purge valve pipe restricted/leaking - Canister vent restricted - Purge valve failure	Check the charcoal canister pipework and vent for integrity. Refer to the relevant workshop manual section.
P044200	Evaporative Emission System Leak Detected (small leak)	- Fuel filler cap not correctly installed - Fuel filler cap seal faulty - Evaporative emission system leak (canister, pipes, etc) - Fuel tank leak - Canister dynamic monitoring of tank leakage (DMTL) valve fault	Refer to the relevant workshop manual section.
P044700	Evaporative Emission System Vent Control Circuit Open	- EVAP DMTL valve circuit short circuit to ground	Refer to the electrical guides and check the DMTL valve circuit. Repair/renew as necessary. Refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
P044800	Evaporative Emission System Vent Control Circuit Shorted	● EVAP DMTL valve circuit short circuit to power	Refer to the electrical guides and check the DMTL valve circuit. Repair/renew as necessary. Refer to the relevant workshop manual section.
P045500	Evaporative Emission System Leak Detected (gross leak/no flow)	● Fuel filler cap not installed ● Fuel filler cap seal faulty/missing ● Evaporative emission system leak (canister, pipes, etc) ● Fuel tank leak ● DMTL valve fault	Check the fuel filler cap and seal, check the canister, pipes, etc. Check the fuel tank for leaks, etc. Refer to the relevant workshop manual section.
P045800	Evaporative Emission System Purge Control Valve Circuit Low	● Purge valve control circuit short circuit to ground ● Purge valve control circuit high resistance ● EVAP canister purge valve failure	Refer to the electrical guides and check the DMTL valve circuit. Repair/renew as necessary. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P045900	Evaporative Emission System Purge Control Valve Circuit High	● Purge valve control circuit short circuit to power	Refer to the electrical guides and check the DMTL valve circuit. Repair/renew as necessary. Refer to the relevant workshop manual section. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P046129	Fuel Level Sensor A Circuit Range/Performance	● Fuel level sensor circuits intermittent short circuit or high resistance ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P04612F	Fuel Level Sensor A Circuit Range/Performance	● Fuel level sensor circuits intermittent short circuit or high resistance ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P046200	Fuel Level Sensor A Circuit Low	● Fuel level sensor circuits intermittent short circuit to ground or high resistance ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P046300	Fuel Level Sensor A Circuit High	● Fuel level sensor circuits intermittent short circuit to power ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P048014	Fan 1 Control Circuit	● Viscous fan speed sensor circuit high resistance	Refer to the electrical guides and check the viscous fan speed sensor circuit. Repair/renew as necessary.
P048015	Fan 1 Control Circuit	● Viscous fan control circuit short circuit to power ● Viscous fan control circuit short circuit to ground	Refer to the electrical guides and check the viscous fan speed sensor circuit. Repair/renew as necessary.
P048300	Fan Performance	● Cooling fan control circuit short circuit to ground ● Cooling fan control circuit short circuit to power ● Cooling fan control circuit high resistance ● Cooling fan fault	Check the cooling fan operation. Refer to the electrical guides and check the fan circuit, Repair/renew as necessary. Clear the DTCs and test for normal operation. Check the pulse width modulated (PWM) signal and check the motor for sticking. Repair/renew as necessary.
P048900	Exhaust Gas Recirculation Control Circuit Low	● EGR valve power supply circuit: high resistance ● EGR valve power supply circuit short circuit to ground	Refer to the relevant workshop manual section.
P049000	Exhaust Gas Recirculation Control Circuit High	● EGR valve drive circuit short circuit to power	Refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
P049300	Fan Overspeed (clutch locked)	● Seized viscous coupling ● Fan speed sensor failure	Check that the viscous coupling turns independently of the fan. Refer to the electrical guides and check the viscous fan speed sensor circuit. Repair/renew as necessary.
P050000	Vehicle Speed Sensor A	● Vehicle speed invalid signal received over CAN	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050162	Vehicle Speed Sensor A Range/Performance	● Vehicle speed range/performance	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050164	Vehicle Speed Sensor A Range/Performance	● Vehicle speed range/performance	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050429	Brake Switch A / B Correlation	● Brake switch malfunction (sub-processor)	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.
P050464	Brake Switch A / B Correlation	● Brake switch malfunction	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.
P050600	Idle Air Control System RPM Lower Than Expected	● Air intake restriction ● Accessory drive overload (defective/seized component)	Check the air intake system, accessory drive belt and components. Refer to the relevant workshop manual section.
P050700	Idle Air Control System RPM Higher Than Expected	● Intake air leak between the mass air flow (MAF) sensor and throttle ● Intake air leak between throttle and engine ● Engine crankcase breather leak	Check the air intake system. Check the engine breather system. Refer to the relevant workshop manual section.
P051216	Starter Request Circuit	● Crank request circuit low input	Refer to the electrical guides and check the starter circuit. Repair/renew as necessary.
P051217	Starter Request Circuit	● Crank request circuit high input	Refer to the electrical guides and check the starter circuit. Repair/renew as necessary.
P051300	Incorrect Immobilizer Key	● Security key invalid	Program keys using the approved diagnostic system. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P052500	Cruise Control Servo Control Circuit Range/Performance	● Internal control module software corruption	Refer to the warranty policy and procedures manual if a module is suspect.
P052616	Fan Speed Sensor Circuit	● Viscous fan speed sensor low	Refer to the electrical guides and check the viscous fan speed sensor circuit.
P052617	Fan speed sensor circuit	● Viscous fan speed sensor high	Refer to the electrical guides and check the viscous fan speed sensor circuit.
P056000	System Voltage	● Battery back-up malfunction ● Battery voltage low ● Battery ground cable: high resistance ● Battery connections loose/corroded ● Battery current drain	Check the battery condition and state of charge.
P056200	System Voltage Low	● Battery voltage low ● Battery ground cable: high resistance ● Battery connections loose/corroded ● Battery current drain	Check the battery condition and state of charge.
P056300	System Voltage High	● System boosted from high voltage ● Battery voltage high ● Generator over charge condition	Check if the vehicle has been jump-started. Check the battery condition and state of charge.
P057400	Cruise Control System - Vehicle Speed Too High	● Incorrect speed sensor signal	Check for ABS DTCs. Refer to the relevant workshop manual section DTC index.

DTC	Description	Possible causes	Action
P057600	Cruise Control Input Circuit Low	● Speed control switch short circuit to ground ● Speed control switch high resistance	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057700	Cruise Control Input Circuit High	● Speed control switch short circuit to power	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057800	Cruise Control Multi-Function Input A Circuit Stuck	● Speed control multi-function input A circuit high resistance ● Speed control multi-function input A circuit; short circuit to ground ● Speed control multi-function input A circuit; short circuit to power ● Speed control switch stuck	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057900	Cruise Control Multi-Function Input A Circuit Range/Performance	● Speed control multi-function input A circuit high resistance ● Speed control multi-function input A circuit; short circuit to ground ● Speed control multi-function input A circuit; short circuit to power ● Speed control switch stuck	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P058500	Cruise Control Multi-Function Input A / B Correlation	● Cruise control acceleration monitor fault	Check for other DTCs and Repair/renew those first. Clear this DTC and retest.
P060143	Internal Control Module Memory Check Sum Error	● Transmission control module (TCM) Internal control module memory check sum error - special memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060145	Internal Control Module Memory Check Sum Error	● Transmission control module (TCM) internal control module memory check sum error - program memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060442	Internal Control Module Random Access Memory (RAM) Error	● ECM internal control module RAM error	Refer to the warranty policy and procedures manual if a module is suspect.
P060443	Internal Control Module Random Access Memory (RAM) Error	● ECM general memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060444	Internal Control Module Random Access Memory (RAM) Error	● ECM shut off RAM test - special memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060445	Internal Control Module Random Access Memory (RAM) Error	● ECM RAM check sum - data memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060542	Internal Control Module Read Only Memory (ROM) Error	● TCM - general memory failure ROM checksum	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060543	Internal Control Module Read Only Memory (ROM) Error	● TCM - shut off ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060544	Internal Control Module Read Only Memory (ROM) Error	● TCM - initial ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060545	Internal Control Module Read Only Memory (ROM) Error	● TCM - continuous ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P060546	Internal Control Module Read Only Memory (ROM) Error	- TCM - continuous ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060548	Internal Control Module Read Only Memory (ROM) Error	- ECM circuits short circuit to ground - ECM circuits short circuit to power - ECM circuits high resistance - TCM - shut off ROM test - supervision software fault	Check the ECM circuits. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060601	Control Module Processor	- PCM/ECM processor controller test - general electrical failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060604	Control Module Processor	- PCM/ECM processor error capturing instructions	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060605	Control Module Processor	- PCM/ECM processor scheduling sequence check - system programming failures	Program the module using the approved diagnostic system.
P060641	Control Module Processor	- PCM/ECM processor watch dog timer fault - general checksum failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060642	Control Module Processor	- PCM/ECM processor error capturing instructions - general memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060643	Control Module Processor	- PCM/ECM processor duplication memory fault - special memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060644	Control Module Processor	- PCM/ECM processor duplication memory fault - data memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060645	Control Module Processor	- PCM/ECM processor detection of write to internal ROM - program memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060646	Control Module Processor	- PCM/ECM processor detection of write to internal ROM - calibration/parameter memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060647	Control Module Processor	- PCM/ECM processor watch dog timer fault/processor fault	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060648	Control Module Processor	- PCM/ECM processor scheduling sequence check/processor - supervision software failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060649	Control Module Processor	- PCM/ECM processor controller test/processor - internal electronic failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060700	Control Module Performance	- ECM event information - CPU watch dog	Check the ECM circuits and connectors. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060D00	Internal Control Module Accelerator Pedal Position Performance	- ECM internal communication error	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P060E62	Internal Control Module Throttle Position Performance	● Throttle motor amplifier failure for valve sensor malfunction - ECM internal signal compare failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060E64	Internal Control Module Throttle Position Performance	● Throttle position communication - ECM internal signal plausibility failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P061000	Control Module Vehicle Options Error	● Car configuration file (CCF) settings mismatch	Configure the module using the approved diagnostic system.
P061600	Starter Relay Circuit Low	● Starter relay drive circuit short circuit to ground ● Starter relay drive circuit high resistance ● Starter relay failure	Check the starter relay operation. Refer to the electrical guides and check the starter relay circuit. Repair/renew as necessary.
P061700	Starter Relay Circuit High	● Starter relay drive circuit short circuit to battery ● Starter relay failure	Check the starter relay operation. Refer to the electrical guides and check the starter relay circuit. Repair/renew as necessary.
P061A00	Internal Control Module Torque Performance	● Pedal follower error	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and Repair/renew other DTCs first. If this code still sets, contact the technical help desk.
P061A29	Internal Control Module Torque Performance	● Absolute engine torque calculation failure - sub-processor	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and Repair/renew other DTCs first. If this code still sets, contact the technical help desk.
P061A64	Internal Control Module Torque Performance	● Absolute engine torque calculation failure	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and Repair/renew other DTCs first. If this code still sets, contact the technical help desk.
P061B29	Internal Control Module Torque Calculation Performance	● Internal control module torque calculation performance	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and Repair/renew other DTCs first. If this code still sets, contact the technical help desk.
P061B64	Internal Control Module Torque Calculation Performance	● Internal control module torque calculation performance	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and Repair/renew other DTCs first. If this code still sets, contact the technical help desk.
P062000	Generator Control Circuit	● Generator failure	Refer to the relevant workshop manual section DTC index.
P062500	Generator Field Terminal Circuit Low	● Voltage sense circuit high resistance ● Generator B+ circuit high resistance/intermittent ● Generator monitor circuit short circuit to ground	Check the main charging circuit fuse. Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P062600	Generator Field Terminal Circuit High	● Generator connector loose/not connected ● Generator monitor circuit short circuit to power ● Generator monitor circuit high resistance	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P062800	Fuel Pump A Control Circuit Low	● Fuel pump control circuit short circuit to ground ● Fuel pump control circuit high resistance	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
		- Fuel pump relay fault	
P062900	Fuel Pump A Control Circuit High	- Fuel pump control circuit short circuit to power - Fuel pump relay fault	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P063000	VIN Not Programmed or Incompatible - ECM/ECM	- VIN not programmed - VIN incompatible with vehicle specification	Configure the module using the approved diagnostic system.
P063305	Immobilizer Key Not Programmed - ECM/PCM	- Security target ID transfer process failed	Program the key using the approved diagnostic system.
P063355	Immobilizer Key Not Programmed - ECM/PCM	- Security no target in EMS	Program the module using the approved diagnostic system.
P063422	PCM / ECM / TCM Internal Temperature A Too High	- ECM internal temperature too high - E box cooling fan obstruction - E box cooling fan operation - ECM internal sensor error	Consider atmospheric and customer driving conditions before carrying out any other action. Check the E box cooling fan function. Refer to the electrical guides and check the ECM circuits. Using a datalogger function, check the ECM temperature. If the temperature value is greater than 130°C (266°F) suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P063424	PCM / ECM / TCM Internal Temperature A Too High	- ECM internal temperature too high - E box cooling fan obstruction - E box cooling fan operation - ECM internal sensor error	Consider atmospheric and customer driving conditions before carrying out any other action. Check the E box cooling fan function. Refer to the electrical guides and check the ECM circuits. Using a datalogger function, check the ECM temperature. If the temperature value is greater than 130°C (266°F) suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P066800	PCM / ECM / TCM Internal Temperature Sensor A Circuit Low	- ECM temperature sensor circuit short circuit to ground	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P066900	PCM / ECM / TCM Internal Temperature Sensor A Circuit High	- TCM temperature sensor circuit short circuit to power	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P068700	ECM/PCM Power Relay Control Circuit High	- ECM control relay malfunction	Check the ECM relay and circuit. Refer to the electrical guides.
P069500	Fan 3 Control Circuit Low	- E box fan circuit short circuit to ground	Check the E box fan operation and circuit. Refer to the electrical guides.
P069600	Fan 3 Control Circuit High	- E box fan circuit short circuit to power	Check the E box fan operation and circuit. Refer to the electrical guides.
P070000	Transmission Control System (MIL Request)	- Transmission fault	Check for other DTCs and rectify those first. Clear this DTC and retest.
P085100	Park / Neutral Switch Input Circuit Low	- Park/Neutral switch circuit short to ground	Check the switch and circuits. Refer to the electrical guides and repair/renew as necessary. Clear the DTCs and test for normal operation.
P085200	Park / Neutral Switch Input Circuit High	- Park/Neutral switch circuit short to power	Check the switch and circuits. Refer to the electrical guides and repair/renew as necessary. Clear the DTCs and test for normal operation.
P131500	Persistent Misfire	- ECM to ignition coil primary circuit fault (cylinder misfire detected DTC also flagged) - Ignition coil failure - Spark plug failure/fouled /incorrect gap - Fuel delivery pressure low - Fuel injector circuit fault(s) (injector DTCs also flagged) - Cylinder compression low	For ignition coil tests, refer to the coil failure DTCs in this index. Check the spark plug conditions and gaps. Check the fuel pressure, check for fuel injector DTCs and refer to the relevant workshop manual section.
P131600	Injector Driver Module Codes Detected	- Engine misfire - injector driver module codes detected	Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P136700	Ignition Spare	• Ignition coil group A monitoring circuit to ECM high resistance, short circuit to ground, short circuit to power • Ignition module/coils ground circuit fault, right hand bank	Refer to the electrical guides and check the ignition monitoring circuit between the ignition coils and ECM. Repair as necessary. For ignition coil tests, refer to the coil failure DTCs in this index.
P136800	Ignition Spare	• Ignition coil group B monitoring circuit to ECM high resistance, short circuit to ground, short circuit to power • Ignition module/coils ground circuit fault left hand bank	Refer to the electrical guides and check the ignition monitoring circuit between the ignition coils and ECM. Repair as necessary. For ignition coil tests, refer to the coil failure DTCs in this index.
P160300	EEPROM Malfunction	• ECM fault	Refer to the warranty policy and procedure manual if an ECM is suspect.
P210129	Throttle Actuator A Control Motor Circuit Range/Performance	• Jammed throttle blade, gearing or motor	Check for fuel charging DTCs and a message in the instrument cluster. Rectify as necessary. If the problem persists, renew the throttle body. Refer to the relevant workshop manual section.
P210162	Throttle Actuator A Control Motor Circuit Range/Performance	• Jammed throttle blade, gearing or motor	Check for fuel charging DTCs and a message in the instrument cluster. Rectify as necessary. If the problem persists, renew the throttle body. Refer to the relevant workshop manual section.
P210164	Throttle Actuator A Control Motor Circuit Range/Performance	• Jammed throttle blade, gearing or motor	Check for fuel charging DTCs and a message in the instrument cluster. Rectify as necessary. If the problem persists, renew the throttle body. Refer to the relevant workshop manual section.
P210177	Throttle Actuator A Control Motor Circuit Range/Performance	• Jammed throttle blade, gearing or motor	Check for fuel charging DTCs and a message in the instrument cluster. Rectify as necessary. If the problem persists, renew the throttle body. Refer to the relevant workshop manual section.
P210329	Throttle Actuator A Control Motor Circuit High	• Throttle Actuator control circuit short circuit to power • ECM fault	Check the electric throttle unit and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedure manual if an ECM is suspect.
P210364	Throttle Actuator A Control Motor Circuit High	• Control circuit short circuit to power • ECM fault	Check the electric throttle unit and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedure manual if an ECM is suspect.
P210500	Throttle Motor Control System - Forced Engine Shutdown	• Throttle MIL request due to fuel cut	Check for DTCs indicating the reason for the fuel cut. Follow the action indicated for those DTCs.
P210629	Throttle Actuator Control System - Forced Limited Power	• Intended reduced availability fault (limp home)	Check for fuel charging DTCs and a message in the instrument cluster. Rectify as necessary. If the problem persists, renew the throttle body. Refer to the relevant workshop manual section.
P210664	Throttle Actuator Control System - Forced Limited Power	• Intended reduced availability fault (limp home)	Check for fuel charging DTCs and a message in the instrument cluster. Rectify as necessary. If the problem persists, renew the throttle body. Refer to the relevant workshop manual section.
P211800	Throttle Actuator Control Motor Current Range/Performance	• Throttle motor over current condition detected • ECM fault	Refer to the electrical guides and check the wiring between the ECM and throttle actuator. Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if an ECM is suspect.
P211900	Throttle Actuator Control Throttle Body Range/Performance	• Throttle spring faulty	Check the throttle return spring on the throttle body. Repair/renew as necessary. Check for fuel charging DTCs and a message in the instrument cluster. Rectify as necessary. If the problem persists, renew the throttle body. Refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
P212200	Throttle/Pedal Position Sensor/Switch D Circuit	- Throttle position sensor circuit 2 low input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P212300	Throttle/Pedal Position Sensor/Switch D Circuit High	- Throttle position sensor circuit 2 high input	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P213529	Throttle/Pedal Position Sensor/Switch A / B Voltage Correlation	- Driver demand sensor - circuit 1 and 2 range/performance - sub-processor	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if an ECM is suspect.
P213564	Throttle/Pedal Position Sensor/Switch A / B Voltage Correlation	- Driver demand sensor - circuit 1 and 2 range/performance - sub-processor	Refer to the guided diagnostic routine for this code on the approved diagnostic system. Refer to the warranty policy and procedures manual if an ECM is suspect.
P222800	Barometric Pressure Sensor A Circuit Low	- Barometric sensor failure (internal ECM fault)	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if an ECM is suspect.
P222900	Barometric Pressure Sensor A Circuit High	- Barometric sensor failure (internal ECM fault)	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if an ECM is suspect.
P240100	Evaporative Emission System Leak Detection Pump Control Circuit Low	- Diagnostic monitoring of tank leaks (DMTL) pump circuit(s) short circuit to ground - DMTL pump circuit(s) high resistance	Refer to the electrical guides and check the wiring between the ECM and DMTL pump. Repair as necessary.
P240200	Evaporative Emission System Leak Detection Pump Control Circuit High	- DMTL pump circuit(s) short circuit to power	Refer to the electrical guides and check the wiring between the ECM and DMTL pump. Repair as necessary.
P240429	Evaporative Emission System Leak Detection Pump Sense Circuit Range/Performance	- DMTL reference leak	Check the evaporative emission system for serviceability and leaks. Check the DMTL pump and circuits. Refer to the electrical guides. Complete a DMTL test. Refer to the relevant workshop manual section.
P24042F	Evaporative Emission System Leak Detection Pump Sense Circuit Range/Performance	- DMTL signal erratic	Check the DMTL pump and circuits. Refer to the electrical guides. Refer to the relevant workshop manual section.
P240500	Evaporative Emission System Leak Detection Pump Sense Circuit Low	- DMTL pump circuit reference circuit low	Refer to the electrical guides and check the wiring between the ECM and DMTL pump. Repair as necessary.
P240600	Evaporative Emission System Leak Detection Pump Sense Circuit High	- DMTL pump circuit reference circuit high	Refer to the electrical guides and check the wiring between the ECM and DMTL pump. Repair as necessary.
P240B00	Evaporative Emission System Leak Detection Pump Heater Circuit Low	- DMTL heater control circuit low	Refer to the electrical guides and check the wiring between the ECM and DMTL pump. Repair as necessary.
P240C00	Evaporative Emission System Leak Detection Pump Heater Circuit High	- DMTL heater control circuit high	Refer to the electrical guides and check the wiring between the ECM and DMTL pump. Repair as necessary.
P245000	Evaporative Emission Control System Switching Valve Performance/Stuck Open	- DMTL pump circuit short circuit, high resistance - DMTL change over valve failed	Refer to the electrical guides and check the wiring between the ECM and DMTL valve. Repair/renew as necessary. Refer to the relevant workshop manual section.
P245100	Evaporative Emission Control System Switching Valve Stuck Closed	- DMTL pump circuit short circuit, high resistance - DMTL change over valve failed	Refer to the electrical guides and check the wiring between the ECM and DMTL valve. Repair/renew as necessary. Refer to the relevant workshop manual section.
P252516	Vacuum reservoir pressure sensor circuit	- Brake booster vacuum pump relay short circuit to ground	Refer to the electrical guides and check the brake pump relay circuits/relay operation.
P252517	Vacuum reservoir pressure sensor circuit	- Brake booster vacuum pump relay short circuit to power	Refer to the electrical guides and check the brake pump relay circuits/relay operation.
P261000	ECM Internal engine off timer performance	- ECM internal error	Refer to the warranty policy and procedures manual if an ECM is suspect.

DTC	Description	Possible causes	Action
P277200	Four Wheel Drive (4WD) Low Switch Circuit Range/Performance	- Low gear ratio plausibility check (CAN TCCM message v actual)	Check for four wheel drive system DTCs. Carry out a complete vehicle read.
U007300	Control Module Communication Bus "A" Off	- CAN Link circuit malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U010100	Lost Communication With TCM	- CAN Link ECM/TCM network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U010200	Lost Communication With Transfer Case Control Module	- CAN Link ECM/transfer case control module network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U010400	Lost Communication With Cruise Control Module	- CAN Link engine control module ECM/Speed control module CAN timeout	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U012100	Lost Communication With Anti-Lock Brake System (ABS) Control Module	- CAN Link ECM/ABS network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U012600	Lost Communication With Steering Angle Sensor Module	- CAN Link ECM/steering angle sensor network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U012800	Lost Communication With Park Brake Control Module	- CAN Link ECM/electric park brake signal missing network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U013300	Lost Communication With Suspension Control Module "A"	- CAN Link ECM/active roll control module network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U013800	Lost Communication with All Terrain Control Module	- CAN Link ECM/terrain optimization switch network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U015100	Lost Communication With Restraints Control Module	- Lost communications - CAN or hardwired	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
U01511F	Lost Communication With Restraints Control Module	● Lost communications - SRS fault	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U015157	Lost Communication With Restraints Control Module	● Lost communications - CAN fault	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U015500	Lost Communication With Instrument Panel Cluster (IPC) Control Module	● CAN Link ECM/IPC network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U016700	Lost Communication With Vehicle Immobilizer Control Module	● Security challenge response timeout	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U023500	Lost Communication With Cruise Control Front Distance Range Sensor	● Lost communication ● Fault status transmitted	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U040264	Invalid Data Received from TCM	● Invalid data received from transmission control module - actual gear position status	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U040267	Invalid Data Received from TCM	● Invalid data received from transmission control module - gear shifter position status	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U040281	Invalid Data Received from TCM	● Invalid data received from transmission control module - output shaft speed signal	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U042381	Invalid Data Received From Instrument Panel Control Module	● External ambient temperature	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U042386	Invalid Data Received From Instrument Panel Control Module	● Battery voltage level	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U042600	Invalid Data Received From Vehicle Immobilizer Control Module	● Security code mismatch	Check the configuration of the modules using the approved diagnostic system.
U206400	Warning Indicator Requested by Another Control Module	● Crash event has occurred	Check for SRS DTCs. Refer to the relevant workshop manual section DTC index.

Electronic Engine Controls - V8 4.4L Petrol - Camshaft Position (CMP) Sensor

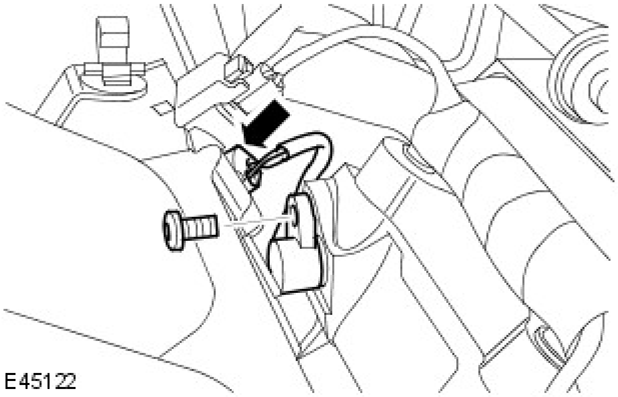
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the engine cover.
For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. NOTE: Removal of the RH is similar to this procedure.



Remove the CMP sensor.

- Disconnect the electrical connector.
- Remove the Torx screw.
- Discard the O-ring seal.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the Torx screw to 7 Nm (5 lb.ft).

Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Crankshaft Position (CKP) Sensor

Removal and Installation

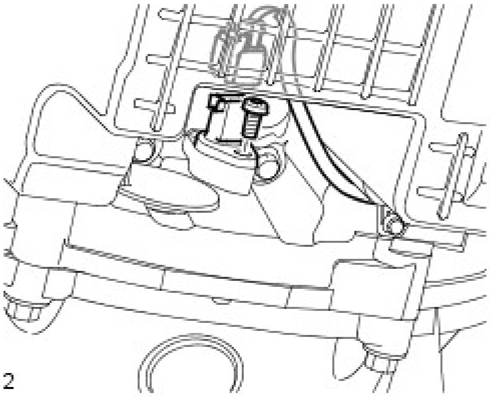
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).



E45412

4. CAUTION: Before the disconnection or removal of any components, make sure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the CKP sensor.

- Disconnect the electrical connector.
- Remove the Torx screw.

Installation

1. To install, reverse the removal procedure.

- Tighten the Torx screw to 8 Nm (6 lb.ft).

2. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Engine Control Module (ECM)

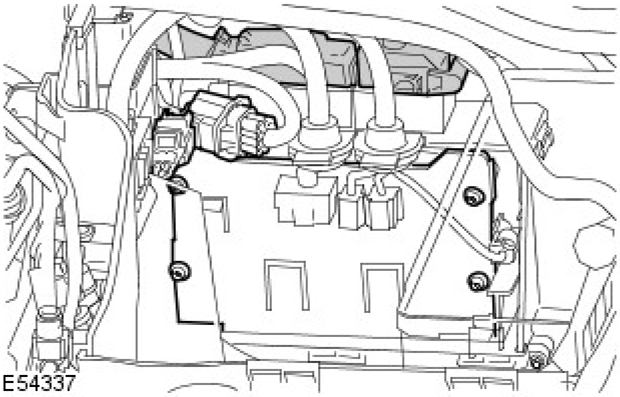
Removal and Installation

Removal

• NOTE: If the ECM is to be replaced, the T4 must be connected prior to battery disconnection and on-screen instructions must be followed.

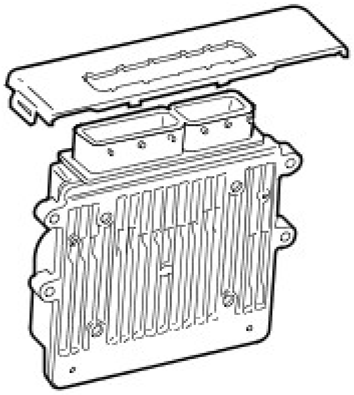
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).



3. Remove the ECM cover.

- Disconnect 2 electrical connectors for access.
- Disconnect the 2 ECM electrical connectors.
- Remove the 4 Torx screws.



4. Remove the ECM.

- Remove the ECM top cover.

Installation

1. Install the ECM.

- Install the ECM cover and secure with Torx screws.
- Install the ECM upper cover.

2. Connect the ECM electrical connectors.

3. Connect the 2 electrical connectors disconnected for access.

4. Install the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

5. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

6. Connect T4 to calibrate a new ECM.

Electronic Engine Controls - V8 4.4L Petrol - Throttle Position (TP) Sensor

Removal and Installation

Removal

- NOTE: The TP sensor is part of the throttle body assembly and cannot be serviced separately.

1. Remove the throttle body.
For additional information, refer to: Throttle Body Gasket (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Removal and Installation).

Installation

1. Install the throttle body.
For additional information, refer to: Throttle Body Gasket (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Removal and Installation).

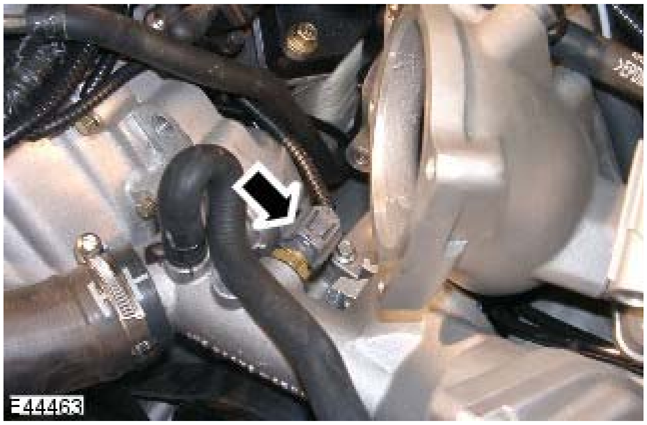
Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the throttle body.
   For additional information, refer to: Throttle Body Gasket (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Removal and Installation).



3. Remove the ECT sensor.
   - Position the engine gas recirculation (EGR) coolant hose aside for access.
   - Position an absorbent cloth to collect fluid spillage.
   - Disconnect the electrical connector.
   - Remove the sensor and discard the seal.

Installation

1. To install, reverse the removal procedure.
   - Clean the components.
2. Tighten the ECT sensor to 18 Nm (13 lb.ft).
3. Top-up the coolant.

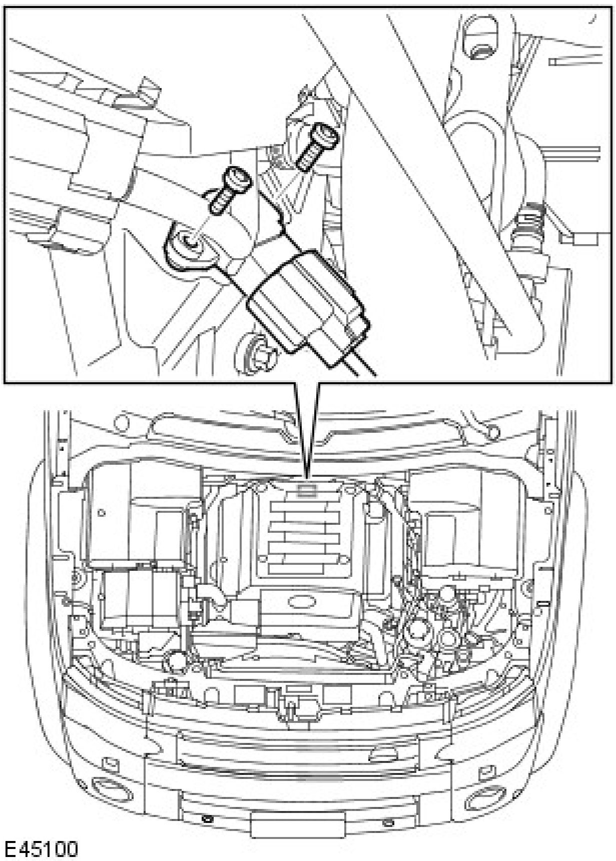
Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Manifold Absolute Pressure (MAP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Remove the manifold absolute pressure (MAP) sensor.
   - Disconnect the electrical connector.
   - Remove the 2 Torx screws.



E45100

Installation

1. To install, reverse the removal procedure.
   - Clean the component mating faces.
2. NOTE: For NAS vehicles only.

   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A, General Procedures).

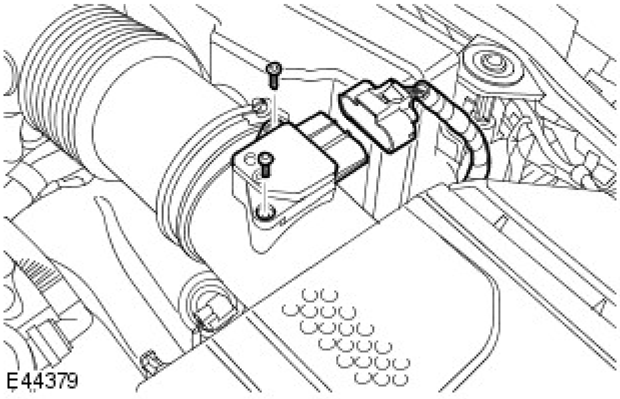
Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Mass Air Flow (MAF) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the MAF sensor.
   - Disconnect the electrical connector.
   - Remove the 2 screws.



Installation

1. To install, reverse the removal procedure.
   - Tighten Torx screws to 2 Nm (1.5 lb.ft).
2. NOTE: Federal market vehicles only.

   If required, carry out a short drive cycle.
   For additional information, refer to: Powertrain Control Module (PCM) Short Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).
3. NOTE: Non federal market vehicles only.

   Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

Electronic Engine Controls - V8 4.4L Petrol - Heated Oxygen Sensor (HO2S) LH

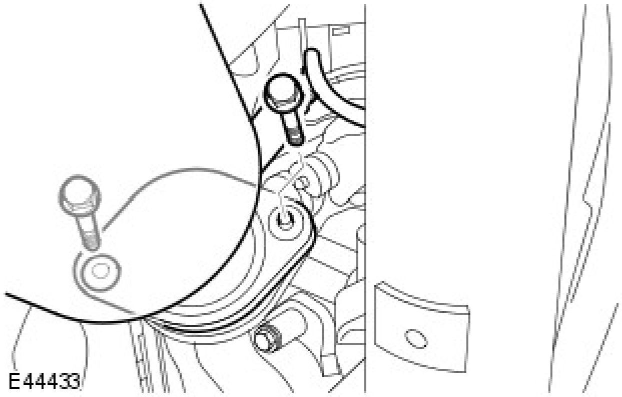
Removal and Installation

Special Tool(s)	
	Wrench, HO2S 310-121(LRT-19-014)

Removal

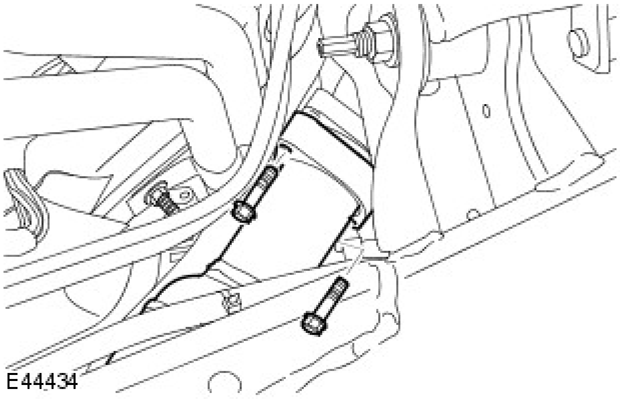
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



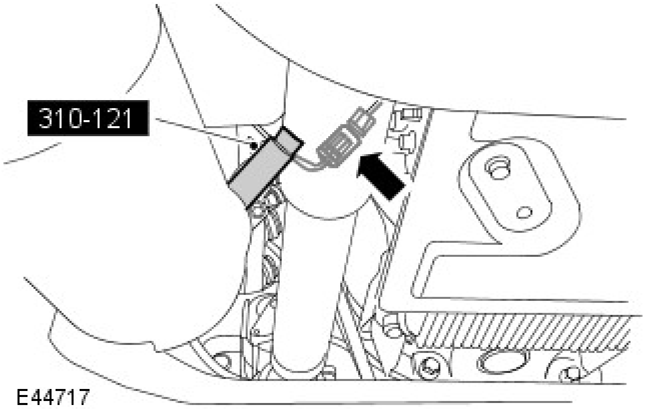
2. Disconnect the LH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.



3. Disconnect the RH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.



4. Using the special tool, remove the HO2S.

- Release the wiring harness.
- Disconnect the electrical connector.

Installation

1. CAUTIONS:

⚠ Make sure the anti-seize compound does not contact the HO2S tip.

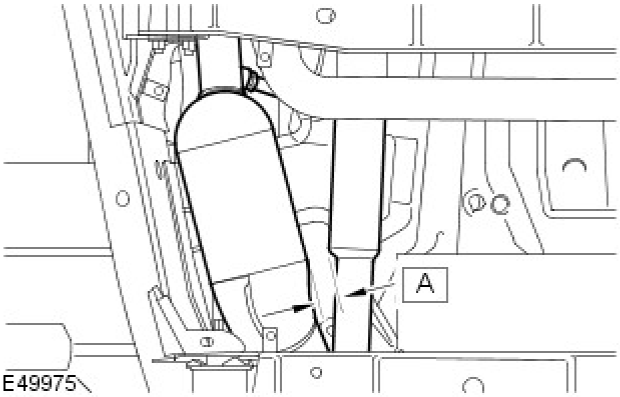
⚠ Make sure the H02S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Using the special tool, install the HO2S.

- Clean the components.
- Apply an anti-seize compound to the thread of the sensor.
- Tighten the HO2S to 45 Nm (33 lb.ft).
- Connect the electrical connector.
- Attach the wiring harness.

2. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).



3. ⚠ CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

4. Using the approved diagnostic equipment, clear the powertrain control module (PCM) adaptions.

Electronic Engine Controls - V8 4.4L Petrol - Catalyst Monitor Sensor LH

Removal and Installation

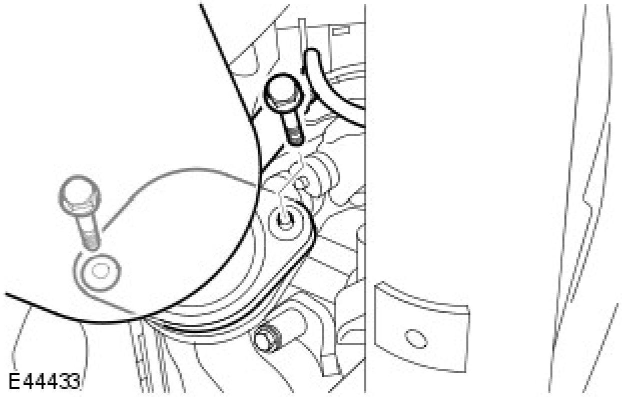
Special Tool(s)	
	Wrench, HO2S 310-121 (LRT-19-014)

Removal

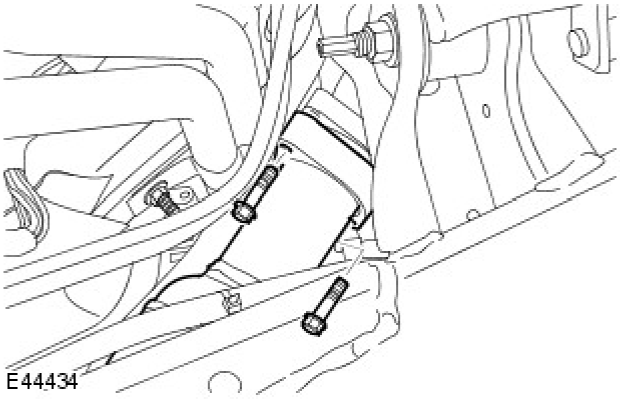
1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

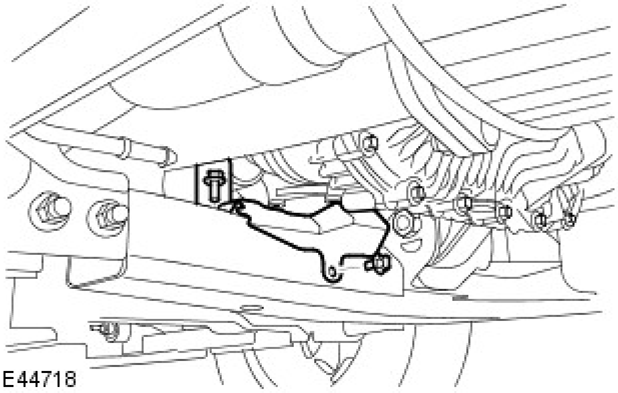
   Raise and support the vehicle.

2. Disconnect the LH catalytic converter from the exhaust manifold.
   - Remove and discard the 2 bolts.



3. Disconnect the RH catalytic converter from the exhaust manifold.
   - Remove and discard the 2 bolts.

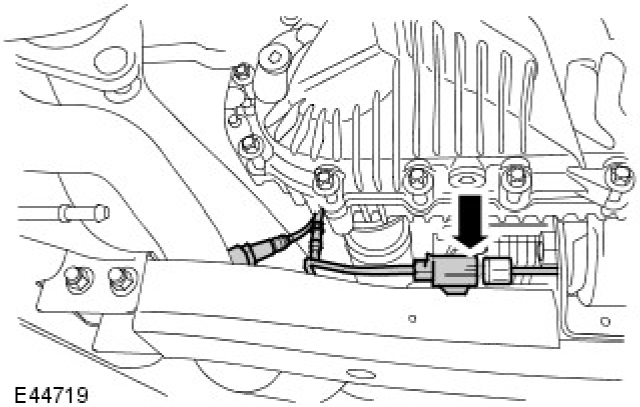




E44718

4. Remove the catalyst monitor sensor electrical connector heat shield.

- Remove the 2 bolts.



E44719

5. Using the special tool, remove the catalyst monitor sensor.

- Release the wiring harness.
- Disconnect the electrical connector.

Installation

1. CAUTIONS:

⚠ Make sure the anti-seize compound does not contact the catalyst monitor sensor tip.

⚠ Make sure the catalyst monitor sensor wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Using the special tool, install the catalyst monitor sensor.

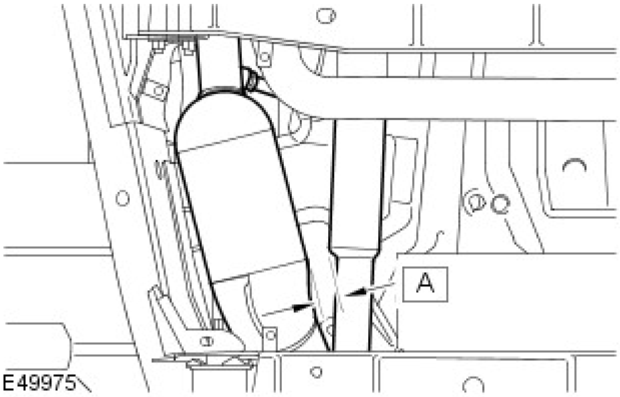
- Clean the components.
- Apply an anti-seize compound to the thread of the sensor.
- Tighten the catalyst monitor sensor to 45 Nm (33 lb.ft).
- Connect the electrical connector.
- Attach the wiring harness.

2. Install the heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

3. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).



4. ⚠ CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

5. NOTE: For NAS vehicles only.

If required, carry out a long drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).

Published: 11-May-2011

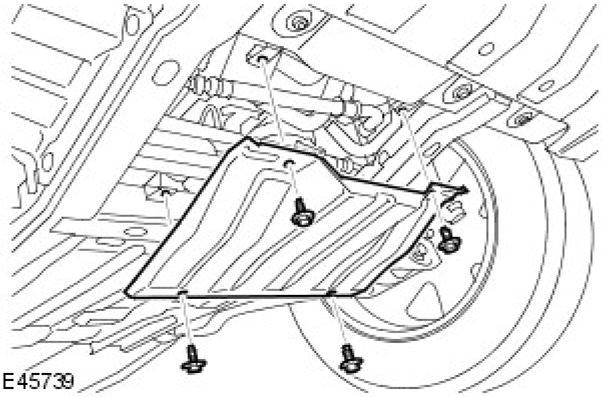
Electronic Engine Controls - V8 4.4L Petrol - Engine Oil Pressure (EOP) Sensor

Removal and Installation

Removal

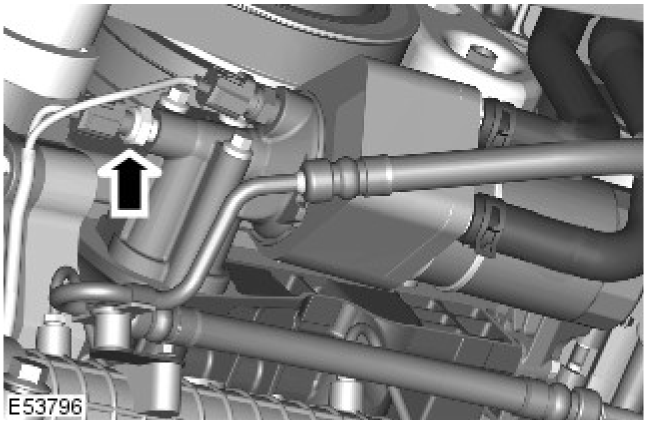
1. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



2. Remove the radiator access panel.

- Remove the 4 bolts.



3. Remove the oil pressure sensor.

- Disconnect the electrical connector.
- Position a container to collect the fluid.

Installation

1. To install, reverse the removal procedure.

- Tighten the oil pressure sensor to 12 Nm (9 lb.ft).
- Tighten the M6 bolts to 10 Nm (7 lb.ft).
- Tighten the M10 bolts to 45 Nm (33 lb.ft).

2. Check and top-up the engine oil.

Electronic Engine Controls - V8 4.4L Petrol - Fuel Temperature Sensor

Removal and Installation

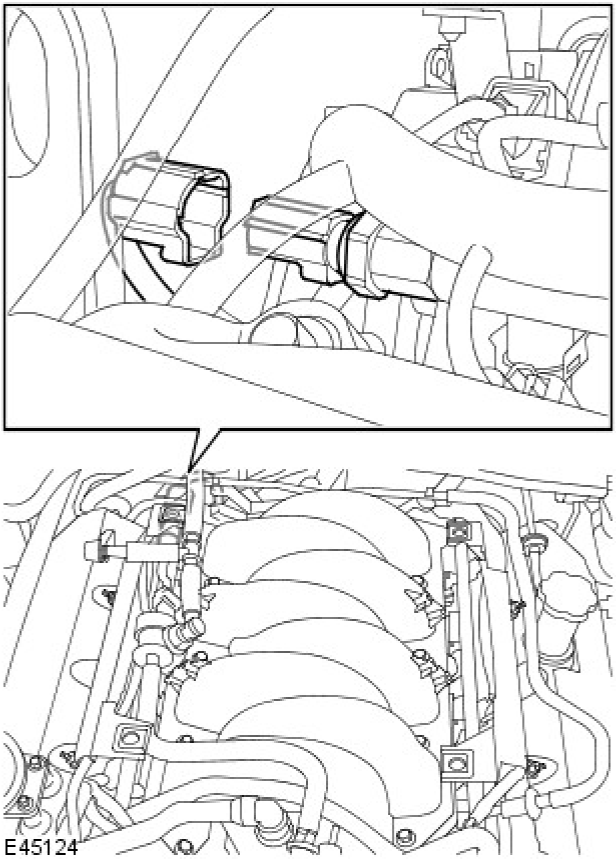
Removal

1. Secure the hood in the service position.

- Release the support struts.

2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Remove the engine cover.
For additional information, refer to: Engine Cover - V8 4.4L Petrol (501-05 Interior Trim and Ornamentation, Removal and Installation).



4. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Remove the fuel temperature sensor.

- Disconnect the electrical connector.
- Position an absorbent cloth to collect fluid spillage.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Apply sealant to the sensor thread.
- Tighten the sensor to 7 Nm (5 lb.ft).

Published: 11-May-2011

Electronic Engine Controls - V8 4.4L Petrol - Oil Temperature Sensor

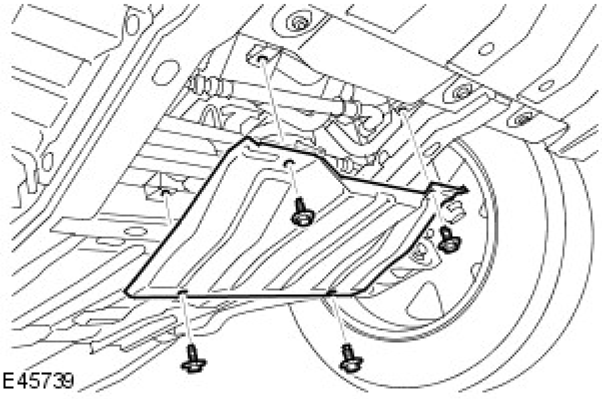
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the radiator access panel.

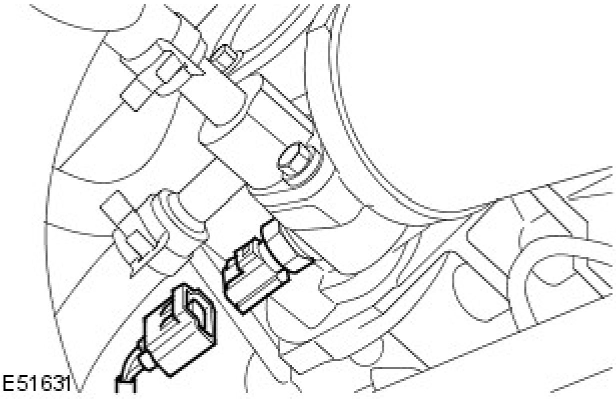
- Remove the 4 bolts.



3. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the oil temperature sensor.

- Disconnect the electrical connector.
- Position a container to collect the fluid.



Installation

1. To install, reverse the removal procedure.

- Tighten the oil temperature sensor to 20 Nm (15 lb.ft).
- Tighten the bolts to 10 Nm (7 lb.ft).

2. Check and top-up the engine oil.

Electronic Engine Controls - V8 4.4L Petrol - Variable Camshaft Timing (VCT) Oil Control Solenoid

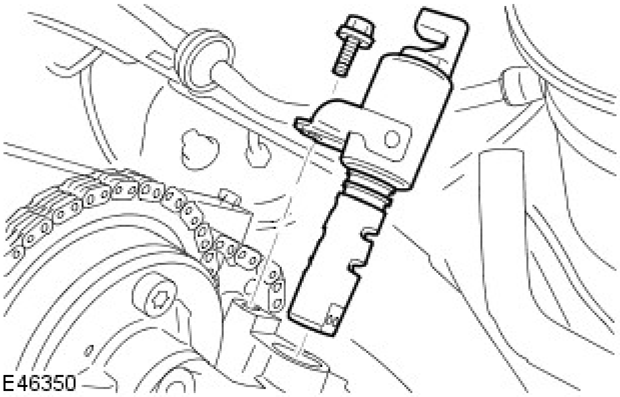
Removal and Installation

Removal

- NOTE: Removal of the RH is similar to this procedure.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the valve cover.
For additional information, refer to: Valve Cover LH (303-01B Engine - V8 4.4L Petrol, In-vehicle Repair).



3. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the variable camshaft timing (VCT) oil control solenoid.

- Remove the bolt.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Tighten the bolt to 10 Nm (7 lb.ft).

2. NOTE: For NAS vehicles only

If required, carry out a short drive cycle

Electronic Engine Controls - V8 4.4L Petrol - Knock Sensor (KS)

Removal and Installation

Removal

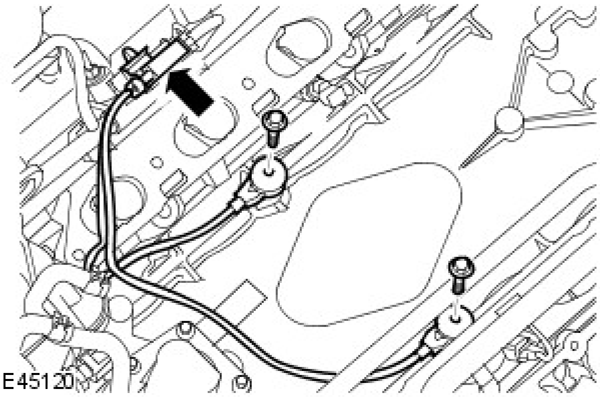
• NOTE: The LH and RH Knock sensors are removed and serviced as a pair.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the intake manifold gaskets.
For additional information, refer to: Intake Manifold Assembly (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Removal and Installation).

3. Remove the KS.

- Disconnect the electrical connector.
- Remove the 2 bolts.



Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Tighten the bolts to 20 Nm (15 lb.ft).

OVERVIEW

The TdV6 engine has an Electronic Diesel Control (EDC) engine management system supplied by Siemens. The system is controlled by an ECM and is able to monitor, adapt and precisely control the fuel injection. The ECM uses multiple sensor inputs and precision control of actuators to achieve optimum performance during all driving conditions.

The ECM controls fuel delivery to all six cylinders via a Common Rail (CR) injection system. The CR system uses a fuel rail to accumulate highly pressurized fuel and feed the six, electronically controlled injectors. The fuel rail is located in close proximity to the injectors, which assists in maintaining full system pressure at each injector at all times.

The ECM uses the drive by wire principle for acceleration control. There are no control cables or physical connections between the accelerator pedal and the engine. Accelerator pedal demand is communicated to the ECM by two potentiometers located in a throttle position sensor. The ECM uses the two signals to determine the position, rate of movement and direction of movement of the pedal. The ECM then uses this data, along with other engine information from other sensors, to achieve the optimum engine response.

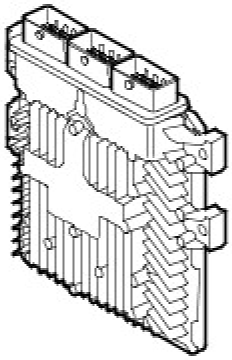
The ECM processes information from the following input sources:

- CKP
- CMP
- Manifold air temperature and pressure
- Coolant temperature
- Oil temperature
- Inlet air flow and temperature
- Fuel rail temperature
- Knock sensors (one per cylinder bank)

The ECM outputs controlling signals to the following sensors and actuators:

- Fuel injectors
- Cooling fan solenoid
- Electronic Throttle
- Electronically controlled turbo vanes
- Port deactivation
- Fuel pressure control valve
- Fuel volume control valve
- E-box fan
- Electronic EGR
- Glow plugs

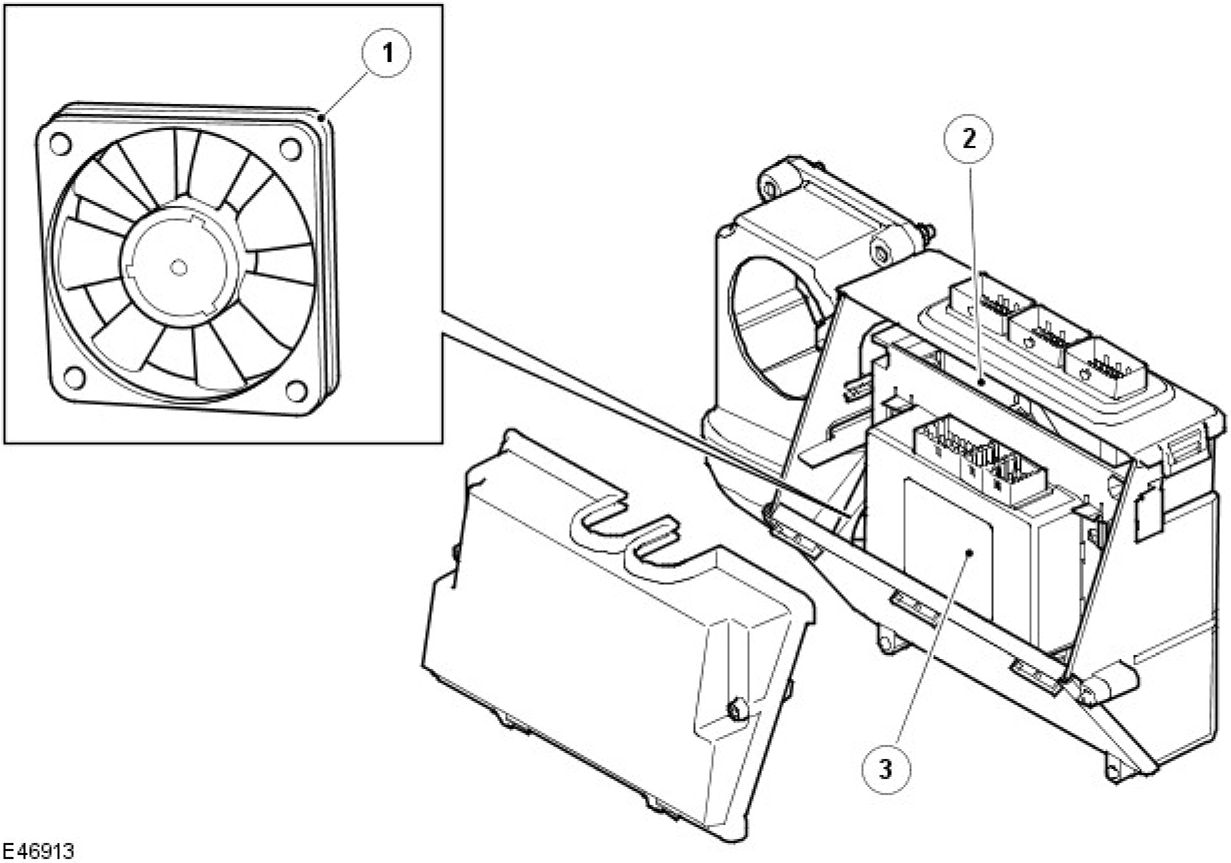
ENGINE CONTROL MODULE (ECM)



E46899

The ECM is located in the E-Box in the plenum area attached to the bulkhead. The E-Box is always on the opposite side to the hand of drive.

E Box



E46913

Item	Part Number	Description
1		E box fan
2		ECM
3		Transfer box control module

Inputs

The ECM has the following inputs:

- Engine coolant temperature
- Stop lamp switch (two signals one via ABS module on controller area network (CAN) and one hardwired)
- MAP
- Throttle pedal position 1
- Throttle pedal position 2
- Electronic throttle position
- Viscous fan speed

- Engine speed and position sensor (CKP)
- CMP
- Engine oil temperature
- Speed control switches (resistive ladders)
- Vehicle speed (via CAN bus)
- Generator monitor
- RCM
- MAF/IAT.

Outputs

The ECM outputs to the following:

- Throttle actuator
- Fuel injectors (6)
- EGR Valves
- Engine cooling fan
- Fuel pump relay
- Starter relay
- EMS main relay
- Generator control

The ECM is connected to the vehicle harnesses via three connectors. The ECM contains data processors and memory microchips. The output signals to the actuators are in the form of ground paths provided by driver circuits within the ECM. The ECM driver circuits produce heat during normal operation and dissipate this heat via the casing. The fan in the E-box assists with the cooling process by maintaining a constant temperature within the E-box. The fan is controlled by ECM. The E-box has pipe connections to the vehicle interior and receives additional cooled air via the air conditioning (A/C) system. Some sensors receive a regulated voltage supplied by the ECM. This avoids incorrect signals caused by voltage drop during cranking.

The ECM performs self diagnostic routines and stores fault codes in its memory. These fault codes and diagnostics can be accessed using a Land Rover approved diagnostic system. If the ECM is to be replaced, the new ECM is supplied 'blank' and must be configured to the vehicle using a Land Rover approved diagnostic system. A 'flash' electrically erasable programmable read only memory (EEPROM) allows the ECM to be externally configured, using a Land Rover approved diagnostic system, with market specific or new tune information up to 14 times. If a fifteenth update is required the ECM must be replaced. The current engine tune data can be accessed and read using a Land Rover approved diagnostic system.

When a new ECM is fitted, it must also be synchronized to the central junction box (CJB) using a Land Rover approved diagnostic system. ECM's cannot be 'swapped' between vehicles.

The ECM is connected to the engine sensors which allow it to monitor the engine operating conditions. The ECM processes these signals and decides the actions necessary to maintain optimum engine performance in terms of driveability, fuel efficiency and exhaust emissions. The memory of the ECM is programmed with instructions for how to control the engine, this is known as the strategy. The memory also contains data in the form of maps which the ECM uses as a basis for fueling and emission control. By comparing the information from the sensors to the to the data in the maps, the ECM is able to calculate the various output requirements. The ECM contains an adaptive strategy which updates the system when components vary due to production tolerances or ageing.

The ECM receives a vehicle speed signal on a CAN bus connection from the ABS module. Vehicle speed is an important input to the ECM strategies. The ABS module derives the speed signal from the ABS wheel speed sensors. The frequency of this signal changes according to road speed. The ECM uses this signal to determine the following:

- How much to reduce engine torque during gear changes
- When to permit speed control operation
- To control the operation of the speed control system
- Implementation of the idle strategy when the vehicle is stationary.

ECM Harness Connector C0872 Pin details

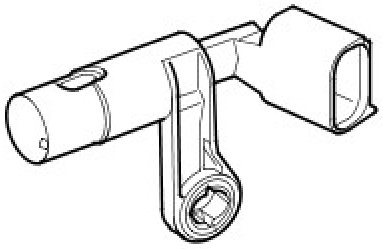
IMMOBILIZATION

Vehicle immobilization is controlled by the CJB. The CJB is connected to the medium speed CAN bus, which it uses to communicate with the ECM via the instrument cluster and the high speed CAN bus. The CJB wakes up the immobilization system when a key is inserted in the ignition switch key barrel. The CJB then validates the coded data it receives from the transponder coil in the key via the transponder coil. The CJB then signals the ECM to allow engine starting.
For additional information, refer to: Anti-Theft - Passive (419-01B Anti-Theft - Passive, Description and Operation).

CAMSHAFT POSITION (CMP) SENSOR



E46902

The CMP sensor is located on the front face of the left hand cylinder head. The sensor tip protrudes through the face to pick up on the reluctor behind the camshaft pulley. The CMP sensor is a Hall effect type sensor

The ECM uses the CMP sensor signal to determine if the piston in No. 1 cylinder is at injection top dead center (TDC) or exhaust TDC. Once this has been established, the ECM can then operate the correct injector to inject fuel into the cylinder when the piston is at injection TDC.

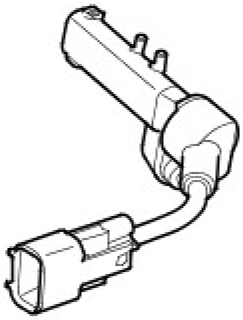
The CMP sensor is used by the ECM at engine start-up to synchronize the ECM with the CKP sensor signal. The ECM does this by using the CMP sensor signal to identify number one cylinder to ensure the correct injector timing. Once the ECM has established the injector timing, the CMP sensor signal is no longer used.

The CMP sensor receives a 5V supply from the ECM. Two further connections to the ECM provide ground and signal output.

If a fault occurs, an error is registered in the ECM. Two types of failure can occur; camshaft signal frequency too high or total failure of the camshaft signal. The error recorded by the ECM can also relate to a total failure of the crankshaft signal or crankshaft signal dynamically implausible. Both components should be checked to determine the cause of the fault.

If a fault occurs with the CMP sensor when the engine is running, the engine will continue to run but the ECM will deactivate boost pressure control. Once the engine is switched off, the engine will crank but will not restart while the fault is present.

CRANKSHAFT POSITION (CKP) SENSOR



E46903

The CKP sensor is located at the rear of the engine block on the left hand side. The sensor tip is aligned with a magnetic trigger which is attached to the crankshaft. The reluctor is a press fit on the end of the crankshaft. The trigger wheel must be carefully aligned to the crankshaft to ensure correct timing. The sensor produces a square wave signal, the frequency of which is proportional to engine speed.

The ECM monitors the CKP sensor signal and can detect engine over-speed. The ECM counteracts engine over-speed by gradually fading out speed synchronized functions. The CKP is a Hall effect sensor. The sensor measures the magnetic field variation induced by the magnetized trigger wheel.

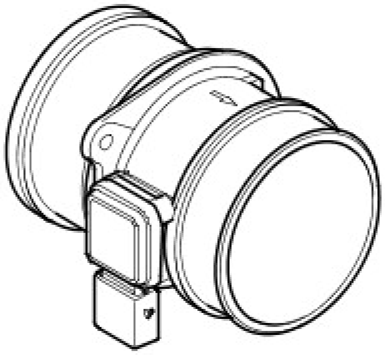
The trigger wheel has two missing teeth representing 6º of crankshaft rotation. The two missing teeth provide a reference point for the angular position of the crankshaft.

When the space with the two missing teeth pass the sensor tip, a gap in the signal is produced which the ECM uses to determine the crankshaft position. The air gap between the sensor tip and the ring is important to ensure correct signals are output to the ECM. The recommended air gap between the CKP and the trigger wheel is 0.4 mm- 1.5 mm.

The ECM uses the signal from the CKP sensor for the following functions:

- Synchronisation.
- Determine fuel injection timing.
- Enable the fuel pump relay circuit (after the priming period).
- Produce an engine speed signal which is broadcast on the CAN bus for use by other systems.

MASS AIR FLOW/INTAKE AIR TEMPERATURE (MAF/IAT) SENSOR



E46904

The MAF/IAT sensor is located on the inlet air duct directly after the air filter box. The sensor combines the two functions of a MAF sensor and an IAT sensor in one unit. The sensor is housed in a plastic moulding which is connected between the intake manifold and the air intake pipe.

The MAF sensor works on the hot film principle. Two sensing elements are contained within a film. One element is maintained at ambient (air intake) temperature, e.g. 25°Celsius (77°F). The other element is heated to 200°Celsius (392°F) above the ambient temperature, e.g. 225°Celsius (437°F). Intake air entering the engine passes through the MAF sensor and has a cooling effect on the film. The ECM monitors the current required to maintain the 200°Celsius (392°F) differential between the two elements and uses the differential to provide a precise, non-linear, signal which equates to the volume of air being drawn into the engine.

The MAF sensor output is a digital signal proportional to the mass of the incoming air. The ECM uses this data, in conjunction with signals from other sensors and information from stored fueling maps, to determine the precise fuel quantity to be injected into the cylinders. The signal is also used as a feedback signal for the EGR system.

The IAT sensor incorporates a negative temperature coefficient (NTC) thermistor in a voltage divider circuit. The NTC thermistor works on the principle of decreasing resistance in the sensor as the temperature of the intake air increases. As the thermistor allows more current to pass to ground, the voltage sensed by the ECM decreases. The change in voltage is proportional to the temperature change of the intake air. Using the voltage output from the IAT sensor, the ECM can correct the fueling map for intake air temperature. The correction is an important requirement because hot air contains less oxygen than cold air for any given volume.

The MAF sensor receives a 12V supply from the Battery Junction Box (BJB) and a ground connection via the ECM. Two further connections to the ECM provide a MAF signal and IAT signal.

The IAT sensor receives a 5V reference voltage from the ECM and shares a ground with the MAF sensor. The signal output from the IAT sensor is calculated by the ECM by monitoring changes in the supplied reference voltage to the IAT sensor voltage divider circuit.

The ECM checks the calculated air mass against the engine speed. If the calculated air mass is not plausible, the ECM uses a default air mass figure which is derived from the average engine speed compared to a stored characteristic map. The air mass value will be corrected using values for boost pressure, atmospheric pressure and air temperature.

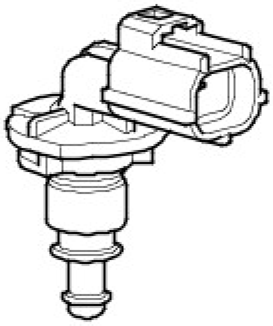
If the MAF sensor fails the ECM implements the default strategy based on engine speed. In the event of a MAF sensor signal failure, the following symptoms may be observed:

- EGR system off
- Delayed engine response
- Reduced engine performance.

If the IAT sensor fails the ECM uses a default intake air temperature of 40°Celsius (104°F). In the event of an IAT sensor failure, any of the following symptoms may be observed:

- Under fueling, resulting in reduced engine performance.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR



E46905

The ECT sensor is located in the top hose at the coolant manifold junction. The ECT sensor provides the ECM and the instrument cluster with engine coolant temperature status.

The ECM uses the temperature information for the following functions:

- Fueling calculations
- Limit engine operation if engine coolant temperature becomes too high
- Cooling fan operation
- Glow plug activation time.

The instrument cluster uses the temperature information for temperature gauge operation. The engine coolant temperature signal is also transmitted on the CAN bus by the instrument cluster for use by other systems.

The ECM/ECT sensor circuit consists of an internal voltage divider circuit which incorporates an NTC thermistor. As the coolant temperature rises the resistance through the sensor decreases and vice versa. The output from the sensor is the change in voltage as the thermistor allows more current to pass to earth relative to the temperature of the coolant.

The ECM compares the signal voltage to stored values and adjusts fuel delivery to ensure optimum driveability at all times. The engine will require more fuel when it is cold to overcome fuel condensing on the cold metal surfaces inside the combustion chamber. To achieve a richer air/fuel ratio, the ECM extends the injector opening time. As the engine warms up the air/fuel ratio is leaned off.

The input to the sensor is a 5V reference voltage supplied from the voltage divider circuit within the ECM. The ground from the sensor is also connected to the ECM which measures the returned current and calculates a resistance figure for the sensor which relates to the coolant temperature.

The following table shows engine coolant temperature values and the corresponding sensor resistance and voltage values.

Coolant Temperature Sensor Response

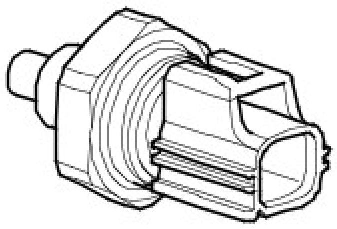
Temperature (Degrees Celsius)	Resistance (Kohms)	Voltage (Volts)
-40	925	4.54
-30	496	4.46
-20	277	4.34
-10	160	4.15
0	96	3.88
10	59	3.52
20	37	3.09
30	24	2.62
40	16	2.15
50	11	1.72
60	7.5	1.34
70	5.6	1.04
80	3.8	0.79
90	2.9	0.64
100	2.08	0.49
110	1.56	0.38
120	1.19	0.29
130	0.918	0.22
140	0.673	0.17
150	0.563	0.14

If the ECT sensor fails, the following symptoms may be observed:

- Difficult cold start (under extreme conditions).
- Engine performance compromised.
- Temperature gauge inoperative or inaccurate reading.

In the event of ECT sensor signal failure, the ECM applies a default value of 80°Celsius (176°F) coolant temperature for fueling purposes. The ECM will also permanently operate the cooling fan at all times when the ignition is switched on, to protect the engine from overheating.

ENGINE OIL TEMPERATURE SENSOR



E46906

The oil temperature sensor is located in the engine oil pan. The temperature sensor is a NTC type which operates in the -30 Degrees Celsius to +150 Degrees Celsius temperature range.

Oil Temperature Sensor Response

Temperature Degrees Celsius	Resistance Ohms
60	620
90	255
120	117
150	60

FUEL RAIL TEMPERATURE SENSOR

The fuel rail temperature sensor is located on the LP return line.

The sensor is an NTC sensor which is connected to the ECM by two wires. The ECM fuel temperature sensor circuit consists of an internal voltage divider circuit which incorporates an NTC thermistor. As the fuel temperature rises the resistance through the sensor decreases. The output from the sensor is the change in voltage as the thermistor allows more current to pass to earth relative to the temperature of the fuel.

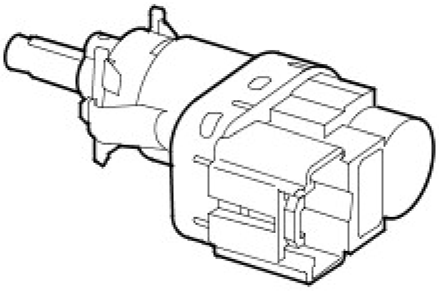
The ECM monitors the fuel temperature constantly. If the fuel temperature exceeds 85°Celsius (185°F), the ECM invokes an engine 'derate' strategy. This reduces the amount of fuel delivered to the injectors in order to allow the fuel to cool. When this occurs, the driver may notice a loss of performance.

Further fuel cooling is available by a bi-metallic valve diverting fuel through the fuel cooler when the fuel reaches a predetermined temperature. In hot climate markets, an electrically operated cooling fan is positioned in the air intake ducting to the fuel cooler. This is controlled by a thermostatic switch, which switches the fan on and off when the fuel reaches a predetermined temperature.

The wires to the fuel sensor are monitored by the ECM for short and open circuit. The ECM also monitors the 5V supply. If a failure occurs a fault is recorded in the ECM memory and the ECM uses a default fuel pressure value.

If the ECM registers an 'out of range' deviation between the pressure signal from the sensor and the pre-programmed 'set point' a fault is stored in the ECM memory. Depending on the extent of the deviation, the ECM will reduce the injection quantity, stop the engine immediately or prevent further engine starting.

BRAKE LIGHT SWITCH



E46910

The brake switch is located on the brake pedal and is operated by the brake pedal. The switch has a normally open circuit switch which closes the circuit when the driver has applied the brakes. The switch is connected directly to the ECM and the ECM also receives a brake light signal on the CAN bus from the ABS control module.

The ECM uses the brake signal for the following:

To limit fueling during braking

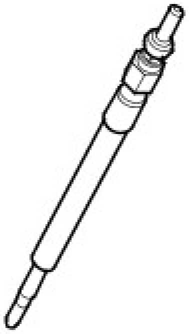
To inhibit/cancel Speed control if the brakes are applied.

In the event of a brake switch failure, the following symptoms may be observed:

Speed control inactive

Increased fuel consumption.

GLOW PLUGS



E46912

Three glow plugs are located in each of the cylinder heads, on the inlet side. The glow plugs and the glow plug relay are a vital part of the engine starting strategy. The glow plugs heat the air inside the cylinder during cold starts to assist combustion. The use of glow plugs helps reduce the amount of additional fuel required on start-up, and consequently reduces the emission of black smoke. The use of glow plugs also reduces the amount of injection advance required, which reduces engine noise, particularly when idling with a cold engine.

There are three phases of glow plug activity:

- Pre-heat
- During crank
- Post heat

The main part of the glow plug is a tubular heating element which protrudes into the combustion chamber of the engine. The heating element contains a spiral filament encased in magnesium oxide powder. At the tip of the tubular heating element is the heater coil. Behind the heater coil, and connected in series, is a control coil. The control coil regulates the heater coil to ensure that it does not overheat.

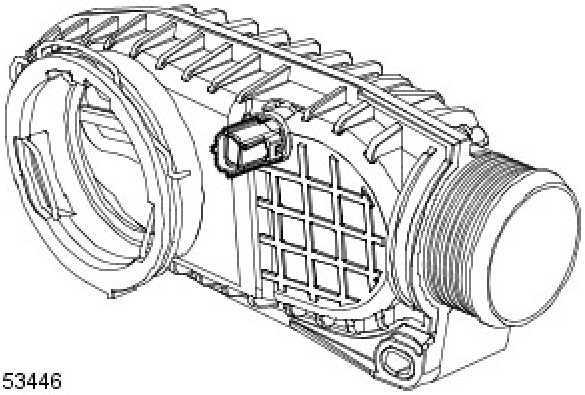
Pre-heat is the length of time the glow plugs operate prior to engine cranking. The ECM controls the pre-heat time based on ECT sensor output and battery voltage. If the ECT sensor fails, the ECM will use the IAT sensor value as a default value. The pre-heat duration is extended if the coolant temperature is low and the battery is not fully charged.

Post heat is the length of time the glow plugs operate after the engine starts. The ECM controls the post heating time based on ECT sensor output. The post heat phase reduces engine noise, improves idle quality and reduces hydrocarbon emissions.

When the ignition is switched on to position II, the glow plug warning lamp illuminates and the instrument cluster displays 'PREHEATING' in the message centre. The glow-lamp is activated separately from the glow-plugs, so is not illuminated during or after start. The plugs can still be ON when the lamp is off in these two phases.

In the event of glow plug failure, the engine may be difficult to start and excessive smoke emissions may be observed after starting.
For additional information, refer to: Glow Plug System (303-07C Glow Plug System - TDV6 2.7L Diesel, Description and Operation).

BOOST AIR TEMPERATURE SENSOR



E53446

The is boost air temperature sensor is located in the rear of the intake chamber immediately preceding the electric throttle. The sensor is used to measure the intake air temperature from the turbo in order to calculate the required amount of fueling.

BOOST PRESSURE CONTROL

The Boost Pressure (BP) sensor is located post turbo after the electric throttle valve. The sensor provides a voltage signal to the ECM relative to the intake manifold pressure. The BP sensor has a three pin connector which is connected to the ECM and provides a 5V reference supply from the ECM, a signal input to the ECM and a ground for the sensor.

The BP sensor uses a diaphragm transducer to measure pressure. The ECM uses the BP sensor signal for the following functions:

- Maintain manifold boost pressure.
- Reduce exhaust smoke emissions when driving at high altitude.
- Control of the EGR system.

If the BP sensor fails, the ECM uses a default pressure of 1013 mbar (14 lbf/in²). In the event of a BP sensor failure, the following symptoms may be observed:

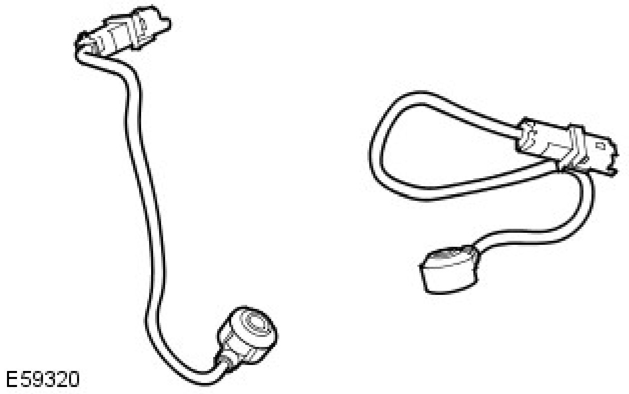
- Altitude compensation inoperative (black smoke emitted from the exhaust).
- Active boost control inoperative.

Boost control is achieved by the use of a direct drive electric actuator. The actuator is attached to the side of the turbo unit and is connected with the control mechanism via a linkage. The electric actuator works on the torque motor principal and has integrated control module.

The electric actuator moves the control vanes through an 60 degree stroke and has the capability to learn its own maximum stroke positions. The electric actuator is controlled via pulse width modulation (PWM) signals from the ECM.
For additional information, refer to: Turbocharger (303-04E Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Description and Operation).

If the ECM detects a fault with the Boost Pressure (BP) sensor, it uses an open loop boost control based on engine speed and airflow as a default value.

KNOCK SENSORS



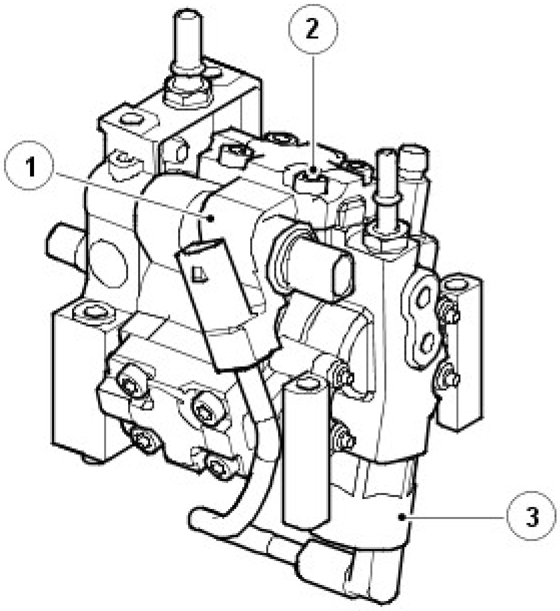
The TdV6 diesel EMS has two knock sensors located in the cylinder head of the inboard side of the V of the engine, adjacent to cylinders 2 and 5. The sensors are connected to the ECM via a twisted pair.

The knock sensors produce a voltage signal in proportion to the amount of mechanical vibration generated at each ignition point. Each sensor monitors the related cylinder bank.

The knock sensors incorporate a piezo-ceramic crystal. This crystal produces a voltage whenever an outside force tries to deflect it, (i.e. exerts a mechanical load on it). When the engine is running, the compression waves in the material of the cylinder block, caused by the combustion of the fuel/air mixture within the cylinders, deflect the crystal and produce an output voltage signal. The signals are supplied to the ECM, which compares them with `mapped' signals stored in memory. From this, the ECM can determine when detonation occurs on individual cylinders. When detonation is detected, the ECM can adjust the pilot fuel quantity to reduce combustion noise, compensating for fuel quantity variations due to injector wear.

Care must be taken at all times to avoid damaging the knock sensors, but particularly during removal and fitting procedures. The recommendations regarding torque and surface preparation must be adhered to. The torque applied to the sensor and the quality of the surface preparation both have an influence over the transfer of mechanical noise from the cylinder block to the crystal.

FUEL RAIL PRESSURE CONTROL VALVE



E46984

Item	Part Number	Description
1	-	Fuel volume control valve
2	-	High pressure fuel pump
3	-	Fuel rail pressure control valve

The fuel rail pressure control valve is incorporated into the high pressure fuel pump. The control valve regulates the fuel pressure within the fuel rail and is controlled by the ECM. The control valve is a PWM controlled solenoid valve.

When the solenoid is de-energized, an internal spring holds an internal valve closed. At fuel pressure of 100 bar (1450 lbf/in²) or higher, the force of the spring is overcome, opening the valve and allowing fuel pressure to decay into the fuel return pipe. When the pressure in the fuel rail decays to approximately 100 bar (1450 lbf/in²) or less, the spring force overcomes the fuel pressure and closes the valve. When the ECM energizes the solenoid, the valve is closed allowing the fuel pressure to build. The pressure in the fuel rail in this condition can reach approximately 1600 bar.

The ECM controls the fuel rail pressure by operating the control valve solenoid using a PWM signal. By varying the duty cycle of the PWM signal, the ECM can accurately control the fuel rail pressure and hence the pressure delivered to the injectors according to engine load. This is achieved by the control valve allowing a greater or lesser volume of fuel to pass from the high pressure side of the pump to the un-pressurized fuel return line, regulating the pressure on the high pressure side.

The fuel rail pressure control valve receives a PWM signal from the ECM of between 0 and 12V. The ECM controls the operation of the control valve using the following information to determine the required fuel pressure:

- Fuel rail pressure
- Engine load
- Accelerator pedal position
- Engine temperature
- Engine speed.

In the event of a total failure of the fuel rail pressure control valve, the engine will not start.

In the event of a partial failure of the fuel rail pressure control valve, the ECM will activate the solenoid with the minimum duty cycle which results in the injection quantity being limited.

FUEL VOLUME CONTROL VALVE (VCV)

The fuel rail volume control valve is incorporated into the high pressure fuel pump. The VCV spills unwanted fuel back to the tank (or LP system) or forwards it to the fuel rail pressure control valve. This avoids unused fuel being pressurized by the HP stage of the pump, only to be spilt back to LP by the pressure control valve wasting energy and heating the fuel.

INJECTORS

There are six electronic fuel injectors (one for each cylinder) located in a central position between the four valves of each cylinder. The ECM divides the injectors into two banks of three with cylinders 1 to 3 being designated bank A and cylinders 4 to 6 designated bank B, with injector numbers 1 and 4 at the front of the engine.

The following table details the injector number to cylinder number relationship. The injectors follow the engine firing order.

Cylinder Number	Injector Number
1	1
2	3
3	5
4	2
5	4
6	6

Each injector is supplied with pressurized fuel from the fuel rail and delivers finely atomized fuel directly into the combustion chambers. Each injector is individually controlled by the ECM which operates each injector in the firing order and controls the injector opening period via PWM signals. Each injector receives a 120V supply from the ECM and, using programmed injection/timing maps and sensor signals, determines the precise pilot and main injector timing for each cylinder. If battery voltage falls to between 6 and 9V, fuel injector operation is restricted, affecting emissions, engine speed range and idle speed. In the event of a failure of a fuel injector, the following symptoms may be observed:

- Engine misfire
- Idle irregular
- Reduced engine performance
- Reduced fuel economy
- Difficult starting
- Increased smoke emissions.

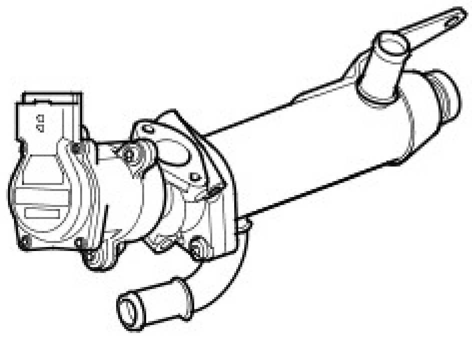
The ECM monitors the wires for each injector for short circuit and open circuit, each injector and the transient current within the ECM. If a defect is found, an error is registered in the ECM for the injector in question.
For additional information, refer to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

The EGR system comprises:

- EGR modulator x 2
- EGR cooler x 2
- Associated connecting pipes

EGR Modulator and Cooler



E46914

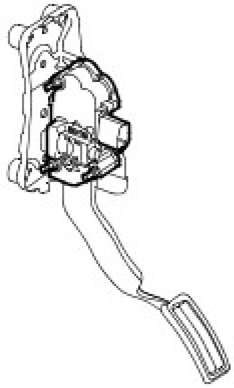
The combined EGR modulator and cooler is located under each cylinder bank, between the exhaust manifold and the cylinder head. The cooler side of the EGR is connected to the vehicle cooling system via hoses. The inlet exhaust side is connected directly into the exhaust manifolds on each side. The exhaust gas passes through the cooler and is expelled via the actuator and a metal pipe into the throttle housing. The EGR modulator is a solenoid operated valve which is controlled by the ECM. The ECM uses the EGR modulator to control the amount of exhaust gas being re-circulated in order to reduce exhaust emissions and combustion noise.

The EGR modulator is controlled by an H bridge driver to control the precise amount of exhaust gas delivered to the cylinders.

The modulators are operated through their full range at each engine shut down, to clear any carbon deposits that may have built up whilst the engine was running

In the event of a failure of the EGR modulator, the EGR function will become inoperative. The ECM can monitor the EGR modulator solenoid for short circuits and store fault codes in the event of failure. The modulator can also be activated for testing using a Land Rover approved diagnostic system.
For additional information, refer to: Engine Emission Control (303-08C Engine Emission Control - TDV6 2.7L Diesel, Description and Operation).

ACCELERATOR PEDAL POSITION (APP) SENSOR



E47297

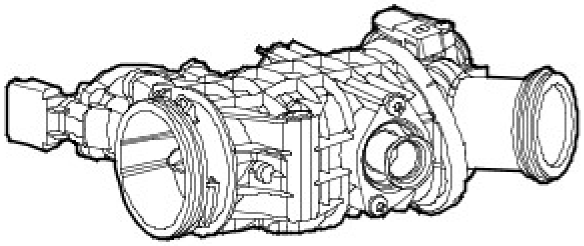
The APP sensor is incorporated into the pedal assembly. The sensor is a twin track rotary potentiometer type.

The APP sensor is located in plastic housing which is integral with the throttle pedal. The housing is injection moulded and provides location for the APP sensor. The sensor is mounted externally on the housing and is secured with two Torx screws. The external body of the sensor has a six pin connector which accepts a connector on the vehicle wiring harness.

The APP sensor is installed on the pedal box and consists of a twin track potentiometer with wipers driven by a linkage connected to the accelerator pedal. Each potentiometer track has a 5 volt supply and ground connection from the ECM, and produces a linear signal voltage to the ECM proportional to the position of the accelerator pedal. The signal voltage from track 1 of the potentiometer is approximately double that of the signal voltage from track 2.

From the sensor signals, the ECM determines driver demand as a percentage of pedal travel, where 0% is with the pedal released and 100% is with the pedal fully depressed. Driver demand is then used to calculate throttle angle, fuel quantity and ignition timing. The ECM also outputs driver demand on the CAN system, for use by the brake and gearbox control systems.

ELECTRONIC THROTTLE



E46900

The electric throttle body is located in the inlet tract prior to where the inlet splits to divert air flow into the two separate air intake manifolds. The electric throttle controls the volume of air allowed into the inlet manifold by means of a DC motor which controls a flap in the body of the throttle. The throttle is used for protecting against engine runaway in the event of engine oil pullover. A detection strategy is used to enable the valve to be closed to shutdown the engine via oxygen starvation. The throttle is on a physical spring return which holds it in the open position. The throttle is only driven closed electronically when required by a diagnostic strategy.

Just after the throttle flap the tubes from the EGR valves/coolers are joined into the assembly.

DIESEL PARTICULATE FILTER (DPF) CONTROL - VEHICLES FROM 2008MY

Vehicles from 2008MY are fitted with a Diesel Particulate Filter (DPF) which collects the particulate matter produced during the combustion process and reduces the particulates entering the atmosphere.

The DPF is located in the exhaust system, downstream of the catalytic converter. A major feature of the DPF is its ability for regeneration. Regeneration is the burning of particulates trapped by the filter to prevent obstruction to the free flow of exhaust gasses. The regeneration process is controlled by the ECM and takes place at calculated intervals and is not noticeable by the driver of the vehicle.

For details of the DPF and the regeneration processes refer to the relevant exhaust system section.
For additional information, refer to: Exhaust System (309-00C Exhaust System - TDV6 2.7L Diesel, Description and Operation).

Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged or destroyed.

The exhaust gas and DPF temperatures are controlled by the DPF software located in the ECM. The DPF software monitors the load status of the DPF based on driving style, distance travelled and signals from a differential pressure sensor and temperature sensors located before and after the DPF in the exhaust system. When the particulate loading of the DPF reaches predetermined levels, the DPF is actively regenerated by adjusting, in conjunction with the ECM, various engine control functions such as:

- fuel injection
- intake air throttle
- EGR
- turbocharger boost pressure control.

The regeneration process is possible because of the flexibility of the common-rail fuel injection engine which provides precise control of fuel flow, fuel pressure and injection timing which are essential requirements to promote the efficient regeneration process.

The ECM contains the DPF software which controls and monitors the DPF and the regeneration process. The software is broken down into three separate modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module, which interact with each other to provide precise DPF control.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested. The DPF supervisor module is a sub-system of the DPF co-ordinator module.

DPF Co-Ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and controlling the following DPF regeneration requests:

- EGR cut-off
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests EGR cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the EGR system confirming that the EGR valve is closed.

• NOTE: The EGR valve is open at idle to allow reduced NO_x. EGR is not used during part load due to intake manifold contamination.

When the EGR valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- Timing and quantity of the four split injections per stroke (pilot, main and two post injections).
- Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- EGR control
- Turbocharger boost pressure control
- Intake air temperature and pressure control.

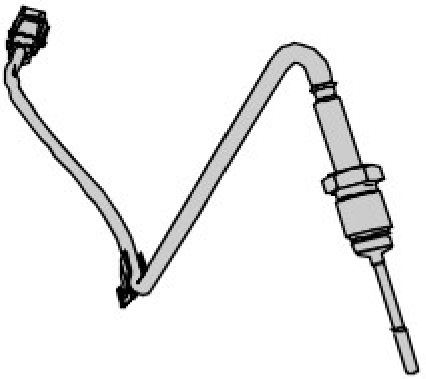
During active regeneration, the EGR operation is disabled and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

Restricting the air intake during DPF regeneration has the following functions:

- Increase in engine load
- Slower combustion
- Reduction in the mass of air taken in
- A reduction in the speed of the exhaust gases and therefore an increase in the time for which the gases are in the catalytic converter.

The module controls the intake air temperature by actuating the EGR throttle and by adjustment of the turbocharger boost pressure control.

DPF Temperature Sensors



E48497

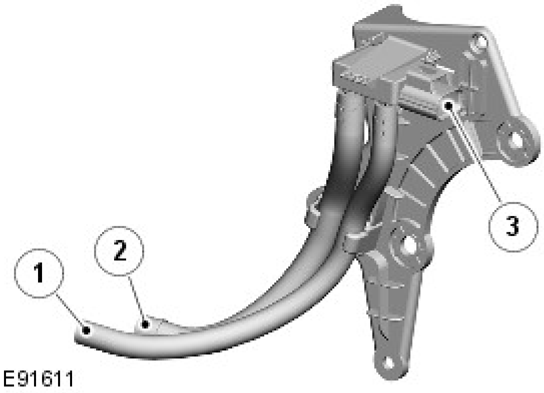
Three temperature sensors are used in the DPF system. One is located in the turbocharger outlet elbow, the second sensor is after the catalytic converter and the third sensor is located after the DPF.

The sensors measure the temperature of exhaust gas exiting the turbocharger, before it passes through the DPF and after it has passed through the DPF and provides the information required by the ECM to calculate the DPF temperature. The information is used, in conjunction with other data, to estimate the amount of accumulated particulate and to control the DPF temperature.

The sensors are Negative Temperature Co-efficient (NTC) type resistors, which measure the temperature of the exhaust gases. The resistance, and subsequently the voltage at the sensor will decrease as the exhaust gas temperature increases.

In the event of a fault in a temperature sensor, the ECM uses a substitute value of 350°C (1202°F).

Differential Pressure Sensor



Item	Part Number	Description
1	-	Low pressure connection
2	-	High pressure connection
3	-	Electrical connector

The differential pressure sensor is located on the rear of the transfer box, adjacent to the DPF.

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet and outlet pressures of the DPF.

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conduction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet air flow and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

A DPF is recognized as overloaded if the differential pressure under certain operating conditions exceeds the overload limit calculated by the ECM. The DPF software may start regeneration attempts but be unable to complete them. These attempts are counted by the ECM and, if the maximum number of regeneration attempts is reached, a fault entry is recorded in the ECM at the next ignition on cycle.

The DPF software performs the following checks using the DPF differential pressure sensor:

- Plausibility check
- Diesel particulate filter efficiency
- Diesel particulate filter overloaded
- Diesel particulate filter clogged
- Monitoring of the maximum regeneration attempts in the lower load range.

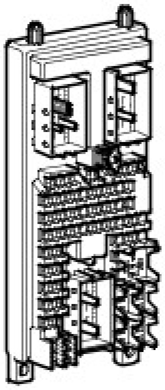
TERRAIN RESPONSE™

The Terrain Response system allows the driver to select a program which will provide the optimum settings for traction and performance for prevailing terrain conditions.

As part of Terrain Response there will be different throttle pedal progression maps associated with different Terrain Response modes. The two extremes are likely to be a sand map (quick build up of torque with pedal travel) and grass/gravel/snow (very cautious build up of torque).

The TdV6 implementation of throttle progression is based on a fixed blend time. The torque will blend from that on one map to that on the new map (for the same pedal position) over a fixed time. This means blending will always take the same amount of time but when the torque change is small the torque increase over time will be small, whilst if the torque change is greater then the torque increase over time will be steeper. The resulting acceleration of the vehicle will depend on the torque difference between the two maps as well as on the gear and range selected. The worst case blending that could ever occur has been calibrated to match the blend rate for petrol derivatives as closely as possible, so as to give a transparent behaviour to customers. For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

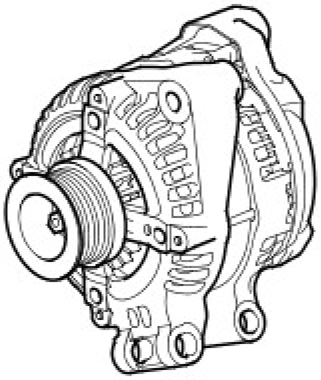
CENTRAL JUNCTION BOX (CJB)



E47607

The CJB initiates the power up and power down routines within the ECM. When the ignition is turned on 12V is applied to the Ignition Sense input. The ECM then starts its power up routines and turns on the ECM main relay; the main power to the ECM and it's associated system components. When the ignition is turned OFF the ECM will maintain its powered up state for up to 60 seconds while it initiates its power down routine and on completion will turn off the ECM main relay.

GENERATOR



E47591

The generator has a multifunction voltage regulator for use in a 14V charging system with 6÷12 zener diode bridge rectifiers.

The ECM monitors the load on the electrical system via PWM signal and adjusts the generator output to match the required load. The ECM also monitors the battery temperature to determine the generator regulator set point. This characteristic is necessary to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximize any rechargeability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing of the battery with consequent water loss.
For additional information, refer to: Generator (414-02C Generator and Regulator - TDV6 2.7L Diesel, Description and Operation).

The generator has a smart charge capability that will reduce the electrical load on the generator reducing torque requirements, this is implemented to utilize the engine torque for other purposes. This is achieved by monitoring three signals to the ECM:

- Generator sense (A sense), measures the battery voltage at the CJB.
- Generator communication (Alt Com) communicates desired generator voltage set point from ECM to generator.
- Generator monitor (Alt Mon) communicates the extent of generator current draw to ECM. This signal also transmits faults to the ECM which will then sends a message to the instrument cluster on the CAN bus to illuminate the charge warning lamp.

Electronic Engine Controls - TDV6 2.7L Diesel - Electronic Engine Controls

Diagnosis and Testing

Overview

This section covers the sensors and units for the engine management system, refer to section 303-14C - Electronic Engine Controls - 2.7L workshop manual section.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Engine oil level ● Cooling system coolant level ● Fuel level ● Fuel contamination/grade/quality ● Fuel leaks ● Accessory drive belt ● Sensor installation/condition ● Viscous fan and solenoid	● Fuses ● Wiring harness ● Electrical connector(s) ● 5 volt sensor supply ● Sensor(s) ● Engine control module (ECM) ● Transmission control module (TCM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Engine cranks, but does not start	● Inertia fuel shut off (IFS) switch ● Low/Contaminated fuel ● Air leakage ● Low pressure fuel system fault ● Fuel pump module fault ● Blocked fuel filter ● Fuel volume control valve (VCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Fuel injection pump failure ● Crankshaft position (CKP) sensor ● ECM fault	Check that the inertia switch has not tripped. Check the fuel level/condition. Check the intake air system for leaks. Check the fuel pump module operation, check the low pressure fuel system for leaks/damage. Check the fuel filter, check the VCV and FPCV. Check the fuel injection pump. Refer to the relevant workshop manual section. Check the CKP sensor circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
Difficult to start	● Glow plug system fault (very cold conditions) ● Low/Contaminated fuel ● Air leakage ● Fuel pump module fault ● Low pressure fuel system fault ● Blocked fuel filter ● Fuel volume control valve (VCV) blocked/contaminated	Check the glow plug circuits. Check the fuel level/condition. Check the intake air system for leaks. Check the fuel pump module operation, check the low pressure fuel system for leaks/damage. Check the fuel filter, check the VCV and FPCV. For EGR valve tests, refer to the relevant workshop manual section.

Symptom	Possible causes	Action
	● Fuel pressure control valve (FPCV) blocked/contaminated ● Exhaust gas recirculation (EGR) valve(s) fault	
Rough idle	● Air ingress ● Low/Contaminated fuel ● Low pressure fuel system fault ● Blocked fuel filter ● Fuel volume control valve (VCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Exhaust gas recirculation (EGR) valve(s) fault	Check the intake air system for leaks. Check the fuel level/condition. Check the low pressure fuel system for leaks/damage. Check the fuel filter, check the VCV and FPCV and EGR valve tests, refer to the relevant workshop manual section.
Lack of power when accelerating	● Intake air system fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust gas recirculation (EGR) valve(s) fault ● Variable geometry turbocharger (VGT) actuator fault	Check the intake air system. Check for a blockage/restriction in the exhaust system, install new components as necessary. Check the fuel pressure. For EGR valve tests and VGT actuator tests, refer to the relevant workshop manual section.
Engine stops/stalls	● Air leakage ● Low/Contaminated fuel ● Low pressure fuel system fault ● High pressure fuel leak ● Fuel volume control valve (VCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Exhaust gas recirculation (EGR) valve fault	Check the intake air system for leaks. Check the fuel level/condition. Check the fuel system for leaks/damage. Check for fuel system leaks, check the VCV and FPCV. For EGR valve tests, refer to the relevant workshop manual section.
Engine judders	● Low/Contaminated fuel ● Air ingress ● Low pressure fuel system fault ● Fuel metering valve blocked/contaminated ● Fuel volume control valve (VCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● High pressure fuel leak ● Fuel injection pump fault	Check the fuel level/condition. Check the intake air system for leaks. Check the low pressure fuel system for leaks/damage. Check the high pressure fuel system for leaks, check the VCV and FPCV. Check the fuel injection pump. Refer to the relevant workshop manual section.
Excessive fuel consumption	● Low pressure fuel system fault ● Fuel volume control valve (VCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Fuel temperature sensor leak	Check the low pressure fuel system for leaks/damage. Check the VCV and FPCV, the fuel temperature sensor, fuel injection pump, etc for leaks. Refer to the relevant workshop manual section. Check for injector DTCs. For EGR valve tests, refer to the relevant workshop manual section.

Symptom	Possible causes	Action
	- High pressure fuel leak - Injector(s) failure - Exhaust gas recirculation (EGR) valve(s) fault	

DTC Index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

Power latch

There are references to "power latch" within the DTC index. This is where the module must be reset by means of a complete power down and power up.

EU3 Base Engine DTCs

DTC	Description	Possible causes	Action
C003100	Left Front Wheel Speed Sensor	- Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003400	Right Front Wheel Speed Sensor	- Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003700	Left Rear Wheel Speed Sensor	- Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
C003A00	Right Rear Wheel Speed Sensor	- Invalid data received from ABS wheel speed signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
P000100	Fuel Volume Regulator Control Circuit / Open	- Fuel volume control valve (VCV) circuit high resistance - VCV circuit open circuit - VCV failure	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a HPP is suspect.
P000200	Fuel Volume Regulator Control Circuit Range/Performance	- Fuel volume control valve (VCV) circuit high resistance - VCV circuit short circuit to ground - VCV circuit short circuit to power - VCV failure	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a HPP is suspect.
P000300	Fuel Volume Regulator Control Low	- Fuel volume control valve (VCV) circuit high resistance - VCV circuit short circuit to ground - VCV failure - ECM failure	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a HPP is suspect.
P000400	Fuel Volume Regulator Control Circuit High	- Fuel volume control valve (VCV) circuit short circuit to power - VCV failure - ECM failure	Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced

DTC	Description	Possible causes	Action
			separately). Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a HPP is suspect.
P004500	Turbocharger/Supercharger Boost Control A Circuit / Open	● Variable geometry turbocharger (VGT) actuator circuit high resistance ● VGT actuator circuit short circuit to ground ● VGT actuator failure ● ECM failure	Refer to the electrical guides and check the VGT circuit. Refer to the warranty policy and procedures manual if a module is suspect.
P004600	Turbocharger/Supercharger Boost Control A Circuit Range/Performance	● Variable geometry turbocharger (VGT) actuator circuit high resistance ● VGT actuator circuit short circuit to ground ● VGT actuator circuit short circuit to power ● VGT actuator failure ● ECM failure	Refer to the electrical guides and check the VGT circuit. Refer to the warranty policy and procedures manual if a module is suspect.
P004700	Turbocharger/Supercharger Boost Control A Circuit Low	● Variable geometry turbocharger (VGT) actuator circuit high resistance ● VGT actuator circuit short circuit to ground ● VGT actuator failure ● ECM failure	Refer to the electrical guides and check the VGT circuit. Refer to the warranty policy and procedures manual if a module is suspect.
P004800	Turbocharger/Supercharger Boost Control A Circuit High	● Variable geometry turbocharger (VGT) actuator circuit short circuit to power ● VGT actuator failure ● ECM failure	Refer to the electrical guides and check the VGT circuit. Refer to the warranty policy and procedures manual if a module is suspect.
P006900	MAP - Barometric Pressure Correlation	● Air leakage in intake path between turbocharger and engine ● MAP sensor circuit high resistance ● MAP sensor circuit short circuit to ground ● MAP sensor circuit short circuit to power ● MAP sensor failure ● ECM failure	Refer to the relevant workshop manual section. Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P006A00	MAP - Mass or Volume Air Flow Correlation	● Air leakage in intake path between turbocharger and engine ● MAP sensor circuit high resistance ● MAP sensor circuit short circuit to ground ● MAP sensor circuit short circuit to power ● MAP sensor failure ● ECM failure	Check the intake air system for leakage after the turbocharger. Refer to the relevant workshop manual section. Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P008700	Fuel rail/system pressure too low	● Fuel rail pressure (FRP) sensor disconnected ● FRP sensor to ECM sensing circuit short circuit to ground	Refer to the electrical guides and check the FRP sensor circuits. For FRP sensor tests, refer to the relevant workshop manual section. Check the low pressure fuel lines for damage or restrictions. Check the fuel pressure. Check the low pressure fuel pump module

DTC	Description	Possible causes	Action
		● FRP sensor supply circuit high resistance ● FRP sensor failure ● Fuel line leak ● Restricted fuel line ● Fuel pump module circuit high resistance ● Fuel pump module circuit short circuit to ground ● Fuel pump module failure ● Volume control valve fault ● Pressure control valve fault	circuits and operation. Check for fuel rail and high pressure fuel line leaks. Check for VCV and PCV DTCs and rectify as necessary.
P008800	Fuel rail/system pressure too high	● Fuel rail pressure (FRP) sensor to ECM wiring (supply/sense): short circuit to each other ● FRP sensor to ECM sense circuit short circuit to power ● FRP sensor failure ● Fuel pressure control valve (FPCV) fault ● Fuel pump module circuit short circuit to power ● Fuel pump module failure	Check the FRP sensor circuits. Refer to the electrical guides. For FRP sensor tests, refer to the relevant workshop manual section. Check the fuel lines, check the fuel pressure and the fuel pump module circuits.
P009000	Fuel Pressure Regulator 1 Control Circuit/Open	● Fuel pressure control valve (PCV) circuit high resistance ● FPCV circuit short circuit to ground ● PCV failure	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009100	Fuel Pressure Regulator 1 Control Circuit Low	● Fuel pressure control valve (PCV) circuit high resistance ● PCV circuit short circuit to ground ● PCV failure	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009200	Fuel Pressure Regulator 1 Control Circuit High	● Fuel pressure control valve (PCV) circuit short circuit to power ● PCV failure	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009700	Intake Air Temperature Sensor 2 Circuit Low (Bank 1)	● Air charge temperature (ACT) sensor circuit high resistance ● ACT sensor circuit short circuit to ground ● ACT sensor failure	Refer to the electrical guides. and check the ACT sensor and circuits.
P009800	Intake Air Temperature Sensor 2 Circuit High (Bank 1)	● Air charge temperature (ACT) sensor circuit short circuit to power ● ACT sensor failure	Refer to the electrical guides. and check the ACT sensor and circuits.

DTC	Description	Possible causes	Action
P009900	Intake Air Temperature Sensor 2 Circuit Intermittent/Erratic (Bank 1)	● Air charge temperature (ACT) sensor circuit high resistance ● ACT sensor circuit short circuit to ground ● ACT sensor circuit short circuit to power ● ACT sensor failure	Refer to the electrical guides. and check the ACT sensor and circuits.
P010000	Mass or Volume Air Flow A Circuit	● Mass air flow (MAF) sensor circuit high resistance ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor failure	Refer to the electrical guides and check the MAF sensor and circuits. Clear the DTCs and test for normal operation. If the problem persists, renew the MAF sensor.
P010400	Mass or Volume Air Flow A Circuit Intermittent/Erratic	● Air leakage ● Mass air flow (MAF) sensor circuit high resistance ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor failure	Refer to the electrical guides and check the MAF sensor and circuits. Clear the DTCs and test for normal operation. If the problem persists, renew the MAF sensor.
P010600	Manifold Absolute Pressure/BARO Sensor Range/Performance	● Manifold absolute pressure (MAP) sensor circuit high resistance ● MAP sensor circuit short circuit to ground ● MAP sensor circuit short circuit to power ● MAP sensor failure	Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P010700	Manifold Absolute Pressure/BARO Sensor Low	● Manifold absolute pressure (MAP) sensor circuit high resistance ● MAP sensor circuit short circuit to ground ● MAP sensor failure	Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P010800	Manifold Absolute Pressure/BARO Sensor High	● Manifold absolute pressure (MAP) sensor circuit short circuit to power ● MAP sensor failure	Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P010900	Manifold Absolute Pressure/BARO Sensor Intermittent	● Manifold absolute pressure (MAP) sensor circuit high resistance ● MAP sensor circuit short circuit to ground ● MAP sensor circuit short circuit to power ● MAP sensor failure	Check the MAP sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P010A00	Mass or Volume Air Flow B Circuit	● Mass air flow (MAF) sensor circuit high resistance ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor failure	Check the MAF sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P010E00	Mass or Volume Air Flow B Circuit Intermittent/Erratic	● Air leakage ● Mass air flow (MAF) sensor circuit high resistance ● MAF sensor circuit short	Refer to the relevant workshop manual section. Check the MAF sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		circuit to ground - MAF sensor circuit short circuit to power - MAF sensor failure	
P010F00	Mass or Volume Air Flow Sensor A/B Correlation	- Air leakage (post turbocharger) - Mass air flow (MAF) sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor failure - VGT actuator circuit high resistance - VGT actuator circuit short circuit to ground - VGT actuator circuit short circuit to power - VGT actuator failure	Refer to the relevant workshop manual section. Check the MAF sensor and circuits. Refer to the electrical guides. For VGT actuator circuit tests, refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P011200	Intake Air Temperature Sensor 1 Circuit Low (Bank 1)	- Intake air temperature (IAT) sensor circuit high resistance - IAT sensor circuit short circuit to ground - IAT sensor failure	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. If the values are outside this range, install a new MAF sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011300	Intake Air Temperature Sensor 1 Circuit High (Bank 1)	- Intake air temperature (IAT) sensor circuit short circuit to power - IAT sensor failure	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. If the values are outside this range, install a new MAF sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011400	Intake Air Temperature Sensor 1 Intermittent/Erratic (Bank 1)	- Intake air temperature (IAT) sensor circuit high resistance - IAT sensor circuit short circuit to ground - IAT sensor circuit short circuit to power - IAT sensor failure	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. If the values are outside this range, install a new MAF sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011600	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	- Engine coolant temperature (ECT) sensor circuit high resistance - ECT sensor circuit short circuit to ground - ECT sensor circuit short circuit to power - ECT sensor failure	Check the ECT sensor and circuits. Refer to the electrical guides. With the engine cold, read the coolant temperature sensor using a data logger function and start the engine. Record the value and allow the engine to idle for 20 minutes. After 20 minutes, recheck the value. If the value has not increased by more than 10°C, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011700	Engine Coolant Temperature Sensor 1 Circuit Low	- Engine coolant temperature (ECT) sensor circuit high resistance - ECT sensor circuit short circuit to ground - ECT sensor failure	Check the ECT sensor and circuits. Refer to the electrical guides. With the engine cold, read the coolant temperature sensor using a data logger function and start the engine. Record the value and allow the engine to idle for 20 minutes. After 20 minutes, recheck the value. If the value has not increased by more than 10°C, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011800	Engine Coolant Temperature Sensor 1 Circuit High	- Engine coolant temperature (ECT) sensor circuit short circuit to power	Check the ECT sensor and circuits. Refer to the electrical guides. With the engine cold, read the coolant temperature sensor using a data logger function and start the engine. Record the value and

DTC	Description	Possible causes	Action
		ECT sensor failure	allow the engine to idle for 20 minutes. After 20 minutes, recheck the value. If the value has not increased by more than 10°C, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011900	Engine Coolant Temperature Sensor 1 Circuit Intermittent/Erratic	Engine coolant temperature (ECT) sensor circuit high resistance ECT sensor circuit short circuit to ground ECT sensor circuit short circuit to power ECT sensor failure	Check the ECT sensor and circuits. Refer to the electrical guides. With the engine cold, read the coolant temperature sensor using a data logger function and start the engine. Record the value and allow the engine to idle for 20 minutes. After 20 minutes, recheck the value. If the value has not increased by more than 10°C, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P018100	Fuel Temperature Sensor A Circuit Range/Performance	Fuel temperature sensor circuit high resistance Fuel temperature sensor circuit short circuit to ground Fuel temperature sensor circuit short circuit to power Fuel temperature sensor failure	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Check the fuel temperature using a data logger function. Make sure the fuel temperature is less than 30°C (86°F). Start the engine and allow to warm up for ten minutes. Recheck the fuel temperature. If the value has not increased by more than 8°C in this time, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P018200	Fuel Temperature Sensor A Circuit Low	Fuel temperature sensor circuit high resistance Fuel temperature sensor circuit short circuit to ground Fuel temperature sensor failure	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Check the fuel temperature using a data logger function. Make sure the fuel temperature is less than 30°C (86°F). Start the engine and allow to warm up for ten minutes. Recheck the fuel temperature. If the value has not increased by more than 8°C in this time, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P018300	Fuel Temperature Sensor A Circuit High	Fuel temperature sensor circuit short circuit to power Fuel temperature sensor failure	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Check the fuel temperature using a data logger function. Make sure the fuel temperature is less than 30°C (86°F). Start the engine and allow to warm up for ten minutes. Recheck the fuel temperature. If the value has not increased by more than 8°C in this time, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P018400	Fuel Temperature Sensor A Circuit Intermittent	Fuel temperature sensor circuit high resistance Fuel temperature sensor circuit short circuit to ground Fuel temperature sensor circuit short circuit to power Fuel temperature sensor failure	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Check the fuel temperature using a data logger function. Make sure the fuel temperature is less than 30°C (86°F). Start the engine and allow to warm up for ten minutes. Recheck the fuel temperature. If the value has not increased by more than 8°C in this time, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019100	Fuel Rail Pressure Sensor A Circuit Range/Performance	Fuel rail pressure (FRP) sensor circuit high resistance FRP sensor circuit short circuit to ground FRP sensor circuit short circuit to power FRP sensor failure	Check the fuel level and the condition and correct connection of the low-pressure fuel circuit lines (incorrect connection of the lines to and from the fuel filter can cause serious fuel pressure fluctuations). Check the FRP sensor and circuits. Check the fuel pump module and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P019200	Fuel Rail Pressure Sensor A Circuit Low	Fuel rail pressure (FRP) sensor circuit high resistance FRP sensor circuit short	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. If the value is 0 MPa (0 lbs/in^2), install a new

DTC	Description	Possible causes	Action
		circuit to ground - FRP sensor failure	sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019300	Fuel Rail Pressure Sensor A Circuit High	- Fuel rail pressure (FRP) sensor circuit short circuit to power - FRP sensor failure	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. If the value is greater than 180 MPa (26,106 lbs/in²), install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019400	Fuel Rail Pressure Sensor A Circuit Intermittent/Erratic	- Fuel rail pressure (FRP) sensor circuit high resistance - FRP sensor circuit short circuit to ground - FRP sensor circuit short circuit to power - FRP sensor failure	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. Increase the engine speed to 2,000 rpm and recheck the fuel pressure. If the value has changed by more than 40 MPa (5,801 lbs/in²) per 10 ms, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019500	Engine Oil Temperature Sensor Circuit	- Engine oil temperature (EOT) sensor circuit high resistance - EOT sensor circuit short circuit to ground - EOT sensor circuit short circuit to power - EOT sensor failure	Check the EOT sensor and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P019600	Engine Oil Temperature Sensor Range/Performance	- Engine oil temperature (EOT) sensor circuit high resistance - EOT sensor circuit short circuit to ground - EOT sensor circuit short circuit to power - EOT sensor failure	Check the EOT sensor and circuits. Refer to the electrical guides. From cold, start the engine and check the oil temperature using a data logger function. Allow the engine to idle for ten minutes and recheck the oil temperature. If the value has not increased by more than 5°C in this time, install a new sensor. Clear the DTCs and test for normal operation.
P019700	Engine Oil Temperature Sensor Circuit Low	- Engine oil temperature (EOT) sensor circuit high resistance - EOT sensor circuit short circuit to ground - EOT sensor failure	Check the EOT sensor and circuits. Refer to the electrical guides. Repair/renew as necessary.
P019800	Engine Oil Temperature Sensor Circuit High	- Engine oil temperature (EOT) sensor circuit short circuit to power - EOT sensor failure	Check the EOT sensor and circuits. Refer to the electrical guides. Repair/renew as necessary.
P019900	Engine Oil Temperature Sensor Circuit Intermittent/Erratic	- Engine oil temperature (EOT) sensor circuit high resistance - EOT sensor circuit short circuit to ground - EOT sensor circuit short circuit to power - EOT sensor failure	Check the EOT sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the oil temperature using a data logger function. Increase the engine speed to 2,000 rpm and recheck the value after two minutes at this engine speed. If the value has increased by more than 40°C per second, install a new sensor. Clear the DTCs and test for normal operation.
P020100	Cylinder 1 Injector Circuit / Open	- Fuel injector circuit high resistance - Fuel injector circuit short circuit to ground - Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short

DTC	Description	Possible causes	Action
			circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020200	Cylinder 2 Injector Circuit / Open	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020300	Cylinder 3 Injector Circuit / Open	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020400	Cylinder 4 Injector Circuit / Open	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020500	Cylinder 5 Injector Circuit / Open	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020600	Cylinder 6 Injector Circuit / Open	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high

DTC	Description	Possible causes	Action
			resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020A00	Cylinder 1 Injection Timing	• Fuel injector circuit high resistance • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020B00	Cylinder 2 Injection Timing	• Fuel injector circuit high resistance • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020C00	Cylinder 3 Injection Timing	• Fuel injector circuit high resistance • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020D00	Cylinder 4 Injection Timing	• Fuel injector circuit high resistance • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020E00	Cylinder 5 Injection Timing	• Fuel injector circuit high resistance • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew

DTC	Description	Possible causes	Action
			as necessary. Clear the DTCs and test for normal operation.
P020F00	Cylinder 6 Injection Timing	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector failure	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P021900	Engine Overspeed Condition	● Crankshaft position (CKP) sensor circuit high resistance ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CMP sensor circuit high resistance ● Camshaft position (CMP) sensor circuit short circuit to ground ● CMP sensor circuit short circuit to power ● CKP sensor failure ● CMP sensor failure	Check the CKP and CMP sensor circuits. Refer to the electrical guides. Rectify as necessary. If no fault is found in the circuits, install new sensors as necessary. Clear the DTCs and test for normal operation. Check for oil ingestion into the intake air path. Rectify as necessary.
P023400	Turbocharger/Supercharger A Overboost Condition	● Air leakage ● Manifold absolute pressure (MAP) sensor circuit high resistance ● MAP sensor circuit short circuit to ground ● MAP sensor circuit short circuit to power ● MAP sensor failure ● Exhaust gas recirculation (EGR) fault ● VGT actuator fault	Refer to the relevant workshop manual section. Check the MAP sensor and circuits. Refer to the electrical guides. For EGR valve tests, refer to the relevant workshop manual section. Check for DTCs indicating EGR or VGT actuator faults. Refer to the warranty policy and procedures manual if a module is suspect.
P029900	Turbocharger/Supercharger A Underboost Condition	● Air leakage, post turbocharger ● Manifold absolute pressure (MAP) sensor circuit high resistance ● MAP sensor circuit short circuit to ground ● MAP sensor circuit short circuit to power ● MAP sensor failure ● Exhaust gas recirculation (EGR) fault ● VGT actuator fault	Check for a post turbocharger air leak, for additional information, refer to the relevant workshop manual section. Check the MAP sensor and circuits. Refer to the electrical guides. For EGR valve tests, refer to the relevant workshop manual section. Check for DTCs indicating EGR or VGT actuator faults. Refer to the warranty policy and procedures manual if a module is suspect.
P029A00	Cylinder 1- Fuel Trim at Max Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC

DTC	Description	Possible causes	Action
		- Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P029B00	Cylinder 1- Fuel Trim at Min Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P029E00	Cylinder 2- Fuel Trim at Max Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P029F00	Cylinder 2 - Fuel Trim at Min Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02A200	Cylinder 3 - Fuel Trim at Max Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above

DTC	Description	Possible causes	Action
		the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	tests are all within range, install a new injector.
P02A300	Cylinder 3 - Fuel Trim at Min Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02A600	Cylinder 4 - Fuel Trim at Max Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02A700	Cylinder 4 - Fuel Trim at Min Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02AA00	Cylinder 5 - Fuel Trim at Max Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.

DTC	Description	Possible causes	Action
		● Injector fault	
P02AB00	Cylinder 5 - Fuel Trim at Min Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02AE00	Cylinder 6 - Fuel Trim at Max Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02AF00	Cylinder 6 - Fuel Trim at Min Limit	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P032600	Knock Sensor 1 Circuit Range/Performance (Bank 1)	● Knock sensor (KS) circuit high resistance ● KS circuit short circuit to ground ● KS circuit short circuit to power ● KS failure	Check that the knock sensors are correctly installed and tightened to the correct torque. Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033100	Knock Sensor 1 Circuit Range/Performance (Bank 2)	● Knock sensor (KS) circuit high resistance ● KS circuit short circuit to ground ● KS circuit short circuit to power ● KS failure	Check that the knock sensors are correctly installed and tightened to the correct torque. Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.

DTC	Description	Possible causes	Action
P033500	Crankshaft Position Sensor A Circuit	● Crankshaft position (CKP) sensor gap incorrect/foreign matter on sensor face /damaged teeth on rotor ● CKP sensor circuit high resistance ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor failure	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P033600	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor gap incorrect/foreign matter on sensor face /damaged teeth on rotor ● CKP sensor circuit high resistance ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor failure	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P033700	Crankshaft Position Sensor A Circuit Low	● Crankshaft position (CKP) sensor gap incorrect/foreign matter on sensor face /damaged teeth on rotor ● CKP sensor circuit high resistance ● CKP sensor circuit short circuit to ground ● CKP sensor failure	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P033900	Crankshaft Position Sensor A Circuit Intermittent	● Crankshaft position (CKP) sensor gap incorrect/foreign matter on sensor face /damaged teeth on rotor ● CKP sensor circuit high resistance ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor failure	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P034100	Camshaft Position Sensor A Circuit Range/Performance (Bank 1 or single sensor)	● Camshaft position (CMP) sensor gap incorrect/foreign matter on sensor face /damaged rotor ● CMP sensor circuit high resistance ● CMP sensor circuit short circuit to ground ● CMP sensor circuit short circuit to power ● CMP sensor failure	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P034200	Camshaft Position Sensor A Circuit Low (Bank 1 or single sensor)	● Camshaft position (CMP) sensor gap incorrect/foreign matter on sensor face /damaged rotor	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
		- CMP sensor circuit high resistance - CMP sensor circuit short circuit to ground - CMP sensor failure	
P038300	Glow Plug Control Module Control Circuit Low	- Glow plug relay, control circuit high resistance - Glow plug relay, control circuit short circuit to ground - Glow plug relay failure	Check the battery condition and state of charge. Check the relay and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new relay. Clear the DTCs and test for normal operation.
P038400	Glow Plug Control Module Control Circuit High	- Glow plug relay, control circuit short circuit to power - Glow plug relay failure	Check the battery condition and state of charge. Check the relay and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new relay. Clear the DTCs and test for normal operation.
P040100	Exhaust Gas Recirculation A Flow Insufficient Detected	- Exhaust gas recirculation (EGR) valve incorrectly installed or loose - EGR pipe blocked - EGR valve stuck closed, blocked - EGR coolers blocked - EGR valve failure - MAF sensor fault	Refer to the relevant workshop manual section. Check the EGR valve, coolers and pipework. Refer to the electrical guides and check the MAF sensor and circuits. Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. Clear the DTCs and test for normal operation.
P040200	Exhaust Gas Recirculation A Flow Excessive Detected	- Exhaust gas recirculation (EGR) valve incorrectly installed or loose - EGR pipe blocked - EGR valve stuck/sticking - EGR coolers blocked - EGR valve circuit high resistance - EGR valve circuit short circuit to ground - EGR valve circuit short circuit to power - EGR valve failure - MAF sensor fault	Refer to the relevant workshop manual section. Check the EGR valve, coolers and pipework. Refer to the electrical guides and check the MAF sensor and circuits. Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. Clear the DTCs and test for normal operation.
P040300	Exhaust Gas Recirculation A Control Circuit	- Exhaust gas recirculation (EGR) valve circuit high resistance - EGR valve circuit short circuit to ground - EGR valve circuit short circuit to power - EGR valve failure	Refer to the relevant workshop manual section. Check the EGR valve, coolers and pipework. Refer to the electrical guides and check the MAF sensor and circuits. Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. Clear the DTCs and test for normal operation.
P040400	Exhaust Gas Recirculation A Control Circuit Range/Performance	- Intake air temperature (IAT) sensor fault - Manifold air pressure (MAP) sensor fault - MAF sensor fault - Exhaust gas recirculation (EGR) valve stuck/sticking - EGR valve circuit high resistance - EGR valve circuit short circuit to ground - EGR valve circuit short	Refer to the relevant workshop manual section. Check the EGR valve, coolers and pipework. Refer to the electrical guides and check the MAF sensor and circuits. Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
		circuit to power - EGR valve failure	
P040500	Exhaust Gas Recirculation Sensor A Circuit Low	- Exhaust gas recirculation (EGR) valve circuit high resistance - EGR valve circuit short circuit to ground - EGR valve failure	Refer to the relevant workshop manual section. Check the EGR valve, coolers and pipework. Refer to the electrical guides and check the MAF sensor and circuits. Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. Clear the DTCs and test for normal operation.
P040600	Exhaust Gas Recirculation Sensor A Circuit High	- Exhaust gas recirculation (EGR) valve circuit short circuit to power - EGR valve failure	Refer to the relevant workshop manual section. Check the EGR valve, coolers and pipework. Refer to the electrical guides and check the MAF sensor and circuits. Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. Clear the DTCs and test for normal operation.
P040700	Exhaust Gas Recirculation Sensor B Circuit Low	- Exhaust gas recirculation (EGR) throttle position sensor circuit high resistance - EGR throttle position sensor circuit short circuit to ground - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P040800	Exhaust Gas Recirculation Sensor B Circuit High	- Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to power - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P048300	Fan Performance	- Cooling fan control circuit short circuit to ground - Cooling fan control circuit short circuit to power - Cooling fan control circuit high resistance - Cooling fan fault	Check the cooling fan operation. Refer to the electrical guides and check the fan circuit, repair/renew as necessary. Clear the DTCs and test for normal operation. Check the pulse width modulated (PWM) signal and check the motor for sticking. Repair/renew as necessary.
P048700	Exhaust Gas Recirculation Throttle Control Circuit A / Open	- Exhaust gas recirculation (EGR) throttle position sensor circuit high resistance - Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to ground - Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to power - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048800	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	- Exhaust gas recirculation (EGR) throttle position sensor circuit high resistance	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command

DTC	Description	Possible causes	Action
		● Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to ground ● Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to power ● EGR modulator failure	the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P049300	Fan Overspeed (clutch locked)	● Seized viscous coupling ● Fan speed sensor failure	Check that the viscous coupling turns independently of the fan. Refer to the electrical guides and check the viscous fan speed sensor circuit. Repair/renew as necessary.
P049400	Fan Speed Low	● Viscous fan restriction ● Viscous fan solenoid circuit high resistance ● Viscous fan solenoid circuit short circuit to ground ● Viscous fan solenoid failure	Clear any obstruction from the viscous fan. Refer to the electrical guides and check the viscous fan solenoid and circuits. Refer to the relevant workshop manual section.
P049500	Fan Speed High	● Viscous fan solenoid circuit short circuit to power ● Viscous fan solenoid failure	Refer to the electrical guides and check the viscous fan solenoid and circuits. Refer to the electrical guides.
P050000	Vehicle Speed Sensor A	● Vehicle speed invalid signal received over CAN	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050162	Vehicle Speed Sensor A Range/Performance	● Vehicle speed range/performance	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050164	Vehicle Speed Sensor A Range/Performance	● Vehicle speed range/performance	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050400	Brake switch A/B Correlation	● The brake pressure reading does not agree with the brake lamp switch value ● Brake switch failure ● ECM failure	Check the brake switch and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P050429	Brake Switch A / B Correlation	● Brake switch malfunction (sub-processor)	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.
P050464	Brake Switch A / B Correlation	● Brake switch malfunction	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.
P050600	Idle Air Control System RPM Lower Than Expected	● Intake air restriction ● Accessory drive overload (defective/seized component)	Check the air intake system. Check the accessory drive belt and components. Refer to the relevant workshop manual section.
P050700	Idle Air Control System RPM Higher Than Expected	● Intake air leak between the mass air flow (MAF) sensor and throttle ● Intake air leak between throttle and engine ● Engine crankcase breather leak	Check the air intake system. Check the engine breather system. Refer to the relevant workshop manual section.
P051216	Starter Request Circuit	● Crank request circuit low input	Refer to the electrical guides and check the starter circuit. Repair/renew as necessary.
P051217	Starter Request Circuit	● Crank request circuit high input	Refer to the electrical guides and check the starter circuit. Repair/renew as necessary.

DTC	Description	Possible causes	Action
P051300	Incorrect Immobilizer Key	● Security key invalid	Program keys using the approved diagnostic system. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P052900	Fan Speed Sensor Circuit Intermittent	● Fan obstruction ● Viscous fan circuit issue ● Viscous fan damage/fault	Clear any obstruction, refer to the electrical guides and check the viscous fan solenoid and circuits. Repair/renew as necessary. Refer to the relevant workshop manual section.
P056000	System Voltage	● Battery back-up malfunction ● Battery voltage low ● Battery ground cable: high resistance ● Battery connections loose/corroded ● Battery current drain	Check the battery condition and state of charge. Refer to the relevant workshop manual section.
P056200	System Voltage Low	● Battery condition/state of charge ● Battery ground cable high resistance ● Battery connections loose/corroded ● Battery current drain ● Battery power distribution circuits	Check the battery connections and condition and charge as necessary. Refer to the electrical guides and check the battery power supplies to the ECM, etc. Repair/renew as necessary. Refer to the relevant workshop manual section.
P056300	System Voltage High	● System boosted from high voltage ● Battery voltage high ● Generator over charge condition	Check if the vehicle has been jump-started. Check the battery condition and state of charge. Refer to the relevant workshop manual section.
P056600	Cruise Control OFF Signal	● Speed control (CANCEL) switch signal circuit short circuit to power ● Speed control cancel switch stuck/jammed ● Speed control cancel switch failure	Check the operation of the cancel switch. Refer to the electrical guides and check the circuit. Repair/renew as necessary. Refer to the relevant workshop manual section.
P056700	Cruise Control RESUME Signal	● Speed control (RESUME) switch signal circuit short circuit to power ● Speed control resume switch stuck/jammed ● Speed control resume switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P056900	Cruise Control COAST Signal	● Speed control (-) switch signal circuit short circuit to power ● Speed control - switch stuck/jammed ● Speed control - switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P057000	Cruise Control ACCEL Signal	● Speed control + switch signal circuit short circuit to power ● Speed control + switch stuck/jammed ● Speed control + switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P057100	Brake Switch A Circuit	● The brake pressure reading does not agree with the brake lamp switch value	Check the brake switch and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		- Brake switch failure - ECM failure	
P057400	Cruise Control System - Vehicle Speed Too High	- Incorrect speed sensor signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
P057600	Cruise Control Input Circuit Low	- Speed control switch short circuit to ground - Speed control switch high resistance	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057700	Cruise Control Input Circuit High	- Speed control switch short circuit to power	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057800	Cruise Control Multi-Function Input A Circuit Stuck	- Speed control multi-function input A circuit high resistance - Speed control multi-function input A circuit short circuit to ground - Speed control multi-function input A circuit short circuit to power - Speed control switch stuck	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057900	Cruise Control Multi-Function Input A Circuit Range/Performance	- Speed control multi-function input A circuit high resistance - Speed control multi-function input A circuit short circuit to ground - Speed control multi-function input A circuit short circuit to power - Speed control switch stuck	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P058500	Cruise Control Multi-Function Input A / B Correlation	- Cruise control acceleration monitor fault	Check for other DTCs and Repair/renew those first. Clear this DTC and retest.
P060000	Serial Communication Link	- Internal control module communication link	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060143	Internal Control Module Memory Check Sum Error	- Transmission control module (TCM) internal control module memory check sum error - special memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060145	Internal Control Module Memory Check Sum Error	- Transmission control module (TCM) internal control module memory check sum error - program memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060300	Internal Control Module Keep Alive Memory (KAM) Error	- ECM internal control module KAM error	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060400	Internal Control Module Random Access Memory (RAM) Error	- ECM internal control module RAM error	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060442	Internal Control Module Random Access Memory (RAM) Error	- ECM general memory failure	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060443	Internal Control Module Random Access Memory (RAM) Error	- ECM shut off RAM test - special memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P060444	Internal Control Module Random Access Memory (RAM) Error	- ECM RAM check sum - data memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060445	Internal Control Module Random Access Memory (RAM) Error	- ECM failure - program memory failure	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060500	Internal Control Module Read Only Memory (ROM) Error	- ECM internal control module ROM error	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060542	Internal Control Module Read Only Memory (ROM) Error	- TCM - general memory failure ROM checksum	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060543	Internal Control Module Read Only Memory (ROM) Error	- TCM - shut off ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060544	Internal Control Module Read Only Memory (ROM) Error	- TCM - initial ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060545	Internal Control Module Read Only Memory (ROM) Error	- TCM - continuous ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060546	Internal Control Module Read Only Memory (ROM) Error	- TCM - continuous ROM test	Clear DTC and retest. If the problem persists, renew the TCM. Refer to the warranty policy and procedures manual if a module is suspect.
P060548	Internal Control Module Read Only Memory (ROM) Error	- ECM circuits short circuit to ground - ECM circuits short circuit to power - ECM circuits high resistance - TCM - shut off ROM test - supervision software fault	Check the ECM circuits. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060601	Control Module Processor	- PCM/ECM processor - Controller test - general electrical failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060604	Control Module Processor	- PCM/ECM processor error capturing instructions	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060605	Control Module Processor	- PCM/ECM processor scheduling sequence check - system programming failures	Program the module using the approved diagnostic system.
P060641	Control Module Processor	- PCM/ECM processor watch dog timer fault - general checksum failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060642	Control Module Processor	- PCM/ECM processor error capturing instructions - general memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060643	Control Module Processor	- PCM/ECM processor duplication memory fault - special memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060644	Control Module Processor	- PCM/ECM processor duplication memory fault - data memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060645	Control Module Processor	- PCM/ECM processor detection of write to internal ROM - program memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P060646	Control Module Processor	- PCM/ECM processor detection of write to internal ROM - calibration/parameter memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060647	Control Module Processor	- PCM/ECM processor watch dog timer fault/processor fault	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060648	Control Module Processor	- PCM/ECM processor scheduling sequence check/processor - supervision software failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060649	Control Module Processor	- PCM/ECM processor controller test/processor - internal electronic failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060700	Control Module Performance	- ECM - event information - CPU watch dog	Check the ECM circuits and connectors. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060A00	Internal Control Module Monitoring Processor Performance	- ECM - event information - CPU watch dog	Check the ECM circuits and connectors. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060B00	Internal Control Module A/D Processing Performance	- ECM - event information - Processor monitoring conversion not plausible	Check the ECM circuits and connectors. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060C00	Internal Control Module Main Processor Performance	- ECM - event information processor monitoring speed not plausible	Check the ECM circuits and connectors. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060D00	Internal Control Module Accelerator Pedal Position Performance	- ECM internal communication error	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060E62	Internal Control Module Throttle Position Performance	- Throttle motor amplifier failure for valve sensor malfunction - ECM internal signal compare failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060E64	Internal Control Module Throttle Position Performance	- Throttle position communication - ECM internal signal plausibility failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P061000	Control Module Vehicle Options Error	- Car configuration file (CCF) settings mismatch	Configure the module using the approved diagnostic system.
P061600	Starter Relay Circuit Low	- Starter relay drive circuit short circuit to ground - Starter relay drive circuit high resistance - Starter relay failure	Check the starter relay operation. Refer to the electrical guides and check the starter relay circuit. Repair/renew as necessary.
P061700	Starter Relay Circuit High	- Starter relay drive circuit short circuit to battery - Starter relay failure	Check the starter relay operation. Refer to the electrical guides and check the starter relay circuit. Repair/renew as necessary.

DTC	Description	Possible causes	Action
P061A00	Internal Control Module Torque Performance	● Pedal follower error	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061A29	Internal Control Module Torque Performance	● Absolute engine torque calculation failure - sub-processor	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061A64	Internal Control Module Torque Performance	● Absolute engine torque calculation failure	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061B29	Internal Control Module Torque Calculation Performance	● Internal control module torque calculation performance	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061B64	Internal Control Module Torque Calculation Performance	● Internal control module torque calculation performance	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061C00	Internal Control Module Engine RPM Performance	● Processor monitoring speed not plausible	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061E00	Internal Control Module Brake Signal Performance	● Cruise intervention not plausible	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P062000	Generator Control Circuit	● Generator failure	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P062200	Generator Field Terminal Circuit	● Generator circuit fault ● Generator failure	Refer to the electrical guides and check the generator circuit. Repair/renew as necessary. Refer to the relevant workshop manual section.
P062500	Generator Field Terminal Circuit Low	● Voltage sense circuit high resistance ● Generator B+ circuit high resistance/intermittent ● Generator monitor circuit short circuit to ground	Check the main charging circuit fuse. Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P062600	Generator Field Terminal Circuit High	● Generator connector loose/not connected ● Generator monitor circuit short circuit to power ● Generator monitor circuit high resistance	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P062700	Fuel Pump A Control Circuit / Open	● Fuel pump module relay control circuit short circuit to power ● Fuel pump module relay failure	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Refer to the relevant workshop manual section. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062800	Fuel Pump A Control Circuit Low	● Fuel pump control circuit short circuit to ground ● Fuel pump control circuit high resistance ● Fuel pump relay fault	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062900	Fuel Pump A Control Circuit High	● Fuel pump control circuit short circuit to power ● Fuel pump relay fault	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P062B00	Internal Control Module Fuel Injector Control Performance	● Fuel cut not plausible ● Monitoring of post injection ● Monitoring of fuel mass adaption ● Monitoring of accelerator pedal position	Check and Repair/renew other DTCs first. If this code still sets, contact the technical help desk.
P062D00	Fuel Injector Driver Circuit Performance Bank 1	● Injector(s) disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure ● ECM failure	Refer to the electrical guides and check the injector circuits. Rectify as necessary. Clear the DTCs and test for normal operation. Refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P062E00	Fuel Injector Driver Circuit Performance Bank 2	● Injector(s) disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure ● ECM failure	Refer to the electrical guides and check the injector circuits. Rectify as necessary. Clear the DTCs and test for normal operation. Refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P063000	VIN Not Programmed or Incompatible - ECM/PCM	● VIN not programmed ● VIN incompatible with vehicle specification	Configure the module using the approved diagnostic system.
P063305	Immobilizer Key Not Programmed - ECM/PCM	● Security target ID transfer process failed	Program the key using the approved diagnostic system.
P063355	Immobilizer Key Not Programmed - ECM/PCM	● Security no target in EMS	Program the module using the approved diagnostic system.
P063400	PCM / ECM / TCM Internal Temperature A Too High	● ECM internal temperature too high ● E box cooling fan obstruction ● E box cooling fan operation ● ECM internal sensor error	Consider atmospheric and customer driving conditions before carrying out any other action. Check the E box cooling fan function. Refer to the electrical guides and check the ECM circuits. Using a datalogger function, check the ECM temperature. If the temperature value is greater than 130°C (266°F) suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P063422	PCM / ECM / TCM Internal Temperature A Too High	● ECM internal temperature too high ● E box cooling fan obstruction ● E box cooling fan operation ● ECM internal sensor error	Consider atmospheric and customer driving conditions before carrying out any other action. Check the E box cooling fan function. Refer to the electrical guides and check the ECM circuits. Using a datalogger function, check the ECM temperature. If the temperature value is greater than 130°C (266°F) suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P063424	PCM / ECM / TCM Internal Temperature A Too High	● ECM internal temperature too high ● E box cooling fan obstruction ● E box cooling fan operation ● ECM internal sensor error	Consider atmospheric and customer driving conditions before carrying out any other action. Check the E box cooling fan function. Refer to the electrical guides and check the ECM circuits. Using a datalogger function, check the ECM temperature. If the temperature value is greater than 130°C (266°F) suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P064200	Sensor Reference Voltage A Circuit Low	● ECM power supply circuit high resistance ● ECM power supply circuit short circuit to ground ● ECM ground circuit high resistance ● 5 Volt supply ● ECM relay malfunction ● ECM failure	Check the ECM power supply and relay circuits. Check the 5 volt sensor supply. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P064300	Sensor Reference Voltage A Circuit High	• ECM power supply circuit short circuit to power • ECM ground circuit short circuit to power • 5 Volt supply • ECM relay malfunction • ECM failure	Check the ECM power supply and relay circuits. Check the 5 volt sensor supply. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P060644	Control Module Processor	• PCM/ECM processor duplication memory fault - data memory failure	Clear DTC and retest. If the problem persists, renew the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P065200	Sensor Reference Voltage B Circuit Low	• ECM power supply circuit high resistance • ECM power supply circuit short circuit to ground • ECM ground circuit high resistance • 5 Volt supply • ECM relay malfunction • ECM failure	Check the ECM power supply and relay circuits. Check the 5 volt sensor supply. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P065300	Sensor Reference Voltage B Circuit High	• ECM power supply circuit short circuit to power • ECM ground circuit short circuit to power • 5 Volt supply • ECM relay malfunction • ECM failure	Check the ECM power supply and relay circuits. Check the 5 volt sensor supply. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P066700	PCM / ECM / TCM Internal Temperature Sensor A Range/Performance	• ECM internal temperature sensor range/performance	Check the ECM circuits. Refer to the electrical guides. Using a data logger function, check the ECM internal temperature. Start the engine and allow to idle for five minutes before rechecking the temperature. If the temperature has increased by more than 10°C per 100 ms suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P066800	PCM / ECM / TCM Internal Temperature Sensor A Circuit Low	• ECM temperature sensor circuit short circuit to ground	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, check the ECM circuits. Refer to the electrical guides. Using a datalogger function, check the ECM internal temperature. If the value is less than -40°C (-40°F), suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P066900	PCM / ECM / TCM Internal Temperature Sensor A Circuit High	• TCM temperature sensor circuit short circuit to power	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P067000	Glow Plug Control Module Control Circuit / Open	• Glow plug relay, control circuit high resistance • Glow plug relay, control circuit short circuit to ground • Glow plug relay failure	Check the glow plug relay circuits. Refer to the electrical guides. Check the relay operation. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P068700	ECM/PCM Power Relay Control Circuit High	• ECM control relay malfunction	Check the ECM relay and circuit. Refer to the electrical guides.
P069300	Fan 2 Control Circuit Low	• Viscous fan control circuit short circuit to ground • Viscous fan control circuit high resistance • Viscous fan solenoid failure	Check the viscous fan solenoid and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P069400	Fan 2 Control Circuit High	• Viscous fan control circuit short circuit to power • Viscous fan solenoid failure	Check the viscous fan solenoid and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P069500	Fan 3 Control Circuit Low	● E box fan circuit short circuit to ground	Check the E box fan operation and circuit. Refer to the electrical guides.
P069600	Fan 3 Control Circuit High	● E box fan circuit short circuit to power	Check the E box fan operation and circuit. Refer to the electrical guides.
P070000	Transmission Control System (MIL Request)	● Transmission fault	Check for other DTCs and rectify those first. Clear this DTC and retest.
P085100	Park / Neutral Switch Input Circuit Low	● Park/Neutral switch circuit short to ground	Check the switch and circuits. Refer to the electrical guides and repair/renew as necessary. Clear the DTCs and test for normal operation.
P085200	Park / Neutral Switch Input Circuit High	● Park/Neutral switch circuit short to power	Check the switch and circuits. Refer to the electrical guides and repair/renew as necessary. Clear the DTCs and test for normal operation.
P0A0900	DC/DC Converter Status Circuit Low	● DC/DC converter circuit low	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P0A1000	DC/DC Converter Status Circuit High	● DC/DC converter circuit high	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P113600	E box fan circuit performance	● E box fan circuit short circuit to ground ● E box fan circuit short circuit to power ● E box fan circuit high resistance ● E box fan failure	Check the E box fan and circuits and fan operation. Refer to the electrical guides.
P120000	Injector Range/Performance	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector leaking ● Fuel injector failure ● ECM failure	Refer to the electrical guides and check the injector circuits. Refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P125900	Immobilizer to PCM Signal Error	● Incorrect ID received from instrument pack	Configure the system using the approved diagnostic system.
P133400	EGR Throttle Position Sensor Minimum/Maximum Stop Performance	● Exhaust gas recirculation (EGR) valve stuck/sticking ● EGR valve circuit high resistance ● EGR valve circuit short circuit to ground ● EGR valve circuit short circuit to power ● Intake air shut off throttle stuck/sticking ● Intake air shut off throttle circuit high resistance ● Intake air shut off throttle circuit short circuit to ground ● Intake air shut off throttle circuit short circuit to power ● Intake air shut off throttle failure ● ECM failure	Check the EGR valve and circuits. Refer to the electrical guides. Refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P133500	EGR Position Sensor Minimum/Maximum Stop Performance	● EGR valve circuit high resistance ● EGR valve circuit short circuit to ground	Check the EGR valve and circuits. Refer to the electrical guides. Using a datalogger function, check the EGR valve angles and command the valve to 0% pulse width modulated (PWM). Recheck the angle. The

DTC	Description	Possible causes	Action
		• EGR valve circuit short circuit to power • EGR valve failure	value should be 0 - 20%. If the value is outside this range, install a new valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P133600	Crankshaft/Camshaft Sensor Range/Performance	• CKP sensor circuit high resistance • CKP sensor circuit short circuit to ground • CKP sensor circuit short circuit to power • CMP sensor circuit high resistance • CMP sensor circuit short circuit to ground • CMP sensor circuit short circuit to power • CKP sensor failure • CMP sensor failure	Check the CMP and CKP sensors and circuits. Refer to the electrical guides. If no fault is found in the circuits, install new sensors as necessary. Clear the DTCs and test for normal operation.
P140A00	Exhaust Gas Recirculation Sensor C Circuit Low	• EGR valve circuit (left-hand bank) high resistance • EGR valve circuit short circuit to ground • EGR valve failure	Check the EGR valve and circuits. Refer to the electrical guides. Using a datalogger function, check the EGR valve angle with the ignition on and the engine off. Command the valve angle to 0% pulse width modulated (PWM), then to 100% pulse width modulated (PWM) and recheck the angles. The angles should range between 0 - 20% and 80 - 95%. If this is not the case, install a new valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P140B00	Exhaust Gas Recirculation Sensor C Circuit High	• EGR valve circuit (left-hand bank) short circuit to power • EGR valve failure	Check the EGR valve and circuits. Refer to the electrical guides. Using a datalogger function, check the EGR valve angle with the ignition on and the engine off. Command the valve angle to 0% pulse width modulated (PWM), then to 100% pulse width modulated (PWM) and recheck the angles. The angles should range between 0 - 20% and 80 - 95%. If this is not the case, install a new valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P140C00	Exhaust Gas Recirculation Control Circuit B	• Intake air shut off throttle circuit high resistance • Intake air shut off throttle circuit short circuit to ground • Intake air shut off throttle circuit short circuit to power • Intake air shut off throttle failure • ECM failure	Check the EGR valve and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P140D00	Exhaust Gas Recirculation Control Circuit B Range/Performance	• Exhaust gas recirculation (EGR) control circuit range/performance (left-hand bank) • Intake air temperature (IAT) sensor fault • Manifold absolute pressure (MAP) sensor fault • Mass air flow (MAF) sensor fault • EGR valve stuck closed, blocked • EGR valve circuit high resistance • EGR valve circuit short circuit to ground	Check the IAT, MAP and MAF sensors and circuits. Refer to the electrical guides. For left-hand bank EGR valve circuit tests, refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
		- EGR valve circuit short circuit to power - EGR valve failure	
P140E00	EGR Position Sensor C Minimum/Maximum Stop Performance	- Exhaust gas recirculation (EGR) valve circuit (left-hand bank) high resistance - EGR valve circuit short circuit to ground - EGR valve circuit short circuit to power - EGR valve failure	Check the EGR valve and circuits. Refer to the electrical guides. Using a datalogger function, check the EGR valve angles and command the valve to 0% pulse width modulated (PWM). Recheck the angle. The value should be between 0 - 20%. If the value is outside this range, install a new valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P141A00	Exhaust Gas Recirculation Sensor A Circuit Intermittent/Erratic	- EGR valve circuit (right-hand bank) high resistance - EGR valve circuit short circuit to ground - EGR valve circuit short circuit to power - EGR valve failure	Check the EGR valve and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Using a datalogger function, check the EGR valve position. After a further 5 seconds, recheck the position. If the value has increased by more than 80% per 10 ms, recheck the circuits. If no fault is found in the circuits, install a new EGR valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P141B00	Exhaust Gas Recirculation Sensor B Circuit Intermittent/Erratic	- Intake air shut off throttle circuit high resistance - Intake air shut off throttle circuit short circuit to ground - Intake air shut off throttle circuit short circuit to power - Intake air shut off throttle failure	Check the EGR valve and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Using a datalogger function, check the EGR valve position. After a further 5 seconds, recheck the position. If the value has increased by more than 80% per 10 ms, recheck the circuits. If no fault is found in the circuits, install a new EGR valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P141C00	Exhaust Gas Recirculation Sensor C Circuit Intermittent/Erratic	- EGR valve circuit (left-hand bank) high resistance - EGR valve circuit short circuit to ground - EGR valve circuit short circuit to power - EGR valve failure - ECM failure	Check the EGR valve and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Using a datalogger function, check the EGR valve position. After a further 5 seconds, recheck the position. If the value has increased by more than 80% per 10 ms, recheck the circuits. If no fault is found in the circuits, install a new EGR valve. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P151B00	Idle Speed Control - RPM Lower Than Expected	- Oil level - Intake air restriction - Accessory drive overload (defective/seized component) - Engine compression	Check the engine oil level and condition. Check the driven components (generator, air conditioning compressor, etc). Repair/renew as necessary. Check the engine compressions only once other options are ruled out. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P151C00	Idle Speed Control - RPM Higher Than Expected	- Intake air leak between MAF sensor and intake air shut off throttle - Intake air leak between intake air shut off throttle and engine - Engine crankcase breather leak	Inspect the engine intake AND breather system, refer to the relevant workshop manual section.
P155100	Cylinder 1 Injector Circuit Range/Performance	- Injector disconnected - Injector circuit high resistance, short circuit to ground, short circuit to power - Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
P155200	Cylinder 2 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155300	Cylinder 3 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155400	Cylinder 4 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155500	Cylinder 5 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P155600	Cylinder 6 Injector Circuit Range/Performance	● Injector disconnected ● Injector circuit high resistance, short circuit to ground, short circuit to power ● Injector failure	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Refer to the relevant workshop manual section.
P156300	Injection Pump Control Module Requesting Engine Stop	● Internal control module monitoring performance	Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, refer to the warranty policy and procedures manual if a module is suspect.
P159000	Cruise Control INCREASE DISTANCE Signal	● Speed control headway plus switch stuck/jammed ● Speed control headway plus switch signal circuit short circuit to power ● Speed control headway plus switch failure	Check the cruise control switch operation. Refer to the electrical guides and check the circuits. Rectify as necessary. Refer to the relevant workshop manual section.
P159100	Cruise Control DECREASE DISTANCE Signal	● Speed control headway minus switch stuck/jammed ● Speed control headway minus switch signal circuit short circuit to power ● Speed control headway minus switch failure	Check the cruise control switch operation. Refer to the electrical guides and check the circuits. Rectify as necessary. Refer to the relevant workshop manual section.
P160200	Immobilizer/ECM Communication Error	● CAN Link ECM/instrument cluster CAN timeout	Refer to the Network Communications section in the workshop manual.
P162100	Immobilizer Code Words Do Not Match	● Challenge does not match	Configure the system using the approved diagnostic system.
P162200	Immobilizer ID Does Not Match	● Key status unknown	Program the key using the approved diagnostic system.
P163900	Vehicle ID Block Corrupted, Not Programmed	● Vehicle configuration	Configure the system using the approved diagnostic system.
P193400	Vehicle Speed Signal	● Vehicle speed invalid signal received over CAN	Check for ABS and TCM DTCs and rectify as necessary. Refer to the relevant workshop manual section. Refer to the Network Communications section in the workshop manual.

DTC	Description	Possible causes	Action
P193500	Brake Switch/Sensor Signal	● Error on brake switch sensor coming on CAN	Check the brake switch operation. Refer to the electrical guides and check the circuits. Refer to the Network Communications section in the workshop manual.
P193600	Clutch Switch/Sensor Signal	● Clutch switch/sensor CAN signal plausibility	Check for DTCs indicating CAN serial bus errors. Refer to the Network Communications section in the workshop manual.
P193A00	Invalid Scan Tool Communication/Request	● Invalid scan tool communication request	This is not a fault, but event information of the communication between the scan tool and ECM. Clear/ignore this DTC.
P200800	Intake Manifold Runner Control Circuit / Open (Bank 1)	● Port de-activation solenoid circuit high resistance ● Port de-activation solenoid circuit short circuit to ground ● Port de-activation solenoid failure	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.
P200900	Intake Manifold Runner Control Circuit Low (Bank 1)	● Port de-activation solenoid circuit high resistance ● Port de-activation solenoid circuit short circuit to ground ● Port de-activation solenoid failure	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.
P201000	Intake Manifold Runner Control Circuit High (Bank 1)	● Port de-activation solenoid circuit short circuit to power ● Port de-activation solenoid failure	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.
P212200	Throttle/Pedal Position Sensor/Switch D Circuit Low	● Circuit voltage below threshold - track 1 ● Accelerator pedal position (APP) sensor circuits short circuit to ground ● APP sensor circuits short circuit to power ● APP sensor fault	Check the APP sensor circuits. Refer to the electrical guides. Using a datalogger function, check the APP sensor track 1 value with the pedal in the rest position. If the value is not approximately 0%, install a new pedal. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P212300	Throttle/Pedal Position Sensor/Switch D Circuit High	● Circuit voltage above threshold - track 1 ● Accelerator pedal position (APP) sensor circuits short circuit to ground ● APP sensor circuits short circuit to power ● APP sensor fault	Check the APP sensor circuits. Refer to the electrical guides. Using a datalogger function, check the APP sensor track 1 value with the pedal in the rest position. If the value is not approximately 99%, install a new pedal. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P212700	Throttle/Pedal Position Sensor/Switch E Circuit Low	● Circuit voltage below threshold - track 2 ● Accelerator pedal position (APP) sensor circuits short circuit to ground ● APP sensor circuits short circuit to power ● APP sensor fault	Check the APP sensor circuits. Refer to the electrical guides. Using a datalogger function, check the APP sensor track 2 value with the pedal in the rest position. If the value is not approximately 0%, install a new pedal. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P212800	Throttle/Pedal Position Sensor/Switch E Circuit High	● Circuit voltage above threshold - track 2 ● Accelerator pedal position (APP) sensor circuits short circuit to ground ● APP sensor circuits short circuit to power ● APP sensor fault	Check the APP sensor circuits. Refer to the electrical guides. Using a datalogger function, check the APP sensor track 2 value with the pedal in the wide open position. If the value is not approximately 99%, install a new pedal. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P213800	Throttle/Pedal Position Sensor/Switch D / E Voltage Correlation	• Signal compare fault (the value difference between channels is greater than it should be • Accelerator pedal position (APP) sensor circuits short circuit to ground • APP sensor circuits short circuit to power • APP sensor fault	Check the APP sensor circuits. Refer to the electrical guides. Using a datalogger function, check the APP sensor values for tracks 1 and 2 with the pedal in the idle position, and again in the wide open position. Both tracks should read approximately 0% in the idle position and 99% in the wide open position. If any of the values are incorrect, install a new pedal. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P214100	Exhaust Gas Recirculation Throttle Control Circuit A Low	• EGR sensor circuits short circuit (to ground/power /other circuits • EGR sensor circuits high resistance • EGR sensor fault	Check the EGR sensor circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation. Using a datalogger function, read the difference between the EGR throttle set point and the actual throttle position, and the EGR throttle position. Check that the throttle is open and command the throttle closed. Check that the throttle position value increases to above 90%. Check the difference between set point and actual. This value should not exceed either maximum 5% or minimum -15%. Check that the EGR throttle is not sticking. Install a new right-hand valve as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P214200	Exhaust Gas Recirculation Throttle Control Circuit A High	• EGR sensor circuits short circuit (to ground/power /other circuits • EGR sensor circuits high resistance • EGR sensor fault	Check the EGR sensor circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation. Using a datalogger function, read the difference between the EGR throttle set point and the actual throttle position, and the EGR throttle position. Check that the throttle is open and command the throttle closed. Check that the throttle position value increases to above 90%. Check the difference between set point and actual. This value should not exceed either maximum 5% or minimum -15%. Check that the EGR throttle is not sticking. Install a new left-hand valve as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P219900	Intake Air Temperature ½ Correlation	• Intake air temperature (IAT) sensor circuit high resistance, short circuit to ground, short circuit to power • Air charge temperature (ACT) sensor circuit high resistance, short circuit to ground, short circuit to power • IAT sensor failure • ACT sensor failure • ECM failure	Check the IAT sensor and circuits. Refer to the electrical guides. For ACT sensor, refer to the relevant workshop manual section. Refer to the warranty policy and procedures manual if a module is suspect.
P222800	Barometric Pressure Sensor A Circuit Low	• Barometric sensor failure (internal ECM fault)	Using a datalogger function, check the ambient pressure and the manifold absolute pressures in both banks with the engine off. If the ambient pressure is significantly different to the manifold pressures suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P222900	Barometric Pressure Sensor A Circuit High	• Barometric sensor failure (internal ECM fault)	Using a datalogger function, check the ambient pressure and the manifold absolute pressures in both banks with the engine off. If the ambient pressure is significantly different to the manifold pressures suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.

DTC	Description	Possible causes	Action
P223000	Barometric Pressure Sensor A Circuit Intermittent/Erratic	● BARO sensor failure (internal ECM fault)	Check the ECM circuits. Refer to the electrical guides. Using a datalogger function, check the ambient pressure. Increase the engine speed to 1,500 rpm and recheck the pressure. If the pressure has increased by more than 30 KPa (4.35 lbs/in²) per 100 ms, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P226300	Turbocharger/Supercharger Boost System Performance	● Air leakage post turbocharger ● Intake air temperature (IAT) sensor circuit high resistance, short circuit to ground, short circuit to power ● Manifold absolute pressure (MAP) sensor circuit high resistance, short circuit to ground, short circuit to power ● Mass air flow (MAF) sensor circuit high resistance, short circuit to ground, short circuit to power ● Exhaust gas recirculation (EGR) circuit high resistance, short circuit to ground, short circuit to power ● VGT actuator failure ● Turbocharger vanes stuck/sticking	Check the turbocharger and linkage mechanical condition. Check the intake air system condition, rectify as necessary. Check for sensor DTCs. Check the IAT and MAP sensor circuits. Refer to the electrical guides and rectify as necessary. Using a datalogger function, check the turbocharger actuator position. Turn the ignition on, engine off and command the turbocharger actuator to 95% pulse width modulated (PWM) then to 5% pulse width modulated (PWM) and recheck the turbocharger actuator position. The value at 95% pulse width modulated (PWM) should be 80 - 95%, and at 5% pulse width modulated (PWM), 0 - 20%. If this is not the case, install a new turbocharger. Clear the DTCs and test for normal operation.
P226900	Water in Fuel Condition	● Water in fuel condition ● Water in fuel sensor circuit short circuit to ground ● Water in fuel sensor fault	Drain the water from the fuel filter. Clear the DTC and retest. If the DTC resets, check the sensor circuit. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor.
P228800	Injector Control Pressure Too High	● Fuel pressure control valve (FPCV) minimum limit reached ● Fuel injector control pressure too high ● FPCV circuit fault ● FPCV failure ● Fuel pump module circuit short circuit to power ● Fuel pump module failure ● Fuel injection pump failure	Check the fuel pressure, refer to the relevant section of the workshop manual. Check the fuel pump module circuits and the FPCV circuits. Refer to the electrical guides. For FPCV and fuel injection pump, refer to the relevant workshop manual section.
P229000	Injector Control Pressure Too Low	● Fuel pressure control valve (FPCV) maximum limit reached ● Fuel injector control pressure too low ● Fuel line leak ● Fuel filter/system restriction ● FPCV circuit fault ● FPCV failure ● Fuel pump module circuit short circuit to ground ● Fuel pump module failure ● Fuel injection pump failure	Check the fuel pressure, refer to the relevant section of the workshop manual. Check the fuel pump module circuits and the FPCV circuits. Refer to the electrical guides. For FPCV and fuel injection pump, refer to the relevant workshop manual section.
P229200	Injector Control Pressure Erratic	● Fuel injector control pressure erratic ● FPCV circuit fault	Check the fuel pressure, refer to the relevant section of the workshop manual. Check the fuel pump module circuits and the FPCV circuits. Refer to the electrical

DTC	Description	Possible causes	Action
		- FPCV failure - Fuel pump module circuit high resistance, short circuit to ground, short circuit to power - Fuel pump module failure - Fuel injection pump failure	guides. For FPCV and fuel injection pump, refer to the relevant workshop manual section.
P229900	Brake Pedal Position/Accelerator Pedal Position Incompatible	- Event information (this code indicates unexpected simultaneous operation of the accelerator and brake pedals) - Brake lamp switch fault - Accelerator pedal position (APP) sensor fault - APP sensor circuits short circuit to ground - APP sensor circuits short circuit to power - APP sensor circuits high resistance - Brake lamp switch circuits short circuit to ground - Brake lamp switch circuits short circuit to power - Brake lamp switch circuits high resistance	Check the brake lamp function. If the brake lights function correctly, check the APP sensor using a datalogger function. Check both APP sensor tracks with the pedal in the rest position. Recheck the values with the pedal in the wide-open position. Both tracks should range between 0% at idle to 99% at wide open throttle. If the values are correct, check the APP sensor and brake lamp switch circuits. Refer to the electrical guides. Also note that the driver may have been left-foot-braking. If the values are incorrect, install a new pedal. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P250500	ECM / PCM Power Input Signal	- ECM relay circuit high resistance - ECM relay circuit short circuit to ground - ECM relay failure	Check the ECM relay circuits. Refer to the electrical guides. Activate the relay and check for an audible 'click'. Install a new relay as necessary. Clear the DTCs and test for normal operation.
P250700	ECM / PCM Power Input Signal Low	- ECM relay circuit high resistance - ECM relay circuit short circuit to ground - ECM relay failure	Check the ECM relay circuits. Refer to the electrical guides. Activate the relay and check for an audible 'click'. Install a new relay as necessary. Clear the DTCs and test for normal operation.
P250800	ECM / PCM Power Input Signal High	- ECM relay circuit short circuit to power - ECM relay failure	Check the ECM relay circuits. Refer to the electrical guides. Activate the relay and check for an audible 'click'. Install a new relay as necessary. Clear the DTCs and test for normal operation.
U000100	High Speed CAN Communication Bus	- CAN Mute	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U007300	Control Module Communication Bus "A" Off	- CAN Link circuit malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U010100	Lost Communication With TCM	- CAN Link ECM/TCM network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Action
U010200	Lost Communication With Transfer Case Control Module	- CAN Link ECM/transfer case control module network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U010400	Lost Communication With Cruise Control Module	- CAN Link engine control module ECM/Speed control module CAN timeout	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U012100	Lost Communication With Anti-Lock Brake System (ABS) Control Module	- CAN Link ECM/ABS network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U012600	Lost Communication With Steering Angle Sensor Module	- CAN Link ECM/steering angle sensor network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U012800	Lost Communication With Park Brake Control Module	- CAN Link ECM/electric park brake signal missing network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U013300	Lost Communication With Suspension Control Module "A"	- CAN Link ECM/active roll control module network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U013800	Lost Communication with All Terrain Control Module	- CAN Link ECM/terrain optimization switch network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U015100	Lost Communication With Restraints Control Module	- Lost communications - CAN or hardwired	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U01511F	Lost Communication With Restraints Control Module	- Lost communications - SRS fault	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Action
U015157	Lost Communication With Restraints Control Module	● Lost communications - CAN fault	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U015500	Lost Communication With Instrument Panel Cluster (IPC) Control Module	● CAN Link ECM/IPC network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U016400	Lost Communication With HVAC Control Module	● CAN communication error	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U016700	Lost Communication With Vehicle Immobilizer Control Module	● Security challenge response timeout	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U017000	Lost Communication With "Restraints System Sensor A"	● CAN Link ECM/restraints control module (RCM) network malfunction	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U023500	Lost Communication With Cruise Control Front Distance Range Sensor	● Lost communication ● Fault status transmitted	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U040264	Invalid Data Received from TCM	● Invalid data received from transmission control module - actual gear position status	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U040267	Invalid Data Received from TCM	● Invalid data received from transmission control module - gear shifter position status	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U040281	Invalid Data Received from TCM	● Invalid data received from transmission control module - output shaft speed signal	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.

DTC	Description	Possible causes	Action
U042381	Invalid Data Received From Instrument Panel Control Module	- External ambient temperature	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
U042386	Invalid Data Received From Instrument Panel Control Module	- Battery voltage level	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.
U042600	Invalid Data Received From Vehicle Immobilizer Control Module	- Security code mismatch	Check the configuration of the modules using the approved diagnostic system.
U040500	Invalid Data Received From Cruise Control Module	- ECM/speed control module invalid data received	Check for other CAN DTCs or apparently unrelated customer complaints. Carry out a complete vehicle DTC read. Check the CAN and module power and ground circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. Refer to the Network Communications section of the workshop manual.

EU4 Additional DTCs

DTC	Description	Possible causes	Action
B10A231	Crash Input	- Inertia event circuit open circuit	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A236	Crash Input	- Inertia event circuit frequency low	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A237	Crash Input	- Inertia event circuit frequency high	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A239	Crash Input	- Inertia event circuit frequency below mid level	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A23A	Crash Input	- Inertia event circuit frequency above mid level	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
P000113	Fuel Volume Regulator Control Circuit / Open	- Fuel volume control valve circuit high resistance - Fuel volume control valve circuit open circuit - Fuel volume control valve fault	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a HPP is suspect.
P000311	Fuel Volume Regulator Control Circuit Low	- Fuel volume control valve circuit short circuit to ground - Fuel volume control valve fault	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P000319	Fuel Volume Regulator Control Circuit Low	- Fuel volume control valve circuit short circuit to ground - Fuel volume control valve fault	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the

DTC	Description	Possible causes	Action
			resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a HPP is suspect.
P000412	Fuel Volume Regulator Control Circuit High	● Fuel volume control valve (VCV) circuit short circuit to power ● VCV failure	Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a HPP is suspect.
P000E21	Fuel Volume Regulator Control Exceeded Learning Limit	● Fuel volume control valve amplitude is less than the minimum specified	Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P000E22	Fuel Volume Regulator Control Exceeded Learning Limit	● Fuel volume control valve amplitude is greater than the maximum specified	Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P006A21	MAP - Mass or Volume Air Flow Correlation	● Air leakage in the intake path between the turbocharger and the engine	Check the intake air system for leakage after the turbocharger. Check for DTCs indicating a MAP sensor fault. Rectify as necessary. Clear the DTCs and test for normal operation.
P006A22	MAP - Mass or Volume Air Flow Correlation	● Mass or volume air flow correlation: right-hand bank - signal amplitude greater than maximum ● Oil ingress into the intake manifold ● Manifold absolute sensor and temperature (MAPT) sensor circuit fault ● MAPT sensor fault ● MAF sensor fault ● Turbocharger fault	With the engine at idle, check the manifold air pressure and indicated torque set points using a data logger function. If the manifold air pressure is greater than 140 KPa (20.31 lbs/in²) or the torque less than 70 Nm (51.63 lbf/ft), check for oil being drawn into the intake manifold. Repair/renew as necessary. Clear the DTCs and test for normal operation. Stop the engine and turn the ignition on. Using a data logger function, monitor the turbocharger actuator angles. Command the actuator to 5% pulse width modulated (PWM) then to 95% pulse width modulated (PWM) and check the angle values. The angle at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% 80 - 95%. If the values are inside this range, install a new MAF sensor. Refer to the relevant section of the workshop manual. If the values are outside this range, install a new turbocharger. Clear the DTCs and test for normal operation.
P007C16	Charge Air Cooler Temperature Sensor Circuit Low (Bank 1)	● Right-hand charge air temperature sensor circuit high resistance (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) ● Charge air temperature sensor circuit short circuit to ground ● Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. Install a new MAPT if necessary. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P007D17	Charge Air Cooler Temperature Sensor Circuit High (Bank 1)	● Charge air temperature sensor circuit short circuit to power (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) ● Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. Install a new MAPT if necessary. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P007E27	Charge Air Cooler Temperature Sensor Circuit Intermittent/Erratic (Bank 1)	● Right-hand charge air temperature sensor circuit high resistance (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) ● Charge air temperature sensor circuit short circuit to ground ● Charge air temperature sensor circuit short circuit to power ● Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. With the engine running and at operating temperature, check the charge air temperature using a data logger function. Record the measurement at idle and increase the engine speed to 3,000 rpm. Record the reading and compare with the idle figure. If the value has increased by more than 20°C in 100 ms, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P008772	Fuel rail/system pressure too low	● Pressure control valve fault	Refer to the electrical guides and check the PCV actuator circuits and rectify as necessary. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect.
P008873	Fuel rail/system pressure too high	● Fuel pressure control valve (PCV) stuck closed	Refer to the electrical guides and check the PCV actuator circuits and rectify as necessary. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect.
P008921	Fuel Pressure Regulator Performance	● Fuel pressure control valve performance - signal amplitude less than minimum ● Fuel pressure control valve circuit high resistance ● Fuel pressure control valve circuit short circuit to ground ● Fuel pressure control valve circuit short circuit to power ● Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P008922	Fuel Pressure Regulator Performance	● Fuel pressure control valve performance - signal amplitude greater than maximum ● Fuel pressure control valve circuit high resistance	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the warranty policy and

DTC	Description	Possible causes	Action
		- Fuel pressure control valve circuit short circuit to ground - Fuel pressure control valve circuit short circuit to power - Fuel pressure control valve fault	procedures manual if a high pressure fuel pump is suspect. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P00892F	Fuel Pressure Regulator Performance	- Fuel pressure control valve performance - signal erratic - Fuel pressure control valve circuit high resistance - Fuel pressure control valve circuit short circuit to ground - Fuel pressure control valve circuit short circuit to power - Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P009013	Fuel Pressure Regulator 1 Control Circuit/Open	- Fuel pressure control valve circuit high resistance - Fuel pressure control valve circuit open circuit - Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009111	Fuel Pressure Regulator 1 Control Circuit Low	- Fuel pressure control valve circuit short circuit to ground - Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009119	Fuel Pressure Regulator 1 Control Circuit Low	- Fuel pressure control valve circuit short circuit to power (circuit current above threshold) - Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009212	Fuel Pressure Regulator 1 Control Circuit High	- Fuel pressure control valve circuit short circuit to power - Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P010036	Mass or Volume Air Flow A Circuit	- Mass air flow (MAF) sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor circuit high resistance	Refer to the electrical guides and check the MAF sensor and circuits. Clear the DTCs and test for normal operation. If the problem persists, renew the MAF sensor.

DTC	Description	Possible causes	Action
		- MAF sensor fault	
P010116	Mass or Volume Air Flow A Circuit Range/Performance	- Intake air path fault - Mass air flow (MAF) sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor fault	Check the intake air system for leaks, restrictions, etc. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. If the problem persists, renew the MAF sensor.
P010117	Mass or Volume Air Flow A Circuit Range/Performance	- Intake air path fault - Mass air flow (MAF) sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor fault	Check the intake air system for leaks, restrictions, etc. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. If the problem persists, renew the MAF sensor.
P010221	Mass or Volume Air Flow A Circuit Low	- Intake air system fault - Mass air flow (MAF) sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - Exhaust gas recirculation (EGR) valve fault	Check the intake air system for leaks, etc. Repair/renew as necessary. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Check that the EGR valves are not stuck. Using a data logger function, monitor the air flow and EGR valve position for both banks and road test the vehicle. Check that the EGR valves are in synch. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P010322	Mass or Volume Air Flow A Circuit High	- Check for water ingress into the Mass air flow (MAF) sensor - Water in the air intake can give the impression of high air flow - Intake air system fault - MAF sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor fault - Turbocharger fault	Check the intake air system for leaks, etc. Repair/renew as necessary. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. With the ignition on, engine off, and using a data logger function, monitor the turbocharger actuator angles. Command the actuator to 5% pulse width modulated (PWM) then to 95% pulse width modulated (PWM) and check the angle values. The angle at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% pulse width modulated (PWM) 80 - 95%. If the values are inside this range, install a new MAF sensor. If the values are outside this range, install a new turbocharger. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P010438	Mass or Volume Air Flow A Circuit Intermittent/Erratic	- Mass air flow (MAF) sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor circuit high resistance	Check the MAF sensor and circuits. Refer to the electrical guides. Measure the mass air flow at idle using a data logger function and record the value. Increase the engine speed to 2,000 rpm and record the value. If the value has changed by more than 30.55 g/s install a new MAF sensor and recheck. Clear the DTCs and test for normal operation.
P011216	Intake Air Temperature Sensor 1 Circuit Low (Bank 1)	- Intake air temperature (IAT) sensor circuit low input - voltage below threshold - IAT sensor circuit high resistance - IAT sensor circuit short circuit to ground - IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. If the values are outside this range, install a new MAF sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011317	Intake Air Temperature Sensor 1 Circuit High (Bank 1)	- Intake air temperature (IAT) sensor circuit short circuit to power - IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. If the

DTC	Description	Possible causes	Action
			resistance is outside this range, install a new MAF sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011427	Intake Air Temperature Sensor 1 Intermittent/Erratic (Bank 1)	● Intake air temperature (IAT) sensor circuit intermittent high resistance ● IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Read the intake air temperature using a data logger function and record the value. After ten minutes, read the value again and compare to the first reading. If the value has increased by more than 10° C per 100 ms, install a new MAF sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011626	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	● Engine coolant temperature (ECT) sensor circuit range/performance - signal rate of change below threshold ● ECT sensor circuit intermittent high resistance ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. With the engine cold, read the coolant temperature sensor using a data logger function and start the engine. Record the value and allow the engine to idle for 20 minutes. After 20 minutes, recheck the value. If the value has not increased by more than 10°C, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011716	Engine Coolant Temperature Sensor 1 Circuit Low	● Engine coolant temperature (ECT) sensor circuit low input - voltage below threshold ● ECT sensor circuit short circuit to ground ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Measure the resistance of the sensor. Nominal resistance at 20°C (68°F) should be between 35.47 and 39.21 Kohms. If the resistance is outside this range, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011817	Engine Coolant Temperature Sensor 1 Circuit High	● Engine coolant temperature (ECT) sensor circuit high input - voltage above threshold ● ECT sensor circuit short circuit to power ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Measure the resistance of the sensor. Nominal resistance at 20°C (68°F) should be between 35.47 and 39.21 Kohms. If the resistance is outside this range, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P011927	Engine Coolant Temperature Sensor 1 Circuit Intermittent/Erratic	● Engine coolant temperature (ECT) sensor circuit intermittent/erratic - signal rate of change above threshold ● ECT sensor circuit intermittent high resistance ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Read the coolant temperature using a data logger function and record the value. Increase the engine speed to 2,000 rpm and recheck the value after two minutes at this engine speed. If the value has increased faster than 5°C per second, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P018126	Fuel Temperature Sensor A Circuit Range/Performance	● Fuel temperature sensor circuit range/performance - signal rate of change below threshold ● Fuel temperature sensor circuit intermittent high resistance ● Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Check the fuel temperature using a data logger function. Make sure the fuel temperature is less than 30°C (86°F). Start the engine and allow to warm up for ten minutes. Recheck the fuel temperature. If the value has not increased by more than 8°C in this time, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P018216	Fuel Temperature Sensor A Circuit Low	● Fuel temperature sensor circuit low input - voltage below threshold ● Fuel temperature sensor circuit short circuit to ground ● Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Measure the sensor resistance. Nominal resistance at 20°C (68°F) should be between 5.86 and 6.62 Kohms. If the resistance is outside this range, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P018317	Fuel Temperature Sensor A Circuit High	● Fuel temperature sensor circuit high input - voltage above threshold ● Fuel temperature sensor circuit short circuit to power ● Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Measure the sensor resistance. Nominal resistance at 20°C (68°F) should be between 5.86 and 6.62 Kohms. If the resistance is outside this range, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P018427	Fuel Temperature Sensor A Circuit Intermittent	● Fuel temperature sensor circuit intermittent - signal rate of change above threshold ● Fuel temperature sensor circuit intermittent high resistance ● Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Check the fuel temperature using a data logger function. Increase the engine speed to 2,000 rpm and recheck the value. If the value has increased by more than 10°C per 100 ms, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019123	Fuel Rail Pressure Sensor A Circuit Range/Performance	● Fuel rail pressure (FRP) sensor circuit range/performance - signal stuck low ● Low fuel level ● Blocked/incorrectly connected low-pressure fuel lines ● FRP sensor circuit short circuit to ground ● FRP sensor circuit short circuit to power ● FRP sensor circuit high resistance ● FRP sensor fault ● Fuel pump module circuit short circuit to ground ● Fuel pump module circuit short circuit to power ● Fuel pump module circuit high resistance ● Fuel pump module fault	Check the fuel level and the condition and correct connection of the low-pressure fuel circuit lines (incorrect connection of the lines to and from the fuel filter can cause serious fuel pressure fluctuations). Check the FRP sensor and circuits. Check the fuel pump module and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P019124	Fuel Rail Pressure Sensor A Circuit Range/Performance	● Fuel rail pressure (FRP) sensor circuit range/performance - signal stuck high ● FRP sensor circuit short circuit to ground ● FRP sensor circuit short circuit to power ● FRP sensor circuit high resistance ● FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. Stop the engine, turn the ignition on, and recheck the fuel pressure. If the pressure is greater than 10 MPa (1,450 lbs/in²) after 0.4 seconds, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019165	Fuel Rail Pressure Sensor A Circuit Range/Performance	● Fuel rail pressure (FRP) sensor circuit range/performance - signal has too few transitions/events ● FRP sensor circuit high resistance ● FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. Increase the engine speed to 2,000 rpm and recheck the fuel pressure. If the value has changed by more than 40 MPa (5,801 lbs/in²) per 10 ms, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019216	Fuel Rail Pressure Sensor A Circuit Low	● Fuel rail pressure (FRP) sensor circuit low input - voltage below threshold ● FRP sensor circuit short circuit to ground	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. If the value is 0 MPa (0 lbs/in²), install a new sensor. Refer to the relevant section of the

DTC	Description	Possible causes	Action
		- FRP sensor fault	workshop manual. Clear the DTCs and test for normal operation.
P019317	Fuel Rail Pressure Sensor A Circuit High	- Fuel rail pressure (FRP) sensor circuit high input - voltage above threshold - FRP sensor circuit short circuit to power - FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. If the value is greater than 180 MPa (26,106 lbs/in²), install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019427	Fuel Rail Pressure Sensor A Circuit Intermittent/Erratic	- Fuel rail pressure (FRP) sensor circuit intermittent/erratic - signal rate of change above threshold - FRP sensor circuit high resistance - FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. Increase the engine speed to 2,000 rpm and recheck the fuel pressure. If the value has changed by more than 40 MPa (5,801 lbs/in²) per 10 ms, install a new sensor. Refer to the relevant section of the workshop manual. Clear the DTCs and test for normal operation.
P019626	Engine Oil Temperature Sensor Range/Performance	- Engine oil temperature (EOT) sensor circuit range/performance- signal rate of change below threshold - EOT sensor circuit intermittent high resistance - EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. From cold, start the engine and check the oil temperature using a data logger function. Allow the engine to idle for ten minutes and recheck the oil temperature. If the value has not increased by more than 5°C in this time, install a new sensor. Clear the DTCs and test for normal operation.
P019716	Engine Oil Temperature Sensor Circuit Low	- Engine oil temperature (EOT) sensor circuit low input - voltage below threshold - EOT sensor circuit short circuit to ground - EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. Repair/renew as necessary.
P019817	Engine Oil Temperature Sensor Circuit High	- Engine oil temperature (EOT) sensor circuit high input - voltage above threshold - EOT sensor circuit short circuit to power - EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. Repair/renew as necessary.
P019927	Engine Oil Temperature Sensor Circuit Intermittent/Erratic	- Engine oil temperature (EOT) sensor circuit intermittent - signal rate of change above threshold - EOT sensor circuit intermittent high resistance - EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the oil temperature using a data logger function. Increase the engine speed to 2,000 rpm and recheck the value after two minutes at this engine speed. If the value has increased by more than 40°C per second, install a new sensor. Clear the DTCs and test for normal operation.
P020101	Cylinder 1 Injector Circuit / Open	- Fuel injector circuit open cylinder 1 - general electrical fault - Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P020201	Cylinder 2 Injector Circuit / Open	• Fuel injector circuit open cylinder 2 - general electrical fault • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020301	Cylinder 3 Injector Circuit / Open	• Fuel injector circuit open cylinder 3 - general electrical fault • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020401	Cylinder 4 Injector Circuit / Open	• Fuel injector circuit open cylinder 4 - general electrical fault • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020501	Cylinder 5 Injector Circuit / Open	• Fuel injector circuit open cylinder 5 - general electrical fault • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020601	Cylinder 6 Injector Circuit / Open	• Fuel injector circuit open cylinder 6 - general electrical fault • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P020A33	Cylinder 1 Injection Timing	● Cylinder 1 injection timing - signal low time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020A35	Cylinder 1 Injection Timing	● Cylinder 1 injection timing - signal high time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020B33	Cylinder 2 Injection Timing	● Cylinder 2 injection timing - signal low time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020B35	Cylinder 2 Injection Timing	● Cylinder 2 injection timing - signal high time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020C33	Cylinder 3 Injection Timing	● Cylinder 3 injection timing - signal low time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P020C35	Cylinder 3 Injection Timing	• Cylinder 3 injection timing - signal high time greater than maximum • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020D33	Cylinder 4 Injection Timing	• Cylinder 4 injection timing - signal low time greater than maximum • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020D35	Cylinder 4 Injection Timing	• Cylinder 4 injection timing - signal high time greater than maximum • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020E33	Cylinder 5 Injection Timing	• Cylinder 5 injection timing - signal low time greater than maximum • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020E35	Cylinder 5 Injection Timing	• Cylinder 5 injection timing - signal high time greater than maximum • Fuel injector circuit short circuit to ground • Fuel injector circuit short circuit to power • Fuel injector circuit high resistance • Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P020F33	Cylinder 6 Injection Timing	● Cylinder 6 injection timing - signal low time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P020F35	Cylinder 6 Injection Timing	● Cylinder 6 injection timing - signal high time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P023627	Turbocharger/Supercharger Boost Sensor A Circuit Range/Performance	● Right-hand turbocharger boost sensor circuit high - signal rate of change above threshold ● Manifold absolute pressure and temperature (MAPT) sensor circuit intermittent high resistance ● Manifold absolute pressure and temperature (MAPT) sensor fault	During the following, clear DTCs and recheck after each step. Check the MAPT sensor and circuits. Refer to the electrical guides. Start the engine and check the manifold air pressure at idle using a data logger function. Increase the engine speed to 1,500 rpm and recheck the manifold air pressure. If the pressure has increased by more than 50 KPa per 10 ms, install a new sensor. Clear the DTCs and test for normal operation.
P023716	Turbocharger/Supercharger Boost Sensor A Circuit Low	● Right-hand turbocharger boost sensor circuit low - voltage below threshold ● Manifold absolute pressure and temperature (MAPT) sensor circuit short circuit to ground ● Manifold absolute pressure and temperature (MAPT) sensor fault	During the following, clear DTCs and recheck after each step. Check the MAPT sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. Clear the DTCs and test for normal operation.
P023817	Turbocharger/Supercharger Boost Sensor A Circuit High	● Right-hand turbocharger boost sensor circuit high - voltage above threshold ● Manifold absolute pressure and temperature (MAPT) sensor circuit short circuit to power ● Manifold absolute pressure and temperature (MAPT) sensor fault	During the following, clear DTCs and recheck after each step. Check the MAPT sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. Clear the DTCs and test for normal operation.
P023D21	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor A Correlation	● Manifold absolute pressure (MAP) sensor/right-hand turbocharger boost sensor correlation - signal amplitude less than minimum ● Intake air system fault	Check the intake air system. Check the turbocharger mechanical condition and operation. Check for oil being drawn into the intake manifold. Rectify as necessary. Using a data logger function, monitor the turbocharger actuator position and command the actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) in 5% steps.

DTC	Description	Possible causes	Action
		● Turbocharger mechanical fault ● Oil ingestion into manifold	Check the results. There should be a smooth curve between the minimum and maximum values. If not, install a new turbocharger. Clear the DTCs and test for normal operation.
P023D22	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor A Correlation	● Manifold absolute pressure (MAP) sensor/right-hand turbocharger boost sensor correlation - signal amplitude greater than maximum ● Intake air system fault ● Turbocharger mechanical fault ● Intake air temperature (IAT) sensor fault ● Mass air flow (MAF) sensor fault ● Manifold absolute pressure and temperature (MAPT) sensor fault ● Exhaust gas recirculation (EGR) sensor fault ● Turbocharger actuator position sensor fault	Check the intake air system. Check the turbocharger mechanical condition and operation. Check for DTCs indicating a listed sensor fault. Rectify as necessary. Using a data logger function, monitor the turbocharger actuator position and command the actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) in 5% steps. Check the results. There should be a smooth curve between the minimum and maximum values. If not, install a new turbocharger. Clear the DTCs and test for normal operation.
P026300	Cylinder 1 Contribution/Balance	● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for blow-by etc and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P026600	Cylinder 2 Contribution/Balance	● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for blow-by etc and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P026900	Cylinder 3 Contribution/Balance	● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for blow-by etc and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P027200	Cylinder 4 Contribution/Balance	● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for blow-by etc and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC

DTC	Description	Possible causes	Action
			resets. If the above tests are all within range, install a new injector.
P027500	Cylinder 5 Contribution/Balance	● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for blow-by etc and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P027800	Cylinder 6 Contribution/Balance	● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for blow-by etc and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P029C00	Cylinder 1 - Injector Restricted	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P029D00	Cylinder 1- Injector Leaking	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02A000	Cylinder 2 - Injector Restricted	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above

DTC	Description	Possible causes	Action
		the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	tests are all within range, install a new injector.
P02A100	Cylinder 2 - Injector Leaking	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02A400	Cylinder 3 - Injector Restricted	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02A500	Cylinder 3 - Injector Leaking	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02A800	Cylinder 4 - Injector Restricted	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.

DTC	Description	Possible causes	Action
		● Injector fault	
P02A900	Cylinder 4 - Injector Leaking	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02AC00	Cylinder 5 - Injector Restricted	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02AD00	Cylinder 5 - Injector Leaking	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P02B000	Cylinder 6 - Injector Restricted	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.

DTC	Description	Possible causes	Action
P02B100	Cylinder 6 - Injector Leaking	● Fuel injector circuit high resistance ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Injector leak ● Cylinder compression low - Cylinder leakage past the injector - Cylinder leakage past the glow plug - Mechanical fault, valve, piston/ring, etc ● Injector fault	Refer to the electrical guides and check the fuel injector circuit. Check the injector and surrounding area for evidence of fuel leakage. Disconnect the injector and check for evidence of fuel leakage in the connector. Rectify as necessary. Clear the DTCs. Reconnect the injector and start the engine. Allow to warm up to above 60°C (140°F) and allow to idle (cylinder balance diagnosis is now active). If the DTC resets, check for Cylinder leakage and rectify as necessary. Clear the DTCs and recheck. Carry out a compression test only if the DTC resets. If the above tests are all within range, install a new injector.
P032621	Knock Sensor 1 Circuit Range/Performance (Bank 1)	● Knock sensor (KS) 1 circuit range/performance, right-hand bank (rear) - signal amplitude less than minimum ● KS incorrectly installed ● KS connections reversed ● KS circuit short circuit to ground	Check that the knock sensors are correctly installed and tightened to the correct torque. Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P032622	Knock Sensor 1 Circuit Range/Performance (Bank 1)	● Knock sensor (KS) 1 circuit range/performance, right-hand bank (rear) - signal amplitude greater than maximum ● KS incorrectly installed ● KS connections reversed ● KS circuit short circuit to ground	Check that the KNOCK SENSORS are correctly installed and tightened to the correct torque. Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033121	Knock Sensor 1 Circuit Range/Performance (Bank 2)	● Knock sensor (KS) 2 circuit range/performance, left-hand bank (rear) - signal amplitude less than minimum ● KS incorrectly installed ● KS connections reversed ● KS circuit short circuit to ground	Check that the (KS) are correctly installed and tightened to the correct torque. Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033122	Knock Sensor 1 Circuit Range/Performance (Bank 2)	● Knock sensor (KS) 2 circuit range/performance, left-hand bank (rear) - signal amplitude greater than maximum ● KS incorrectly installed ● (KS) connections reversed ● (KS) circuit short circuit to ground	Check that the KNOCK SENSORS are correctly installed and tightened to the correct torque. Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033578	Crankshaft Position Sensor A Circuit	● Crankshaft position (CKP) sensor - alignment or adjustment incorrect ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P033631	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal missing ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P033638	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal frequency ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P033664	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal plausibility fault ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P033666	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal has too many transitions/events ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. Clear the DTCs and test for normal operation.
P034129	Camshaft Position Sensor A Circuit Range/Performance (Bank 1 or single sensor)	● Camshaft position (CMP) sensor range/performance - signal invalid ● CMP sensor circuit short circuit to ground ● CMP sensor circuit short circuit to power ● CMP sensor circuit high resistance ● CMP sensor fault	Check the CMP sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. Clear the DTCs and test for normal operation.
P03413A	Camshaft Position Sensor A Circuit Range/Performance (Bank 1 or single sensor)	● Camshaft position (CMP) sensor range/performance - too many pulses ● Camshaft segment period too short	Check the CMP sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P034231	Camshaft Position Sensor A Circuit Low (Bank 1 or single sensor)	● Camshaft position (CMP) sensor circuit low input - no signal ● CMP sensor circuit short circuit to ground ● CMP sensor circuit short circuit to power ● CMP sensor circuit high resistance ● CMP sensor fault	Check the CMP sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. Clear the DTCs and test for normal operation.
P038072	Glow Plug/Heater Circuit A	● Right-hand bank glow plug circuit - actuator stuck open ● Low battery voltage ● Relay circuit **from** relay	Check the battery condition and state of charge. Check the relay and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new relay. Clear the DTCs and test for normal operation.
P038073	Glow Plug/Heater Circuit A	● Right-hand bank glow plug circuit - actuator stuck closed ● Low battery voltage ● Relay circuit **to** relay	Check the battery condition and state of charge. Check the relay and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new relay. Clear the DTCs and test for normal operation.
P040121	Exhaust Gas Recirculation A Flow Insufficient Detected	● Exhaust gas recirculation (EGR) insufficient flow detected - signal amplitude less than minimum ● EGR control deviation lower limit right-hand bank (intake manifold tuning (IMT) valve closed) bank specific control of EGR	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angles for both banks. Command the valve actuators to 100% then 0% pulse width modulated (PWM), and recheck the valve angles. The angles should range between 95% and 5%. If this is not the case, install new valves as necessary. Clear the DTCs and test for normal operation.
P040222	Exhaust Gas Recirculation A Flow Excessive Detected	● Right-hand exhaust gas recirculation (EGR) excessive flow detected - signal amplitude greater than maximum ● EGR control deviation upper limit right-hand bank (intake manifold tuning (IMT) valve closed) bank specific control of EGR	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM), and recheck the valve angles. The angles should range between 5% and 95%. If this is not the case, install a new valve as necessary. Clear the DTCs and test for normal operation.
P040319	Exhaust Gas Recirculation A Control Circuit	● Right-hand exhaust gas recirculation (EGR) control circuit - current over threshold ● EGR valve control circuit short circuit to ground ● EGR valve control circuit short circuit to power	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, turn the ignition on and check the EGR valve values for both banks. Turn the ignition off and make sure the cleaning cycle is performed (the valves should cycle from 0% to 100% approximately 6 times). Turn the ignition on, command the actuators to 0% pulse width modulated (PWM) and check the sensor reading. The value should be 0 - 20%. Command the actuators to 100% pulse width modulated (PWM) and check the sensor reading. The value should be 80 - 95%. If the values are outside this range, install a new valve as necessary. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P040521	Exhaust Gas Recirculation Sensor A Circuit Low	● Right-hand exhaust gas recirculation (EGR) sensor circuit low - signal amplitude less than minimum ● EGR valve position sensor circuit short circuit to ground	Check the right-hand EGR sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angle. With the ignition on, engine off, command the valve actuator to 0% pulse width modulated (PWM), and then to 100% pulse width modulated (PWM) and recheck the EGR valve angle. The value should range from 0 - 20% to 80 - 95%. If this is not the case, install a new sensor.

DTC	Description	Possible causes	Action
		- EGR valve position sensor fault	Clear the DTCs and test for normal operation.
P040622	Exhaust Gas Recirculation Sensor A Circuit High	- Right-hand exhaust gas recirculation (EGR) sensor circuit high - signal amplitude greater than maximum - EGR valve position sensor circuit short circuit to power - EGR valve position sensor fault	Check the right-hand EGR sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angle. With the ignition on, engine off, command the valve actuator to 0% pulse width modulated (PWM), and then to 100% pulse width modulated (PWM) and recheck the EGR valve angle. The value should range from 0 - 20% to 80 - 95%. If this is not the case, install a new sensor. Clear the DTCs and test for normal operation.
P040721	Exhaust Gas Recirculation Sensor B Circuit Low	- Right-hand exhaust gas recirculation (EGR) throttle position sensor circuit low - signal amplitude less than minimum - EGR throttle position sensor circuit short circuit to ground - EGR throttle position sensor circuit high resistance - EGR sensor fault	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P040822	Exhaust Gas Recirculation Sensor B Circuit High	- Right-hand exhaust gas recirculation (EGR) throttle position sensor circuit low - signal amplitude greater than maximum - EGR throttle position sensor circuit short circuit to power - EGR throttle position sensor fault	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P045A00	Exhaust Gas Recirculation B Control Circuit	- EGR valve circuit fault - EGR valve fault - engine control module (ECM) fault	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, turn the ignition on and check the EGR valve values for both banks. Turn the ignition off and make sure the cleaning cycle is performed (the valves should cycle from 0% to 100% approximately 6 times). Turn the ignition on, command the actuators to 0% pulse width modulated (PWM) and check the sensor reading. The value should be 0 - 20%. Command the actuators to 100% pulse width modulated (PWM) and check the sensor reading. The value should be 80 - 95%. If the values are outside this range, install a new valve as necessary. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P045A19	Exhaust Gas Recirculation B Control Circuit	- Left-hand exhaust gas recirculation (EGR) control circuit - current over threshold - EGR valve control circuit short circuit to ground - EGR valve control circuit short circuit to power	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, turn the ignition on and check the EGR valve values for both banks. Turn the ignition off and make sure the cleaning cycle is performed (the valves should cycle from 0% to 100% approximately 6 times). Turn the ignition on, command the actuators to 0% pulse width modulated (PWM) and check the sensor reading. The value should be 0 - 20%. Command the actuators to 100% pulse width modulated (PWM) and check the sensor reading. The value should be 80 - 95%. If the values are outside this range, install a new valve as necessary. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.

DTC	Description	Possible causes	Action
P045C00	Exhaust Gas Recirculation B Control Circuit Low	- Left-hand exhaust gas recirculation (EGR) control circuit low - EGR valve sticking - Intake air temperature (IAT) sensor circuit fault - Ambient pressure (AMP) sensor circuit fault - Manifold absolute pressure and temperature (MAPT) sensor circuit fault - Mass air flow (MAF) sensor circuit fault - EGR sensor circuit fault	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P045D00	Exhaust Gas Recirculation B Control Circuit High	- Left-hand exhaust gas recirculation (EGR) control circuit high - EGR valve sticking - Intake air temperature (IAT) sensor circuit fault - Ambient pressure (AMP) sensor circuit fault - Manifold absolute pressure and temperature (MAPT) sensor circuit fault - Mass air flow (MAF) sensor circuit fault - EGR sensor circuit fault	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P048811	Exhaust gas recirculation (EGR) - intake air shut off throttle range/performance	- Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to ground - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048812	Exhaust gas recirculation (EGR) - intake air shut off throttle range/performance	- Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to power - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048813	Exhaust gas recirculation (EGR) - intake air shut off throttle range/performance	- Exhaust gas recirculation (EGR) throttle position sensor circuit high resistance - Exhaust gas recirculation	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width

DTC	Description	Possible causes	Action
		(EGR) throttle position sensor circuit open circuit ● EGR modulator failure	modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048821	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	● Right-hand exhaust gas recirculation (EGR) throttle control circuit range/performance - signal amplitude less than minimum ● Right-hand EGR throttle adaption is at the bottom limit	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position then command the throttle position set point to 0% pulse width modulated (PWM) and recheck the position. If the 0% pulse width modulated (PWM) position is not between 0% and 20%, install a new EGR valve. Clear the DTCs and test for normal operation.
P048822	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	● Right-hand exhaust gas recirculation (EGR) throttle control circuit range/performance - signal amplitude greater than maximum ● Right-hand EGR throttle adaption is at the top limit	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position then command the throttle position set point to 0% pulse width modulated (PWM) and recheck the position. If the 0% pulse width modulated (PWM) position is not between 0% and 20%, install a new EGR valve. Clear the DTCs and test for normal operation.
P048900	Exhaust Gas Recirculation Control Circuit Low	● Right-hand exhaust gas recirculation (EGR) control circuit low ● EGR valve sticking ● Intake air temperature (IAT) sensor circuit fault ● Ambient pressure (AMP) sensor circuit fault ● Manifold absolute pressure and temperature (MAPT) sensor circuit fault ● Mass air flow (MAF) sensor circuit fault ● EGR sensor circuit fault	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P049000	Exhaust Gas Recirculation A Control Circuit High	● Right-hand exhaust gas recirculation (EGR) control circuit high ● EGR valve sticking ● Intake air temperature (IAT) sensor circuit fault ● Ambient pressure (AMP) sensor circuit fault ● Manifold absolute pressure and temperature (MAPT) sensor circuit fault ● Mass air flow (MAF) sensor circuit fault ● EGR sensor circuit fault	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P049313	Fan Overspeed (clutch locked)	● Fan circuit open circuit	Refer to the electrical guides and check the viscous fan speed sensor circuit. Repair/renew as necessary.
P049411	Fan Speed Low	● Viscous fan solenoid circuit short circuit to ground ● Viscous fan solenoid failure	Refer to the electrical guides and check the viscous fan solenoid and circuits. Refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
P049512	Fan Speed High	● Viscous fan solenoid circuit short circuit to power ● Viscous fan solenoid failure	Refer to the electrical guides and check the viscous fan solenoid and circuits. Refer to the relevant workshop manual section.
P050100	Vehicle Speed Sensor A Range/Performance	● Vehicle speed sensor 1 range/performance - signal out of range ● Investigate for anti-lock braking system (ABS) faults - the signal from the wheel speed sensors is not plausible	Check for DTCs indicating an ABS fault. Speed sensor codes are listed at the head of this table.
P050462	Brake Switch A / B Correlation	● Brake switch A/B correlation - signal compare fault ● Brake lamp switch fault ● Brake lamp switch circuit fault	Check the brake switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P052721	Fan Speed Sensor Circuit Range/Performance	● Fan speed sensor circuit range/performance - signal amplitude less than minimum ● Fan circuit short circuit to ground ● Fan circuit short circuit to power ● Fan circuit high resistance ● Fan fault	Check the fan and circuits, including the pulse width modulated (PWM) signal circuit. Refer to the electrical guides. Check the motor for sticking. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P052722	Fan Speed Sensor Circuit Range/Performance	● Fan speed sensor circuit range/performance - signal amplitude greater than maximum ● Fan circuit short circuit to ground ● Fan circuit short circuit to power ● Fan circuit high resistance ● Fan fault	Check the fan and circuits, including the pulse width modulated (PWM) signal circuit. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P052727	Fan Speed Sensor Circuit Range/Performance	● Fan speed sensor circuit range/performance - signal rate of change above threshold ● Fan circuit intermittent high resistance - Loose connections	Check the fan and circuits, including the pulse width modulated (PWM) signal circuit. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P056216	System Voltage Low	● Battery condition/state of charge ● Battery ground cable high resistance ● Battery connections loose/corroded ● Battery current drain ● Battery power distribution circuits	Check the battery connections and condition and charge as necessary. Refer to the electrical guides and check the battery power supplies to the ECM, etc. Repair/renew as necessary. Refer to the relevant workshop manual section.
P056317	System Voltage High	● System voltage high - circuit voltage above threshold ● Battery voltage greater than maximum threshold	Check the battery connections and condition and charge as necessary. Check the battery power supplies to the ECM, etc. Repair/renew as necessary.

DTC	Description	Possible causes	Action
P056A00	Cruise Control INCREASE DISTANCE Signal	● Speed control switch 3 stuck closed (HEADDOWN)	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P056B00	Cruise Control DECREASE DISTANCE Signal	● Speed control switch 4 stuck closed (HEADUP)	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P057162	Brake Switch A Circuit	● Brake switch A circuit - signal compare fault ● Brake lamp switch circuit fault	Check the brake switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P05781C	Cruise Control Multi-Function Input A Circuit Stuck	● Speed control multi-function input A circuit stuck - circuit voltage out of range ● Switch circuit high resistance ● Switch fault	Check the switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P05791C	Cruise Control Multi-Function Input A Circuit Range/Performance	● Speed control multi-function input A circuit stuck - circuit voltage out of range ● Switch circuit high resistance ● Switch fault	Check the switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P057929	Cruise Control Multi-Function Input A Circuit Range/Performance	● Speed control multi-function input A circuit range/performance - signal invalid ● Switch circuit short circuit to ground ● Switch circuit short circuit to power ● Switch fault	Check the switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P060448	Internal Control Module Random Access Memory (RAM) Error	● ECM circuits short circuit to ground ● ECM circuits short circuit to power ● ECM circuits high resistance	Check the ECM circuits. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060768	Control Module Performance	● Engine control module (ECM) performance - event information ● ECM circuits short circuit to ground ● ECM circuits short circuit to power ● ECM circuits high resistance	Check the ECM circuits. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060A48	Internal Control Module Monitoring Processor Performance	● Engine control module (ECM) monitoring processor performance - supervision software fault ● ECM circuits short circuit to ground ● ECM circuits short circuit to power ● ECM circuits high resistance	Check the ECM circuits. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P060B48	Internal Control Module A/D Processing Performance	● Engine control module (ECM) A/D processing performance - supervision software fault ● ECM circuits short circuit to ground	Check the ECM circuits. Refer to the electrical guides. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
		- ECM circuits short circuit to power - ECM circuits high resistance	
P060D46	Internal Control Module Accelerator Pedal Position Performance	- Internal control module accelerator pedal position performance - calibration/parameter memory fault - Pedal value not plausible - Engine control module (ECM) circuits short circuit to ground - Engine control module (ECM) circuits short circuit to power - Engine control module (ECM) circuits high resistance	Check and Repair/renew other DTCs first. If this code still sets, contact the technical help desk.
P061712	Starter Relay Circuit High	- Starter relay drive circuit short circuit to power - Starter relay fault	Check the starter circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P061A46	Internal Control Module Torque Performance	- Calibration/parameter memory fault - Torque not plausible - Monitoring of driveability functions	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061C48	Internal Control Module Engine RPM Performance	- Supervision software fault - Processor monitoring speed not plausible	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P061E46	Internal Control Module Brake Signal Performance	- Calibration/parameter memory fault - Cruise intervention not plausible	Retrieve the flight recorder data using the approved diagnostic system and the customer statement relating to the concern. Check and rectify other DTCs first. If this code still sets, contact the technical help desk.
P062101	Generator Lamp Terminal Circuit	- Generator brushes low	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Clear the DTCs and test for normal operation.
P062116	Generator Lamp Terminal Circuit	- Generator system voltage low	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Clear the DTCs and test for normal operation.
P062229	Generator Lamp Terminal Circuit	- Charging circuit fault - Generator fault	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Clear the DTCs and test for normal operation.
P062511	Generator Field Terminal Circuit Low	- Generator field terminal (altmon) circuit short circuit to ground - Generator control (altcom) circuit short circuit to ground - Generator control (altcom) circuit high resistance - Generator fault	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Clear the DTCs and test for normal operation.
P062615	Generator Field Terminal Circuit High	- Generator field terminal (altmon) circuit short circuit to power - Generator field terminal (altmon) circuit high	Check the charging voltage. Check the charging system circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new generator. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
		resistance ● Generator fault	
P062712	Fuel Pump A Control Circuit / Open	● Fuel pump relay control circuit short circuit to power ● Fuel pump relay fault	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Refer to the relevant workshop manual section. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062811	Fuel Pump A Control Circuit Low	● Fuel pump relay control circuit short circuit to ground ● Fuel pump relay fault	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062913	Fuel Pump A Control Circuit High	● Fuel pump relay control circuit high resistance ● Fuel pump relay control circuit open circuit ● Fuel pump relay fault	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062D01	Fuel Injector Driver Circuit Performance Bank 1	● Fuel injector circuits short circuit to ground ● Fuel injector circuits short circuit to power ● Fuel injector circuits high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition switch off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections at fuel injectors 1, 2, 3 and 4. Disconnect the injectors and measure the resistance and capacitance of each injector. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If one or more injectors are outside this range, install new injectors as necessary. Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P062E01	Fuel Injector Driver Circuit Performance Bank 2	● Fuel injector circuits short circuit to ground ● Fuel injector circuits short circuit to power ● Fuel injector circuits high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition switch off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections at fuel injectors 5, 6, 7 and 8. Disconnect the injectors and measure the resistance and capacitance of each injector. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If one or more injectors are outside this range, install new injectors as necessary. Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P063468	PCM / ECM / TCM Internal Temperature A Too High	● ECM internal temperature too high ● E box cooling fan obstruction ● E box cooling fan operation ● ECM internal sensor error	Consider atmospheric and customer driving conditions before carrying out any other action. Check the ECM circuits. Refer to the electrical guides. Using a data logger function, check the ECM temperature. If the temperature value is greater than 130°C (266°F) suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P064216	Sensor Reference Voltage A Circuit Low	● ECM circuits short circuit to ground ● ECM circuits high resistance ● ECM fault	Check the ECM power supply and relay circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P064317	Sensor Reference Voltage A Circuit High	● ECM circuits short circuit to power ● ECM fault	Check the ECM power supply and relay circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.

DTC	Description	Possible causes	Action
P065216	Sensor Reference Voltage B Circuit Low	- ECM circuits short circuit to ground - ECM circuits high resistance - ECM fault	Check the ECM power supply and relay circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P065317	Sensor Reference Voltage B Circuit High	- ECM circuits short circuit to power - ECM fault	Check the ECM power supply and relay circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P065B11	Generator Control Circuit Range/Performance	- Generator control circuit (altcom) short circuit to ground - Generator control circuit (altcom) high resistance - Generator fault	Check the generator and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P065B12	Generator Control Circuit Range/Performance	- Generator control circuit (altcom) short circuit to power - Generator fault	Check the generator and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P066727	PCM / ECM / TCM Internal Temperature Sensor A Range/Performance	- ECM circuits intermittent high resistance - ECM fault	Check the ECM circuits. Refer to the electrical guides. Using a data logger function, check the ECM internal temperature. Start the engine and allow to idle for five minutes before rechecking the temperature. If the temperature has increased by more than 10°C per 100 ms suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P066816	PCM / ECM / TCM Internal Temperature Sensor A Circuit Low	- ECM circuits short circuit to ground - ECM fault	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, check the ECM circuits. Refer to the electrical guides. Using a data logger function, check the ECM internal temperature. If the value is less than -40°C (-40°F), suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P066917	PCM / ECM / TCM Internal Temperature Sensor A Circuit High	- ECM circuits short circuit to power - ECM fault	Clear the DTC, cycle the ignition, allow power latch and retest. If the DTC resets, check the ECM circuits. Refer to the electrical guides. Using a data logger function, check the ECM internal temperature. If the value is greater than 130°C (266°F), suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P067013	Glow Plug Control Module Control Circuit / Open	- Glow plug relay, control circuit high resistance - Glow plug relay, control circuit short circuit to ground - Glow plug relay failure	Check the glow plug relay circuits. Refer to the electrical guides. Check the relay operation. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P069311	Fan 2 Control Circuit Low	- Viscous fan control circuit high resistance - Viscous fan solenoid fault	Check the viscous fan solenoid and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P069313	Fan 2 Control Circuit Low	- Viscous fan control circuit short circuit to ground - Viscous fan solenoid fault	Check the viscous fan solenoid and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P069412	Fan 2 Control Circuit High	- Viscous fan control circuit short circuit to power - Viscous fan solenoid fault	Check the viscous fan solenoid and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P083100	Clutch Pedal Switch A Circuit Low	- Clutch pedal switch circuit short to ground	Check the switch and circuits. Refer to the electrical guides and repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P083200	Clutch Pedal Switch A Circuit High	- Clutch pedal switch circuit short to battery	Check the switch and circuits. Refer to the electrical guides and repair/renew as necessary. Clear the DTCs and test for normal operation.
P085062	Park/Neutral Switch Input Circuit	- Park/Neutral switch plausibility check - signal compare fault - Controller area network (CAN) circuit fault	Check the switch and circuits. Refer to the electrical guides. Check for DTCs indicating a CAN fault. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P085212	Park / Neutral Switch Input Circuit High	- Park/Neutral switch circuit short circuit to power	Check the switch and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P0A0916	DC/DC Converter Status Circuit Low	- DC/DC converter less than minimum	Clear the DTCs, turn the ignition off and allow power latch. Check for DTCs. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P0A1017	DC/DC Converter Status Circuit High	- DC/DC converter greater than maximum	Clear the DTCs, turn the ignition off and allow power latch. Check for DTCs. If the DTC resets, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P115A68	Low Fuel Level - Forced Limited Power	- Low fuel level - forced limited power - event information (anti air suction intervention occurred) - Low fuel - Fuel level sensor circuit short circuit to ground - Fuel level sensor circuit high resistance - Fuel level sensor fault	Check that there is sufficient fuel in the tank. Check the fuel level sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new fuel level sensor. Clear the DTCs and test for normal operation.
P115B68	Low Fuel Level - Forced Engine Shutdown	- Low fuel level - forced engine shutdown - event information (anti air suction intervention occurred) - Low fuel - Fuel level sensor circuit short circuit to ground - Fuel level sensor circuit high resistance - Fuel level sensor fault	Check that there is sufficient fuel in the tank. Check the fuel level sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new fuel level sensor. Clear the DTCs and test for normal operation.
P115F11	Electronic Control Module Cooling Fan Circuit	- E-box fan circuits short circuit to ground - E-box fan fault	Check the E-box fan and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new fan. Clear the DTCs and test for normal operation.
P115F12	Electronic Control Module Cooling Fan Circuit	- E-box fan circuits short circuit to power - E-box fan fault	Check the E-box fan and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new fan. Clear the DTCs and test for normal operation.
P115F13	Electronic Control Module Cooling Fan Circuit	- E-box fan circuits high resistance - E-box fan fault	Check the E-box fan and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new fan. Clear the DTCs and test for normal operation.
P116F2F	Fuel Volume Regulator Control Exceeded Control Limits	- Fuel volume control valve circuit fault - signal erratic - Fuel volume control valve fault	Check the fuel volume control valve and circuits. Refer to the electrical guides. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P117D00	Fuel Volume Regulator Control Exceeded Maximum Control Limit	- Fuel volume control valve circuit fault - Fuel volume control valve fault	Check the fuel volume control valve and circuits. Refer to the electrical guides. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced

DTC	Description	Possible causes	Action
			separately). Clear the DTCs and test for normal operation.
P117E00	Fuel Volume Regulator Control Exceeded Minimum Control Limit	● Fuel volume control valve circuit fault ● Fuel volume control valve fault	Check the fuel volume control valve and circuits. Refer to the electrical guides. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P123A21	BARO - Turbocharger/Supercharger Boost Sensor A Correlation	● Barometric - turbocharger boost sensor A (manifold absolute pressure temperature [MAPT] sensor) correlation - signal amplitude less than minimum ● MAPT sensor circuit fault ● MAPT sensor fault ● Engine control module (ECM) fault	Recover the freeze-frame data to determine when the code was set. Check the MAPT sensor and circuits. Refer to the electrical guides. Make sure the coolant temperature is above 0°C (32°F) and with the ignition on, engine not running, check the manifold absolute pressure using a data logger function. If the values are significantly different from ambient pressure, install a new MAPT sensor. Clear the DTCs and test for normal operation. Start the engine and allow to idle. Check the manifold absolute pressure and compare with the values at ignition on, engine not running. The pressure should have increased to between 52.7 Kpa and 120 Kpa (7.64 and 17.40 lbs/in²). If this is not the case, install a new MAPT sensor. Refer to the relevant section of the workshop manual. If the problem persists, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P123A22	BARO - Turbocharger/Supercharger Boost Sensor A Correlation	● Barometric - turbocharger boost sensor A (manifold absolute pressure temperature [MAPT] sensor) correlation - signal amplitude greater than maximum ● MAPT sensor circuit fault ● MAPT sensor fault ● Engine control module (ECM) fault	Recover the freeze-frame data to determine when the code was set. Check the MAPT sensor and circuits. Refer to the electrical guides. Make sure the coolant temperature is above 0°C (32°F) and with the ignition on, engine not running, check the manifold absolute pressure using a data logger function. If the values are significantly different from ambient pressure, install a new MAPT sensor. Clear the DTCs and test for normal operation. Start the engine and allow to idle. Check the manifold absolute pressure and compare with the values at ignition on, engine not running. The pressure should have increased to between 52.7 Kpa and 120 Kpa (7.64 and 17.40 lbs/in²). If this is not the case, install a new MAPT sensor. Refer to the relevant section of the workshop manual. If the problem persists, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P123B21	BARO - Turbocharger/Supercharger Boost Sensor B Correlation	● Barometric - turbocharger boost sensor B (manifold absolute pressure temperature [MAPT] sensor) correlation - signal amplitude less than minimum ● MAPT sensor circuit fault ● MAPT sensor fault ● Engine control module (ECM) fault	Recover the freeze-frame data to determine when the code was set. Check the MAPT sensor and circuits. Refer to the electrical guides. Make sure the coolant temperature is above 0°C (32°F) and with the ignition on, engine not running, check the manifold absolute pressure using a data logger function. If the values are significantly different from ambient pressure, install a new MAPT sensor. Clear the DTCs and test for normal operation. Start the engine and allow to idle. Check the manifold absolute pressure and compare with the values at ignition on, engine not running. The pressure should have increased to between 52.7 Kpa and 120 Kpa (7.64 and 17.40 lbs/in²). If this is not the case, install a new MAPT sensor. Refer to the relevant section of the workshop manual. If the problem persists, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P123B22	BARO - Turbocharger/Supercharger Boost Sensor B Correlation	● Barometric - turbocharger boost sensor B (manifold absolute pressure	Recover the freeze-frame data to determine when the code was set. Check the MAPT sensor and circuits. Refer to the electrical guides. Make sure the coolant

DTC	Description	Possible causes	Action
		temperature [MAPT] sensor) correlation - signal amplitude greater than maximum - MAPT sensor circuit fault - MAPT sensor fault - Engine control module (ECM) fault	temperature is above 0°C (32°F) and with the ignition on, engine not running, check the manifold absolute pressure using a data logger function. If the values are significantly different from ambient pressure, install a new MAPT sensor. Clear the DTCs and test for normal operation. Start the engine and allow to idle. Check the manifold absolute pressure and compare with the values at ignition on, engine not running. The pressure should have increased to between 52.7KPa and 120 Kpa (7.64 and 17.40lbs/in²). If this is not the case, install a new MAPT sensor. Refer to the relevant section of the workshop manual. If the problem persists, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P125987	Immobilizer to PCM Signal Error	- ECM ID timeout occurred	Check the circuits between the modules. Refer to the electrical guides. Check for network DTCs. Repair/renew as necessary. Clear the DTCs and test for normal operation. If the DTC resets, contact the technical help desk.
P132A00	Turbocharger/Supercharger Boost Control A Electrical	- Turbocharger boost control A electrical - Turbocharger circuit fault - Turbocharger fault - Engine control module (ECM) fault	Check the turbocharger and circuits. Refer to the electrical guides. Turn the ignition on and using a data logger function, record the turbocharger actuator angles. Command the turbocharger actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) and recheck the recorded angles. The value at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% pulse width modulated (PWM), 80 - 95%. If the angles are within these ranges, clear the codes and retest. If the angles are outside the range, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P132A19	Turbocharger/Supercharger Boost Control A Electrical	- Turbocharger boost control A electrical - circuit current above threshold - Turbocharger circuit fault - Turbocharger fault - Engine control module (ECM) fault	Check the turbocharger and circuits. Refer to the electrical guides. Turn the ignition on and using a data logger function, record the turbocharger actuator angles. Command the turbocharger actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) and recheck the recorded angles. The value at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% pulse width modulated (PWM), 80 - 95%. If the angles are within these ranges, clear the codes and retest. If the angles are outside the range, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P132B21	Turbocharger/Supercharger Boost Control A Performance	- Turbocharger boost control A performance - signal amplitude less than minimum - Turbocharger connections: water ingress, poor contacts - Turbocharger actuator circuits short circuit to ground - Turbocharger actuator circuits short circuit to power - Turbocharger actuator circuits high resistance - Turbocharger actuator fault - Turbocharger actuator control deviation below minimum threshold	Check the turbocharger and circuits. Refer to the electrical guides. Using a data logger function, record the turbocharger actuator angle at idle and at 3,000 rpm. From idle, 'blip' the throttle to maximum and allow to idle and record the turbocharger actuator angles. At idle, the angle should be approximately 95%, at 3,000 rpm, approximately 40%, and when 'blipped' the voltage should change smoothly at approximately 25% per 100 ms. If the angles do not change, or do not change at the expected rate, suspect the turbocharger actuator is sticking. Install a new turbocharger. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P132B22	Turbocharger/Supercharger Boost Control A Performance	● Turbocharger boost control A performance - signal amplitude greater than maximum ● Turbocharger connections: water ingress, poor contacts ● Turbocharger actuator circuits short circuit to ground ● Turbocharger actuator circuits short circuit to power ● Turbocharger actuator circuits high resistance ● Turbocharger actuator fault - Turbocharger actuator control deviation above maximum threshold	Check the turbocharger and circuits. Refer to the electrical guides. Using a data logger function, record the turbocharger actuator angle at idle and at 3,000 rpm. From idle, 'blip' the throttle to maximum and allow to idle and record the turbocharger actuator angles. At idle, the angle should be approximately 95%, at 3,000 rpm, approximately 40%, and when 'blipped' the voltage should change smoothly at approximately 25% per 100 ms. If the angles do not change, or do not change at the expected rate, suspect the turbocharger actuator is sticking. Install a new turbocharger. Clear the DTCs and test for normal operation.
P133521	EGR Position Sensor Minimum/Maximum Stop Performance	● Right-hand exhaust gas recirculation (EGR) position sensor - signal amplitude less than minimum ● EGR valve circuit short circuit to ground ● EGR valve fault	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angles and command the valve to 0% pulse width modulated (PWM). Recheck the angle. The value should be 0 - 20%. If the value is outside this range, install a new valve. Clear the DTCs and test for normal operation.
P133522	EGR Position Sensor Minimum/Maximum Stop Performance	● Right-hand exhaust gas recirculation (EGR) position sensor minimum/maximum stop performance - signal amplitude greater than maximum ● EGR valve circuit short circuit to power ● EGR valve fault	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angles and command the valve to 0% pulse width modulated (PWM). Recheck the angle. The value should be 0 - 20%. If the value is outside this range, install a new valve. Clear the DTCs and test for normal operation.
P133676	Crankshaft/Camshaft Sensor Range/Performance	● CKP sensor incorrectly installed/damaged ● CMP sensor incorrectly installed/damaged ● CKP sensor fault ● CMP sensor fault	Check the CMP and CKP sensors and circuits. Refer to the electrical guides. If no fault is found in the circuits, install new sensors as necessary. Clear the DTCs and test for normal operation.
P133678	Crankshaft/Camshaft Sensor Range/Performance	● Camshaft - one tooth off	Check the CMP and CKP sensors and circuits. Refer to the electrical guides. If no fault is found in the circuits, install new sensors as necessary. Clear the DTCs and test for normal operation.
P138E21	Turbocharger Boost Control Position Sensor A Minimum/Maximum Stop Performance	● Signal amplitude less than minimum ● Right-hand turbocharger boost control position sensor A adaption diagnosis below bottom limit	Check the turbocharger and circuits. Refer to the electrical guides. Using a data logger function, record the turbocharger actuator angles. Command the turbocharger actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) and recheck the recorded angles. The value at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% pulse width modulated (PWM), 80 - 95%. If the angles are outside these ranges, install a new turbocharger. Clear the DTCs and test for normal operation.
P138E22	Turbocharger Boost Control Position Sensor A Minimum/Maximum Stop Performance	● Signal amplitude greater than maximum ● Right-hand turbocharger boost control position sensor A adaption diagnosis above top limit	Check the turbocharger and circuits. Refer to the electrical guides. Using a data logger function, record the turbocharger actuator angles. Command the turbocharger actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) and recheck the recorded angles. The value at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% pulse width modulated (PWM), 80 - 95%. If the

DTC	Description	Possible causes	Action
			angles are outside these ranges, install a new turbocharger. Clear the DTCs and test for normal operation.
P140E21	EGR Position Sensor C Minimum/Maximum Stop Performance	● Signal amplitude less than minimum ● EGR valve adaption 1 bottom limit check	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angles and command the valve to 0% pulse width modulated (PWM). Recheck the angle. The value should be between 0 - 20%. If the value is outside this range, install a new valve. Clear the DTCs and test for normal operation.
P140E22	EGR Position Sensor C Minimum/Maximum Stop Performance	● Signal amplitude greater than maximum ● EGR valve adaption 1 top limit check	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angles and command the valve to 0% pulse width modulated (PWM). Recheck the angle. The value should be between 0 - 20%. If the value is outside this range, install a new valve. Clear the DTCs and test for normal operation.
P141A27	Exhaust Gas Recirculation Sensor A Circuit Intermittent/Erratic	● Signal rate of change above threshold ● EGR valve position sensor circuit intermittent high resistance ● EGR sensor fault	Check the EGR valve and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Using a data logger function, check the EGR valve position. After a further 5 seconds, recheck the position. If the value has increased by more than 80% per 10 ms, recheck the circuits. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P141B1C	Exhaust Gas Recirculation Sensor B Circuit Intermittent/Erratic	● Circuit voltage out of range ● EGR throttle position sensor circuit intermittent high resistance ● EGR sensor fault	Check the EGR valve and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Using a data logger function, check the EGR valve position. After a further 5 seconds, recheck the position. If the value has increased by more than 80% per 10 ms, recheck the circuits. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P141C27	Exhaust Gas Recirculation Sensor C Circuit Intermittent/Erratic	● signal rate of change above threshold ● EGR valve position sensor circuit intermittent high resistance ● EGR sensor fault	Check the EGR valve and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Using a data logger function, check the EGR valve position. After a further 5 seconds, recheck the position. If the value has increased by more than 80% per 10 ms, recheck the circuits. If no fault is found in the circuits, install a new EGR valve. Clear the DTCs and test for normal operation.
P150A01	Cylinder 1 Injector Circuit Range/Performance	● Injector circuit short circuit to ground ● Injector circuit short circuit to power ● Injector circuit high resistance ● Injector fault	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Disconnect the injector and measure the resistance and capacitance of the component. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If the values are outside this range, install a new injector as necessary.
P150B01	Cylinder 2 Injector Circuit Range/Performance	● Injector circuit short circuit to ground ● Injector circuit short circuit to power ● Injector circuit high resistance ● Injector fault	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Disconnect the injector and measure the resistance and capacitance of the component. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If the values are outside this range, install a new injector as necessary.
P150C01	Cylinder 3 Injector Circuit Range/Performance	● Injector circuit short circuit to ground ● Injector circuit short circuit to power ● Injector circuit high resistance ● Injector fault	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Disconnect the injector and measure the resistance and capacitance of the component. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If the values are outside this range, install a new injector as necessary.

DTC	Description	Possible causes	Action
P155401	Cylinder 4 Injector Circuit Range/Performance	● Injector circuit short circuit to ground ● Injector circuit short circuit to power ● Injector circuit high resistance ● Injector fault	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Disconnect the injector and measure the resistance and capacitance of the component. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If the values are outside this range, install a new injector as necessary.
P155501	Cylinder 5 Injector Circuit Range/Performance	● Injector circuit short circuit to ground ● Injector circuit short circuit to power ● Injector circuit high resistance ● Injector fault	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Disconnect the injector and measure the resistance and capacitance of the component. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If the values are outside this range, install a new injector as necessary.
P155601	Cylinder 6 Injector Circuit Range/Performance	● Injector circuit short circuit to ground ● Injector circuit short circuit to power ● Injector circuit high resistance ● Injector fault	Check the injector circuits. Refer to the electrical guides. Rectify as necessary. Disconnect the injector and measure the resistance and capacitance of the component. Resistance should be 180 - 220 Kohms, capacitance should be greater than 3 microfarad at 20°C (68°F). If the values are outside this range, install a new injector as necessary.
P157262	Brake Pedal Switch Circuit	● Brake lamp switch/brake travel switch circuit fault - signal compare fault ● Engine control module (ECM) fault	Check the brake lamp switch/brake travel switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation. Refer to the warranty policy and procedures manual if a module is suspect.
P162300	Immobilizer Code Word/ID Number Write Failure	● Challenge failed due to timeout	Check the circuits between the modules. Refer to the electrical guides. Check for network DTCs. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P167C00	CAN Link PCM/PCM Circuit/Network	● Controller area network (CAN) link to engine control module (ECM) circuit network ● ECM circuits short circuit to ground ● ECM circuits short circuit to power ● ECM circuits high resistance ● ECM fault	Cycle the ignition and allow power latch. Check the ECM and circuits. Refer to the electrical guides. Repair/renew as necessary. If no fault is found in the circuits, suspect the ECM. Refer to the warranty policy and procedures manual if a module is suspect.
P193A68	Invalid Scan Tool Communication/Request	● Invalid scan tool communication request	This is not a fault, but event information of the communication between the scan tool and ECM. Clear/ignore this DTC.
P200813	Intake Manifold Runner Control Circuit / Open (Bank 1)	● Port de-activation solenoid circuit high resistance ● Port de-activation solenoid circuit short circuit to ground ● Port de-activation solenoid failure	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.
P200911	Intake Manifold Runner Control Circuit Low (Bank 1)	● Port de-activation solenoid circuit high resistance ● Port de-activation solenoid circuit short circuit to ground ● Port de-activation solenoid failure	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.
P201012	Intake Manifold Runner Control Circuit High (Bank 1)	● Port deactivation control circuit short circuit to power ● Port de-activation solenoid failure	Check the port deactivation valve and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new valve. Clear the DTCs and test for normal operation.

Refer to the electrical guides and check pre-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. Check pre-catalytic converter temperature sensor for dirt contamination, corrosion, water ingress damage. Replace pre-catalytic converter temperature sensor
P042600	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1)	● Pre-catalytic converter temperature sensor gradient check (right hand bank sensor 1) ● Pre-catalytic converter temperature sensor failure ● Pre-catalytic converter temperature sensor circuit - short to ground, power or open circuit ● Pre-catalytic converter temperature sensor circuit high resistance	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check pre-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. Intermittent poor or dirty connections. Install a new sensor as required
P04261A	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1)	● Pre-catalytic converter temperature sensor circuit resistance below threshold (right hand bank sensor 1) ● Pre-catalytic converter temperature sensor plausibility at cold start, temperature difference too high ● Pre-catalytic converter temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check pre-catalytic converter temperature sensor circuit for low resistance, short to ground. Replace pre-catalytic converter temperature sensor

DTC	Description	Possible causes	Action
P04261B	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1)	● Pre-catalytic converter temperature sensor circuit resistance above threshold (right hand bank sensor 1) ● Pre-catalytic converter temperature sensor plausibility at cold start, temperature difference too low ● Pre-catalytic converter temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check pre-catalytic converter temperature sensor circuit for high resistance, open circuit. Replace pre-catalytic converter temperature sensor
P04261E	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1, Sensor Circuit 1)	● Pre-catalytic converter temperature sensor circuit resistance out of range (right hand bank sensor 1) ● Pre-catalytic converter temperature sensor plausibility at engine running, temperature too low ● Pre-catalytic converter temperature sensor stuck at low temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check pre-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. Check pre-catalytic converter temperature sensor for dirt contamination, corrosion, water ingress damage. Replace pre-catalytic converter temperature sensor
P042700	Catalyst Temperature Sensor Circuit Low (Bank 1, Sensor Circuit 1)	● Pre-catalytic converter temperature sensor signal below minimum threshold voltage (right hand bank sensor 1) ● Pre-catalytic converter temperature sensor failure ● Pre-catalytic converter temperature sensor circuit - short to ground	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check pre-catalytic converter temperature sensor circuit for short to ground. Install a new sensor as required
P042800	Catalyst Temperature Sensor Circuit High (Bank 1, Sensor Circuit 1)	● Pre-catalytic converter temperature sensor signal above maximum threshold voltage (right hand bank sensor 1) ● Pre-catalytic converter temperature sensor failure ● Pre-catalytic converter temperature sensor circuit - short power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check Pre-catalytic converter temperature sensor circuit for short to power, open circuit. Install a new sensor as required
P042A62	Catalyst Temperature Sensor Circuit (Bank 1, Sensor Circuit 2)	● Post-catalytic converter temperature sensor signal compare failure (right hand bank sensor 2) ● Post-catalytic converter temperature sensor correlation compare with at least two other sensors ● Post-catalytic converter temperature sensor	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. check post-catalytic converter temperature sensor for dirt contamination, corrosion, water ingress damage. Replace post-catalytic converter temperature sensor

DTC	Description	Possible causes	Action
		failure ● Post-catalytic converter temperature sensor circuit - short to ground, power or open circuit	
P042B00	Catalyst Temperature Sensor Circuit Range/Performance (Bank1, Sensor Circuit 2)	● Post-catalytic converter temperature sensor gradient check (right hand bank sensor 2) ● Post-catalytic converter temperature sensor failure ● Post-catalytic converter temperature sensor circuit - short to ground, power or open circuit ● Post-catalytic converter temperature sensor circuit - high resistance	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. Intermittent poor or dirty connections. Install a new sensor as required
P042B1A	Catalyst Temperature Sensor Circuit Range/Performance (Bank1, Sensor Circuit 2)	● Post-catalytic converter temperature sensor circuit resistance below threshold (right hand bank sensor 2) ● Post-catalytic converter temperature sensor plausibility at cold start, temperature difference too high ● Post-catalytic converter temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post-catalytic converter temperature sensor circuit for low resistance, short to ground. Replace post-catalytic converter temperature sensor
P042B1B	Catalyst Temperature Sensor Circuit Range/Performance (Bank1, Sensor Circuit 2)	● Post-catalytic converter temperature sensor circuit resistance above threshold (right hand bank sensor 2) ● Post-catalytic converter temperature sensor plausibility at cold start, temperature difference too low ● Post-catalytic converter temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post-catalytic converter temperature sensor circuit for high resistance, open circuit. Replace post-catalytic converter temperature sensor
P042B1E	Catalyst Temperature Sensor Circuit Range/Performance (Bank1, Sensor Circuit 2)	● Post-catalytic converter temperature sensor circuit resistance out of range (right hand bank sensor 2) ● Post-catalytic converter temperature sensor plausibility at engine running, temperature too low ● Post-catalytic converter temperature sensor stuck at low temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post-catalytic converter temperature sensor circuit for open circuit, short to ground, short to power. check post-catalytic converter temperature sensor for dirt contamination, corrosion, water ingress damage. Replace post-catalytic converter temperature sensor

DTC	Description	Possible causes	Action
P042C00	Catalyst Temperature Sensor Circuit Low (Bank 1, Sensor Circuit 2)	● Post-catalytic converter temperature sensor signal below minimum threshold voltage (right hand bank sensor 2) ● Post-catalytic converter temperature sensor failure ● Post-catalytic converter temperature sensor circuit - short to ground	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post-catalytic converter temperature sensor circuit for short to ground. Install a new sensor as required
P042D00	Catalyst Temperature Sensor Circuit High (Bank 1, Sensor Circuit 2)	● Post-catalytic converter temperature sensor signal above maximum threshold voltage (right hand bank sensor 2) ● Post-catalytic converter temperature sensor failure ● Post-catalytic converter temperature sensor circuit - short to power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post-catalytic converter temperature sensor circuit for short to power, open circuit. Install a new sensor as required
P242A62	Exhaust Gas Temperature Sensor Circuit Bank 1 Sensor 3	● Post DPF temperature sensor signal compare failure (right hand bank sensor 3) ● Post DPF temperature sensor correlation compare with at least two other sensors ● Post DPF temperature sensor failure	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post DPF temperature sensor circuit for open circuit, short to ground, short to power. Check post DPF temperature sensor for dirt contamination, corrosion, water ingress damage. Replace post DPF temperature sensor
P242B1A	Exhaust Gas Temperature Sensor Circuit Range/Performance Bank 1 Sensor 3	● Post DPF temperature sensor circuit resistance below threshold (right hand bank sensor 3) ● Post DPF temperature sensor plausibility at cold start, temperature difference too high ● Post DPF temperature sensor failure ● Post DPF temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post DPF temperature sensor circuit for low resistance, short to ground. Replace post DPF temperature sensor
P242B1B	Exhaust Gas Temperature Sensor Circuit Range/Performance Bank 1 Sensor 3	● Post DPF temperature sensor circuit resistance above threshold (right hand bank sensor 3) ● Post DPF temperature sensor plausibility at cold start, temperature difference too low ● Post DPF temperature sensor failure ● Post DPF temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post DPF temperature sensor circuit for high resistance, open circuit. Replace post DPF temperature sensor
P242B1E	Exhaust Gas Temperature Sensor Circuit Range/Performance Bank 1 Sensor 3	● Post DPF temperature sensor circuit resistance out of range (right hand bank sensor 3)	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post DPF temperature sensor circuit for open circuit, short to ground, short to power.

DTC	Description	Possible causes	Action
		• Post DPF temperature sensor plausibility at engine running, temperature too low • Post DPF temperature sensor failure • Post DPF temperature sensor stuck at low temperature value	Check post DPF temperature sensor for dirt contamination, corrosion, water ingress damage. Replace post DPF temperature sensor
P242C00	Exhaust Gas Temperature Sensor Circuit Low Bank 1 Sensor 3	• Post DPF temperature sensor signal below minimum threshold voltage (right hand bank sensor 3) • Post DPF temperature sensor failure • Post DPF temperature sensor circuit -short to ground, high resistance	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post DPF temperature sensor circuit for short to ground, high resistance. Install a new sensor as required
P242D00	Exhaust Gas Temperature Sensor Circuit High Bank 1 Sensor 3	• Post DPF temperature sensor signal above max threshold voltage (right hand bank sensor 3) • Post DPF temperature sensor failure • Post DPF temperature sensor circuit - short to power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post DPF temperature sensor circuit for short to power, open circuit. Install a new sensor as required
P242E00	Exhaust Gas Temperature Sensor Circuit Intermittent/Erratic Bank 1 Sensor 3	• Post DPF temperature sensor gradient check (right hand bank sensor 3) • Post DPF temperature sensor failure • Post DPF temperature sensor circuit - short to ground, power or open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check post DPF temperature sensor circuit for open circuit, short to ground, short to power. Intermittent poor or dirty connections. Install a new sensor as required
P242F68	Diesel Particulate Filter Restriction - Ash Accumulation	• DPF event information • DPF partially blocked • DPF circuit internal to ECM	DPF regeneration required. Refer to driver handbook.
P244A00	Diesel Particulate Filter Differential Pressure Too Low(Bank1)	• Differential pressure on particulate filter too low right hand bank	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check DPS circuit for open circuit, short to ground, short to power. Check DPS system external pipework for breakage or leakage. Check DPF internal filter brick for failure. Install DPF as required
P244B00	Diesel Particulate Filter Differential Pressure Too High (Bank 1)	• Differential pressure on particulate filter too high right hand bank • Diesel particulate filter internal failure	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Contact Dealer Technical Support
P245300	Diesel Particulate Filter Pressure Sensor A Circuit Range/Performance	• Differential pressure on particulate filter sensor plausibility before start • DPS system contaminated or blocked • DPS stuck • DPS - short to ground, power or open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check DPS circuit for open circuit, short to ground, short to power. Check DPS system for contamination or blockage. Check DPS for sticking. Install sensor as required

DTC	Description	Possible causes	Action
P245329	Diesel Particulate Filter Pressure Sensor A Circuit Range/Performance	● DPS signal invalid ● Differential pressure on particulate filter sensor plausibility check at engine running ● DPS system contaminated or blocked ● DPS stuck ● DPS - short to ground, power or open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check DPS circuit for open circuit, short to ground, short to power. Check DPS system for contamination or blockage. Check DPS system external pipework for breakage or leakage. Check DPS for sticking. Install sensor as required
P245400	Diesel Particulate Filter Pressure Sensor A Circuit Low	● DPS signal below minimum threshold ● DPS failure ● DPS circuit - short to ground, high resistance	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check DPS circuit for short to ground, high resistance. Install sensor as required
P245500	Diesel Particulate Filter Pressure Sensor A Circuit High	● DPS signal above maximum threshold ● DPS failure ● DPS circuit - short to power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check DPS circuit for open circuit, short to power. Install sensor as required
P245600	Diesel Particulate Filter Pressure Sensor A Circuit Intermittent/Erratic	● DPS signal gradient not plausible ● DPS failure ● DPS circuit - short to ground, power or open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check DPS circuit for open circuit, short to ground, short to power. Install sensor as required
P245800	Diesel Particulate Filter Regeneration Duration	● Delay timer for regeneration exceeds threshold ● DPF circuit internal to ECM	Contact Dealer Technical Support

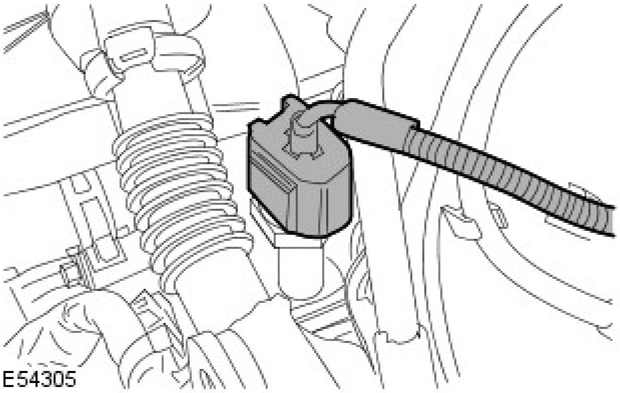
Electronic Engine Controls - TDV6 2.7L Diesel - Engine Oil Pressure (EOP) Sensor

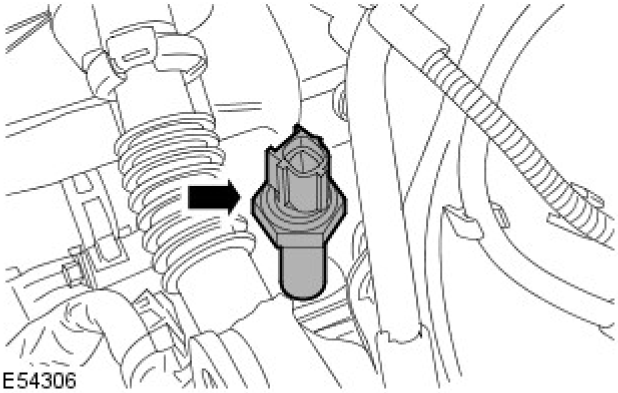
Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the engine oil pressure (EOP) sensor electrical connector.



4. Remove the EOP sensor.



Installation

1. To install, reverse the removal procedure.
   - Tighten the EOP sensor to 15 Nm (11 lb.ft).
2. Check and top-up the engine oil.

Published: 11-May-2011

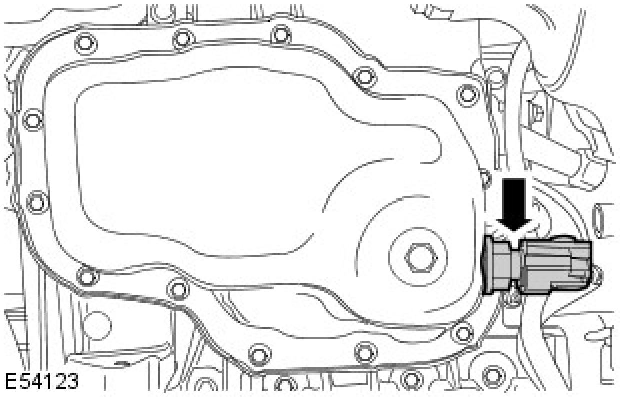
Electronic Engine Controls - TDV6 2.7L Diesel - Oil Temperature Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Drain the engine oil.
For additional information, refer to: Engine Oil Draining and Filling (303-01C Engine - TDV6 2.7L Diesel, General Procedures).



3. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the oil temperature sensor.

- Disconnect the engine oil temperature sensor electrical connector.
- Position a container to collect the oil spillage.
- Remove and discard the O-ring seal.

Installation

1. NOTE: Lubricate new seals with clean engine oil.

Install the oil temperature sensor.

- Clean the component mating faces.
- Install a new O-ring seal.
- Tighten the oil temperature sensor to 20 Nm (15 lb.ft).
- Connect the engine oil temperature sensor electrical connector.

2. Fill the engine with oil.
For additional information, refer to: Engine Oil Draining and Filling (303-01C Engine - TDV6 2.7L Diesel, General Procedures).

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

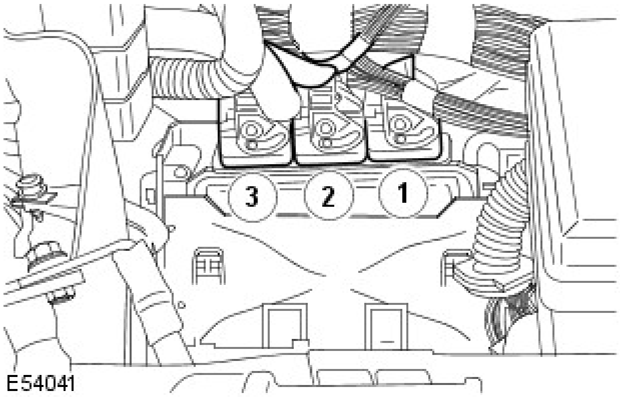
Electronic Engine Controls - TDV6 2.7L Diesel - Engine Control Module (ECM)

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

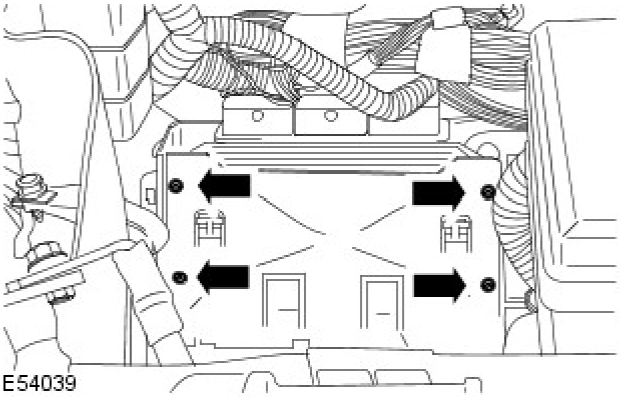
2. Remove the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).



3. NOTE: Right hand drive shown, for Left hand drive reverse the sequence.

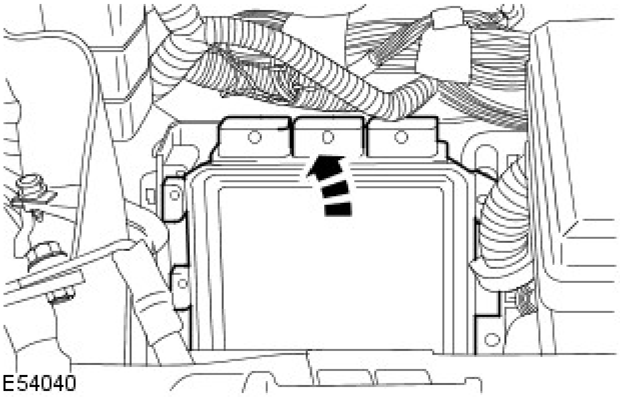
Disconnect the three engine harness electrical connectors in the order shown.

- Position the three engine harness electrical connectors aside for access.



4. Remove the ECM securing plate.

- Remove the four ECM securing bolts



5. Remove the ECM.

- Remove the ECM top cover.

Installation

1. Install the ECM.

- Install the ECM top cover.

2. Install the ECM securing plate.

- Install and tighten the four securing bolts.

3. Connect the three engine harness electrical connectors.

4. Install the four-wheel drive control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

6. NOTE: Vehicles with DPF (Diesel Particulate Filter) installed only.

Renew the engine oil and filter.
For additional information, refer to: Engine Oil Draining and Filling (303-01C Engine - TDV6 2.7L Diesel, General Procedures).

7. Connect T4 to calibrate a new ECM.

Published: 11-May-2011

Electronic Engine Controls - TDV6 2.7L Diesel - Engine Coolant Temperature (ECT) Sensor

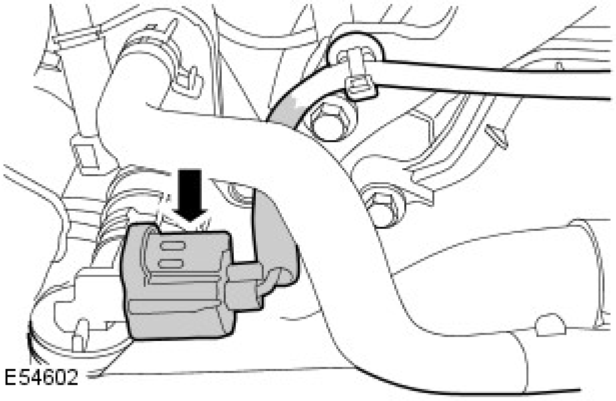
Removal and Installation

Removal

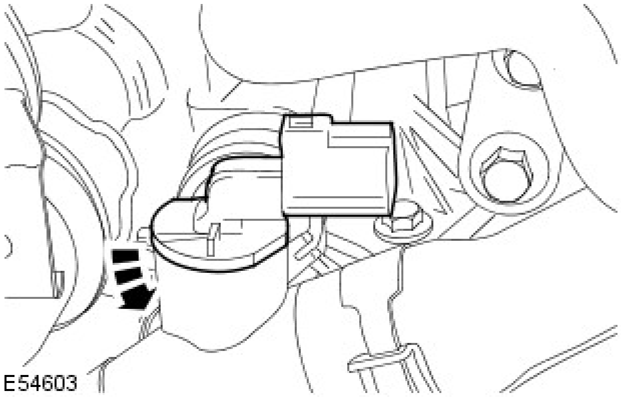
⚠ WARNING: Since injury such as scalding could be caused by escaping steam or coolant, do not remove the engine coolant temperature sensor while the system is hot.

⚠ CAUTION: Engine coolant will damage the paint finished surfaces. If spilt, immediately remove the coolant and clean the area with water.

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the ECT sensor electrical connector.



4. Remove the ECT sensor.
   - Lift the tang and rotate the ECT sensor anti-clockwise.
   - Remove and discard the O-ring seal.



Installation

1. Install the ECT sensor.
   - Clean the component mating faces.
   - Install a new O-ring seal.
2. Connect the ECT sensor electrical connector.
3. Check and top-up the coolant.

- Clean any remaining coolant from around the hoses and pipes.

4. Install the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

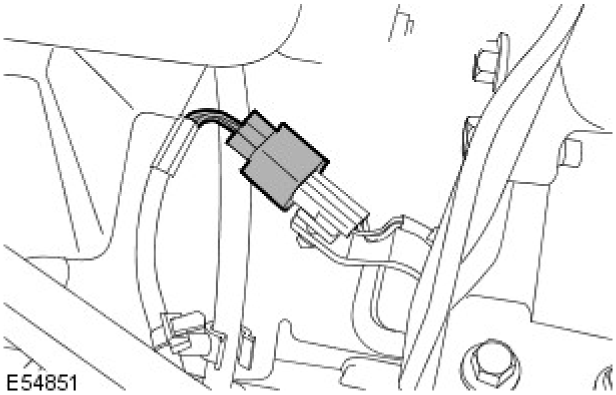
Published: 11-May-2011

Electronic Engine Controls - TDV6 2.7L Diesel - Crankshaft Position (CKP) Sensor

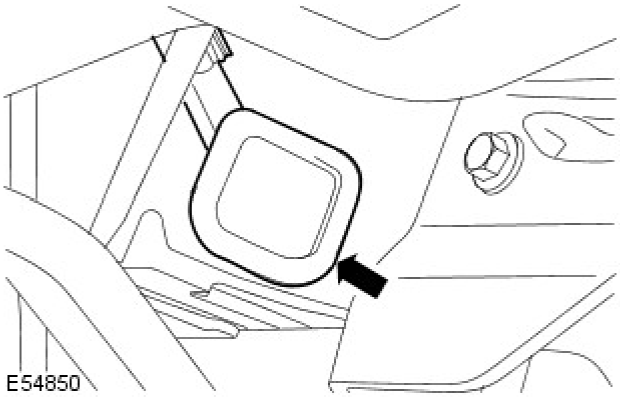
Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the turbocharger.
   For additional information, refer to: Turbocharger (303-04E Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Removal and Installation).
3. Disconnect the CKP sensor electrical connector.



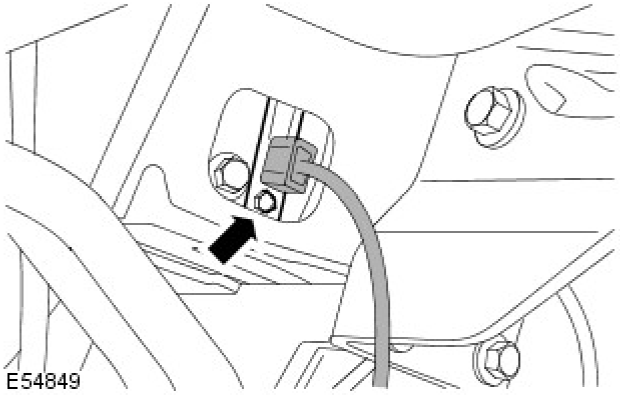
4. Remove the CKP sensor blanking cover.



5. NOTE: The CKP sensor retaining bolt should not be removed from the CKP sensor.

   Remove the CKP sensor.

   - Fully loosen the CKP sensor retaining bolt.



Installation

1. ⚠ CAUTION: Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

To install, reverse the removal procedure.

- Tighten the CKP sensor bolt to 5 Nm (4 lb.ft)

Published: 11-May-2011

Electronic Engine Controls - TDV6 2.7L Diesel - Crankshaft Position (CKP) Sensor Ring

Removal and Installation

Special Tool(s)	
	Installer - Crankshaft Position (CKP) Sensor Ring 303-1130

Removal

• NOTE: The CKP sensor ring must always be discarded and replaced when removed.

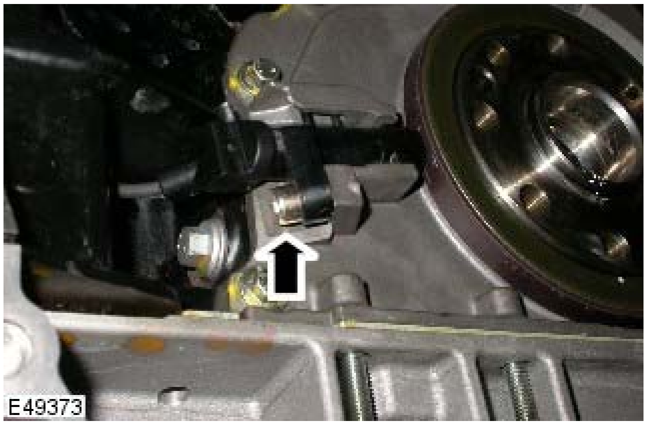
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

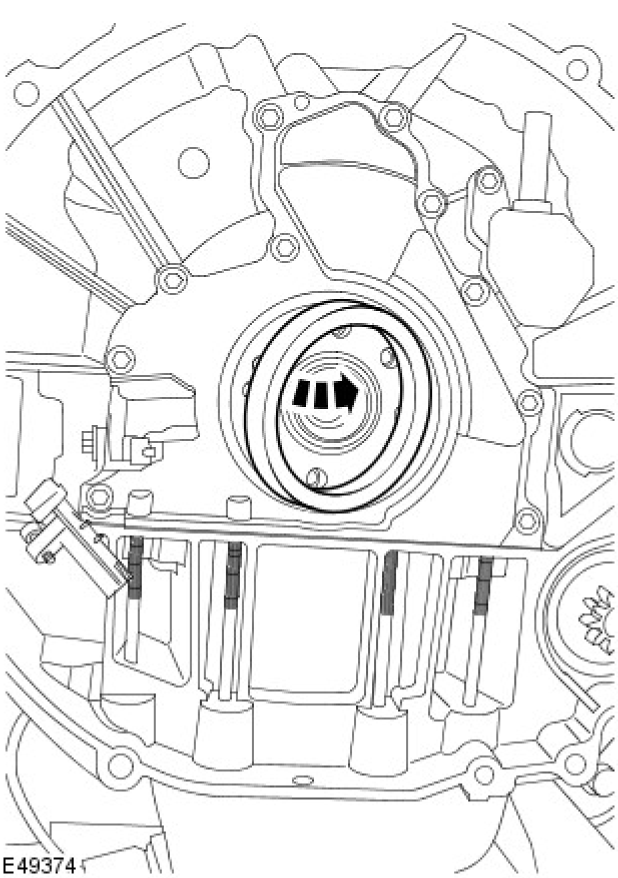
Raise and support the vehicle.

3. Remove the torque converter flexplate.
For additional information, refer to: Flexplate (303-01C Engine - TDV6 2.7L Diesel, In-vehicle Repair).

4. Release the CKP sensor.



- Release the Allen screw.



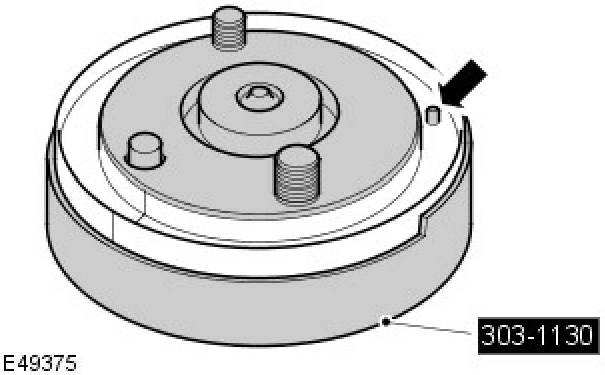
E49374

5. ⚠ CAUTION: Care must be taken to avoid damage to the crankshaft.

Remove the CKP sensor ring.

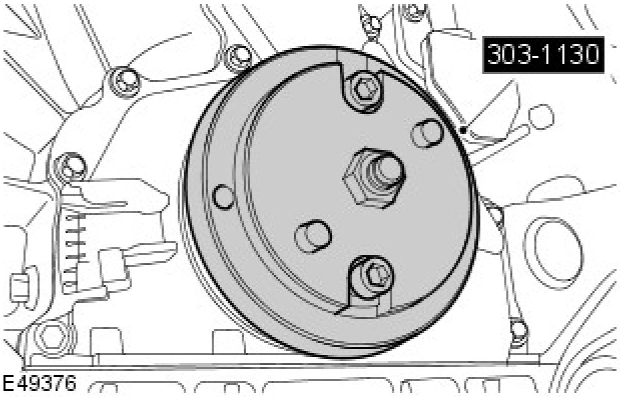
- Carefully remove the CKP sensor ring.

Installation



E49375

1. Install the new CKP sensor ring to the special tool.
   - Wind the special tool nut back to the end of the thread.
   - Engage the CKP sensor ring to the locating pin.



2. Install the CKP sensor ring to the crankshaft.

- Clean the component mating faces.
- Align the dowel and install the special tool to the crankshaft.
- Tighten the 2 Allen screws.
- Tighten the special tool nut, to install the CKP sensor ring to the crankshaft.
- Remove the special tool.

3. Install the CKP sensor.

- Tighten the Allen screw to 6 Nm (4 lb.ft).

4. Install the torque converter flexplate.
For additional information, refer to: Flexplate (303-01C Engine - TDV6 2.7L Diesel, In-vehicle Repair).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

Electronic Engine Controls - TDV6 2.7L Diesel - Camshaft Position (CMP) Sensor

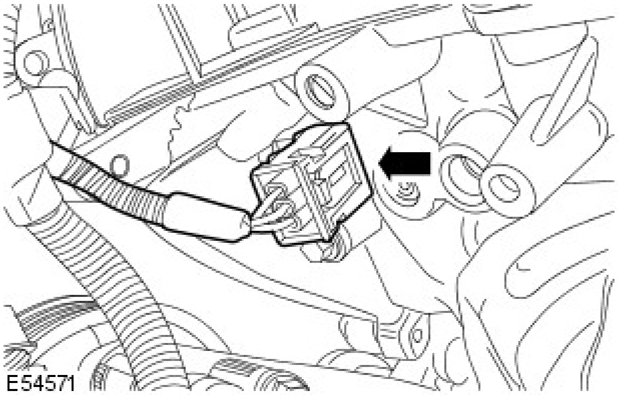
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

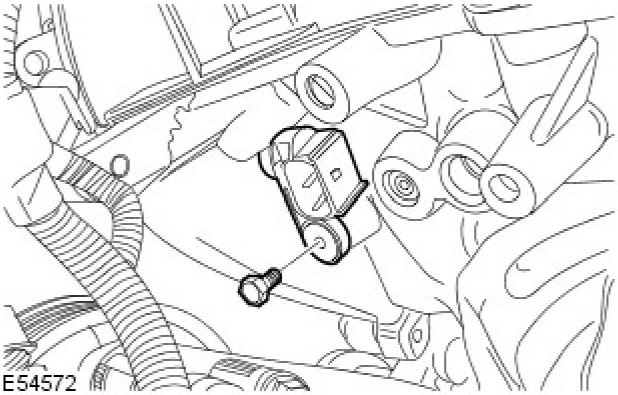
2. Remove the LH exhaust gas recirculation (EGR) valve.
For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve LH - Vehicles Without: Diesel Particulate Filter (DPF) (303-08C Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

3. Disconnect the CMP sensor electrical connector.



4. Remove and discard the CMP sensor.

- Remove the CMP sensor retaining bolt.

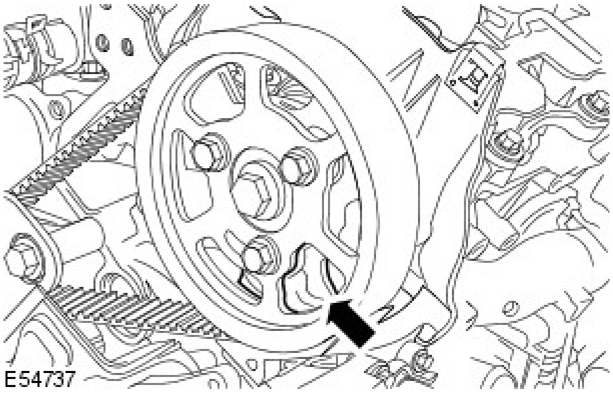


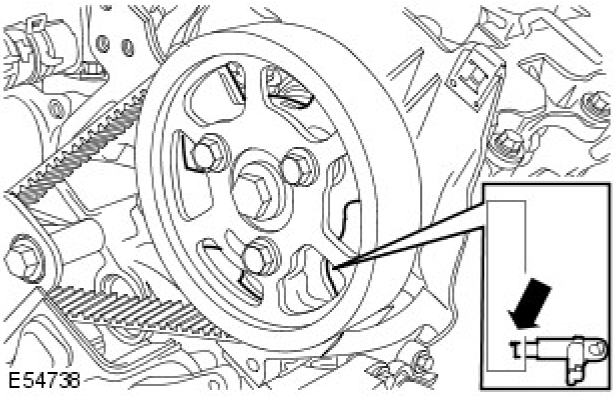
Installation

1. NOTE: Only turn the engine in the normal direction of rotation.

Turn the engine until one of the three webs on the back of the camshaft pulley is visible through the CMP sensor housing.

- Timing belt cover shown removed for clarity.
- Use a mirror, to view the webs on the camshaft pulley through the CMP sensor locating hole.





2. ⚠ CAUTION: The Camshaft position (CMP) sensor tip must rest on one of the three webs on the back of the camshaft pulley. Incorrect installation may result in the CMP sensor being damaged.

Install a new CMP sensor

3. Install the retaining bolt.

- Tighten the bolt to 10 Nm (7 lb.ft).

4. Connect the CMP sensor electrical connector.

5. Install the LH EGR valve.
For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve LH - Vehicles Without: Diesel Particulate Filter (DPF) (303-08C Engine Emission Control - TDV6 2.7L Diesel, Removal and Installation).

6. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

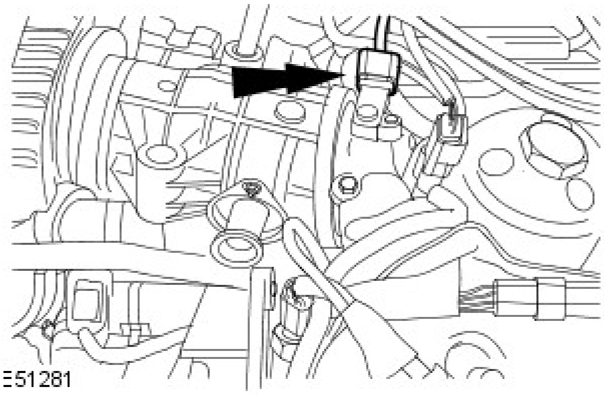
Published: 11-May-2011

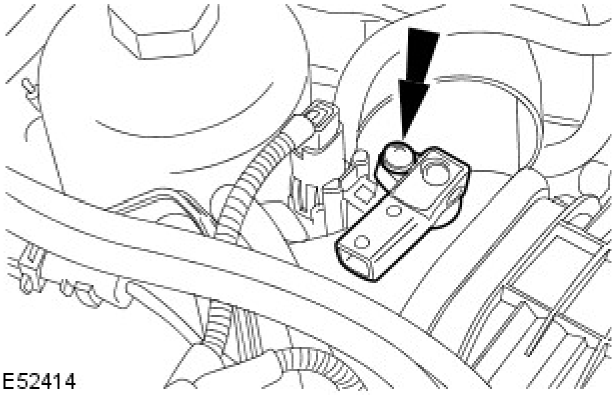
Electronic Engine Controls - TDV6 2.7L Diesel - Manifold Absolute Pressure (MAP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the MAP sensor electrical connector.





4. Remove the MAP sensor.
   - Remove the Torx screw.
   - Remove the O-ring seal.

Installation

1. To install, reverse the removal procedure.
   - Tighten the Torx screw to 3 Nm (2 lb.ft).

Published: 11-May-2011

Electronic Engine Controls - TDV6 2.7L Diesel - Fuel Temperature Sensor

Removal and Installation

Removal

- WARNINGS:

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

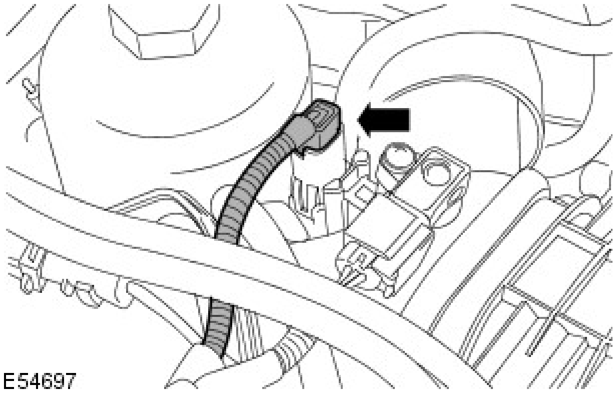
- CAUTIONS:

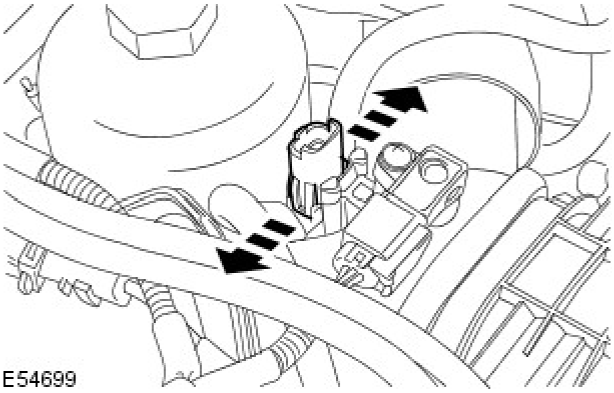
⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

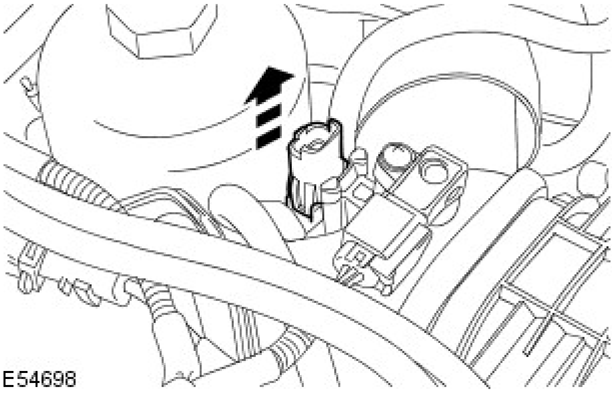
⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the fuel temperature sensor electrical connector.





4. Release the fuel temperature sensor locking tangs.



5. ⚠CAUTION: Always plug any open connections to prevent contamination.

Remove the fuel temperature sensor from the fuel return line.

- Position an absorbent cloth to collect fluid spillage.
- Discard the O-ring seal.
- Clean the seal contact area.
- Install a clean blanking plug to the fuel return line.

Installation

1. To install, reverse the removal procedure.

- Clean the immediate area.

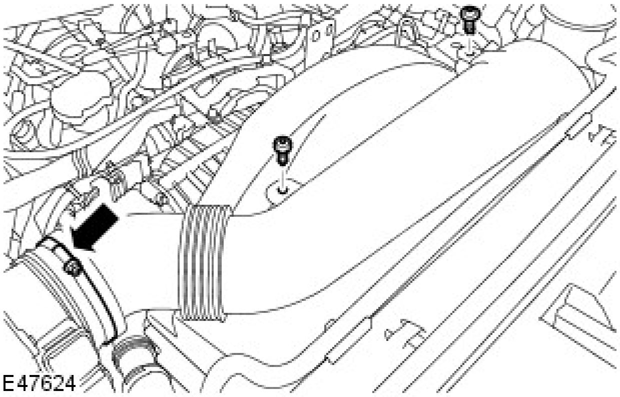
Published: 11-May-2011

Electronic Engine Controls - TDV6 2.7L Diesel - Mass Air Flow (MAF) Sensor

Removal and Installation

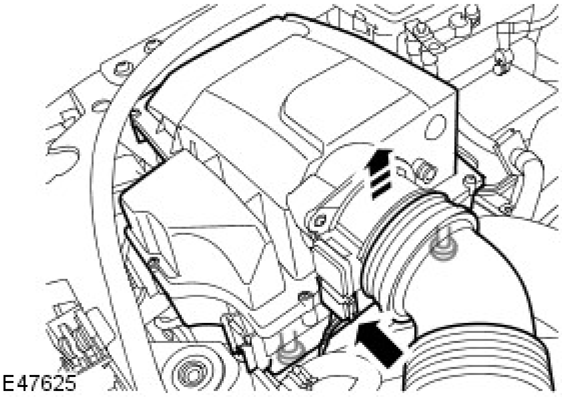
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).



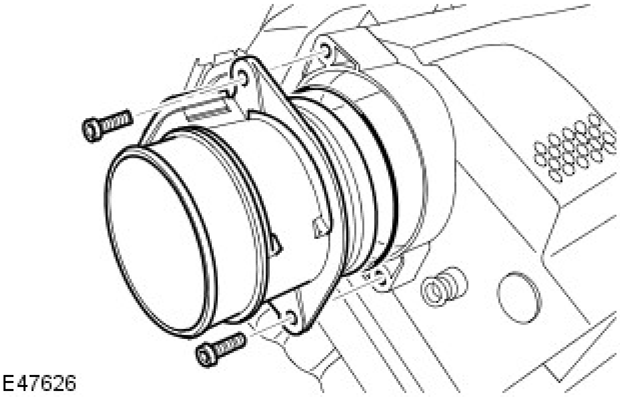
2. Release the air outlet pipe.

- Remove the 2 screws.
- Loosen the clip.



3. Remove the RH air cleaner assembly.

- Disconnect the electrical connector.
- Release the air cleaner from the 2 grommets.



4. Remove the MAF sensor.

- Remove the 2 Torx screws.
- Remove the O-ring seal.

Installation

1. NOTE: When installing the air cleaner, make sure the locating pegs fit securely into the grommets.

To install, reverse the removal procedure.

Published: 11-May-2011

Electronic Engine Controls - TDV6 2.7L Diesel - Intake Air Temperature (IAT) Sensor

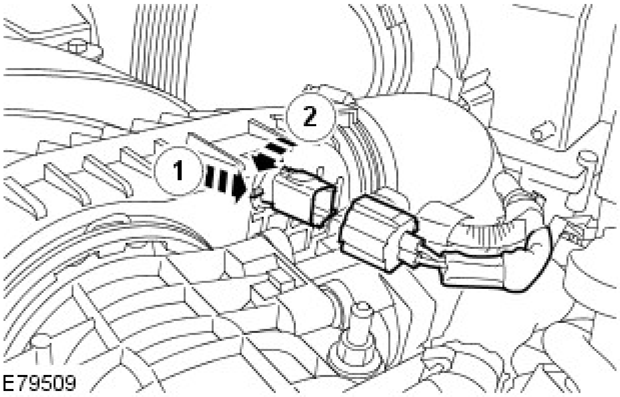
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Remove the intake air temperature (IAT) sensor.



- Disconnect the electrical connector.

Installation

1. To install, reverse the removal procedure.

Published: 09-Mar-2011

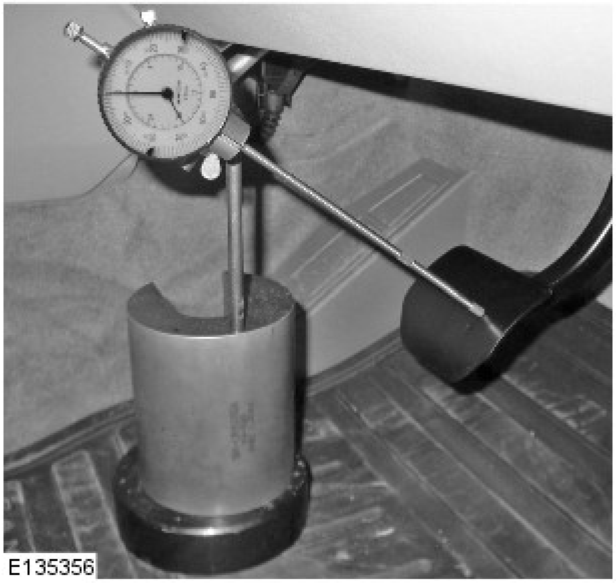
Electronic Engine Controls - TDV6 2.7L Diesel - Brake Pedal Position (BPP) Switch Adjustment

General Procedures

Check

1. Remove the brake pedal rubber.

2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.



Position the DTI gauge on a suitable mounting block, as illustrated.

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.

4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠

Remove the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠ Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.

For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

6		Clutch switch
7		anti-lock brake system (ABS) module

OVERVIEW

The TDV8 engine has an engine management system controlled by an ECM and is able to monitor, adapt and precisely control the fuel injection. The ECM uses multiple sensor inputs and precision control of actuators to achieve optimum performance during all driving conditions.

The ECM controls fuel delivery to all 8 cylinders via a Common Rail (CR) injection system. The CR system uses a fuel rail to accumulate highly pressurized fuel and feed the 8, electronically controlled injectors. The fuel rail is located in close proximity to the injectors, which assists in maintaining full system pressure at each injector at all times.

The ECM uses the drive by wire principle for acceleration control. There are no control cables or physical connections between the accelerator pedal and the engine. Accelerator pedal demand is communicated to the ECM by two potentiometers located in a throttle position sensor. The ECM uses the two signals to determine the position, rate of movement and direction of movement of the pedal. The ECM then uses this data, along with other engine information from other sensors, to achieve the optimum engine response.

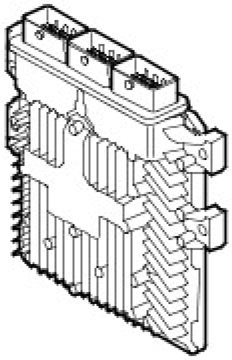
The ECM processes information from the following input sources:

- CKP sensor
- CMP sensor
- Manifold air temperature and pressure
- Coolant temperature
- Oil temperature
- Inlet air flow and temperature
- Fuel rail temperature
- Knock sensors (2 per cylinder bank)

The ECM outputs controlling signals to the following sensors and actuator:

- Fuel injectors
- Cooling fan solenoid
- Electronic Throttle
- Electronic vane controlled turbo
- Port deactivation
- Fuel pressure control valve
- Fuel volume control valve
- E-box fan
- Engine mounts
- Electronic EGR
- Glow plugs

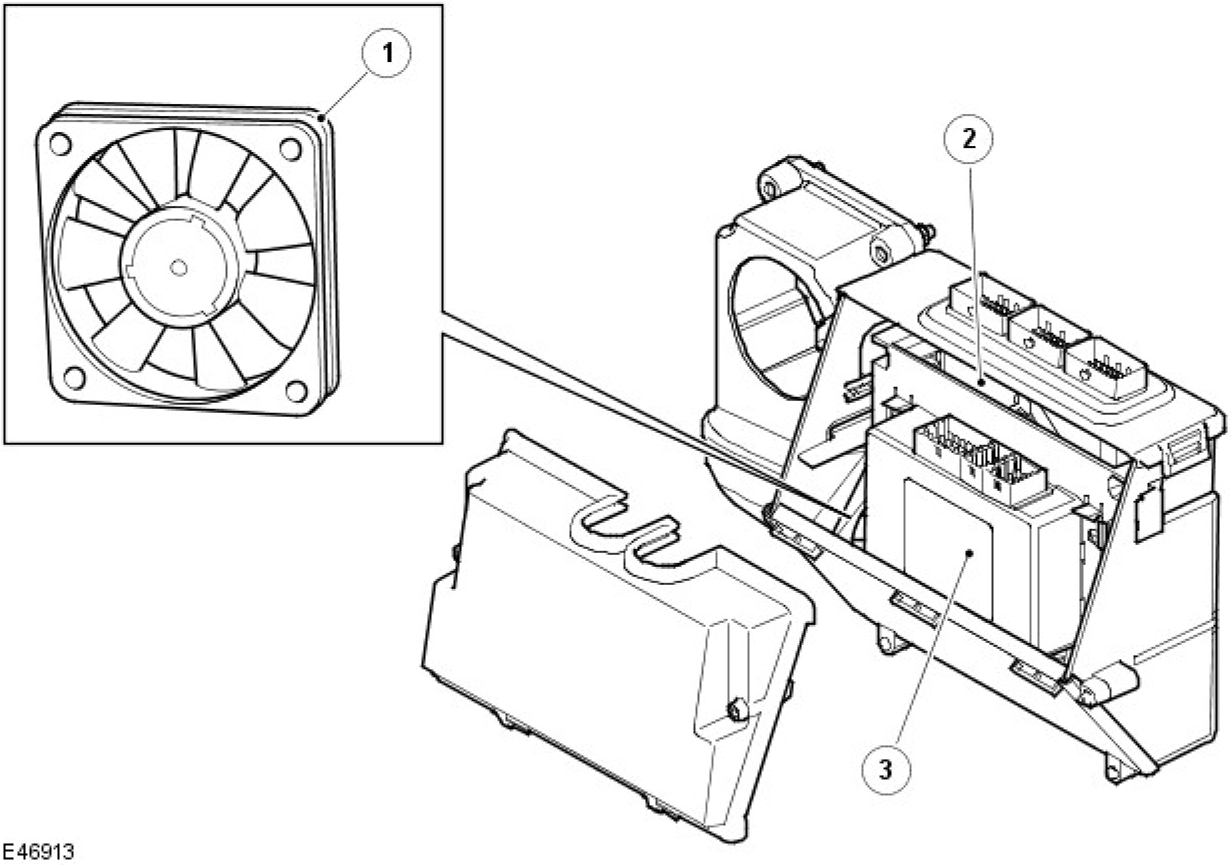
ENGINE CONTROL MODULE (ECM)



E46899

The ECM is located in the E-Box in the plenum area attached to the bulkhead. The E-Box is always on the opposite side to the hand of drive.

E Box



Item	Part Number	Description
1	-	E box fan
2	-	ECM
3	-	Transfer box control module

Inputs

The ECM has the following inputs:

- Engine Coolant Temperature
- Mass airflow (2 off)
- Stop lamp switch (via ABS module on controller area network (CAN)) and hardwired to the ECM
- Manifold Absolute Pressure
- APP sensor - Throttle Pedal Position 1
- APP sensor - Throttle Pedal Position 2
- Electronic throttle Position
- Viscous Fan Speed
- Crankshaft position (engine speed)
- Camshaft position
- Engine Oil Temperature
- Speed Control Switches (resistive ladders)
- Vehicle Speed (via CAN bus)
- Generator Monitor
- Restraints Control Module (RCM)
- Manifold Absolute Pressure and Intake Air Temperature (MAP/IAT)
- Knock sensors (4off)
- Fuel temperature and pressure
- Water in fuel sensor
- Boost air temperature
- Intake air temperature
- Park/neutral switch

Outputs

The ECM outputs to the following:

- Throttle actuators (2of)

- Fuel injectors (8 off)
- EGR Valves
- Electric cooling fan
- Fuel pump relay
- Starter relay
- Air conditioning condenser fan module
- EMS Main relay
- Viscous fan control
- Generator control
- E-box fan control
- Glow plugs
- Fuel volume control valve
- Fuel pressure control valve
- Active engine mounts
- Port deactivation control solenoid valve

The ECM connected to the vehicle harnesses via three connectors. The ECM contains data processors and memory microchips. The output signals to the actuators are in the form of ground paths provided by driver circuits within the ECM. The ECM driver circuits produce heat during normal operation and dissipate this heat via the casing. The fan in the E-box assists with the cooling process by maintaining a constant temperature with the E-box. The E box fan is controlled by the ECM via its internal temperature sensor. The E-box draws air from the vehicle interior and receives additional cooled air via the air conditioning (A/C) system. Some sensors receive a regulated voltage supplied by the ECM. This avoids incorrect signals caused by voltage drop during cranking.

The ECM performs self diagnostic routines and stores fault codes in its memory. These fault codes and diagnostics can be accessed using a Land Rover approved diagnostic system. If the ECM is to be replaced, the new ECM is supplied 'blank' and must be configured to the vehicle using a Land Rover approved diagnostic system. A 'flash' Electronic Erasable Programmable Read Only Memory (EEPROM) allows the ECM to be externally configured, using a Land Rover approved diagnostic system, with market specific or new tune information up to 14 times. If a fifteenth update is required the ECM must be replaced. The current engine tune data can be accessed and read using a Land Rover approved diagnostic system.

When a new ECM is fitted, it must also be synchronized to the CJB using a Land Rover approved diagnostic system. ECM's cannot be 'swapped' between vehicles.

The ECM is connected to the engine sensors which allow it to monitor the engine operating conditions. The ECM processes these signals and decides the actions necessary to maintain optimum engine performance in terms of driveability, fuel efficiency and exhaust emissions. The memory of the ECM is programmed with instructions for how to control the engine, this known as the strategy. The memory also contains data in the form of maps which the ECM uses as a basis for fueling and emission control. By comparing the information from the sensors to the to the data in the maps, the ECM is able to calculate the various output requirements. The ECM contains an adaptive strategy which updates the system when components vary due to production tolerances or ageing.

The ECM receives a vehicle speed signal on a CAN bus connection from the ABS Module. Vehicle speed is an important input to the ECM strategies. The ABS derives the speed signal from the ABS wheel speed sensors. The frequency of this signal changes according to road speed. The ECM uses this signal to determine the following:

- How much to reduce engine torque during gear changes.
- When to permit speed control operation.
- To control the operation of the speed control system.
- Implementation of the idle strategy when the vehicle is stationary.

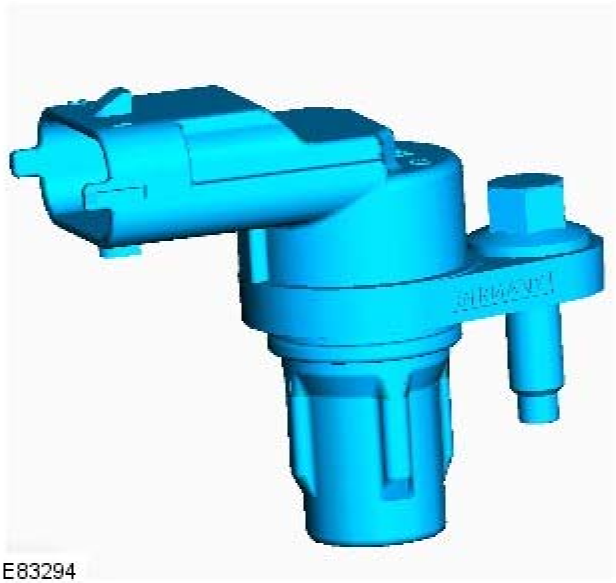
IMMOBILIZATION

The Central Junction Box (CJB) receives information from related systems on the vehicle and passes a coded signal to the ECM to allow starting if all starting parameters have been met. The information is decoded by the ECM which will allow the engine to run if the information is correct.

The information is on a rolling code system and both the CJB and the ECM will require synchronisation if either component is renewed.

The ECM also protects the starter motor from inadvertent operation. The CJB receives an engine speed signal from the ECM via the instrument cluster. When the engine speed exceeds a predetermined value, the CJB prevents operation of the starter motor via an integral starter disable relay.

CAMSHAFT POSITION (CMP) SENSOR



The CMP is located on the rear face of the left hand cylinder head. The sensor tip protrudes through the face to pick up on the reluctor behind the camshaft pulley. The CMP sensor is a Hall effect type sensor

The ECM uses the CMP sensor signal to determine if the piston in No. 1 cylinder is at injection TDC or exhaust TDC. Once this has been established, the ECM can then operate the correct injector to inject fuel into the cylinder when the piston is at injection TDC.

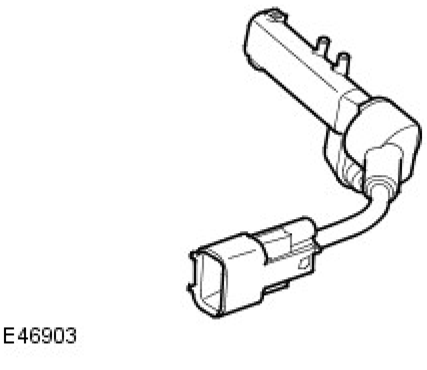
The sensor is a Hall effect sensor which used by the ECM at engine start-up to synchronize the ECM with the CKP sensor signal. The ECM does this by using the CMP sensor signal to identify number one cylinder to ensure the correct injector timing. Once the ECM has established the injector timing, the CMP sensor signal is no longer used.

The CMP sensor receives a 5V supply from the ECM. Two further connections to the ECM provide ground and signal output.

If a fault occurs, an error is registered in the ECM. Two types of failure can occur; camshaft signal frequency too high or total failure of the camshaft signal. The error recorded by the ECM can also relate to a total failure of the crankshaft signal or crankshaft signal dynamically implausible. Both components should be checked to determine the cause of the fault.

If a fault occurs with the CMP sensor when the engine is running, the engine will continue to run but the ECM will deactivate boost pressure control. Once the engine is switched off, the engine will crank but will not restart while the fault is present.

CRANKSHAFT POSITION (CKP) SENSOR



The CKP sensor is located at the rear of the engine block on the left hand side. The sensor tip is aligned with a magnetic trigger which is attached to the crankshaft. The reluctor is a press fit on the end of the crankshaft. The trigger wheel must be carefully aligned to the crankshaft to ensure correct timing. The sensor produces a square wave signal, the frequency of which is proportional to engine speed.

The ECM monitors the CKP sensor signal and can detect engine over-speed. The ECM counteracts engine over-speed by gradually fading out speed synchronized functions. The CKP sensor is a Hall effect sensor. The sensor measures the magnetic field variation induced by the magnetized trigger wheel.

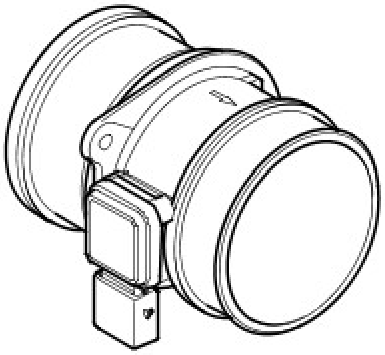
The trigger wheel has two missing teeth representing 12° of crankshaft rotation. The two missing teeth provide a reference point for the angular position of the crankshaft.

When the space with the two missing teeth pass the sensor tip, a gap in the signal is produced which the ECM uses to determine the crankshaft position. The air gap between the sensor tip and the ring is important to ensure correct signals are output to the ECM. The recommended air gap between the CKP sensor and the trigger wheel is 0.4 mm- 1.5 mm.

The ECM uses the signal from the CKP sensor for the following functions:

- Synchronisation.
- Determine fuel injection timing.
- Enable the fuel pump relay circuit (after the priming period).
- Produce an engine speed signal which is broadcast on the CAN bus for use by other systems.

MASS AIR FLOW / INTAKE AIR TEMPERATURE (MAF / IAT) SENSOR



E46904

Two MAF/IAT sensors are located on the intake air duct directly after the air filter box. Each sensor is housed in a plastic molding which is connected between the intake manifold and the air intake pipe.

• NOTE: The MAF/IAT which monitors the LH bank intake does not use the IAT portion of the sensor.

The MAF sensor works on the hot film principle. Two sensing elements are contained within a film. One element is maintained at ambient (air intake) temperature, e.g. 25°Celsius (77°F). The other element is heated to 200°Celsius (392°F) above the ambient temperature, e.g. 225°Celsius (437°F). Intake air entering the engine passes through the MAF sensor and has a cooling effect on the film. The ECM monitors the current required to maintain the 200°Celsius (392°F) differential between the two elements and uses the differential to provide a precise, non-linear, frequency based signal which equates to the volume of air being drawn into the engine.

The MAF sensor output is a digital signal proportional to the mass of the incoming air. The ECM uses this data, in conjunction with signals from other sensors and information from stored fueling maps, to determine the precise fuel quantity to be injected into the cylinders. The signal is also used as a feedback signal for the EGR system.

The IAT sensor incorporates a Negative Temperature Coefficient (NTC) thermistor in a voltage divider circuit. The NTC thermistor works on the principle of decreasing resistance in the sensor as the temperature of the intake air increases. As the thermistor allows more current to pass to ground, the voltage sensed by the ECM decreases. The change in voltage is proportional to the temperature change of the intake air. Using the voltage output from the IAT sensor, the ECM can correct the fueling map for intake air temperature. The correction is an important requirement because hot air contains less oxygen than cold air for any given volume.

The MAF sensor receives a 12V supply from the Battery Junction Box (BJB) and a ground connection via the ECM. Two further connections to the ECM provide a MAF signal and IAT signal.

The IAT sensor receives a 5V reference voltage from the ECM and shares a ground with the MAF sensor. The signal output from the IAT sensor is calculated by the ECM by monitoring changes in the supplied reference voltage to the IAT sensor voltage divider circuit.

The ECM checks the calculated air mass against the engine speed. If the calculated air mass is not plausible, the ECM uses a default air mass figure which is derived from the average engine speed compared to a stored characteristic map. The air mass value will be corrected using values for boost pressure, atmospheric pressure and air temperature.

If the MAF sensor fails the ECM implements the default strategy based on engine speed. In the event of a MAF sensor signal failure, any of the following symptoms may be observed:

- Difficult starting
- Engine stalls after starting
- Delayed engine response

- Emission control inoperative
- Idle speed control inoperative
- Reduced engine performance.

If the IAT sensor fails the ECM uses a default intake air temperature of -5°Celsius (23°F). In the event of an IAT sensor failure, any of the following symptoms may be observed:

- Over fueling, resulting black smoke emitting from the exhaust.
- Idle speed control inoperative.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

E83295

The engine coolant temperature sensor is located in the top hose at the coolant manifold junction. The ECT sensor provides the ECM and the instrument cluster with engine coolant temperature status.

The ECM uses the temperature information for the following functions:

- Fueling calculations
- Limit engine operation if engine coolant temperature becomes too high
- Cooling fan operation
- Glow plug activation time.

The instrument cluster uses the temperature information for temperature gauge operation. The engine coolant temperature signal is also transmitted on the CAN bus by the instrument cluster for use by other systems.

The ECM circuit for the ECT sensor consists of an internal voltage divider circuit which incorporates an NTC thermistor. As the coolant temperature rises the resistance through the sensor decreases and vice versa. The output from the sensor is the change in voltage as the thermistor allows more current to pass to earth relative to the temperature of the coolant.

The ECM compares the signal voltage to stored values and adjusts fuel delivery to ensure optimum driveability at all times. The engine will require more fuel when it is cold to overcome fuel condensing on the cold metal surfaces inside the combustion chamber. To achieve a richer air/fuel ratio, the ECM extends the injector opening time. As the engine warms up the air/fuel ratio is leaned off.

The input to the sensor is a 5V reference voltage supplied from the voltage divider circuit within the ECM. The ground from the sensor is also connected to the ECM which measures the returned current and calculates a resistance figure for the sensor which relates to the coolant temperature.

The following table shows engine coolant temperature values and the corresponding sensor resistance and voltage values.

Coolant Temperature Sensor Response

Temperature (Degrees Celsius)	Resistance (Kohms)	Voltage (Volts)
-40	925	4.54
-30	496	4.46
-20	277	4.34
-10	160	4.15
0	96	3.88

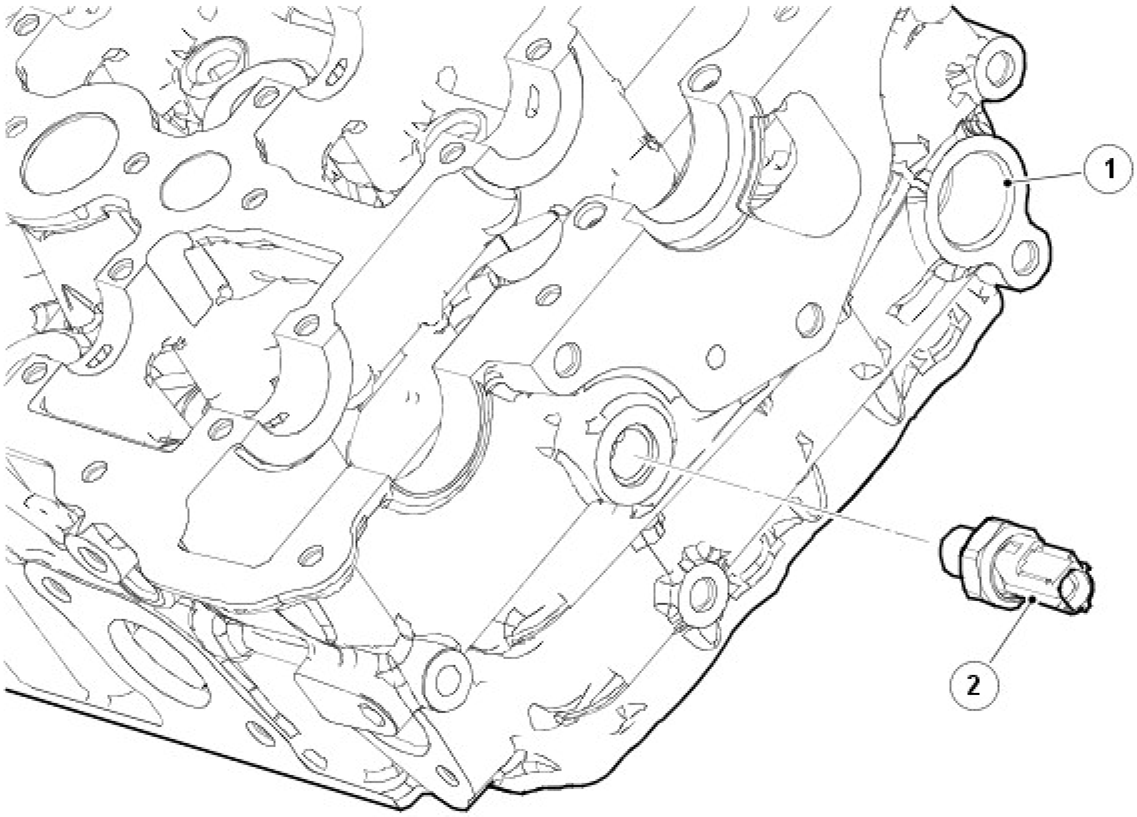
Temperature (Degrees Celsius)	Resistance (Kohms)	Voltage (Volts)
10	59	3.52
20	37	3.09
30	24	2.62
40	16	2.15
50	11	1.72
60	7.5	1.34
70	5.6	1.04
80	3.8	0.79
90	2.9	0.64
100	2.08	0.49
110	1.56	0.38
120	1.19	0.29
130	0.918	0.22
140	0.673	0.17
150	0.563	0.14

If the ECT sensor fails, the following symptoms may be observed:

- Difficult cold start.
- Difficult hot start.
- Engine performance compromised.
- Temperature gauge inoperative or inaccurate reading.

In the event of ECT sensor signal failure, the ECM applies a default value of 80°Celsius (176°F) coolant temperature for Fueling purposes. The ECM will also permanently operate the cooling fan at all times when the ignition is switched on, to protect the engine from overheating.

ENGINE OIL PRESSURE SENSOR

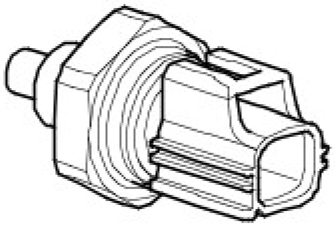


E79909

Item	Part Number	Description
1	-	RH cylinder head
2	-	Oil pressure switch

The oil pressure switch, located in the front of the RH cylinder head, connects a ground input to the instrument cluster when oil pressure is present. The switch operates at a pressure of 0.15 to 0.41 bar (2.2 to 5.9 lbf/in^2).

ENGINE OIL TEMPERATURE SENSOR



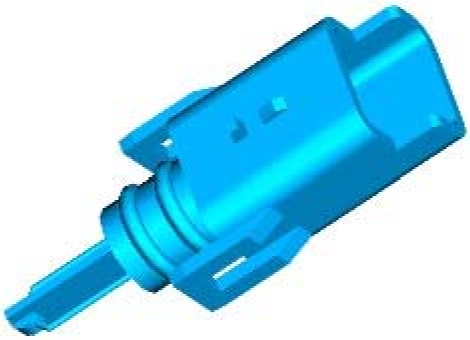
E46906

The oil temperature sensor is located in the engine oil pan. The temperature sensor is a negative temperature coefficient (NTC) type which operates in the -30 Degrees Celsius to +150 Degrees Celsius temperature range.

Oil Temperature Sensor Response

Temperature Degrees Celsius	Resistance Ohms
60	620
90	255
120	117
150	60

FUEL TEMPERATURE SENSOR



E83303

The fuel rail temperature sensor is located on the LP return line at the front of the engine.

The sensor is an NTC sensor which is connected to the ECM by two wires. The ECM fuel temperature sensor circuit consists of an internal voltage divider circuit which incorporates an NTC thermistor. As the fuel temperature rises the resistance through the sensor decreases. The output from the sensor is the change in voltage as the thermistor allows more current to pass to earth relative to the temperature of the fuel.

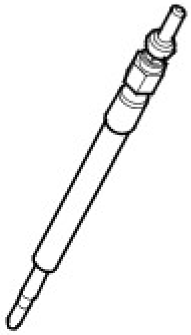
The ECM monitors the fuel temperature constantly. If the fuel temperature exceeds 85°Celsius (185°F), the ECM invokes an engine 'derate' strategy. This reduces the amount of fuel delivered to the injectors in order to allow the fuel to cool. When this occurs, the driver may notice a loss of performance.

Further fuel cooling is available by a bi-metallic valve diverting fuel through the fuel cooler when the fuel reaches a predetermined temperature. In hot climate markets, an electrically operated cooling fan is positioned in the air intake ducting to the fuel cooler. This is controlled by a thermostatic switch, which switches the fan on and off when the fuel reaches a predetermined temperature.

The wires to the fuel sensor are monitored by the ECM for short and open circuit. The ECM also monitors the 5V supply. If a failure occurs a fault is recorded in the ECM memory and the ECM uses a default fuel pressure value.

If the ECM registers an 'out of range' deviation between the pressure signal from the sensor and the pre-programmed 'set point' a fault is stored in the ECM memory. Depending on the extent of the deviation, the ECM will reduce the injection quantity, stop the engine immediately or prevent further engine starting.

GLOW PLUGS



E46912

Three glow plugs are located in each of the cylinder heads, on the inlet side. The glow plugs and the glow plug relay are a vital part of the engine starting strategy. The glow plugs heat the air inside the cylinder during cold starts to assist combustion. The use of glow plugs helps reduce the amount of additional fuel required on start-up, and consequently reduces the emission of black smoke. The use of glow plugs also reduces the amount of injection advance required, which reduces engine noise, particularly when idling with a cold engine.

There are three phases of glow plug activity:

- Pre-heat
- During crank
- Post heat

The main part of the glow plug is a tubular heating element which protrudes into the combustion chamber of the engine. The heating element contains a spiral filament encased in magnesium oxide powder. At the tip of the tubular heating element is the heater coil. Behind the heater coil, and connected in series, is a control coil. The control coil regulates the heater coil to ensure that it does not overheat.

Pre-heat is the length of time the glow plugs operate prior to engine cranking. The ECM controls the pre-heat time based on ECT sensor output and battery voltage. If the ECT sensor fails, the ECM will use the IAT sensor value as a default value. The pre-heat duration is extended if the coolant temperature is low and the battery is not fully charged.

Post heat is the length of time the glow plugs operate after the engine starts. The ECM controls the post heating time based on ECT sensor output. The post heat phase reduces engine noise, improves idle quality and reduces hydrocarbon emissions.

When the ignition is switched on to position II, the glow plug warning lamp illuminates and the instrument cluster displays 'PREHEATING' in the message center. The glow-lamp is activated separately from the glow-plugs, so is not illuminated during or after start. The plugs can still be ON when the lamp is off in these two phases.

In the event of glow plug failure, the engine may be difficult to start and excessive smoke emissions may be observed after starting.

The glow plug warning lamp also serves a second function within the EDC system. If a major EDC system fault occurs, the glow plug warning lamp will be illuminated permanently and a message generated in the instrument cluster. The driver must seek attention to the engine management system at a Land Rover dealer as soon as possible.

BOOST PRESSURE CONTROL

Two manifold absolute pressure and temperature (MAPT) sensors are located post turbo after the electric throttle valves. The sensors provide a voltage signal to the ECM relative to the intake manifold pressure. The MAPT sensor has a three pin connector which is connected to the ECM and provides a 5V reference supply from the ECM, a signal input to the ECM and a ground for the sensor.

The MAPT sensors use diaphragm transducer to measure pressure. The ECM uses the boost pressure sensor signal for the following functions:

- Maintain manifold boost pressure.
- Reduce exhaust smoke emissions when driving at high altitude.
- Control of the EGR system.
- Control of the vacuum control module.

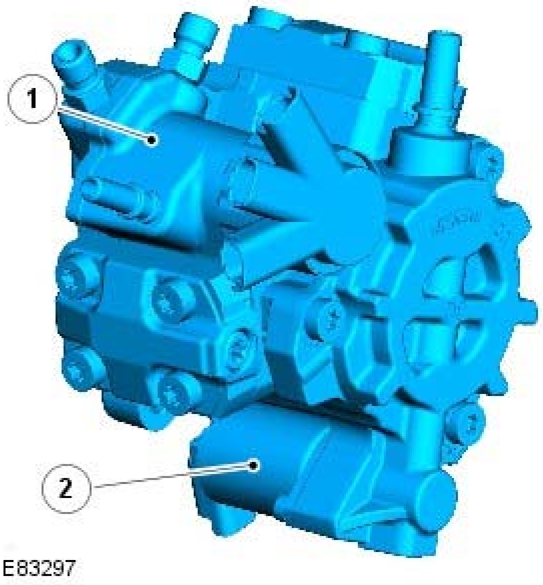
If the MAPT sensors fail, the ECM uses a default pressure of 1013 mbar (14 lbf/in^2). In the event of a MAPT sensor failure, the following symptoms may be observed:

- Altitude compensation inoperative (black smoke emitted from the exhaust).
- Active boost control inoperative.

Boost control is achieved by the use of a direct drive electric actuator. The actuator is attached to the side of the turbo unit and is connected with the control mechanism via a linkage. The electric actuator works on the torque motor principal and has integrated control module.

The electric actuator moves the control vanes through an 60 degree stroke and has the capability to learn its own maximum stroke positions. The electric actuator is controlled via pulse width modulation (PWM) signals from the ECM.

FUEL RAIL PRESSURE CONTROL VALVE



Item	Part Number	Description
1	-	Fuel volume control valve
2	-	Fuel pressure control valve

The fuel pressure control valve is incorporated into the high pressure fuel pump. The control valve regulates the fuel pressure within the fuel rail and is controlled by the ECM. The control valve is a PWM controlled solenoid valve.

When the solenoid is de-energized, an internal spring holds an internal valve closed. At fuel pressure of 100 bar (1450 lbf/in²) or higher, the force of the spring is overcome, opening the valve and allowing fuel pressure to decay into the fuel return pipe. When the pressure in the fuel rail decays to approximately 100 bar (1450 lbf/in²) or less, the spring force overcomes the fuel pressure and closes the valve. When the ECM energizes the solenoid, the valve is closed allowing the fuel pressure to build. The pressure in the fuel rail in this condition can reach approximately 1300 bar (18854 lbf/in²).

The ECM controls the fuel rail pressure by operating the control valve solenoid using a PWM signal. By varying the duty cycle of the PWM signal, the ECM can accurately control the fuel rail pressure and hence the pressure delivered to the injectors according to engine load. This is achieved by the control valve allowing a greater or lesser volume of fuel to pass from the high pressure side of the pump to the un-pressurized fuel return line, regulating the pressure on the high pressure side.

The fuel rail pressure control valve receives a PWM signal from the ECM of between 0 and 12V. The ECM controls the operation of the control valve using the following information to determine the required fuel pressure:

- Fuel rail pressure
- Engine load
- Accelerator pedal position
- Engine temperature
- Engine speed.

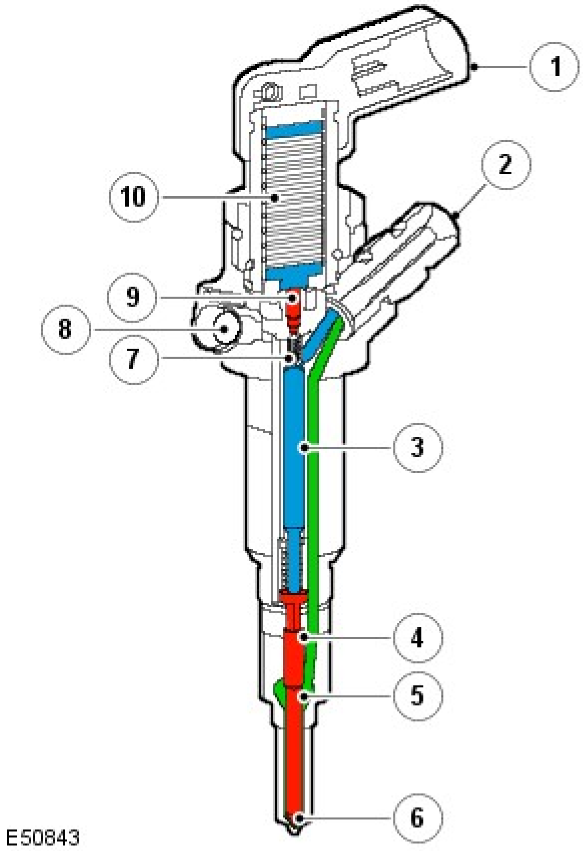
In the event of a total failure of the fuel rail pressure control valve, the engine will not start.

In the event of a partial failure of the fuel rail pressure control valve, the ECM will activate the solenoid with the minimum duty cycle which results in the injection quantity being limited.

FUEL VOLUME CONTROL VALVE

The fuel rail volume control valve is incorporated into the high pressure fuel pump. The VCV spills unwanted fuel back to the tank (or LP system) or forwards it to the PCV. This avoids unused fuel being pressurized by the HP stage of the pump, only to be spilt back to LP by the PCV wasting energy and heating the fuel.

INJECTORS



Item	Part Number	Description
1	-	Harness connection
2	-	HP connection
3	-	Control piston
4	-	Nozzle needle
5	-	Nozzle HP chamber
6	-	Nozzle spray holes
7	-	Valve mushroom
8	-	Fuel return
9	-	Valve piston
10	-	Piezo actuator

There are 8 electronic fuel injectors (one for each cylinder) located in a central position between the four valves of each cylinder. The ECM divides the injectors into two banks of 4 cylinders.

Each injector is supplied with pressurized fuel from the fuel rail and delivers finely atomized fuel directly into the combustion chambers. Each injector is individually controlled by the ECM which operates each injector in the firing order and controls the injector opening period via PWM signals. Each injector receives a 12V supply from the ECM and, using programmed injection/timing maps and sensor signals, determines the precise pilot and main injector timing for each cylinder. If battery voltage falls to between 6 and 9V, fuel injector operation is restricted, affecting emissions, engine speed range and idle speed. In the event of a failure of a fuel injector, the following symptoms may be observed:

- Engine misfire
- Idle irregular
- Reduced engine performance
- Reduced fuel economy
- Difficult starting
- Increased smoke emissions.

The ECM monitors the wires for each injector for short circuit and open circuit, each injector and the transient current within the ECM. If a defect is found, an error is registered in the ECM for the failed injector.

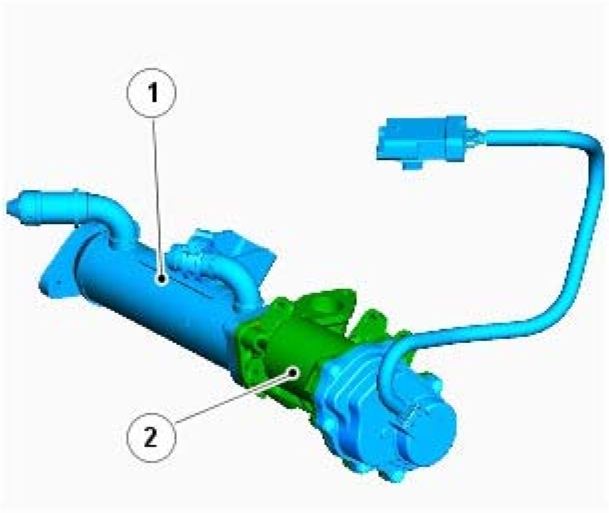
EXHAUST GAS RECIRCULATION (EGR) SYSTEM

The EGR system comprises:

- EGR modulator x 2

- EGR cooler x 2
- Associated connecting pipes

EGR Valve and Cooler



E83298

Item	Part Number	Description
1	-	EGR cooler
2	-	EGR valve

The EGR modulator and cooler are a combined unit.

The combined EGR modulator and cooler is located under each cylinder bank, between the exhaust manifold and the cylinder head. The cooler side of the EGR is connected to the vehicle cooling system, via hoses. The inlet exhaust side is connected directly into the exhaust manifolds on each side. The exhaust gas passes through the cooler and is expelled via the actuator and a metal pipe into the throttle housing. The EGR modulator is a solenoid operated valve which is controlled by the ECM. The ECM uses the EGR modulator to control the amount of exhaust gas being re-circulated in order to reduce exhaust emissions and combustion noise. The EGR is enabled when the engine is at normal operating temperature and under cruising conditions.

The EGR modulator receives a 12V supply from the ECM and is controlled using a PWM signal. The PWM duty signal of the solenoid ground is varied to determine the precise amount of exhaust gas delivered to the cylinders.

The modulators are operated through their full range at each engine shut down, to clear any carbon deposits that may have built up whilst the engine was running

In the event of a failure of the EGR modulator, the EGR function will become inoperative. The ECM can monitor the EGR modulator solenoid for short circuits and store fault codes in the event of failure. The modulator can also be activated for testing using a Land Rover approved diagnostic system.

CYLINDER HEAD PORT DE-ACTIVATION

The cylinder head layout of the engine has been designed to optimize levels of swirl within the combustion chamber across the engine speed range. If there is too much swirl, then as fuel is injected, the high velocity of the swirling gases prevent the jets of atomized fuel reaching the edges of the combustion chamber. This poor distribution of fuel within the combustion chamber causes increased emissions.

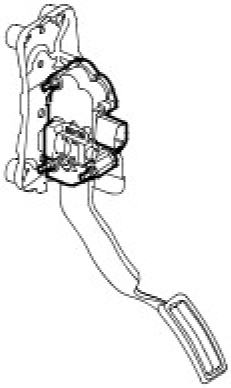
The engine features an intake port deactivation system to enhance the fuel distribution around the combustion chamber.

Each cylinder features two intake ports; one is designed as a helical 'swirl' port, configured to create the optimum swirl for good combustion whilst the other is designed as a 'filling-port', capable of supplying high volumes of air without disturbing in-cylinder swirl.

The helical port is open under all operating conditions. At low loads the filling port is closed off raising gas velocity through the helical port to increase in-cylinder swirl to the required rate. To avoid any risk of high gas flow creating excessive swirl, the filling port is then opened under high gas-flow conditions to help maintain consistent optimum swirl across the engine's operating range.

Port deactivation is controlled by butterfly valves operating within the intake manifold. These are controlled by the ECM via a vacuum operated actuator mounted on the back of the intake manifold for each cylinder bank.

ACCELERATOR PEDAL POSITION (APP) SENSOR



E47297

The APP sensor is incorporated into the pedal assembly. The sensor is a twin track rotary potentiometer type.

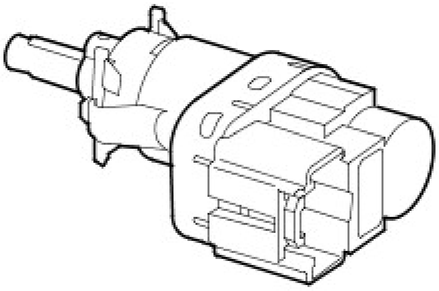
The APP sensor is located in plastic housing which is integral with the throttle pedal. The housing is injection molded and provides location for the APP sensor. The sensor is mounted externally on the housing and is secured with two Torx screws. The external body of the sensor has a six pin connector which accepts a connector on the vehicle wiring harness.

The sensor has a spigot which protrudes into the housing and provides the pivot point for the pedal mechanism. The spigot has a slot which allows for a pin, which is attached to the sensor potentiometers, to rotate through approximately 90°, which relates to pedal movement. The pedal is connected via a link to a drum, which engages with the sensor pin, changing the linear movement of the pedal into rotary movement of the drum. The drum has two steel cables attached to it. The cables are secured to two tension springs which are secured in the opposite end of the housing. The springs provide 'feel' on the pedal movement and require an effort from the driver similar to that of a cable controlled throttle. A detente mechanism is located at the forward end of the housing and is operated by a ball located on the drum. At near maximum throttle pedal movement, the ball contacts the detente mechanism. A spring in the mechanism is compressed and gives the driver the feeling of depressing a 'kickdown' switch when full pedal travel is achieved.

The APP sensor has two potentiometer tracks which each receive a 5V input voltage from the ECM. Track 1 provides an output of 0.5V with the pedal at rest and 2.0V at 100% full throttle. Track 2 provides an output of 0.5V with the pedal at rest and 4.5V at 100% full throttle. The signals from the two tracks are used by the ECM to determine fueling for engine operation and also by the ECM and the transmission control module (TCM) to initiate a kickdown request for the automatic transmission.

The ECM monitors the outputs from each of the potentiometer tracks and can determine the position, rate of change and direction of movement of the throttle pedal. The 'closed throttle' position signal is used by the ECM to initiate idle speed control and also overrun fuel cut-off.

BRAKE LAMP SWITCH



E46910

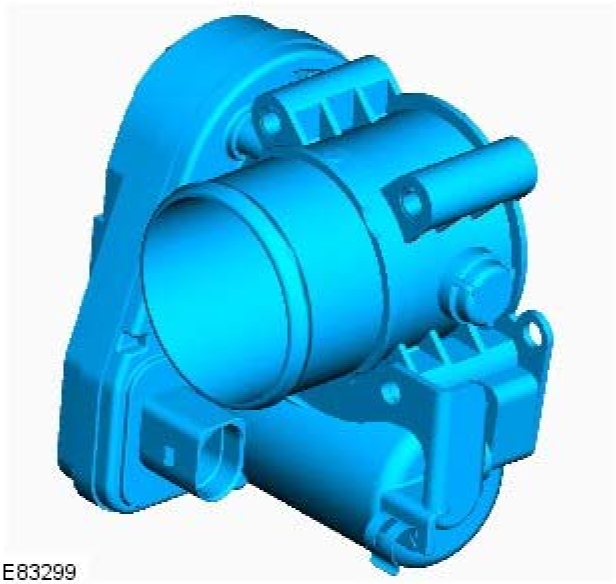
The brake switch is located on the brake pedal and is operated by the brake pedal. The switch has a normally open circuit switch which closes the circuit when the driver has applied the brakes. The switch is connected directly to the ECM and the ECM also receives a brake light signal on the CAN (controller area network) bus from the ABS (anti-lock brake system) control module. .

- To limit fueling during braking
- To inhibit/cancel speed control if the brakes are applied.

In the event of a brake switch failure, the following symptoms may be observed:

- Speed control inactive
- Increased fuel consumption.

ELECTRIC THROTTLE



The electric throttle bodies are located in the intake tract prior to where the inlet splits to divert air flow into the two separate air intake manifolds. The electric throttles control the volume of air allowed into the inlet manifold by means of a direct current (DC) motor which controls a flap in the body of the throttle. This is done in response to inputs from the engine management system.

DIESEL PARTICULATE FILTER (DPF) CONTROL - VEHICLES FROM 2008MY

Vehicles from 2008MY are fitted with a Diesel Particulate Filter (DPF) which collects the particulate matter produced during the combustion process and reduces the particulates entering the atmosphere.

The DPF is located in the exhaust system, downstream of the catalytic converter. A major feature of the DPF is its ability for regeneration. Regeneration is the burning of particulates trapped by the filter to prevent obstruction to the free flow of exhaust gasses. The regeneration process is controlled by the ECM and takes place at calculated intervals and is not noticeable by the driver of the vehicle.

For details of the DPF and the regeneration processes refer to the relevant exhaust system section.
For additional information, refer to: Exhaust System (309-00D Exhaust System - TDV8 3.6L Diesel, Description and Operation).

Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged or destroyed.

The exhaust gas and DPF temperatures are controlled by the DPF software located in the ECM. The DPF software monitors the load status of the DPF based on driving style, distance travelled and signals from a differential pressure sensor and temperature sensors located before and after the DPF in the exhaust system. When the particulate loading of the DPF reaches predetermined levels, the DPF is actively regenerated by adjusting, in conjunction with the ECM, various engine control functions such as:

- fuel injection
- intake air throttle
- EGR
- turbocharger boost pressure control.

The regeneration process is possible because of the flexibility of the common-rail fuel injection engine which provides precise control of fuel flow, fuel pressure and injection timing which are essential requirements to promote the efficient regeneration process.

The ECM contains the DPF software which controls and monitors the DPF and the regeneration process. The software is broken down into three separate modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module, which interact with each other to provide precise DPF control.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested. The DPF supervisor module is a sub-system of the DPF co-ordinator module.

DPF Co-Ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and controlling the following DPF regeneration requests:

- EGR cut-off
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests EGR cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the EGR system confirming that the EGR valve is closed.

• NOTE: The EGR valve is open at idle to allow reduced NO_x. EGR is not used during part load due to intake manifold contamination.

When the EGR valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- Timing and quantity of the four split injections per stroke (pilot, main and two post injections).
- Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- EGR control
- Turbocharger boost pressure control
- Intake air temperature and pressure control.

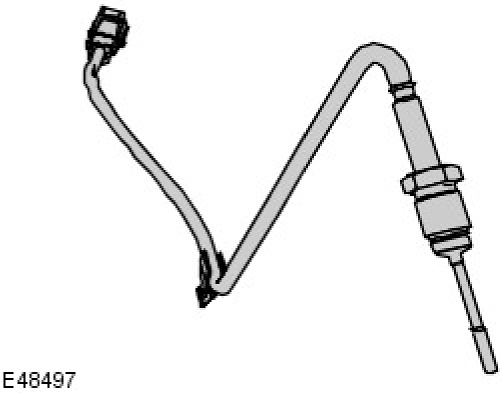
During active regeneration, the EGR operation is disabled and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

Restricting the air intake during DPF regeneration has the following functions:

- Increase in engine load
- Slower combustion
- Reduction in the mass of air taken in
- A reduction in the speed of the exhaust gases and therefore an increase in the time for which the gases are in the catalytic converter.

The module controls the intake air temperature by actuating the EGR throttle and by adjustment of the turbocharger boost pressure control.

DPF Temperature Sensors



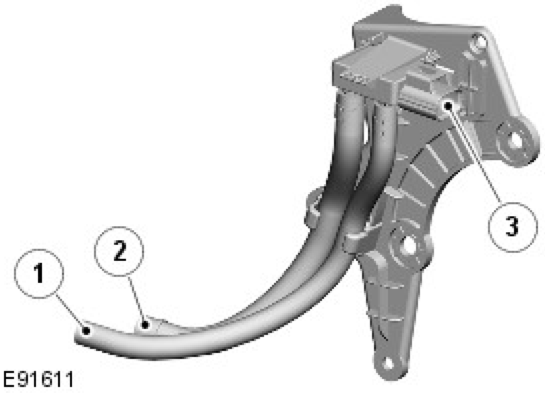
Five temperature sensors are used in the DPF system. One is located in each of the turbocharger outlet elbows, another sensor is located after each catalytic converter and the one sensor is located after the DPF.

The sensors measure the temperature of exhaust gas exiting the turbocharger, before it passes through the DPF and after it has passed through the DPF and provides the information required by the ECM to calculate the DPF temperature. The information is used, in conjunction with other data, to estimate the amount of accumulated particulate and to control the DPF temperature.

The sensors are Negative Temperature Co-efficient (NTC) type resistors, which measure the temperature of the exhaust gases. The resistance, and subsequently the voltage at the sensor will decrease as the exhaust gas temperature increases.

In the event of a fault in a temperature sensor, the ECM uses a substitute value of 350°C (1202°F).

Differential Pressure Sensor



Item	Part Number	Description
1	-	Low pressure connection
2	-	High pressure connection
3	-	Electrical connector

The differential pressure sensor is located on the rear of the transfer box, adjacent to the DPF.

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet and outlet pressures of the DPF.

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conduction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet air flow and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

A DPF is recognized as overloaded if the differential pressure under certain operating conditions exceeds the overload limit calculated by the ECM. The DPF software may start regeneration attempts but be unable to complete them. These attempts are counted by the ECM and, if the maximum number of regeneration attempts is reached, a fault entry is recorded in the ECM at the next ignition on cycle.

The DPF software performs the following checks using the DPF differential pressure sensor:

- Plausibility check
- Diesel particulate filter efficiency
- Diesel particulate filter overloaded
- Diesel particulate filter clogged
- Monitoring of the maximum regeneration attempts in the lower load range.

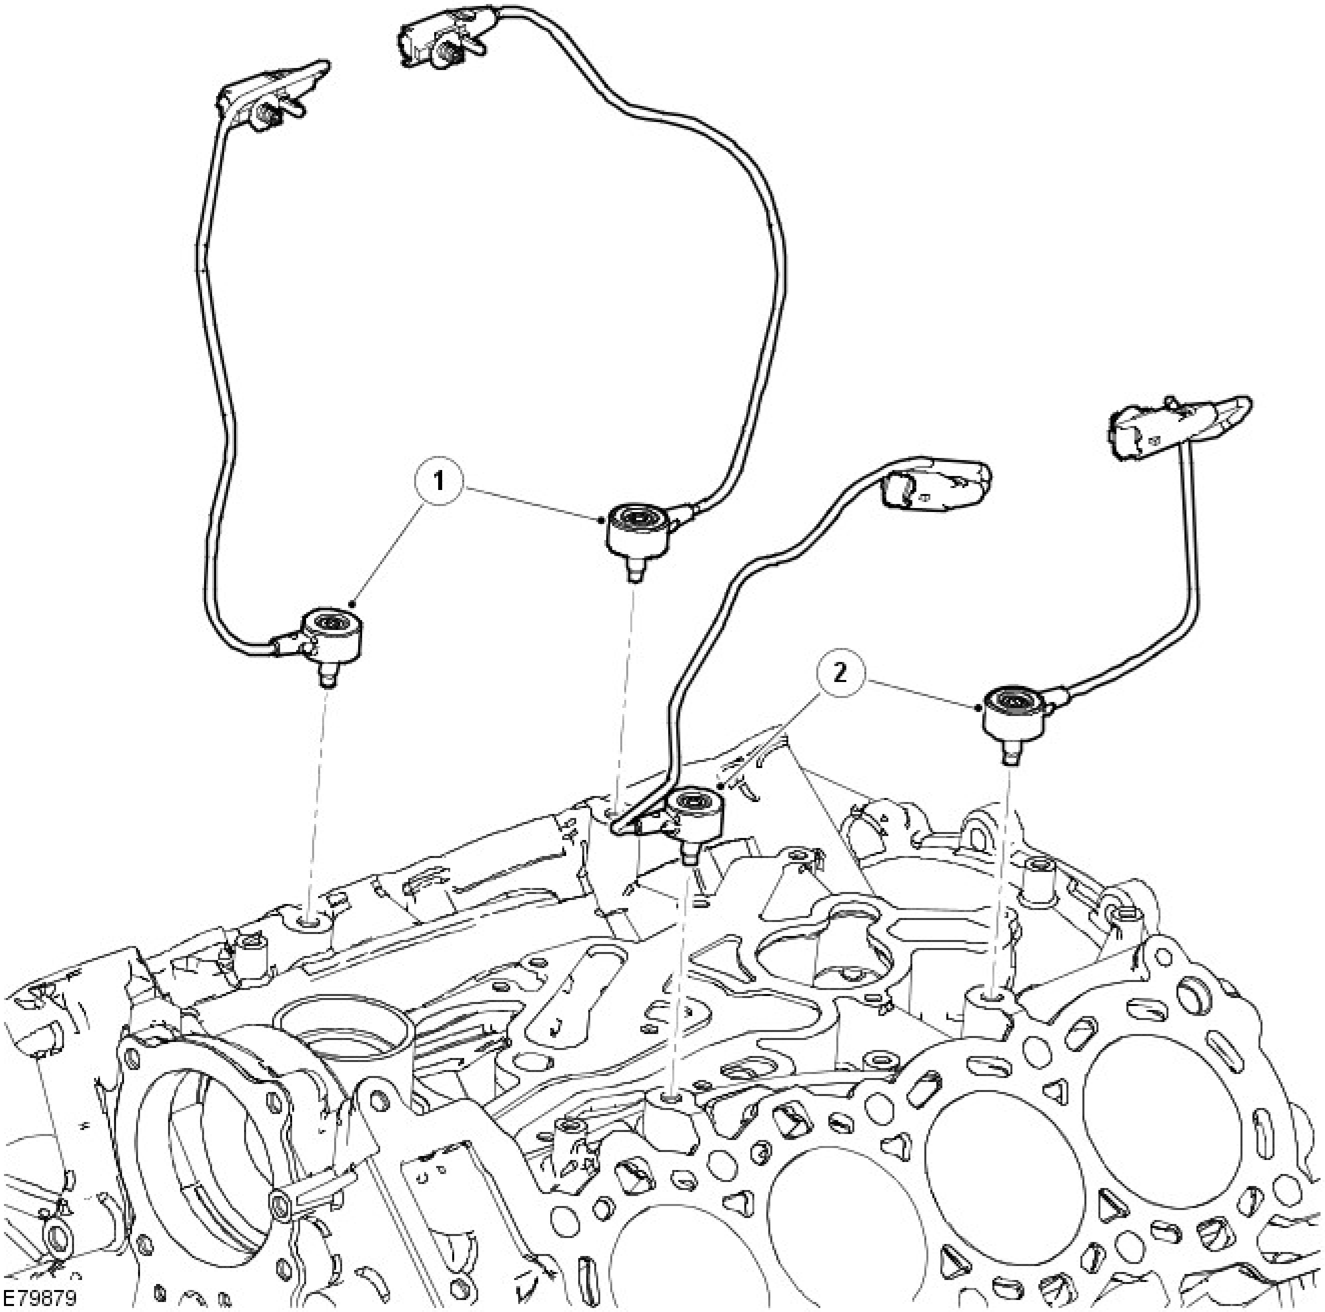
TERRAIN RESPONSE™

Terrain Response system allows the driver to select a program which will provide the optimum settings for traction and performance for prevailing terrain conditions.

As part of Terrain Response there are be different throttle pedal progression maps associated with different Terrain Response modes. The two extremes are likely to be a sand map (quick build up of torque with pedal travel) and grass/gravel/snow (very cautious build up of torque).

The TdV8 implementation of throttle progression is based on a fixed blend time. The torque will blend from that on one map to that on the new map (for the same pedal position) over a fixed time. This means blending will always take the same amount of time but when the torque change is small the torque increase over time will be small, whilst if the torque change is greater then the torque increase over time will be steeper. The resulting acceleration of the vehicle will depend on the torque difference between the two maps as well as on the gear and range selected. The worst case blending that could ever occur has been calibrated to match the blend rate for petrol derivatives as closely as possible, so as to give a transparent behavior to customers.

KNOCK SENSORS



Item	Part Number	Description
1	-	Right Hand Sensors
2	-	Left Hand Sensors

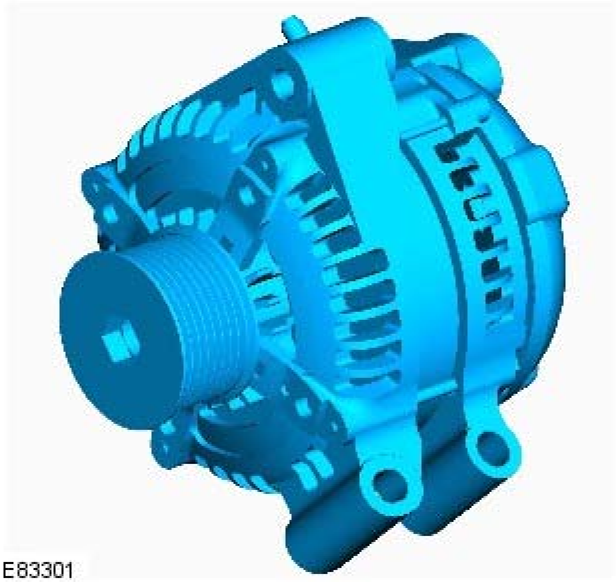
The EMS has 4 knock sensors (2 per bank) located in the cylinder head of the inboard side of the 'V' of the engine. The sensors are connected to the ECM via a twisted pair of wires to minimize electrical interference.

The knock sensors produce a voltage signal in proportion to the amount of mechanical vibration generated at each ignition point. Each sensor monitors the related cylinder bank.

The knock sensors incorporate a piezo-ceramic crystal. This crystal produces a voltage whenever an outside force tries to deflect it, (i.e. exerts a mechanical load on it). When the engine is running, the compression waves in the material of the cylinder block, caused by the combustion of the fuel/air mixture within the cylinders, deflect the crystal and produce an output voltage signal. The signals are supplied to the ECM, which compares them with `mapped' signals stored in memory. From this, the ECM can determine when detonation occurs on individual cylinders. When detonation is detected, the ECM can adjust the pilot fuel quantity to reduce combustion noise, compensating for fuel quantity variations due to injector wear.

Care must be taken at all times to avoid damaging the knock sensors, but particularly during removal and fitting procedures. The recommendations regarding torque and surface preparation must be adhered to. The torque applied to the sensor and the quality of the surface preparation both have an influence over the transfer of mechanical noise from the cylinder block to the crystal.

GENERATOR



The generator has a multifunction voltage regulator for use in a 14V charging system with 6÷12 zener diode bridge rectifiers.

The ECM monitors the load on the electrical system via PWM signal and adjusts the generator output to match the required load. The ECM also monitors the battery temperature to determine the generator regulator set point. This characteristic is necessary to protect the battery; at low temperatures battery charge acceptance is very poor so the voltage needs to be high to maximize any recharge ability, but at high temperatures the charge voltage must be restricted to prevent excessive gassing of the battery with consequent water loss.
For additional information, refer to: Generator (414-02D Generator and Regulator - TDV8 3.6L Diesel, Description and Operation).

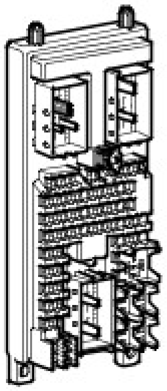
The generator has a smart charge capability that will reduce the electrical load on the generator reducing torque requirements, this is implemented to utilize the engine torque for other purposes. This is achieved by monitoring three signals to the ECM:

- Generator sense (A sense), measures the battery voltage at the CJB.
- Generator communication (Alt Com) communicates desired generator voltage set point from ECM to generator.
- Generator monitor (Alt Mon) communicates the extent of generator current draw to ECM. This signal also transmits faults to the ECM which will then sends a message to the instrument cluster on the CAN bus to illuminate the charge warning lamp.

WATER IN FUEL SENSOR

The water in fuel sensor is located in the base of the fuel filter and is hardwired to the ECM. The sensor operates on the principle of differing resistance values to the transmission of current through water and fuel. When the volume of water in the fuel reaches 85 cm^3 or more, the sensor value is sensed by the ECM. The ECM transmits a message on the high speed controller area network (CAN) bus to the instrument cluster which displays a message 'WATER IN FUEL VISIT DEALER' in the message center.

CENTRAL JUNCTION BOX (CJB)



The CJB initiates the power up and power down routines within the ECM. When the ignition is turned on, 12V is applied to the

'Ignition Sense' input. The ECM then starts its power up routines and turns on the ECM main relay; the main power to the ECM and it's associated system components. When the ignition is turned OFF the ECM will maintain its powered up state for up to 60 seconds while it initiates its power down routine and on completion will turn off the ECM main relay.

Electronic Engine Controls - TDV8 3.6L Diesel - Electronic Engine Controls

Diagnosis and Testing

Overview

This section covers the components of the engine management system.

For information on description and operation, refer to section 303-14 - Electronic Engine Controls - 3.6L (TdV8) of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
Engine oil level Cooling system coolant level Fuel level/contamination Fuel leaks Fuel pumps Intake air system Accessory drive belt Sensor installation/condition Viscous fan and solenoid	Fuses - Fuse F6, engine compartment junction box - Fuse 1E, engine compartment junction box - Fuse 4E, engine compartment junction box - Fuse 13E, engine compartment junction box - Fuse 17E, engine compartment junction box - Fuse 27E, engine compartment junction box - Fuse 25P, passenger compartment junction box - Fuse 60P, passenger compartment junction box Links - Link 1E, engine compartment junction box - Link 4E, engine compartment junction box - Link 6E, engine compartment junction box - Link 11E, engine compartment junction box - Link 14E, engine compartment junction box Wiring harness Electrical connector(s) Injectors Glow plugs 5 volt sensor supply Sensor(s) Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Engine does not crank	Starter relay output circuit high resistance Starter relay output circuit short circuit to power Starter motor fault Ignition switch fault Controller area network (CAN) fault	Check the starter relay and circuits. Refer to the electrical guides. Check the ignition switch operation. Check for DTCs indicating a CAN fault.
Engine cranks, but does not start	Inertia fuel shut off (IFS) switch Main engine control module (ECM) relay fault	Check that the IFS switch has not tripped. Check the main ECM relay and circuits, refer to the electrical guides. Check the fuel level and condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the

Symptom	Possible causes	Action
	- Low/Contaminated fuel - Air leakage - Low-pressure fuel system fault - Fuel pump module (lift pump) fault - Blocked fuel filter - Fuel volume regulator blocked/contaminated - Fuel pressure control valve blocked/contaminated - Fuel pump fault - Crankshaft position (CKP) sensor	fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump: REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Check the CKP sensor circuits. Refer to the electrical guides.
Difficult to start	- Glow plug system fault (very cold conditions) - Low/Contaminated fuel - Air leakage - Fuel pump module (lift pump) fault - Low-pressure fuel system fault - Blocked fuel filter - Fuel volume control valve blocked/contaminated - Fuel pressure control valve blocked/contaminated - Exhaust gas recirculation (EGR) valve(s) fault	Check the glow plug circuits. Refer to the electrical guides. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the lift pump operation, check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. For EGR valve checks: REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Diagnosis and Testing).
Rough idle	- Intake air system fault - Low/Contaminated fuel - Low-pressure fuel system fault - Blocked fuel filter - Fuel volume control valve blocked/contaminated - Fuel pressure control valve blocked/contaminated - Exhaust gas recirculation (EGR) valve(s) fault	Check the intake air system for leaks. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the low-pressure fuel system for leaks/damage. Check the fuel filter, check for DTCs indicating a fuel volume or pressure control valve fault. For EGR valve checks: REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Diagnosis and Testing).
Lack of power when accelerating	- Intake air system fault - Restricted exhaust system - Low fuel pressure - Exhaust gas recirculation (EGR) valve(s) fault - Turbocharger actuator fault	Check the intake air system for leakage or restriction. Check for a blockage/restriction in the exhaust system, install new components as necessary: REFER to: Exhaust System (309-00D Exhaust System - TDV8 3.6L Diesel, Description and Operation). Check for DTCs indicating a fuel pressure fault. For EGR valve checks: REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Diagnosis and Testing). For turbocharger actuator checks: REFER to: Turbocharger (303-04E Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Diagnosis and Testing).
Engine stops/stalls	- Air leakage - Low/Contaminated fuel - Low-pressure fuel system fault - High-pressure fuel leak - Fuel volume control valve blocked/contaminated - Fuel pressure control	Check the intake air system for leaks. Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the fuel system for leaks/damage: Check for DTCs indicating a fuel volume or pressure control valve fault. For EGR valve checks: REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Diagnosis and Testing).

Symptom	Possible causes	Action
	valve blocked/contaminated ● Exhaust gas recirculation (EGR) valve fault	
Engine judders	● Low/Contaminated fuel ● Air ingress ● Low-pressure fuel system fault ● Fuel metering valve blocked/contaminated ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● High-pressure fuel leak ● Fuel pump fault	Check the fuel level/condition. Draw off approximately 1 ltr (2.11 pints) of fuel and allow to stand for 1 minute. Check to make sure there is no separation of the fuel indicating water or other liquid in the fuel. Check the intake air system for leaks. Check the low-pressure fuel system for leaks/damage. Check the high-pressure fuel system for leaks, check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel pump: REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation).
Excessive fuel consumption	● Low-pressure fuel system fault ● Fuel volume control valve blocked/contaminated ● Fuel pressure control valve blocked/contaminated ● Fuel temperature sensor leak ● High-pressure fuel leak ● Injector(s) fault ● Exhaust gas recirculation (EGR) valve(s) fault	Check the low-pressure fuel system for leaks/damage. Check for DTCs indicating a fuel volume or pressure control valve fault. Check the fuel temperature sensor, fuel pump, etc for leaks. Check for injector DTCs. For EGR valve checks: REFER to: Engine Emission Control (303-08D Engine Emission Control - TDV8 3.6L Diesel, Diagnosis and Testing).

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
B10A231	Crash Input	● Inertia event circuit open circuit	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A236	Crash Input	● Inertia event circuit frequency low	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A237	Crash Input	● Inertia event circuit frequency high	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A239	Crash Input	● Inertia event circuit frequency below mid level	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
B10A23A	Crash Input	● Inertia event circuit frequency above mid level	Refer to the electrical guides and check the inertia event circuit between the restraints control module and the engine control module.
P000113	Fuel Volume Regulator Control Circuit / Open	● Fuel volume control valve circuit high resistance ● Fuel volume control valve circuit open circuit ● Fuel volume control valve fault	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and

DTC	Description	Possible causes	Action
			test for normal operation.
P000311	Fuel Volume Regulator Control Circuit Low	- Fuel volume control valve circuit short circuit to ground - Fuel volume control valve fault	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P000319	Fuel Volume Regulator Control Circuit Low	- Fuel volume control valve circuit short circuit to ground - Fuel volume control valve fault	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P000412	Fuel Volume Regulator Control Circuit High	- Fuel volume control valve circuit short circuit to power - Fuel volume control valve fault	• NOTE: An open circuit will prevent the engine from running. Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P000E21	Fuel Volume Regulator Control Exceeded Learning Limit	- Fuel volume control valve amplitude is less than the minimum specified	Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P000E22	Fuel Volume Regulator Control Exceeded Learning Limit	- Fuel volume control valve amplitude is greater than the maximum specified	Refer to the electrical guides and check the fuel volume control valve and circuits. Check the resistance of the valve and install a new high pressure fuel pump if the resistance is not between 1.5 and 15 ohms (the fuel volume control valve cannot be serviced separately). Clear the DTCs and test for normal operation.
P004711	Turbocharger/Supercharger Boost Control A Circuit Low	- Right-hand turbocharger control circuit short circuit to ground - Turbocharger actuator fault	Check the right-hand turbocharger and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. REFER to: Turbocharger (303-04E Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Diagnosis and Testing).
P004812	Turbocharger/Supercharger Boost Control A Circuit High	- Right-hand turbocharger control circuit short circuit to power - Turbocharger actuator fault	Check the right-hand turbocharger and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. REFER to: Turbocharger (303-04E Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Diagnosis and Testing).
P004C11	Turbocharger/Supercharger Boost Control B Circuit Low	- Left-hand turbocharger control circuit short circuit to ground - Turbocharger actuator fault	Check the left-hand turbocharger and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. REFER to: Turbocharger (303-04E Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Diagnosis and Testing).

DTC	Description	Possible causes	Action
P004D12	Turbocharger/Supercharger Boost Control B Circuit High	- Left-hand turbocharger control circuit short circuit to power - Turbocharger actuator fault	Check the left-hand turbocharger and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. REFER to: Turbocharger (303-04E Fuel Charging and Controls - Turbocharger - TDV6 2.7L Diesel, Diagnosis and Testing).
P006A21	MAP - Mass or Volume Air Flow Correlation	- Air leakage in the intake path between the turbocharger and the engine	Check the intake air system for leakage after the turbocharger. Check for DTCs indicating a MAP sensor fault. Rectify as necessary. Clear the DTCs and test for normal operation.
P006A22	MAP - Mass or Volume Air Flow Correlation	- Mass or volume air flow correlation: right-hand bank - signal amplitude greater than maximum - Oil ingress into the intake manifold - Manifold absolute sensor and temperature (MAPT) sensor circuit fault - MAPT sensor fault - MAF sensor fault - Turbocharger fault	With the engine at idle, check the manifold air pressure and indicated torque set points using a data logger function. If the manifold air pressure is greater than 140 KPa (20.31 lbs/in²) or the torque less than 70 Nm (51.63 lbf/ft), check for oil being drawn into the intake manifold. Repair/renew as necessary. Clear the DTCs and test for normal operation. Stop the engine and turn the ignition on. Using a data logger function, monitor the turbocharger actuator angles. Command the actuator to 5% pulse width modulated (PWM) then to 95% pulse width modulated (PWM) and check the angle values. The angle at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% 80 - 95%. If the values are inside this range, install a new MAF sensor. Refer to the relevant section of the workshop manual. If the values are outside this range, install a new turbocharger. Clear the DTCs and test for normal operation.
P007C16	Charge Air Cooler Temperature Sensor Circuit Low (Bank 1)	- Right-hand charge air temperature sensor circuit high resistance (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) - Charge air temperature sensor circuit short circuit to ground - Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. Install a new MAPT if necessary. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P007D17	Charge Air Cooler Temperature Sensor Circuit High (Bank 1)	- Right-hand charge air temperature sensor circuit short circuit to power (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) - Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. Install a new MAPT if necessary. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P007E27	Charge Air Cooler Temperature Sensor Circuit Intermittent/Erratic (Bank 1)	- Right-hand charge air temperature sensor circuit high resistance (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) - Charge air temperature sensor circuit short circuit to ground - Charge air temperature sensor circuit short circuit to power - Right-hand MAPT sensor fault	Check the right-hand MAPT sensor and circuits. Refer to the electrical guides. With the engine running and at operating temperature, check the charge air temperature using a data logger function. Record the measurement at idle and increase the engine speed to 3,000 rpm. Record the reading and compare with the idle figure. If the value has increased by more than 20°C in 100 ms, install a new sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P007F62	Charge Air Cooler Temperature Sensor Bank ½ Correlation	● Charge air temperature sensor left and right-hand bank correlation (the charge air temperature sensors are part of the manifold absolute pressure and temperature (MAPT) sensors) ● Intake air system fault between the sensor(s) and the engine ● Charge air temperature sensor circuit high resistance ● Charge air temperature sensor circuit short circuit to ground ● Charge air temperature sensor circuit short circuit to power ● MAPT sensor(s) fault	Check the intake air system for mechanical faults, leakage, etc. Check the left and right-hand MAPT sensors and circuits. Refer to the electrical guides. With the engine running and at operating temperature, check the charge air temperatures using a data logger function. Record the measurements at idle and increase the engine speed to 3,000 rpm. Record the readings and compare with the idle figures. If the values have changed by more than 30°C higher or lower and there are no other DTCs set, install two new sensors. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P008700	Fuel rail/system pressure too low	● Fuel rail pressure (FRP) sensor disconnected ● FRP sensor to ECM sensing circuit short circuit to ground ● FRP sensor supply circuit high resistance ● FRP sensor failure ● Fuel line leak ● Restricted fuel line ● Fuel pump module circuit high resistance ● Fuel pump module circuit short circuit to ground ● Fuel pump module failure ● Volume control valve fault ● Pressure control valve fault	Refer to the electrical guides and check the FRP sensor circuits. For FRP sensor tests, refer to the relevant workshop manual section. Check the low pressure fuel lines for damage or restrictions. Check the fuel pressure. Check the low pressure fuel pump module circuits and operation. Check for fuel rail and high pressure fuel line leaks. Check for VCV and PCV DTCs and rectify as necessary.
P008800	Fuel rail/system pressure too high	● Fuel rail pressure (FRP) sensor to ECM wiring (supply/sense): short circuit to each other ● FRP sensor to ECM sense circuit short circuit to power ● FRP sensor failure ● Fuel pressure control valve (FPCV) fault ● Fuel pump module circuit short circuit to power ● Fuel pump module failure	Check the FRP sensor circuits. Refer to the electrical guides. For FRP sensor tests, refer to the relevant workshop manual section. Check the fuel lines, check the fuel pressure and the fuel pump module circuits.
P008921	Fuel Pressure Regulator Performance	● Fuel pressure control valve performance - signal amplitude less than minimum ● Fuel pressure control valve circuit high resistance ● Fuel pressure control valve circuit short circuit to ground ● Fuel pressure control valve circuit short circuit to power ● Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P008922	Fuel Pressure Regulator Performance	● Fuel pressure control valve performance - signal amplitude greater than maximum ● Fuel pressure control valve	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve

DTC	Description	Possible causes	Action
		circuit high resistance ● Fuel pressure control valve circuit short circuit to ground ● Fuel pressure control valve circuit short circuit to power ● Fuel pressure control valve fault	cannot be serviced separately). REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P00892F	Fuel Pressure Regulator Performance	● Fuel pressure control valve performance - signal erratic ● Fuel pressure control valve circuit high resistance ● Fuel pressure control valve circuit short circuit to ground ● Fuel pressure control valve circuit short circuit to power ● Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009013	Fuel Pressure Regulator 1 Control Circuit/Open	● Fuel pressure control valve circuit high resistance ● Fuel pressure control valve circuit open circuit ● Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009111	Fuel Pressure Regulator 1 Control Circuit Low	● Fuel pressure control valve circuit short circuit to ground ● Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009119	Fuel Pressure Regulator 1 Control Circuit Low	● Fuel pressure control valve circuit short circuit to power (circuit current above threshold) ● Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the DTCs and test for normal operation.
P009212	Fuel Pressure Regulator 1 Control Circuit High	● Fuel pressure control valve circuit short circuit to power ● Fuel pressure control valve fault	Check the fuel pressure control valve and circuits. Refer to the electrical guides. Check the resistance of the fuel pressure control valve. If the resistance is not between 0 and 5.4 ohms, install a new high pressure fuel pump (the fuel pressure control valve cannot be serviced separately). REFER to: Fuel Pump (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation). Refer to the warranty policy and procedures manual if a high pressure fuel pump is suspect. Clear the

DTC	Description	Possible causes	Action
			DTCs and test for normal operation.
P00A216	Charge Air Cooler Temperature Sensor Circuit Low (Bank 2)	● Left-hand charge air temperature sensor circuit low (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) ● Charge air temperature sensor circuit high resistance ● Charge air temperature sensor circuit short circuit to ground ● Left-hand MAPT sensor fault	Check the left-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. Install a new MAPT if necessary. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P00A317	Charge Air Cooler Temperature Sensor Circuit High (Bank 2)	● Left-hand charge air temperature sensor circuit high (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) ● Charge air temperature sensor circuit high resistance ● Charge air temperature sensor circuit short circuit to ground ● Left-hand MAPT sensor fault	Check the left-hand MAPT sensor and circuits. Refer to the electrical guides. Check the resistance of the temperature sensor (pins 1 and 4 of the MAPT). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. Install a new MAPT if necessary. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P00A427	Charge Air Cooler Temperature Sensor Circuit Intermittent/Erratic (Bank 2)	● Left-hand charge air temperature sensor circuit intermittent/erratic (the charge air temperature sensor is part of the manifold absolute pressure and temperature (MAPT) sensor) ● Charge air temperature sensor circuit high resistance ● Charge air temperature sensor circuit short circuit to ground ● Charge air temperature sensor circuit short circuit to power ● Left-hand MAPT sensor fault	Check the left-hand MAPT sensor and circuits. Refer to the electrical guides. With the engine running and at operating temperature, check the charge air temperature using a data logger function. Record the measurement at idle and increase the engine speed to 3,000 rpm. Record the reading and compare with the idle figure. If the value has increased by more than 20°C in 100 ms, install a new sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P00B821	MAP - Mass or Volume Air Flow Correlation (Bank 2)	● Manifold absolute pressure and temperature (MAPT) sensor - mass or volume air correlation, left-hand bank - signal amplitude less than minimum ● Air leakage in the intake path between the turbocharger and the engine	Check the intake air system for leakage after the turbocharger. Check for DTCs indicating a MAPT sensor fault. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P00B822	MAP - Mass or Volume Air Flow Correlation (Bank 2)	● Manifold absolute pressure and temperature (MAPT) sensor - mass or volume air correlation, left-hand bank - signal amplitude greater than maximum ● Oil ingress into the intake manifold ● MAPT sensor circuit fault ● MAPT sensor fault ● MAF sensor fault	With the engine at idle, check the manifold air pressure and indicated torque set points using a data logger function. If the manifold air pressure is greater than 140 KPa (20.31 lbs/in²) or the torque less than 70 Nm (51.63 lbf/ft), check for oil being drawn into the intake manifold. Repair/renew as necessary. Clear the DTCs and test for normal operation. With the ignition on, engine off and using a data logger function, monitor the turbocharger actuator angles. Command the actuator to 5% pulse width modulated (PWM) then to 95% pulse width

DTC	Description	Possible causes	Action
		- Turbocharger fault	modulated (PWM) and check the angle values. The angle at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% pulse width modulated (PWM) 80 - 99%. If the values are inside this range, install a new MAF sensor. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). If the values are outside this range, install a new turbocharger. REFER to: Turbocharger LH (303-04F Fuel Charging and Controls - Turbocharger - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P010036	Mass or Volume Air Flow A Circuit	- Right-hand mass air flow (MAF) sensor circuit - signal frequency too low - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor circuit high resistance - MAF sensor fault	Check the right-hand MAF sensor and circuits. Refer to the electrical guides. With the engine at idle, check the air flow using a data logger function. If the value is greater than 13.88 g/s or less than 11.11 g/s install a new MAF sensor. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P010116	Mass or Volume Air Flow A Circuit Range/Performance	- Right-hand mass air flow (MAF) sensor range/performance - voltage below threshold - Intake air path fault - MAF sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor fault	Check the intake air system for leaks, restrictions, etc. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. With the engine at idle, check the air flow using a data logger function. If the value is less than 11.11 g/s, install a new sensor and recheck. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).
P010117	Mass or Volume Air Flow A Circuit Range/Performance	- Right-hand mass air flow (MAF) sensor range/performance - voltage above threshold - Intake air path fault - MAF sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor fault	Check the intake air system for leaks, restrictions, etc. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. With the engine at idle, check the air flow using a data logger function. If the value is greater than 13.88 g/s, install a new sensor and recheck. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).
P010121	Mass or Volume Air Flow A Circuit Range/Performance	- Right-hand mass air flow (MAF) sensor range/performance - signal amplitude less than minimum - MAF sensor circuit high resistance - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor fault	Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. With the engine at idle, check the air flow using a data logger function. If the value is less than 11.11 g/s, install a new sensor and recheck. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).
P010122	Mass or Volume Air Flow A Circuit Range/Performance	- Right-hand mass air flow (MAF) sensor range/performance - signal amplitude greater than	Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. With the engine at idle, check the air flow using a data logger

DTC	Description	Possible causes	Action
		maximum ● MAF sensor circuit high resistance ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor fault	function. If the value is greater than 13.88 g/s, install a new sensor and recheck. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).
P010221	Mass or Volume Air Flow A Circuit Low	● Right-hand mass air flow (MAF) sensor circuit low - signal amplitude less than minimum ● Intake air system fault ● MAF sensor circuit high resistance ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● Exhaust gas recirculation (EGR) valve fault	Check the intake air system for leaks, etc. Repair/renew as necessary. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Check that the EGR valves are not stuck. Using a data logger function, monitor the air flow and EGR valve position for both banks and road test the vehicle. Check that the EGR valves are in synch. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P010322	Mass or Volume Air Flow A Circuit High	● Right-hand mass air flow (MAF) sensor circuit high - signal amplitude greater than maximum ● Check for water ingress into the MAF sensor - Water in the air intake can give the impression of high air flow ● Intake air system fault ● MAF sensor circuit high resistance ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor fault ● Turbocharger fault	Check the intake air system for leaks, etc. Repair/renew as necessary. Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. With the ignition on, engine off, and using a data logger function, monitor the turbocharger actuator angles. Command the actuator to 5% pulse width modulated (PWM) then to 95% pulse width modulated (PWM) and check the angle values. The angle at 5% pulse width modulated (PWM) should be 0 - 20%, and at 95% pulse width modulated (PWM) 80 - 95%. If the values are inside this range, install a new MAF sensor. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). If the values are outside this range, install a new turbocharger. REFER to: Turbocharger RH (303-04F Fuel Charging and Controls - Turbocharger - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P010438	Mass or Volume Air Flow A Circuit Intermittent/Erratic	● Right-hand mass air flow (MAF) sensor circuit intermittent/erratic - signal frequency incorrect ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor circuit high resistance	Check the right-hand MAF sensor and circuits. Refer to the electrical guides. Measure the mass air flow at idle using a data logger function and record the value. Increase the engine speed to 2,000 rpm and record the value. If the value has changed by more than 30.55 g/s install a new MAF sensor and recheck. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P010A36	Mass or Volume Air Flow B Circuit	● Left-hand mass air flow (MAF) sensor circuit - signal frequency too low ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor circuit high resistance	Check the left-hand MAF sensor and circuits. Refer to the electrical guides. With the engine at idle, check the air flow using a data logger function. If the value is greater than 13.88 g/s or less than 11.11 g/s install a new MAF sensor. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P010B21	Mass or Volume Air Flow B Circuit Range/Performance	● Left-hand mass air flow (MAF) sensor range/performance - signal amplitude less than minimum ● MAF sensor circuit high resistance ● MAF sensor circuit short circuit to ground ● MAF sensor circuit short circuit to power ● MAF sensor fault	Check the MAF sensor and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation. With the engine at idle, check the air flow using a data logger function. If the value is less than 11.11 g/s, install a new sensor and recheck. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). P010E38	Mass or Volume Air Flow B Circuit Intermittent/Erratic	● Left-hand mass air flow (MAF) sensor circuit intermittent/erratic - signal frequency incorrect ● MAF sensor circuit short circuit to ground	Check the left-hand MAF sensor and circuits. Refer to the electrical guides. Measure the mass air flow at idle using a data logger function and record the value. Increase the engine speed to 2,000 rpm and record the value. If the value has changed by more than 30.55 g/s install a new MAF sensor and

DTC	Description	Possible causes	Action
		- MAF sensor circuit short circuit to power - MAF sensor circuit high resistance	recheck. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation).
P010F62	Mass or Volume Air Flow Sensor A/B Correlation	- Mass or volume air flow sensor right/left-hand correlation - signal compare fault (difference between right and left-hand mass air flow sensors too great) - MAF sensor circuit short circuit to ground - MAF sensor circuit short circuit to power - MAF sensor circuit high resistance - Air leakage in the intake path	Check the left-hand MAF sensor and circuits. Refer to the electrical guides. Check the intake air path for leaks. Check the MAF sensor for carbon or oil contamination. Install a new MAF sensor as necessary. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011216	Intake Air Temperature Sensor 1 Circuit Low (Bank 1)	- Intake air temperature (IAT) sensor circuit low input - voltage below threshold (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used) - IAT sensor circuit high resistance - IAT sensor circuit short circuit to ground - IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. As the two MAF sensors are identical, it is possible to confirm the diagnosis by swapping the units from side to side and testing to see if the DTC resets.
P011317	Intake Air Temperature Sensor 1 Circuit High (Bank 1)	- Intake air temperature (IAT) sensor circuit high input - voltage above threshold (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used) - IAT sensor circuit short circuit to power - IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Measure the resistance of the IAT sensor (pins 2 and 3 of the MAF sensor). Nominal resistance at 20°C (68°F) should be 2.5 Kohms. If the resistance is outside this range, install a new MAF sensor. REFER to: Mass Air Flow (MAF) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). As the two MAF sensors are identical, it is possible to confirm the diagnosis by swapping the units from side to side and testing to see if the DTC resets.
P011427	Intake Air Temperature Sensor 1 Intermittent/Erratic (Bank 1)	- Intake air temperature (IAT) sensor intermittent/erratic - signal rate of change above threshold (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used) - IAT sensor circuit intermittent high resistance - IAT sensor fault	Check the IAT sensor and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Read the intake air temperature using a data logger function and record the value. After ten minutes, read the value again and compare to the first reading. If the value has increased by more than 10° C per 100 ms, swap the MAF sensors side to side and see if the DTC resets.
P011626	Engine Coolant Temperature Sensor 1 Circuit Range/Performance	- Engine coolant temperature (ECT) sensor circuit range/performance - signal rate of change below threshold - ECT sensor circuit intermittent high resistance - ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. With the engine cold, read the coolant temperature sensor using a data logger function and start the engine. Record the value and allow the engine to idle for 20 minutes. After 20 minutes, recheck the value. If the value has not increased by more than 10°C, install a new sensor. REFER to: Engine Coolant Temperature (ECT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P011716	Engine Coolant Temperature Sensor 1 Circuit Low	● Engine coolant temperature (ECT) sensor circuit low input - voltage below threshold ● ECT sensor circuit short circuit to ground ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Measure the resistance of the sensor. Nominal resistance at 20°C (68°F) should be between 35.47 and 39.21 Kohms. If the resistance is outside this range, install a new sensor. REFER to: Engine Coolant Temperature (ECT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011817	Engine Coolant Temperature Sensor 1 Circuit High	● Engine coolant temperature (ECT) sensor circuit high input - voltage above threshold ● ECT sensor circuit short circuit to power ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Measure the resistance of the sensor. Nominal resistance at 20°C (68°F) should be between 35.47 and 39.21 Kohms. If the resistance is outside this range, install a new sensor. REFER to: Engine Coolant Temperature (ECT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011927	Engine Coolant Temperature Sensor 1 Circuit Intermittent/Erratic	● Engine coolant temperature (ECT) sensor circuit intermittent/erratic - signal rate of change above threshold ● ECT sensor circuit intermittent high resistance ● ECT sensor fault	Check the ECT sensor and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Read the coolant temperature using a data logger function and record the value. Increase the engine speed to 2,000 rpm and recheck the value after two minutes at this engine speed. If the value has increased faster than 5°C per second, install a new sensor. REFER to: Engine Coolant Temperature (ECT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011C00	Charge Air Temperature / Intake Air Temperature Correlation (Bank 1)	● Right-hand bank charge air temperature (MAPT)/intake air temperature (IAT) sensor correlation - signal invalid (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used) ● Right-hand MAPT sensor temperature circuits short circuit to ground ● Right-hand MAPT sensor temperature circuits short circuit to power ● Right-hand MAPT sensor temperature circuits high resistance ● Right-hand MAPT sensor fault ● Right-hand MAF sensor temperature circuits short circuit to ground ● Right-hand MAF sensor temperature circuits short circuit to power ● Right-hand MAF sensor temperature circuits high resistance ● Right-hand MAF sensor fault	Check the right-hand MAPT and MAF sensors and circuits. Refer to the electrical guides. Monitor the charge air temperature and intake air temperature signals using a data logger function. Start the engine and "wiggle" the sensor connectors with the engine running. Check the recorded values for the two sensors, the maximum difference should not exceed +40° to -30°C (104° to -22°F). If the IAT sensor is suspect, swap the MAF sensors side to side and recheck. If the fault remains, install a new right-hand MAPT sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P011D00	Charge Air Temperature / Intake Air Temperature Correlation (Bank 2)	● Left-hand bank charge air temperature (MAPT)/intake air temperature (IAT) sensor correlation - signal invalid (the IAT sensor is part of the right-hand MAF sensor. The IAT sensor in the left-hand MAF is not used)	Check the left-hand MAPT and MAF sensors and circuits. Refer to the electrical guides. Monitor the charge air temperature and intake air temperature signals using a data logger function. Start the engine and "wiggle" the sensor connectors with the engine running. Check the recorded values for the two sensors, the maximum difference should not exceed 40° to -30°C (104° to -22°F). If the IAT

DTC	Description	Possible causes	Action
		• Left-hand MAPT sensor temperature circuits short circuit to ground • Left-hand MAPT sensor temperature circuits short circuit to power • Left-hand MAPT sensor temperature circuits high resistance • Left-hand MAPT sensor fault • Right-hand MAF sensor temperature circuits short circuit to ground • Right-hand MAF sensor temperature circuits short circuit to power • Right-hand MAF sensor temperature circuits high resistance • Right-hand MAF sensor fault	sensor is suspect, swap the MAF sensors side to side and recheck. If the fault remains, install a new left-hand MAPT sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P018126	Fuel Temperature Sensor A Circuit Range/Performance	• Fuel temperature sensor circuit range/performance - signal rate of change below threshold • Fuel temperature sensor circuit intermittent high resistance • Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Check the fuel temperature using a data logger function. Make sure the fuel temperature is less than 30°C (86°F). Start the engine and allow to warm up for ten minutes. Recheck the fuel temperature. If the value has not increased by more than 8°C in this time, install a new sensor. REFER to: Fuel Temperature Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P018216	Fuel Temperature Sensor A Circuit Low	• Fuel temperature sensor circuit low input - voltage below threshold • Fuel temperature sensor circuit short circuit to ground • Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Measure the sensor resistance. Nominal resistance at 20°C (68°F) should be between 5.86 and 6.62 Kohms. If the resistance is outside this range, install a new sensor. REFER to: Fuel Temperature Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P018317	Fuel Temperature Sensor A Circuit High	• Fuel temperature sensor circuit high input - voltage above threshold • Fuel temperature sensor circuit short circuit to power • Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Measure the sensor resistance. Nominal resistance at 20°C (68°F) should be between 5.86 and 6.62 Kohms. If the resistance is outside this range, install a new sensor. REFER to: Fuel Temperature Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P018427	Fuel Temperature Sensor A Circuit Intermittent	• Fuel temperature sensor circuit intermittent - signal rate of change above threshold • Fuel temperature sensor circuit intermittent high resistance • Fuel temperature sensor fault	Check the fuel temperature sensor and circuits. Refer to the electrical guides. Start the engine and allow to warm up. Check the fuel temperature using a data logger function. Increase the engine speed to 2,000 rpm and recheck the value. If the value has increased by more than 10°C per 100 ms, install a new sensor. REFER to: Fuel Temperature Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P019123	Fuel Rail Pressure Sensor A Circuit Range/Performance	• Fuel rail pressure (FRP) sensor circuit range/performance - signal stuck low • Low fuel level	Check the fuel level and the condition and correct connection of the low-pressure fuel circuit lines (incorrect connection of the lines to and from the fuel filter can cause serious fuel pressure fluctuations). Check the FRP sensor and circuits.

DTC	Description	Possible causes	Action
		- Blocked/incorrectly connected low-pressure fuel lines - FRP sensor circuit short circuit to ground - FRP sensor circuit short circuit to power - FRP sensor circuit high resistance - FRP sensor fault - Fuel pump module circuit short circuit to ground - Fuel pump module circuit short circuit to power - Fuel pump module circuit high resistance - Fuel pump module fault	Check the fuel pump module and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P019124	Fuel Rail Pressure Sensor A Circuit Range/Performance	- Fuel rail pressure (FRP) sensor circuit range/performance - signal stuck high - FRP sensor circuit short circuit to ground - FRP sensor circuit short circuit to power - FRP sensor circuit high resistance - FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. Stop the engine, turn the ignition on, and recheck the fuel pressure. If the pressure is greater than 10 MPa (1,450 lbs/in²) after 0.4 seconds, install a new sensor. REFER to: Fuel Rail Pressure (FRP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P019165	Fuel Rail Pressure Sensor A Circuit Range/Performance	- Fuel rail pressure (FRP) sensor circuit range/performance - signal has too few transitions/events - FRP sensor circuit high resistance - FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. Increase the engine speed to 2,000 rpm and recheck the fuel pressure. If the value has changed by more than 40 MPa (5,801 lbs/in²) per 10 ms, install a new sensor. REFER to: Fuel Rail Pressure (FRP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P019216	Fuel Rail Pressure Sensor A Circuit Low	- Fuel rail pressure (FRP) sensor circuit low input - voltage below threshold - FRP sensor circuit short circuit to ground - FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. If the value is 0 MPa (0 lbs/in²), install a new sensor. REFER to: Fuel Rail Pressure (FRP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P019317	Fuel Rail Pressure Sensor A Circuit High	- Fuel rail pressure (FRP) sensor circuit high input - voltage above threshold - FRP sensor circuit short circuit to power - FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. If the value is greater than 180 MPa (26,106 lbs/in²), install a new sensor. REFER to: Fuel Rail Pressure (FRP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P019427	Fuel Rail Pressure Sensor A Circuit Intermittent/Erratic	- Fuel rail pressure (FRP) sensor circuit intermittent/erratic - signal rate of change above threshold - FRP sensor circuit high resistance - FRP sensor fault	Check the FRP sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the fuel pressure value using a data logger function. Increase the engine speed to 2,000 rpm and recheck the fuel pressure. If the value has changed by more than 40 MPa (5,801 lbs/in²) per 10 ms, install a new sensor. REFER to: Fuel Rail Pressure (FRP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel,

DTC	Description	Possible causes	Action
			Removal and Installation). Clear the DTCs and test for normal operation.
P019626	Engine Oil Temperature Sensor Range/Performance	● Engine oil temperature (EOT) sensor circuit range/performance- signal rate of change below threshold ● EOT sensor circuit intermittent high resistance ● EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. From cold, start the engine and check the oil temperature using a data logger function. Allow the engine to idle for ten minutes and recheck the oil temperature. If the value has not increased by more than 5°C in this time, install a new sensor. Clear the DTCs and test for normal operation.
P019716	Engine Oil Temperature Sensor Circuit Low	● Engine oil temperature (EOT) sensor circuit low input - voltage below threshold ● EOT sensor circuit short circuit to ground ● EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. Repair/renew as necessary.
P019817	Engine Oil Temperature Sensor Circuit High	● Engine oil temperature (EOT) sensor circuit high input - voltage above threshold ● EOT sensor circuit short circuit to power ● EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. Repair/renew as necessary.
P019927	Engine Oil Temperature Sensor Circuit Intermittent/Erratic	● Engine oil temperature (EOT) sensor circuit intermittent - signal rate of change above threshold ● EOT sensor circuit intermittent high resistance ● EOT sensor fault	Check the EOT sensor and circuits. Refer to the electrical guides. Start the engine and allow to idle. Check the oil temperature using a data logger function. Increase the engine speed to 2,000 rpm and recheck the value after two minutes at this engine speed. If the value has increased by more than 40°C per second, install a new sensor. Clear the DTCs and test for normal operation.
P020101	Cylinder 1 Injector Circuit / Open	● Fuel injector circuit open cylinder 1 - general electrical fault ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020201	Cylinder 2 Injector Circuit / Open	● Fuel injector circuit open cylinder 2 - general electrical fault ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P020301	Cylinder 3 Injector Circuit / Open	- Fuel injector circuit open cylinder 3 - general electrical fault - Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020401	Cylinder 4 Injector Circuit / Open	- Fuel injector circuit open cylinder 4 - general electrical fault - Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020501	Cylinder 5 Injector Circuit / Open	- Fuel injector circuit open cylinder 5 - general electrical fault - Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020601	Cylinder 6 Injector Circuit / Open	- Fuel injector circuit open cylinder 6 - general electrical fault - Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear

DTC	Description	Possible causes	Action
			the DTCs and test for normal operation.
P020701	Cylinder 7 Injector Circuit / Open	● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020801	Cylinder 8 Injector Circuit / Open	● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020A33	Cylinder 1 Injection Timing	● Cylinder 1 injection timing - signal low time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020A35	Cylinder 1 Injection Timing	● Cylinder 1 injection timing - signal high time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short

DTC	Description	Possible causes	Action
			circuit to power and for high resistance. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P020B33	Cylinder 2 Injection Timing	● Cylinder 2 injection timing - signal low time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. P020E35	Cylinder 5 Injection Timing	● Cylinder 5 injection timing - signal high time greater than maximum ● Fuel injector circuit short circuit to ground ● Fuel injector circuit short circuit to power ● Fuel injector circuit high resistance ● Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel)

DTC	Description	Possible causes	Action
			Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P020F33	Cylinder 6 Injection Timing	- Cylinder 6 injection timing - signal low time greater than maximum - Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P020F35	Cylinder 6 Injection Timing	- Cylinder 6 injection timing - signal high time greater than maximum - Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. If the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P021900	Engine Overspeed Condition	- Crankshaft position (CKP) sensor circuit high resistance - Crankshaft position (CKP) sensor circuit short circuit to ground - Crankshaft position (CKP) sensor circuit short circuit to power - Camshaft position (CMP) sensor circuit high resistance - Camshaft position (CMP) sensor circuit short circuit to ground - Camshaft position (CMP) sensor circuit short circuit to power - Oil ingestion	Check the CKP and CMP sensor circuits. Refer to the electrical guides. Rectify as necessary. If no fault is found in the circuits, install new sensors as necessary. REFER to: (303-14D Electronic Engine Controls - TDV8 3.6L Diesel) Crankshaft Position (CKP) Sensor (Removal and Installation), Camshaft Position (CMP) Sensor (Removal and Installation). Clear the DTCs and test for normal operation. Check for oil ingestion into the intake air path. Rectify as necessary.
P021A33	Cylinder 7 Injection Timing	- Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. if the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to:

DTC	Description	Possible causes	Action
			(303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P021A35	Cylinder 7 Injection Timing	- Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. if the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P021B33	Cylinder 8 Injection Timing	- Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. if the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P021B35	Cylinder 8 Injection Timing	- Fuel injector circuit short circuit to ground - Fuel injector circuit short circuit to power - Fuel injector circuit high resistance - Fuel injector fault	During the following, clear DTCs and recheck after each step. Turn the ignition off and wait 20 seconds before turning the ignition back on to recheck DTCs. Check the connections for security. Disconnect the injector and measure the resistance and capacitance of the injector. if the resistance is not between 180 and 220 Kohms, or the capacitance not greater than 3 microfarad, install a new injector. REFER to: (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel) Fuel Injectors LH (Removal and Installation), Fuel Injectors RH (Removal and Installation). If the injector is within specification, check the injector circuits for short circuit to ground, short circuit to power and for high resistance. Refer to the electrical guides. Rectify as necessary. Clear the DTCs and test for normal operation.
P023627	Turbocharger/Supercharger Boost Sensor A Circuit Range/Performance	- Right-hand turbocharger boost sensor circuit high - signal rate of change above threshold - Manifold absolute pressure and temperature (MAPT)	During the following, clear DTCs and recheck after each step. Check the MAPT sensor and circuits. Refer to the electrical guides. Start the engine and check the manifold air pressure at idle using a data logger function. Increase the engine speed to 1,500 rpm and recheck the manifold air pressure. If the

DTC	Description	Possible causes	Action
		sensor circuit intermittent high resistance - Manifold absolute pressure and temperature (MAPT) sensor fault	pressure has increased by more than 50 KPa per 10 ms, install a new sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P023716	Turbocharger/Supercharger Boost Sensor A Circuit Low	- Right-hand turbocharger boost sensor circuit low - voltage below threshold - Manifold absolute pressure and temperature (MAPT) sensor circuit short circuit to ground - Manifold absolute pressure and temperature (MAPT) sensor fault	During the following, clear DTCs and recheck after each step. Check the MAPT sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P023817	Turbocharger/Supercharger Boost Sensor A Circuit High	- Right-hand turbocharger boost sensor circuit high - voltage above threshold - Manifold absolute pressure and temperature (MAPT) sensor circuit short circuit to power - Manifold absolute pressure and temperature (MAPT) sensor fault	During the following, clear DTCs and recheck after each step. Check the MAPT sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. REFER to: Manifold Absolute Pressure and Temperature (MAPT) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P023D21	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor A Correlation	- Manifold absolute pressure (MAP) sensor/right-hand turbocharger boost sensor correlation - signal amplitude less than minimum - Intake air system fault - Turbocharger mechanical fault - Oil ingestion into manifold	Check the intake air system. Check the turbocharger mechanical condition and operation. Check for oil being drawn into the intake manifold. Rectify as necessary. Using a data logger function, monitor the turbocharger actuator position and command the actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) in 5% steps. Check the results. There should be a smooth curve between the minimum and maximum values. If not, install a new turbocharger. REFER to: Turbocharger RH (303-04F Fuel Charging and Controls - Turbocharger - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P023D22	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor A Correlation	- Manifold absolute pressure (MAP) sensor/right-hand turbocharger boost sensor correlation - signal amplitude greater than maximum - Intake air system fault - Turbocharger mechanical fault - Intake air temperature (IAT) sensor fault - Mass air flow (MAF) sensor fault - Manifold absolute pressure and temperature (MAPT) sensor fault - Exhaust gas recirculation (EGR) sensor fault - Turbocharger actuator position sensor fault	Check the intake air system. Check the turbocharger mechanical condition and operation. Check for DTCs indicating a listed sensor fault. Rectify as necessary. Using a data logger function, monitor the turbocharger actuator position and command the actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) in 5% steps. Check the results. There should be a smooth curve between the minimum and maximum values. If not, install a new turbocharger. REFER to: Turbocharger RH (303-04F Fuel Charging and Controls - Turbocharger - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P023E21	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor B Correlation	- Manifold absolute pressure (MAP) sensor/left-hand turbocharger boost sensor correlation - signal amplitude	Check the intake air system. Check the turbocharger mechanical condition and operation. Check for oil being drawn into the intake manifold. Rectify as necessary. Using a data logger function, monitor the

DTC	Description	Possible causes	Action
		less than minimum - Intake air system fault - Turbocharger mechanical fault - Oil ingestion into manifold	turbocharger actuator position and command the actuator to 5% pulse width modulated (PWM), then 95% pulse width modulated (PWM) in 5% steps. Check the results. There should be a smooth curve between the minimum and maximum values. If not, install a new turbocharger. REFER to: Turbocharger LH (303-04F Fuel Charging and Controls - Turbocharger - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P023E22	Manifold Absolute Pressure - Turbocharger/Supercharger Boost Sensor B Correlation	- Manifold absolute pressure (MAP) sensor/left-hand turbocharger boost sensor correlation - signal amplitude greater than maximum - Intake air system fault - Turbocharger mechanical fault - Intake air temperature (IAT) sensor fault - Mass air flow (MAF) sensor fault - Manifold absolute pressure and temperature (MAPT) sensor fault - Exhaust gas recirculation (EGR) sensor fault - Turbocharger actuator position sensor fault	Check the intake air system. Check the turbocharger mechanical condition and operation. Check for DTCs indicating a listed sensor fault. Rectify as necessary. P02DB00	Cylinder 8 fuel injector offset learning at maximum limit	- Fuel injector failure	Replace fuel injector for related cylinder.

DTC	Description	Possible causes	Action
P032621	Knock Sensor 1 Circuit Range/Performance (Bank 1)	- Knock sensor (KS) 1 circuit range/performance, right-hand bank (rear) - signal amplitude less than minimum - KS incorrectly installed - KS connections reversed - KS circuit short circuit to ground	Check that the knock sensors are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P032622	Knock Sensor 1 Circuit Range/Performance (Bank 1)	- Knock sensor (KS) 1 circuit range/performance, right-hand bank (rear) - signal amplitude greater than maximum - KS incorrectly installed - KS connections reversed - KS circuit short circuit to ground	Check that the knock sensors are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P032B21	Knock Sensor 3 Circuit Range/Performance (Bank1)	- Knock sensor (KS) 3 circuit range/performance, right-hand bank (front) - signal amplitude less than minimum - KS incorrectly installed - KS connections reversed - KS circuit short circuit to ground	Check that the knock sensors are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P032B22	Knock Sensor 3 Circuit Range/Performance (Bank1)	- Knock sensor (KS) 3 circuit range/performance, right-hand bank (front) - signal amplitude greater than maximum - KS incorrectly installed - KS connections reversed - KS circuit short circuit to ground	Check that the knock sensors are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033121	Knock Sensor 1 Circuit Range/Performance (Bank 2)	- Knock sensor (KS) 2 circuit range/performance, left-hand bank (rear) - signal amplitude less than minimum - KS incorrectly installed - KS connections reversed - KS circuit short circuit to ground	Check that the KS are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033122	Knock Sensor 1 Circuit Range/Performance (Bank 2)	- Knock sensor (KS) 2 circuit range/performance, left-hand bank (rear) - signal amplitude greater than maximum - KS incorrectly installed - (KS) connections reversed - (KS) circuit short circuit to ground	Check that the KS are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033578	Crankshaft Position Sensor A Circuit	- Crankshaft position (CKP) sensor - alignment or adjustment incorrect - CKP sensor circuit short circuit to ground - CKP sensor circuit short circuit to power - CKP sensor circuit high resistance - CKP sensor fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. REFER to: (303-14D Electronic Engine Controls - TDV8 3.6L Diesel) Crankshaft Position (CKP) Sensor (Removal and Installation), Crankshaft Position (CKP) Sensor Ring (Removal and Installation). Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
		● CKP sensor wheel fault	
P033631	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal missing ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. REFER to: (303-14D Electronic Engine Controls - TDV8 3.6L Diesel) Crankshaft Position (CKP) Sensor (Removal and Installation), Crankshaft Position (CKP) Sensor Ring (Removal and Installation). Clear the DTCs and test for normal operation.
P033638	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal frequency ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. REFER to: (303-14D Electronic Engine Controls - TDV8 3.6L Diesel) Crankshaft Position (CKP) Sensor (Removal and Installation), Crankshaft Position (CKP) Sensor Ring (Removal and Installation). Clear the DTCs and test for normal operation.
P033664	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal plausibility fault ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. REFER to: (303-14D Electronic Engine Controls - TDV8 3.6L Diesel) Crankshaft Position (CKP) Sensor (Removal and Installation), Crankshaft Position (CKP) Sensor Ring (Removal and Installation). Clear the DTCs and test for normal operation.
P033666	Crankshaft position (CKP) sensor circuit range/performance	● Crankshaft position (CKP) sensor range/performance - signal has too many transitions/events ● CKP sensor circuit short circuit to ground ● CKP sensor circuit short circuit to power ● CKP sensor circuit high resistance ● CKP sensor fault ● CKP sensor wheel fault	Check the CKP sensor and circuits. Refer to the electrical guides. Check the sensor and wheel for correct installation and condition. Rectify as necessary. REFER to: (303-14D Electronic Engine Controls - TDV8 3.6L Diesel) Crankshaft Position (CKP) Sensor (Removal and Installation), Crankshaft Position (CKP) Sensor Ring (Removal and Installation). Clear the DTCs and test for normal operation.
P033B21	Knock Sensor 4 Circuit Range/Performance (Bank 2)	● Knock sensor (KS) 4 circuit range/performance, left-hand bank (front) - signal amplitude less than minimum ● KS incorrectly installed ● KS connections reversed ● KS circuit short circuit to ground	Check that the KS are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.
P033B22	Knock Sensor 4 Circuit Range/Performance (Bank 2)	● Knock sensor (KS) 4 circuit range/performance, left-hand bank (front) - signal amplitude greater than maximum ● KS incorrectly installed ● KS connections reversed ● KS circuit short circuit to	Check that the KS are correctly installed and tightened to the correct torque. REFER to: Knock Sensor (KS) RH (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Check that the KS connections are connected to the correct sensor. Check the KS circuit, refer to the electrical guides. Rectify as necessary.

DTC	Description	Possible causes	Action
		ground	
P034129	Camshaft Position Sensor A Circuit Range/Performance (Bank 1 or single sensor)	● Camshaft position (CMP) sensor range/performance - signal invalid ● CMP sensor circuit short circuit to ground ● CMP sensor circuit short circuit to power ● CMP sensor circuit high resistance ● CMP sensor fault	Check the CMP sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. REFER to: Camshaft Position (CMP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P03413A	Camshaft Position Sensor A Circuit Range/Performance (Bank 1 or single sensor)	● Camshaft position (CMP) sensor range/performance - too many pulses ● Camshaft segment period too short	Check the CMP sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. REFER to: Camshaft Position (CMP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P034231	Camshaft Position Sensor A Circuit Low (Bank 1 or single sensor)	● Camshaft position (CMP) sensor circuit low input - no signal ● CMP sensor circuit short circuit to ground ● CMP sensor circuit short circuit to power ● CMP sensor circuit high resistance ● CMP sensor fault	Check the CMP sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor. REFER to: Camshaft Position (CMP) Sensor (303-14D Electronic Engine Controls - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P038072	Glow Plug/Heater Circuit A	● Right-hand bank glow plug circuit - actuator stuck open ● Low battery voltage ● Relay circuit **from** relay	Check the battery condition and state of charge. Check the relay and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new relay. Clear the DTCs and test for normal operation.
P038073	Glow Plug/Heater Circuit A	● Right-hand bank glow plug circuit - actuator stuck closed ● Low battery voltage ● Relay circuit **to** relay	Check the battery condition and state of charge. Check the relay and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new relay. Clear the DTCs and test for normal operation.
P038311	Glow plug control module - control circuit low	● Glow plug relay control circuit short circuit to ground ● Glow plug relay fault	Check the relay and circuits. Refer to the electrical guides. Activate the relay and check for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P038412	Glow Plug Control Module Control Circuit High	● Glow plug relay, control circuit short circuit to power ● Glow plug relay fault	Check the relay and circuits. Refer to the electrical guides. Activate the relay and check for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P040100	Exhaust Gas Recirculation A Flow Insufficient Detected	● EGR control deviation lower limit, right-hand bank (intake manifold tuning (IMT) valve closed - bank specific control of EGR)	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle for the right-hand bank. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P040121	Exhaust Gas Recirculation A Flow Insufficient Detected	● Exhaust gas recirculation (EGR) insufficient flow detected - signal amplitude less than minimum ● EGR control deviation lower limit right-hand bank (intake manifold tuning (IMT) valve	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angles for both banks. Command the valve actuators to 100% then 0% pulse width modulated (PWM), and recheck the valve angles. The angles should range between 95% and 5%. If this is not the case, install new valves as necessary.

DTC	Description	Possible causes	Action
		closed) bank specific control of EGR	REFER to: (303-08D Engine Emission Control - TDV8 3.6L Diesel) Exhaust Gas Recirculation (EGR) Valve LH (Removal and Installation), Exhaust Gas Recirculation (EGR) Valve RH (Removal and Installation). Clear the DTCs and test for normal operation.
P040200	Exhaust Gas Recirculation A Flow Excessive Detected	● Right-hand exhaust gas recirculation (EGR) excessive flow detected ● EGR control deviation upper limit right-hand bank (intake manifold tuning (IMT) valve closed) - bank specific control of EGR	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle for the right-hand bank. Command the valve actuator to 0% then 100% pulse width modulated (PWM) and recheck the values. The angle should range between 5% and 95%. If this is not the case, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P040222	Exhaust Gas Recirculation A Flow Excessive Detected	● Right-hand exhaust gas recirculation (EGR) excessive flow detected - signal amplitude greater than maximum ● EGR control deviation upper limit right-hand bank (intake manifold tuning (IMT) valve closed) bank specific control of EGR	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve angle. Command the valve actuator to 0% then 100% pulse width modulated (PWM), and recheck the valve angles. The angles should range between 5% and 95%. If this is not the case, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P040300	Exhaust Gas Recirculation A Control Circuit	● Right-hand exhaust gas recirculation (EGR) control circuit ● EGR valve circuit fault ● EGR valve fault ● engine control module (ECM) fault	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, turn the ignition on and check the EGR valve values for both banks. Turn the ignition off and make sure the cleaning cycle is performed (the valves should cycle from 0% to 100% approximately 6 times). Turn the ignition on, command the actuators to 0% pulse width modulated (PWM) and check the sensor reading. The value should be 0 - 20%. Command the actuators to 100% pulse width modulated (PWM) and check the sensor reading. The value should be 80 - 95%. If the values are outside this range, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P040319	Exhaust Gas Recirculation A Control Circuit	● Right-hand exhaust gas recirculation (EGR) control circuit - current over threshold ● EGR valve control circuit short circuit to ground ● EGR valve control circuit short circuit to power	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, turn the ignition on and check the EGR valve values for both banks. Turn the ignition off and make sure the cleaning cycle is performed (the valves should cycle from 0% to 100% approximately 6 times). Turn the ignition on, command the actuators to 0% pulse width modulated (PWM) and check the sensor reading. The value should be 0 - 20%. Command the actuators to 100% pulse width modulated (PWM) and check the sensor reading. The value should be 80 - 95%. If the values are outside this range, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If

DTC	Description	Possible causes	Action
			there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P040521	Exhaust Gas Recirculation Sensor A Circuit Low	● Right-hand exhaust gas recirculation (EGR) sensor circuit low - signal amplitude less than minimum ● EGR valve position sensor circuit short circuit to ground ● EGR valve position sensor fault	Check the right-hand EGR sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angle. With the ignition on, engine off, command the valve actuator to 0% pulse width modulated (PWM), and then to 100% pulse width modulated (PWM) and recheck the EGR valve angle. The value should range from 0 - 20% to 80 - 95%. If this is not the case, install a new sensor. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P040622	Exhaust Gas Recirculation Sensor A Circuit High	● Right-hand exhaust gas recirculation (EGR) sensor circuit high - signal amplitude greater than maximum ● EGR valve position sensor circuit short circuit to power ● EGR valve position sensor fault	Check the right-hand EGR sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR valve angle. With the ignition on, engine off, command the valve actuator to 0% pulse width modulated (PWM), and then to 100% pulse width modulated (PWM) and recheck the EGR valve angle. The value should range from 0 - 20% to 80 - 95%. If this is not the case, install a new sensor. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P040721	Exhaust Gas Recirculation Sensor B Circuit Low	● Right-hand exhaust gas recirculation (EGR) throttle position sensor circuit low - signal amplitude less than minimum ● EGR throttle position sensor circuit short circuit to ground ● EGR throttle position sensor circuit high resistance ● EGR sensor fault	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P040822	Exhaust Gas Recirculation Sensor B Circuit High	● Right-hand exhaust gas recirculation (EGR) throttle position sensor circuit low - signal amplitude greater than maximum ● EGR throttle position sensor circuit short circuit to power ● EGR throttle position sensor fault	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P042562	Catalyst Temperature Sensor Circuit (Bank 1 Sensor 1)	● Close coupled catalytic converter inlet temperature sensor signal compare failure ● Close coupled catalytic converter inlet temperature sensor correlation compare with at least two other sensors ● Close coupled catalytic converter inlet temperature sensor failure ● Close coupled catalytic converter inlet temperature sensor circuit - short to ground, power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for open circuit, short to ground, short to power. Check close coupled catalytic converter inlet temperature sensor for dirt contamination, corrosion, water ingress damage. Replace close coupled catalytic converter inlet temperature sensor.

DTC	Description	Possible causes	Action
P042600	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 1)	• Close coupled catalytic converter inlet temperature sensor gradient check • Close coupled catalytic converter inlet temperature sensor failure • Close coupled catalytic converter inlet temperature sensor circuit - short to ground, power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for open circuit, short to ground, short to power. Intermittent poor or dirty connections. Install a new sensor as required.
P04261A	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 1)	• Close coupled catalytic converter inlet temperature sensor circuit resistance below threshold • Close coupled catalytic converter inlet temperature sensor plausibility at cold start, temperature difference too high • Close coupled catalytic converter inlet temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for low resistance, short to ground. Replace close coupled catalytic converter inlet temperature sensor.
P04261B	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 1)	• Close coupled catalytic converter inlet temperature sensor circuit resistance above threshold • Close coupled catalytic converter inlet temperature sensor plausibility at cold start, temperature difference too low • Close coupled catalytic converter inlet temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for high resistance, open circuit. Replace close coupled catalytic converter inlet temperature sensor.
P04261E	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 1)	• Close coupled catalytic converter inlet temperature sensor circuit resistance out of range • Close coupled catalytic converter inlet temperature sensor plausibility at engine running, temperature too low • Close coupled catalytic converter inlet temperature sensor stuck at low temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for open circuit, short to ground, short to power. Check close coupled catalytic converter inlet temperature sensor for dirt contamination, corrosion, water ingress damage. Replace close coupled catalytic converter inlet temperature sensor.
P042700	Catalyst Temperature Sensor Circuit Low (Bank 1 Sensor 1)	• Close coupled catalytic converter inlet temperature sensor signal below minimum threshold voltage • Close coupled catalytic converter inlet temperature sensor failure • Close coupled catalytic converter inlet temperature sensor circuit - short to ground	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for short to ground. Install a new sensor as required.
P042800	Catalyst Temperature Sensor Circuit High (Bank 1 Sensor 1)	• Close coupled catalytic converter inlet temperature sensor signal above maximum threshold voltage	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor

DTC	Description	Possible causes	Action
		- Close coupled catalytic converter inlet temperature sensor failure - Close coupled catalytic converter inlet temperature sensor circuit - short to power, open circuit	circuit for short to power, open circuit. Install a new sensor as required.
P042A62	Catalyst Temperature Sensor Circuit (Bank 1 Sensor 2)	- Close coupled catalytic converter outlet temperature sensor signal compare failure - Close coupled catalytic converter outlet temperature sensor correlation compare with at least two other sensors - Close coupled catalytic converter outlet temperature sensor failure - Close coupled catalytic converter outlet temperature sensor circuit - short to ground, power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for open circuit, short to ground, short to power. check close coupled catalytic converter outlet temperature sensor for dirt contamination, corrosion, water ingress damage. Replace close coupled catalytic converter outlet temperature sensor.
P042B00	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 2)	- Close coupled catalytic converter outlet temperature sensor gradient check - Close coupled catalytic converter outlet temperature sensor failure - Close coupled catalytic converter outlet temperature sensor circuit - short to ground, power, open circuit - Close coupled catalytic converter outlet temperature sensor circuit high resistance	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for open circuit, short to ground, short to power. Intermittent poor or dirty connections. Install a new sensor as required.
P042B1A	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 2)	- Close coupled catalytic converter outlet temperature sensor circuit resistance below threshold - Close coupled catalytic converter outlet temperature sensor plausibility at cold start, temperature difference too high - Close coupled catalytic converter outlet temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for low resistance, short to ground. Replace close coupled catalytic converter outlet temperature sensor.
P042B1B	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 2)	- Close coupled catalytic converter outlet temperature sensor circuit resistance above threshold - Close coupled catalytic converter outlet temperature sensor plausibility at cold start, temperature difference too low - Close coupled catalytic converter outlet temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for high resistance, open circuit. Replace close coupled catalytic converter outlet temperature sensor.

DTC	Description	Possible causes	Action
P042B1E	Catalyst Temperature Sensor Circuit Range/Performance (Bank 1 Sensor 2)	● Close coupled catalytic converter outlet temperature sensor circuit resistance out of range ● Close coupled catalytic converter outlet temperature sensor plausibility at engine running, temperature too low ● Close coupled catalytic converter outlet temperature sensor stuck at low temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for open circuit, short to ground, short to power. check close coupled catalytic converter outlet temperature sensor for dirt contamination, corrosion, water ingress damage. Replace close coupled catalytic converter outlet temperature sensor.
P042C00	Catalyst Temperature Sensor Circuit Low (Bank 1 Sensor 2)	● Close coupled catalytic converter outlet temperature sensor signal below minimum threshold voltage ● Close coupled catalytic converter outlet temperature sensor failure ● Close coupled catalytic converter outlet temperature sensor circuit - short to ground	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for short to ground. Install a new sensor as required.
P042D00	Catalyst Temperature Sensor Circuit High (Bank 1 Sensor 2)	● Close coupled catalytic converter outlet temperature sensor signal above maximum threshold voltage ● Close coupled catalytic converter outlet temperature sensor failure ● Close coupled catalytic converter outlet temperature sensor circuit - short to power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for short to power, open circuit. Install a new sensor as required.
P043562	Catalyst Temperature Sensor Circuit (Bank 2 Sensor 1)	● Close coupled catalytic converter inlet temperature sensor signal compare failure ● Close coupled catalytic converter inlet temperature sensor correlation compare with at least two other sensors ● Close coupled catalytic converter inlet temperature sensor failure ● Close coupled catalytic converter inlet temperature sensor circuit - short to ground, power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for open circuit, short to ground, short to power. Check close coupled catalytic converter inlet temperature sensor for dirt contamination, corrosion, water ingress damage. Replace close coupled catalytic converter inlet temperature sensor.
P043600	Catalyst Temperature Sensor Circuit Range/Performance (Bank 2 Sensor 1)	● Close coupled catalytic converter inlet temperature sensor gradient check ● Close coupled catalytic converter inlet temperature sensor failure ● Close coupled catalytic converter inlet temperature sensor circuit - short to ground, power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for open circuit, short to ground, short to power. Intermittent poor or dirty connections. Install a new sensor as required.
P04361A	Catalyst Temperature Sensor Circuit Range/Performance (Bank 2 Sensor 1)	● Close coupled catalytic converter inlet temperature sensor circuit resistance below threshold	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor

DTC	Description	Possible causes	Action
		● Close coupled catalytic converter inlet temperature sensor plausibility at cold start, temperature difference too high ● Close coupled catalytic converter inlet temperature sensor stuck at high temperature value	circuit for low resistance, short to ground. Replace close coupled catalytic converter inlet temperature sensor.
P04361B	Catalyst Temperature Sensor Circuit Range/Performance (Bank 2 Sensor 1)	● Close coupled catalytic converter inlet temperature sensor circuit resistance above threshold ● Close coupled catalytic converter inlet temperature sensor plausibility at cold start, temperature difference too low ● Close coupled catalytic converter inlet temperature sensor stuck at high temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for high resistance, open circuit. Replace close coupled catalytic converter inlet temperature sensor.
P04361E	Catalyst Temperature Sensor Circuit Range/Performance (Bank 2 Sensor 1)	● Close coupled catalytic converter inlet temperature sensor circuit resistance out of range ● Close coupled catalytic converter inlet temperature sensor plausibility at engine running, temperature too low ● Close coupled catalytic converter inlet temperature sensor stuck at low temperature value	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter inlet temperature sensor circuit for open circuit, short to ground, short to power. Check close coupled catalytic converter inlet temperature sensor for dirt contamination, corrosion, water ingress damage. Replace close coupled catalytic converter inlet temperature sensor.
P043700	Catalyst Temperature Sensor Circuit Low (Bank 2 Sensor 1)	● Close coupled catalytic converter inlet temperature sensor signal below minimum threshold voltage ● Close coupled catalytic converter inlet temperature sensor failure ● Close coupled catalytic converter inlet temperature sensor circuit - short to ground	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for open circuit, short to ground, short to power. check close coupled catalytic converter outlet temperature sensor for dirt contamination, corrosion, water ingress damage. Replace close coupled catalytic converter outlet temperature sensor.
P043C00	Catalyst Temperature Sensor Circuit Low (Bank 2 Sensor 2)	● Close coupled catalytic converter outlet temperature sensor signal below minimum threshold voltage ● Close coupled catalytic converter outlet temperature sensor failure	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for short to ground. Install a new sensor as required.

DTC	Description	Possible causes	Action
		- Close coupled catalytic converter outlet temperature sensor circuit - short to ground	
P043D00	Catalyst Temperature Sensor Circuit High (Bank 2 Sensor 2)	- Close coupled catalytic converter outlet temperature sensor signal above maximum threshold voltage - Close coupled catalytic converter outlet temperature sensor failure - Close coupled catalytic converter outlet temperature sensor circuit - short to power, open circuit	Carry out any pinpoint test associated with this DTC using the manufacturer approved diagnostic system. Refer to the electrical guides and check close coupled catalytic converter outlet temperature sensor circuit for short to power, open circuit. Install a new sensor as required.
P045A00	Exhaust Gas Recirculation B Control Circuit	- EGR valve circuit fault - EGR valve fault - engine control module (ECM) fault	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, turn the ignition on and check the EGR valve values for both banks. Turn the ignition off and make sure the cleaning cycle is performed (the valves should cycle from 0% to 100% approximately 6 times). Turn the ignition on, command the actuators to 0% pulse width modulated (PWM) and check the sensor reading. The value should be 0 - 20%. Command the actuators to 100% pulse width modulated (PWM) and check the sensor reading. The value should be 80 - 95%. If the values are outside this range, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P045A19	Exhaust Gas Recirculation B Control Circuit	- Left-hand exhaust gas recirculation (EGR) control circuit - current over threshold - EGR valve control circuit short circuit to ground - EGR valve control circuit short circuit to power	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, turn the ignition on and check the EGR valve values for both banks. Turn the ignition off and make sure the cleaning cycle is performed (the valves should cycle from 0% to 100% approximately 6 times). Turn the ignition on, command the actuators to 0% pulse width modulated (PWM) and check the sensor reading. The value should be 0 - 20%. Command the actuators to 100% pulse width modulated (PWM) and check the sensor reading. The value should be 80 - 95%. If the values are outside this range, install a new valve as necessary. REFER to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P045C00	Exhaust Gas Recirculation B Control Circuit Low	- Left-hand exhaust gas recirculation (EGR) control circuit low - EGR valve sticking - Intake air temperature (IAT) sensor circuit fault - Ambient pressure (AMP) sensor circuit fault - Manifold absolute pressure and temperature (MAPT)	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
		sensor circuit fault ● Mass air flow (MAF) sensor circuit fault ● EGR sensor circuit fault	
P045D00	Exhaust Gas Recirculation B Control Circuit High	● Left-hand exhaust gas recirculation (EGR) control circuit high ● EGR valve sticking ● Intake air temperature (IAT) sensor circuit fault ● Ambient pressure (AMP) sensor circuit fault ● Manifold absolute pressure and temperature (MAPT) sensor circuit fault ● Mass air flow (MAF) sensor circuit fault ● EGR sensor circuit fault	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P048011	Fan 1 Control Circuit	● Cooling fan control circuit short circuit to ground ● Cooling fan fault	Check the cooling fan and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P048012	Fan 1 Control Circuit	● Cooling fan control circuit short circuit to power ● Cooling fan fault	Check the cooling fan and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P048013	Fan 1 Control Circuit	● Cooling fan control circuit high resistance	Check the cooling fan and circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P048300	Fan Performance	● Cooling fan control circuit short circuit to ground ● Cooling fan control circuit short circuit to power ● Cooling fan control circuit high resistance ● Cooling fan fault	Check the cooling fan operation. Refer to the electrical guides and check the fan circuit, Repair/renew as necessary. Clear the DTCs and test for normal operation. Check the pulse width modulated (PWM) signal and check the motor for sticking. Repair/renew as necessary.
P048700	Exhaust Gas Recirculation Throttle Control Circuit A / Open	● Right-hand exhaust gas recirculation (EGR) valve circuit fault ● EGR valve fault ● engine control module (ECM) fault	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048800	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	● Exhaust gas recirculation (EGR) throttle position sensor circuit high resistance ● Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to ground ● Exhaust gas recirculation (EGR) throttle position sensor	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and

DTC	Description	Possible causes	Action
		circuit short circuit to power - EGR modulator failure	recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048811	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	- Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to ground - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048812	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	- Exhaust gas recirculation (EGR) throttle position sensor circuit short circuit to power - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048813	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	- Exhaust gas recirculation (EGR) throttle position sensor circuit high resistance - Exhaust gas recirculation (EGR) throttle position sensor circuit open circuit - EGR modulator failure	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048819	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	- Right-hand exhaust gas recirculation (EGR) throttle control circuit range/performance - current above threshold - Right-hand EGR throttle over current check	Check the EGR throttle position sensor and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position with the ignition on, engine off and record the value. Command the actuator to 100% pulse width modulated (PWM) and recheck the position reading. The value should be 80 - 95%. Command the actuator to 0% pulse width modulated (PWM) and recheck the position reading. The value should be 5 - 20%. Manually close and open the throttle and

DTC	Description	Possible causes	Action
			check the resistance. The resistance should range from 300 - 2,500 ohms. If the values are not in this range, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation. If there is still an issue, suspect the ECM. Refer to the warranty policy and procedures manual if an ECM is suspect.
P048821	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	● Right-hand exhaust gas recirculation (EGR) throttle control circuit range/performance - signal amplitude less than minimum ● Right-hand EGR throttle adaption is at the bottom limit	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position then command the throttle position set point to 0% pulse width modulated (PWM) and recheck the position. If the 0% pulse width modulated (PWM) position is not between 0% and 20%, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P048822	Exhaust Gas Recirculation Throttle Control Circuit A Range/Performance	● Right-hand exhaust gas recirculation (EGR) throttle control circuit range/performance - signal amplitude greater than maximum ● Right-hand EGR throttle adaption is at the top limit	Check the EGR valve and circuits. Refer to the electrical guides. Using a data logger function, check the EGR throttle position then command the throttle position set point to 0% pulse width modulated (PWM) and recheck the position. If the 0% pulse width modulated (PWM) position is not between 0% and 20%, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P048900	Exhaust Gas Recirculation Control Circuit Low	● Right-hand exhaust gas recirculation (EGR) control circuit low ● EGR valve sticking ● Intake air temperature (IAT) sensor circuit fault ● Ambient pressure (AMP) sensor circuit fault ● Manifold absolute pressure and temperature (MAPT) sensor circuit fault ● Mass air flow (MAF) sensor circuit fault ● EGR sensor circuit fault	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P049000	Exhaust Gas Recirculation A Control Circuit High	● Right-hand exhaust gas recirculation (EGR) control circuit high ● EGR valve sticking ● Intake air temperature (IAT) sensor circuit fault ● Ambient pressure (AMP) sensor circuit fault ● Manifold absolute pressure and temperature (MAPT) sensor circuit fault ● Mass air flow (MAF) sensor circuit fault ● EGR sensor circuit fault	Check for DTCs indicating a sensor fault. Check the IAT, AMP, MAPT, MAF and EGR sensor circuits. Refer to the electrical guides. If no fault is found in the circuits, install a new EGR valve. REFER to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P049300	Fan Overspeed (clutch locked)	● Seized viscous coupling ● Fan speed sensor failure	Check that the viscous coupling turns independently of the fan. Refer to the electrical guides and check the viscous fan speed sensor circuit. Repair/renew as necessary.

DTC	Description	Possible causes	Action
P049313	Fan Overspeed (clutch locked)	● Fan circuit open circuit	Refer to the electrical guides and check the viscous fan speed sensor circuit. Repair/renew as necessary.
P049400	Fan Speed Low	● Viscous fan restriction ● Viscous fan solenoid circuit high resistance ● Viscous fan solenoid circuit short circuit to ground ● Viscous fan solenoid failure	Clear any obstruction from the viscous fan. Refer to the electrical guides and check the viscous fan solenoid and circuits. Refer to the relevant workshop manual section.
P049411	Fan Speed Low	● Viscous fan solenoid circuit short circuit to ground ● Viscous fan solenoid failure	Refer to the electrical guides and check the viscous fan solenoid and circuits. Refer to the relevant workshop manual section.
P049512	Fan Speed High	● Viscous fan solenoid circuit short circuit to power ● Viscous fan solenoid failure	Refer to the electrical guides and check the viscous fan solenoid and circuits. Refer to the relevant workshop manual section.
P049B00	Exhaust Gas Recirculation B Flow Insufficient Detected	● Left-hand exhaust gas recirculation (EGR) insufficient flow detected ● EGR control deviation lower limit (intake manifold tuning [IMT] valve closed) - bank specific control of EGR	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve position and command the valve to 0% then 100% pulse width modulated (PWM). Check the values. If the valve positions are not between 5% and 95%, install a new valve. REFER to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P049C00	Exhaust Gas Recirculation B Flow Excessive Detected	● Left-hand exhaust gas recirculation (EGR) excessive flow detected - signal amplitude greater than maximum ● EGR control deviation upper limit left-hand bank (intake manifold tuning [IMT] valve closed) - bank specific control of EGR	Allow the engine to warm up, switch off and turn the ignition on. Using a data logger function, check the EGR valve position and command the valve to 0% then 100% pulse width modulated (PWM). Check the values. If the valve positions are not between 5% and 95%, install a new valve. REFER to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation). Clear the DTCs and test for normal operation.
P050000	Vehicle Speed Sensor A	● Vehicle speed invalid signal received over CAN	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050100	Vehicle Speed Sensor A Range/Performance	● Vehicle speed sensor 1 range/performance - signal out of range ● Investigate for anti-lock braking system (ABS) faults - the signal from the wheel speed sensors is not plausible	Check for DTCs indicating an ABS fault. Speed sensor codes are listed at the head of this table.
P050162	Vehicle Speed Sensor A Range/Performance	● Vehicle speed range/performance	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050164	Vehicle Speed Sensor A Range/Performance	● Vehicle speed range/performance	Check for wheel speed sensor DTCs. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P050400	Brake switch A / B Correlation	● The brake pressure reading does not agree with the brake lamp switch value ● Brake switch failure ● ECM failure	Check the brake switch and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P050429	Brake Switch A / B Correlation	● Brake switch malfunction (sub-processor)	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P050462	Brake Switch A / B Correlation	● Brake switch A/B correlation - signal compare fault ● Brake lamp switch fault ● Brake lamp switch circuit fault	Check the brake switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P050464	Brake Switch A / B Correlation	● Brake switch malfunction	Check for ABS DTCs, check the brake switch and circuits (refer to the electrical guides). Clear the DTCs and test for normal operation.
P050600	Idle Air Control System RPM Lower Than Expected	● Air intake restriction ● Accessory drive overload (defective/seized component)	Refer to the relevant workshop manual section. Check the accessory drive belt and components, Refer to the relevant workshop manual section.
P050700	Idle Air Control System RPM Higher Than Expected	● Intake air leak between the mass air flow (MAF) sensor and throttle ● Intake air leak between throttle and engine ● Engine crankcase breather leak	Check the air intake system. Check the engine breather system. Refer to the relevant workshop manual section.
P051216	Starter Request Circuit	● Crank request circuit low input	Refer to the electrical guides and check the starter circuit. Repair/renew as necessary.
P051300	Incorrect Immobilizer Key	● Security key invalid	Program keys using the approved diagnostic system. Investigate and repair any codes stored in other CAN modules. Clear the codes and retest.
P051217	Starter Request Circuit	● Crank request circuit high input	Refer to the electrical guides and check the starter circuit. Repair/renew as necessary.
P052721	Fan Speed Sensor Circuit Range/Performance	● Fan speed sensor circuit range/performance - signal amplitude less than minimum ● Fan circuit short circuit to ground ● Fan circuit short circuit to power ● Fan circuit high resistance ● Fan fault	Check the fan and circuits, including the pulse width modulated (PWM) signal circuit. Refer to the electrical guides. Check the motor for sticking. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P052722	Fan Speed Sensor Circuit Range/Performance	● Fan speed sensor circuit range/performance - signal amplitude greater than maximum ● Fan circuit short circuit to ground ● Fan circuit short circuit to power ● Fan circuit high resistance ● Fan fault	Check the fan and circuits, including the pulse width modulated (PWM) signal circuit. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P052727	Fan Speed Sensor Circuit Range/Performance	● Fan speed sensor circuit range/performance - signal rate of change above threshold ● Fan circuit intermittent high resistance - Loose connections	Check the fan and circuits, including the pulse width modulated (PWM) signal circuit. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P056000	System Voltage	● Battery back-up malfunction ● Battery voltage low ● Battery ground cable: high resistance ● Battery connections loose/corroded ● Battery current drain	Check the battery condition and state of charge. Refer to the relevant workshop manual section.

DTC	Description	Possible causes	Action
P056200	System Voltage Low	● Battery condition/state of charge ● Battery ground cable high resistance ● Battery connections loose/corroded ● Battery current drain ● Battery power distribution circuits	Check the battery connections and condition and charge as necessary. Refer to the electrical guides and check the battery power supplies to the ECM, etc. Repair/renew as necessary. Refer to the relevant workshop manual section.
P056216	System Voltage Low	● Battery condition/state of charge ● Battery ground cable high resistance ● Battery connections loose/corroded ● Battery current drain ● Battery power distribution circuits	Check the battery connections and condition and charge as necessary. Refer to the electrical guides and check the battery power supplies to the ECM, etc. Repair/renew as necessary. Refer to the relevant workshop manual section.
P056300	System Voltage High	● System boosted from high voltage ● Battery voltage high ● Generator over charge condition	Check if the vehicle has been jump-started. Check the battery condition and state of charge. Refer to the relevant workshop manual section.
P056317	System Voltage High	● System voltage high - circuit voltage above threshold ● Battery voltage greater than maximum threshold	Check the battery connections and condition and charge as necessary. Check the battery power supplies to the ECM, etc. Repair/renew as necessary.
P056500	Cruise Control ON Signal	● Speed control (ON) switch signal circuit short circuit to power ● Speed control resume switch stuck/jammed ● Speed control resume switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P056600	Cruise Control OFF Signal	● Speed control (OFF) switch signal circuit short circuit to power ● Speed control resume switch stuck/jammed ● Speed control resume switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P056700	Cruise Control RESUME Signal	● Speed control (+) switch signal circuit short circuit to power ● Speed control - switch stuck/jammed ● Speed control - switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P056900	Cruise Control COAST Signal	● Speed control (-) witch signal circuit short circuit to power ● Speed control - switch stuck/jammed ● Speed control - switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P056A00	Cruise Control INCREASE DISTANCE Signal	● Speed control switch 3 stuck closed (HEADDOWN)	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P056B00	Cruise Control DECREASE DISTANCE Signal	● Speed control switch 4 stuck closed (HEADUP)	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P057000	Cruise Control ACCEL Signal	● Speed control + switch signal circuit short circuit to power ● Speed control + switch stuck/jammed ● Speed control + switch failure	Check the switch operation. Check the switch circuits. Refer to the electrical guides. Repair/renew as necessary. Refer to the relevant workshop manual section. Clear the DTCs and test for normal operation.
P057100	Brake Switch A Circuit	● The brake pressure reading does not agree with the brake lamp switch value ● Brake switch failure ● ECM failure	Check the brake switch and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
P057162	Brake Switch A Circuit	● Brake switch A circuit - signal compare fault ● Brake lamp switch circuit fault	Check the brake switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P057400	Cruise Control System - Vehicle Speed Too High	● Incorrect speed sensor signal	Check for ABS DTCs. Refer to the relevant workshop manual section.
P057600	Cruise Control Input Circuit Low	● Speed control switch short circuit to ground ● Speed control switch high resistance	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057700	Cruise Control Input Circuit High	● Speed control switch short circuit to power	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P057800	Cruise Control Multi-Function Input A Circuit Stuck	● Speed control multi-function input A circuit high resistance ● Speed control multi-function input A circuit short circuit to ground ● Speed control multi-function input A circuit short circuit to power ● Speed control switch stuck	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P05781C	Cruise Control Multi-Function Input A Circuit Stuck	● Speed control multi-function input A circuit stuck - circuit voltage out of range ● Switch circuit high resistance ● Switch fault	Check the switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P057900	Cruise Control Multi-Function Input A Circuit Range/Performance	● Speed control multi-function input A circuit high resistance ● Speed control multi-function input A circuit short circuit to ground ● Speed control multi-function input A circuit short circuit to power ● Speed control switch stuck	Refer to the electrical guides and check the cruise control circuit between the ECM and switch. Check the switch operation and renew/renew as necessary.
P05791C	Cruise Control Multi-Function Input A Circuit Range/Performance	● Speed control multi-function input A circuit stuck - circuit voltage out of range ● Switch circuit high resistance ● Switch fault	Check the switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.
P057929	Cruise Control Multi-Function Input A Circuit Range/Performance	● Speed control multi-function input A circuit range/performance - signal invalid ● Switch circuit short circuit to ground ● Switch circuit short circuit to power ● Switch fault	Check the switch and circuits. Refer to the electrical guides. Clear the DTCs and test for normal operation.

Electronic Engine Controls - TDV8 3.6L Diesel - Camshaft Position (CMP) Sensor

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

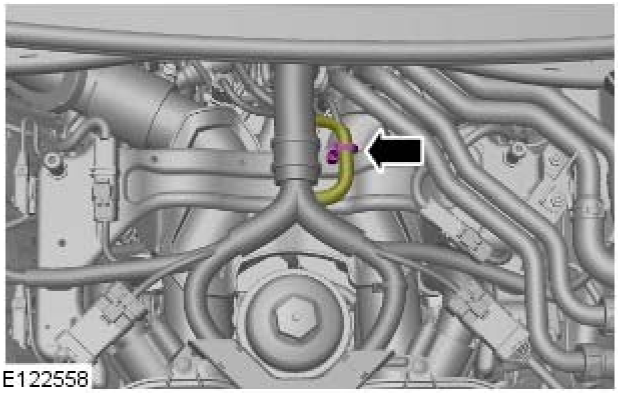
2. Remove the engine cover.
For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

3. Partially drain the cooling system.
For additional information, refer to: Cooling System Partial Draining, Filling and Bleeding (303-03E Engine Cooling - TDV8 3.6L Diesel, General Procedures).

4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

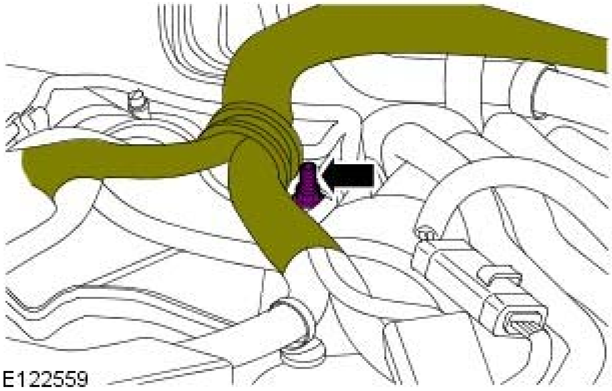
Raise and support the vehicle.

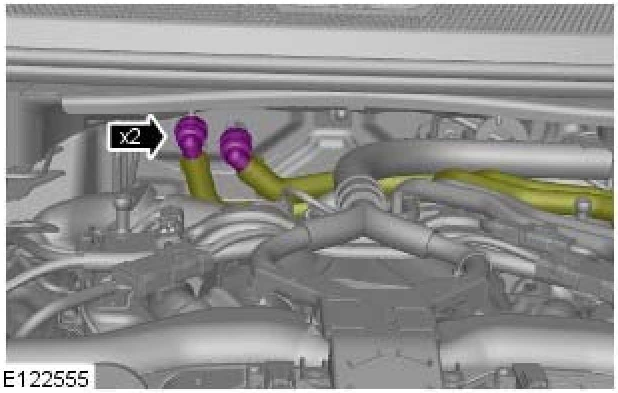
5. Release the wiring harness clip.



6. Release the engine wiring harness bracket.

- Remove the bolt.
- Reposition the engine wiring harness.

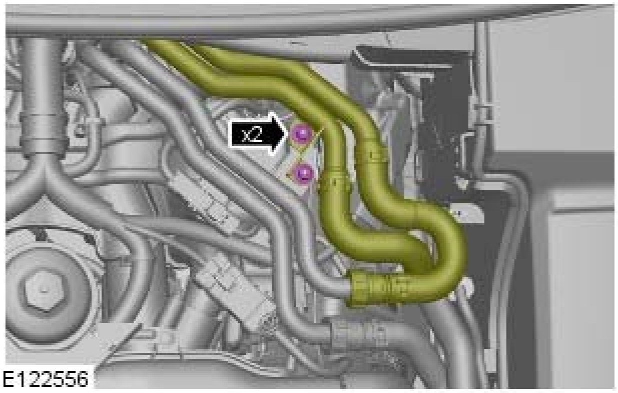




7. ⚠ CAUTION: Be prepared to collect escaping coolant.

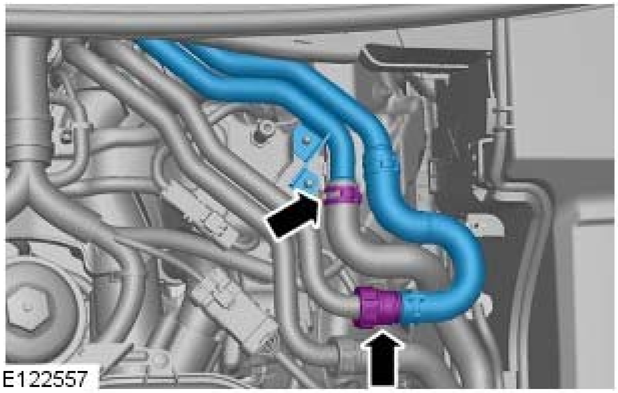
Release the 2 coolant hoses.

- Position container to collect fluid loss.



8. Release the coolant pipes.

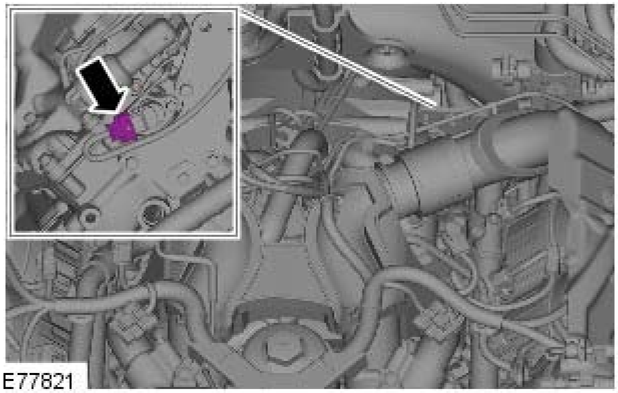
- Remove the 2 nuts.



9. ⚠ CAUTION: Note the fitted position of the component prior to removal.

Remove the coolant pipe assembly.

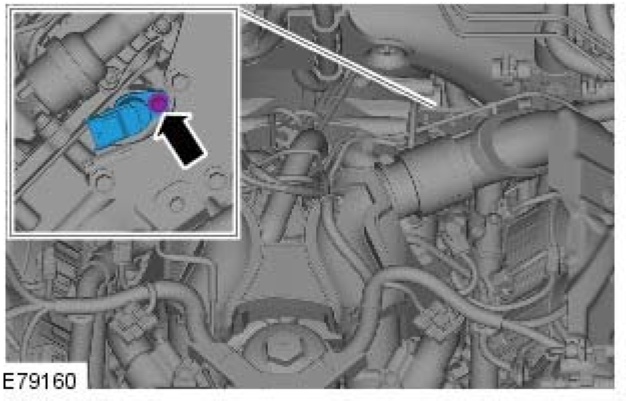
- Release the 2 coolant hoses.



10. Disconnect the camshaft position (CMP) sensor electrical connector.

11. Remove the CMP sensor.

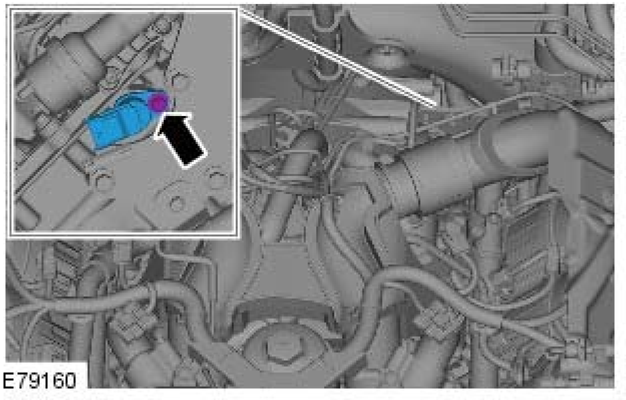
- Remove the bolt.
- Remove and discard the O-ring seal.



Installation

1. To install, reverse the removal procedure.

- Install a new O-ring seal.
- Tighten the bolt to 10 Nm (7 lb.ft).



Published: 11-May-2011

Electronic Engine Controls - TDV8 3.6L Diesel - Crankshaft Position (CKP) Sensor

Removal and Installation

Removal

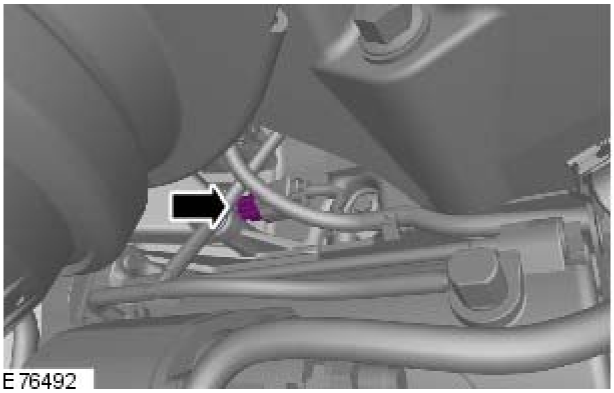
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the flexplate.
For additional information, refer to: Flexplate (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).

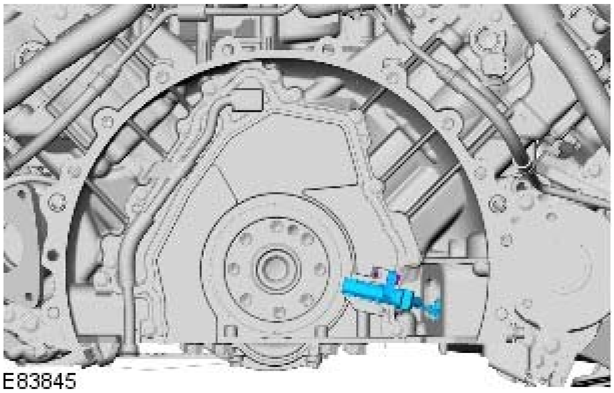
4. Disconnect the crankshaft position (CKP) sensor electrical connector.



5. NOTE: The CKP sensor bolt should not be removed from the CKP sensor.

Remove the crankshaft position (CKP) sensor.

- Fully loosen the bolt.
- Release the CKP sensor blanking cover.



Installation

1. ⚠ CAUTION: Install the CKP sensor correctly into the housing. Failure to follow this instruction may result in damage to the CKP sensor.

Install the CKP sensor.

- Tighten the bolt to 5 Nm (4 lb.ft).
- Secure the CKP sensor blanking cover.

2. Connect the CKP sensor electrical connector.

3. Install the flexplate.

For additional information, refer to: Flexplate (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).

4. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

Electronic Engine Controls - TDV8 3.6L Diesel - Crankshaft Position (CKP) Sensor Ring

Removal and Installation

Special Tool(s)	
	Installer - Crankshaft Position (CKP) Sensor Ring 303-1237

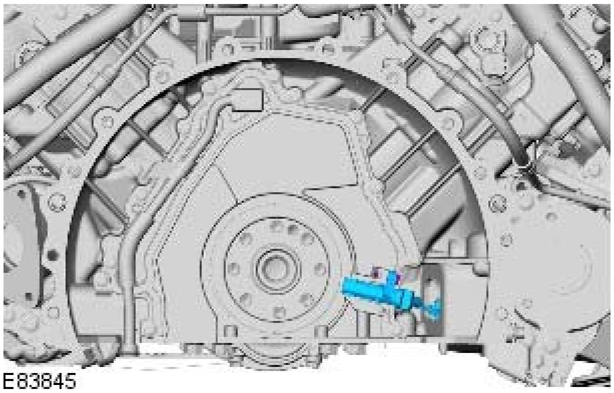
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

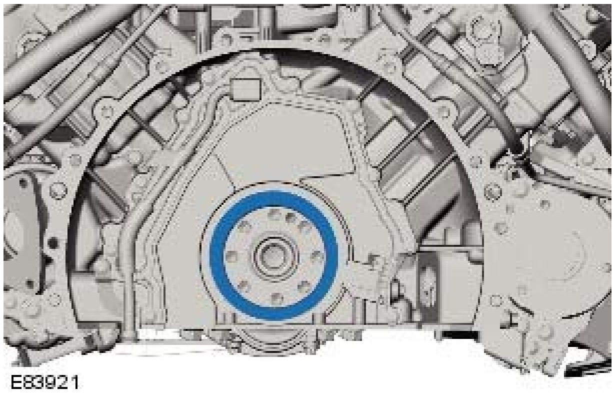
Raise and support the vehicle.

3. Remove the flexplate.
For additional information, refer to: Flexplate (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).



4. Remove the crankshaft position (CKP) sensor.

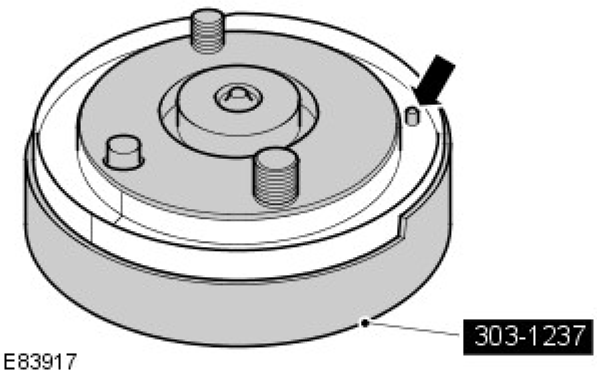
- Remove the bolt.



5. ⚠ CAUTION: Care must be taken to avoid damage to the crankshaft.

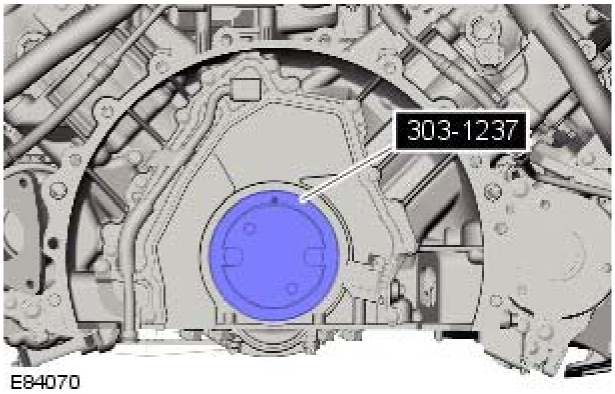
Remove and discard the CKP sensor ring.

Installation



1. Install a new CKP sensor ring to the special tool.

- Wind the special tool nut back to the end of the thread.
- Engage the CKP sensor ring to the locating pin.



2. Install the CKP sensor ring to the crankshaft.

- Clean the component mating faces.
- Align the dowel and install the special tool to the crankshaft.
- Tighten the 2 bolts.
- Tighten the special tool nut, to install the CKP sensor ring to the crankshaft.
- Remove the special tool.

3. Install the CKP sensor.

- Tighten the bolt to 5 Nm (4 lb.ft).

4. Install the flexplate.
For additional information, refer to: Flexplate (303-01D Engine - TDV8 3.6L Diesel, In-vehicle Repair).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV8 3.6L Diesel - Engine Control Module (ECM)

Removal and Installation

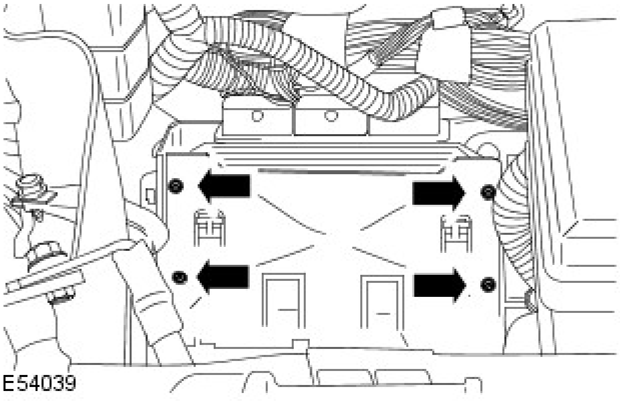
Removal

- NOTE: RHD shown, LHD is similar.

1. NOTE: All vehicles.

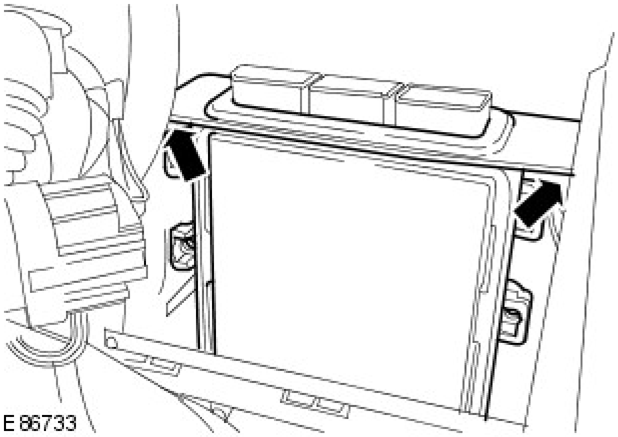
Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the four-wheel drive (4WD) control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).



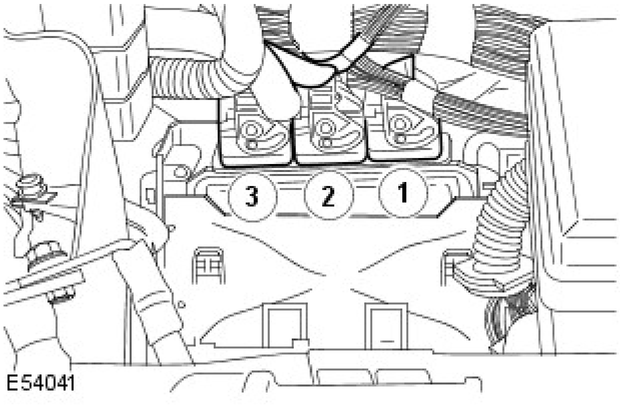
3. Remove the engine control module (ECM) front cover.

- Fully loosen the 4 screws.

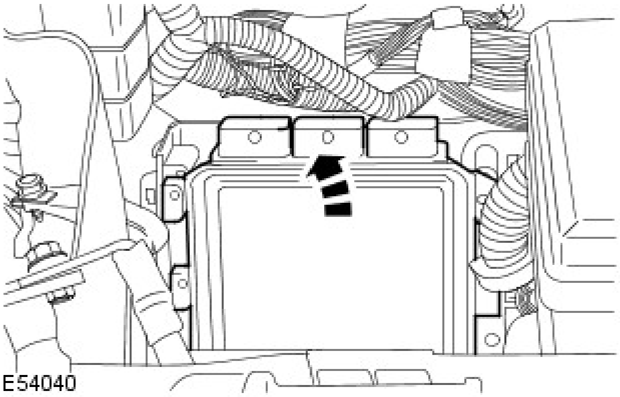


4. Release the ECM top cover.

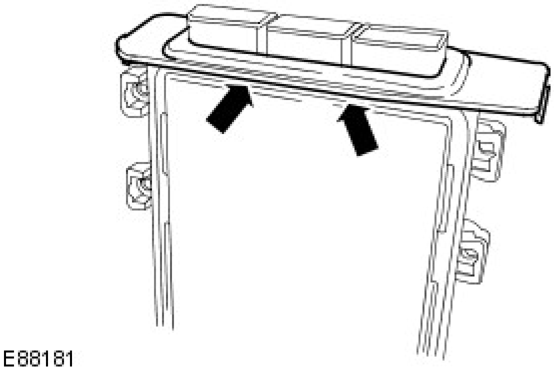
- Release the 2 clips.



5. Disconnect the 3 electrical connectors.



6. Remove the ECM.



7. NOTE: Do not disassemble further if the component is removed for access only.

Remove the ECM top cover from the ECM.

- Release the clips.

Installation

1. NOTE: All vehicles.

Install the ECM top cover to the ECM.

- Secure with the clips.

2. Install the ECM.

3. Connect the electrical connectors.

4. Secure the ECM top cover.

- Secure the clips.

5. Install the ECM front cover.

- Tighten the screws to 2 Nm (1 lb.ft).

6. Install the 4WD control module.
For additional information, refer to: Four-Wheel Drive (4WD) Control Module (308-07A Four-Wheel Drive Systems, Removal and Installation).

7. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

8. NOTE: Vehicles with DPF (Diesel Particulate Filter) installed only.

• NOTE: Only carry out the following step if a new ECM is to be installed.

Renew the engine oil and filter.
For additional information, refer to: Engine Oil Draining and Filling (303-01D Engine - TDV8 3.6L Diesel, General Procedures).

9. NOTE: All vehicles.

- NOTE: Only carry out the following step if a new ECM is to be installed.

  Using the Land Rover approved diagnostic system, calibrate a new ECM.

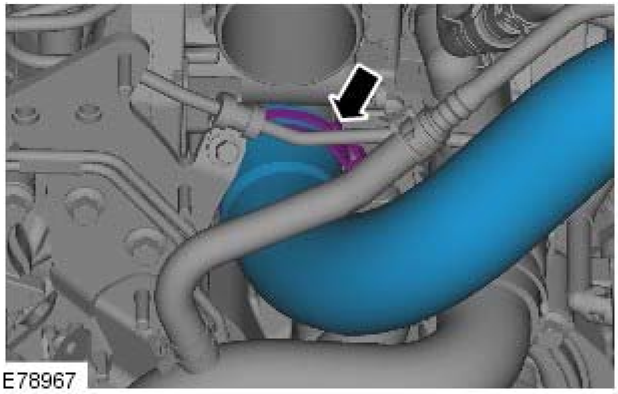
Published: 11-May-2011

Electronic Engine Controls - TDV8 3.6L Diesel - Engine Coolant Temperature (ECT) Sensor

Removal and Installation

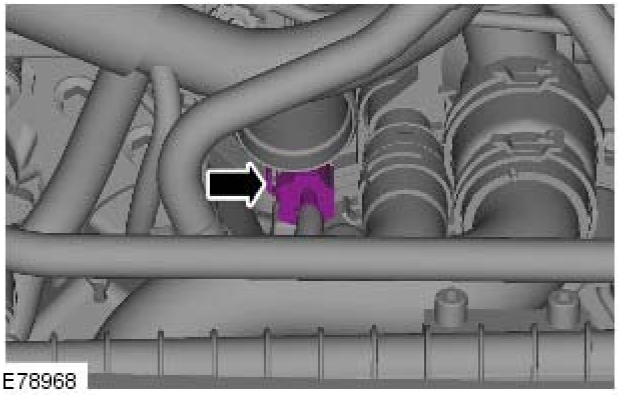
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Raise and support the vehicle.
3. Remove the cooling fan assembly.
   For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).



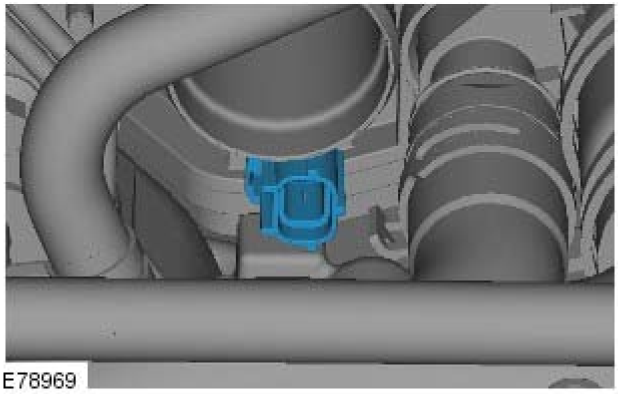
E78967

4. Disconnect the upper coolant hose from the coolant distribution manifold.
   - Release the clip.



E78968

5. Disconnect the engine coolant temperature (ECT) sensor electrical connector.



E78969

6. Remove the ECT sensor.
   - Remove and discard the clip.
   - Remove and discard the O-ring seal.

Installation

1. NOTE: Lubricate the O-ring seal with clean coolant.

   Install the ECT sensor.

   - Install a new O-ring seal.
   - Install a new clip.

2. Connect the ECT sensor electrical connector.
3. Connect the upper coolant hose to the coolant distribution manifold.

   - Secure the clip.

4. Install the cooling fan assembly.
   For additional information, refer to: Cooling Fan (303-03E Engine Cooling - TDV8 3.6L Diesel, Removal and Installation).
5. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Published: 11-May-2011

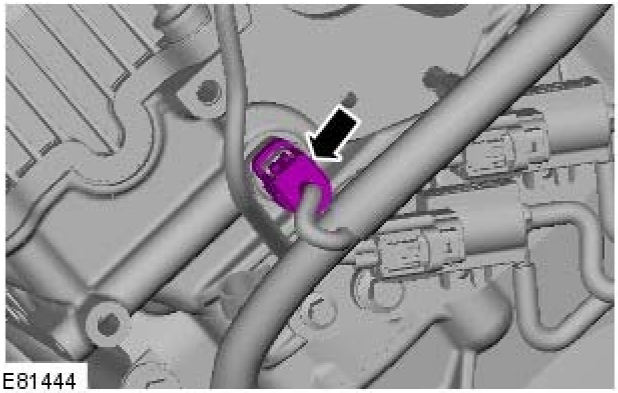
Electronic Engine Controls - TDV8 3.6L Diesel - Engine Oil Pressure (EOP) Sensor

Removal and Installation

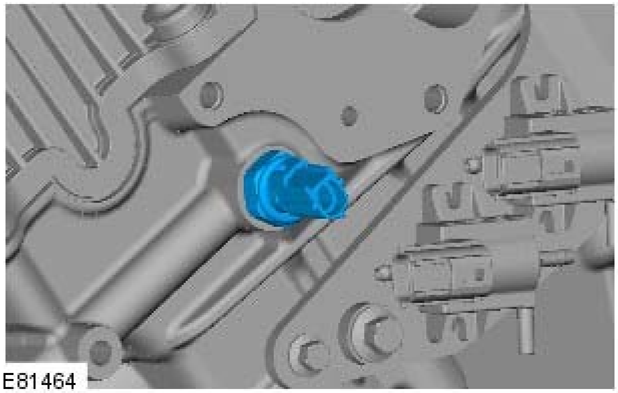
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the brake vacuum pump.
For additional information, refer to: Brake Vacuum Pump - TDV8 3.6L Diesel (206-07 Power Brake Actuation, Removal and Installation).



3. Disconnect the engine oil pressure (EOP) sensor electrical connector.



4. Remove the EOP sensor.

Installation

1. Install the EOP sensor.

- Tighten the sensor to 15 Nm (11 lb.ft).

2. Connect the EOP sensor electrical connector.

3. Install the brake vacuum pump.
For additional information, refer to: Brake Vacuum Pump - TDV8 3.6L Diesel (206-07 Power Brake Actuation, Removal and Installation).

4. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV8 3.6L Diesel - Fuel Rail Pressure (FRP) Sensor

Removal and Installation

Removal

1. NOTE: The fuel rail pressure (FRP) sensor is part of the RH fuel rail and cannot be serviced separately.

Remove the RH fuel rail.
For additional information, refer to: Fuel Rail RH (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation).

Installation

1. Install the RH fuel rail.
For additional information, refer to: Fuel Rail RH (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Removal and Installation).

Published: 11-May-2011

Electronic Engine Controls - TDV8 3.6L Diesel - Fuel Temperature Sensor

Removal and Installation

Removal

- WARNINGS:

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

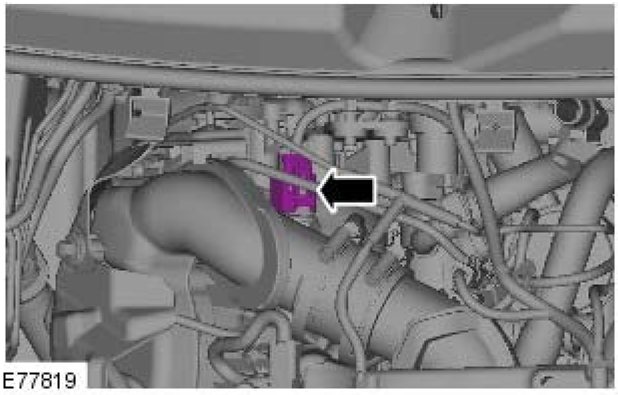
- CAUTIONS:

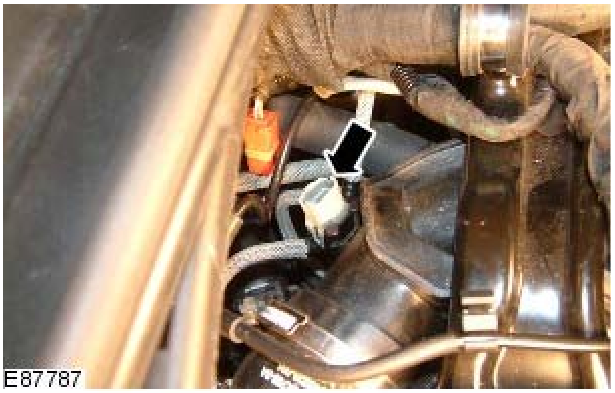
⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠ Always carry out the cleaning process before carrying out any repairs to the fuel injection system components. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Disconnect the fuel temperature sensor electrical connector.





E87787

4. ⚠CAUTION: Always plug any open connections to prevent contamination.

Remove the fuel temperature sensor from the fuel return line.

- Position an absorbent cloth to collect fluid spillage.
- Release the 2 clips.
- Discard the O-ring seal.
- Clean the seal contact area.

Installation

1. To install, reverse the removal procedure.

- Clean the immediate area.
- Install a new O-ring seal.

Published: 11-May-2011

Electronic Engine Controls - TDV8 3.6L Diesel - Knock Sensor (KS) LH

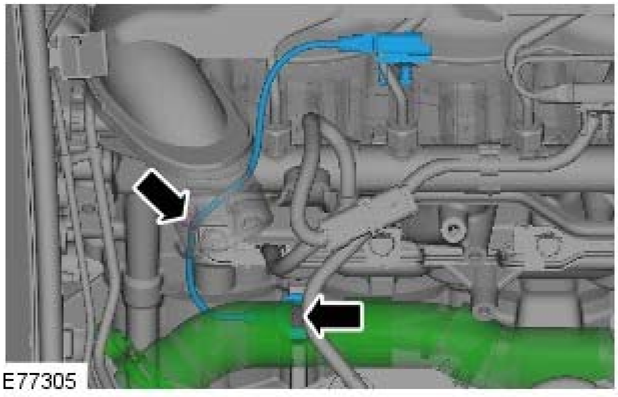
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the LH exhaust gas recirculation (EGR) valve.
For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve LH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation).

3. Remove the knock sensor (KS).



- Release the KS wiring harness.
- Reposition the coolant hose.
- Remove the bolt.

Installation

1. ⚠ CAUTION: Make sure that the mating faces are clean and free of foreign material.

To install, reverse the removal procedure.

- Tighten the bolt to 20 Nm (15 lb.ft).

Published: 11-May-2011

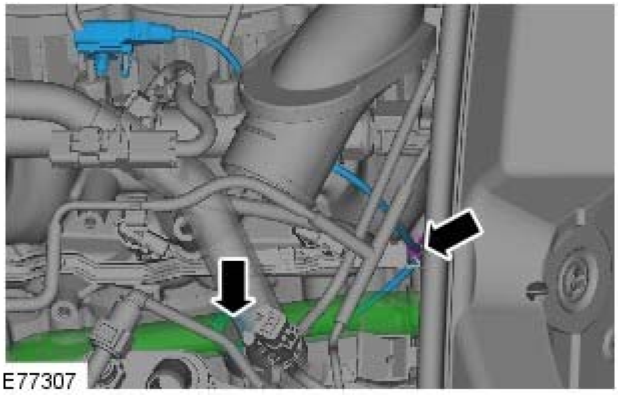
Electronic Engine Controls - TDV8 3.6L Diesel - Knock Sensor (KS) RH

Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the RH exhaust gas recirculation (EGR) valve.
For additional information, refer to: Exhaust Gas Recirculation (EGR) Valve RH (303-08D Engine Emission Control - TDV8 3.6L Diesel, Removal and Installation).



3. Remove the knock sensor (KS).

- Release the KS wiring harness.
- Reposition the coolant hose.
- Remove the bolt.

Installation

1. ⚠ CAUTION: Make sure that the mating faces are clean and free of foreign material.

To install, reverse the removal procedure.

- Tighten the bolt to 20 Nm (15 lb.ft).

Electronic Engine Controls - TDV8 3.6L Diesel - Manifold Absolute Pressure and Temperature (MAPT) Sensor

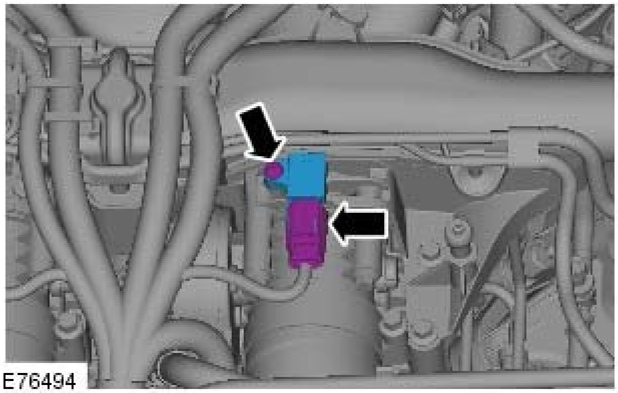
Removal and Installation

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Remove the engine cover.
   For additional information, refer to: Engine Cover - TDV8 3.6L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. NOTE: Left-hand shown, right-hand similar.

   Remove the manifold absolute pressure and temperature (MAPT) sensor.

   - Disconnect the electrical connector.
   - Remove the screw.



Installation

1. To install, reverse the removal procedure.

Published: 11-May-2011

Electronic Engine Controls - TDV8 3.6L Diesel - Mass Air Flow (MAF) Sensor

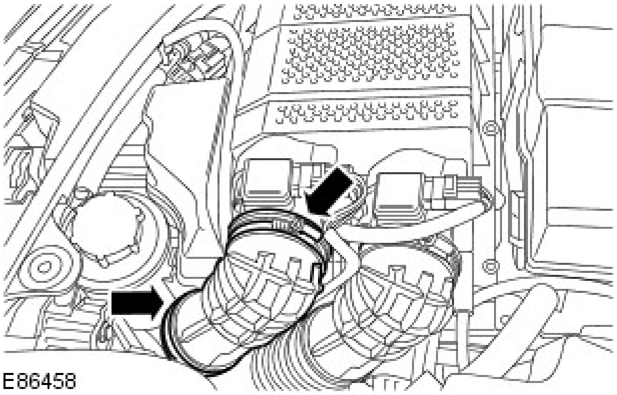
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

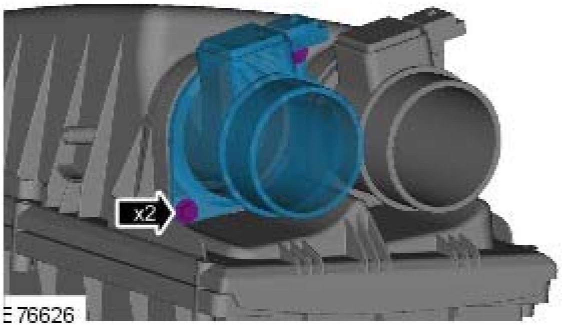
2. Remove the mass air flow (MAF) outlet pipe.

- Disconnect the MAF sensor electrical connector.
- Loosen the 2 clips.



3. Remove the MAF sensor.

- Remove the 2 screws.
- Remove and discard the O-ring seal.



Installation

1. Install the MAF sensor.

- Install a new O-ring seal.
- Tighten the 2 screws to 2 Nm (1 lb.ft).

2. Install the MAF outlet pipe.

- Tighten the clips.
- Connect the MAF sensor electrical connector.

3. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Electronic Engine Controls - TDV8 3.6L Diesel - Exhaust Gas Temperature Sensor

Removal and Installation

Removal

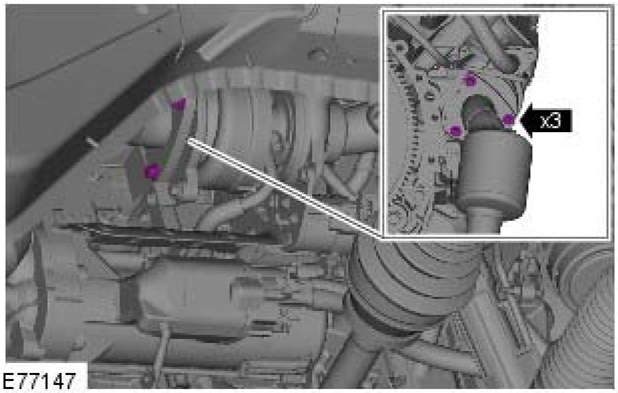
⚠ WARNING: Observe due care when working near a hot exhaust system.

• NOTE: LH pre-catalytic converter exhaust gas temperature sensor shown, post catalytic converter and post diesel particulate filter (DPF) sensors similar.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

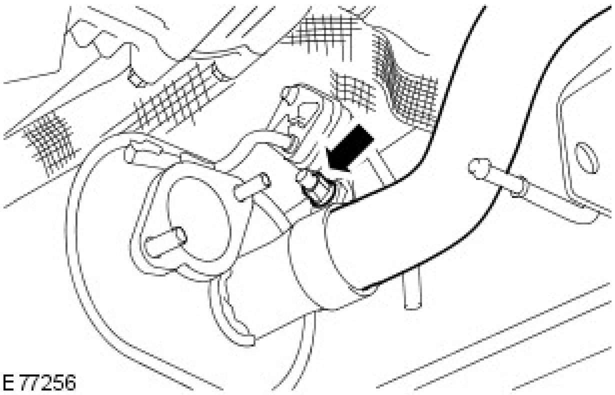
2. NOTE: RH shown, LH is similar.



Release the LH catalytic converter.

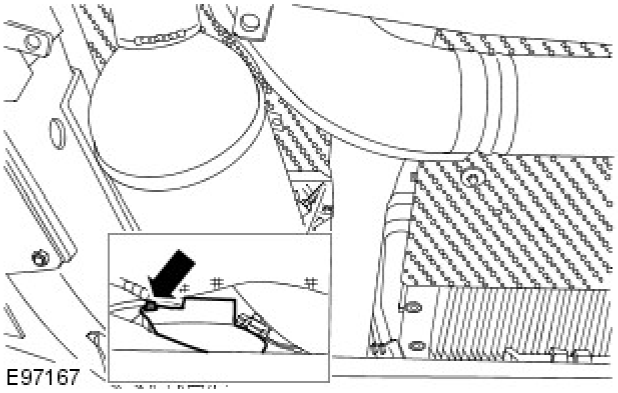
- Remove the 3 bolts.

3. NOTE: RH catalytic converter shown removed for clarity.

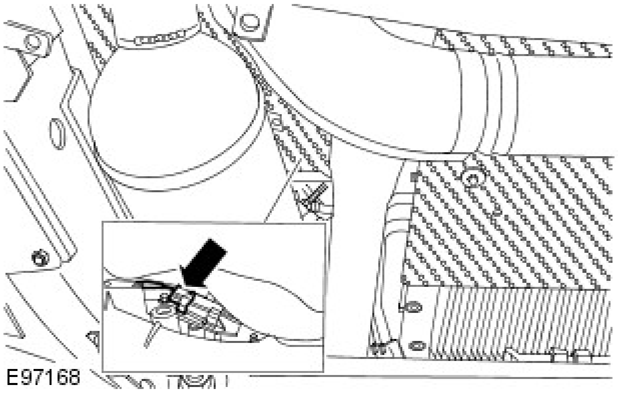


Loosen the catalytic converter to diesel particulate filter (DPF) retaining clamp.

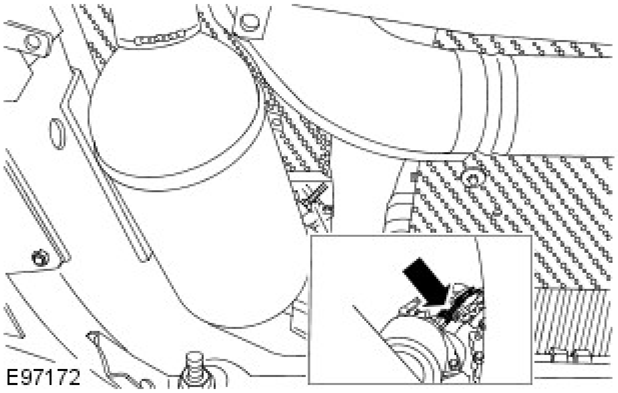
4. Remove the exhaust gas temperature sensor electrical connector heat shield.



- Remove the bolt.



5. Disconnect the exhaust gas temperature sensor electrical connector.



6. Remove the exhaust gas temperature sensor.

- Reposition the LH catalytic converter.

Installation

1. Install the exhaust gas temperature sensor.

- Tighten to 35 Nm (26 lb.ft).

2. Connect the exhaust gas temperature sensor electrical connector.

3. Install the exhaust gas temperature sensor connector heat shield.

- Tighten the bolt to 10 Nm (7 lb.ft).

4. Secure the LH catalytic converter.

- Tighten the bolts to 25 Nm (18 lb.ft).

5. Tighten the LH catalytic converter to DPF clamp.

- Tighten the nut to 48 Nm (35 lb.ft).

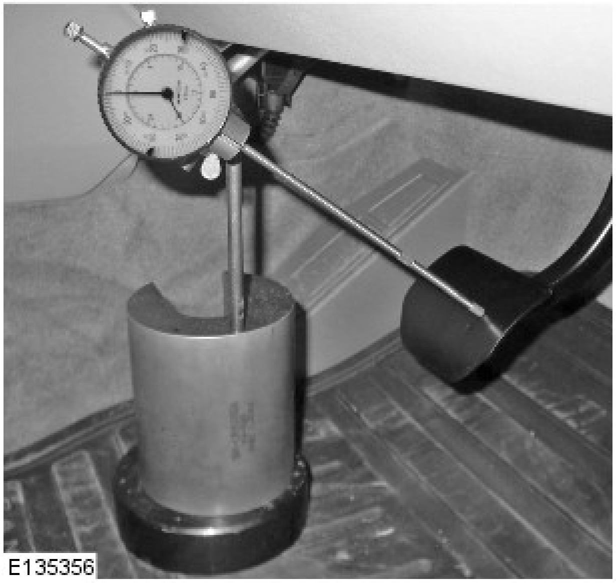
Electronic Engine Controls - TDV8 3.6L Diesel - Brake Pedal Position (BPP) Switch Adjustment

General Procedures



Check

1. Remove the brake pedal rubber.

2. NOTE: Make sure that the dial test indicator (DTI) gauge is in line with the brake pedal movement.

Position the DTI gauge on a suitable mounting block, as illustrated.

3. With the aid of another technician, gently press the brake pedal until the stoplamps illuminate.

4. NOTE: The specification is that the stoplamps should illuminate at between 5.5mm and 8.5mm brake pedal travel.

Note the measurement of the brake pedal travel from rest position until the stoplamps illuminated.

Adjust

1. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠

Remove the stoplamp switch.
For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

2. CAUTIONS:

⚠ The brake pedal **must not** be pressed during this operation. Failure to follow this instruction may result in damage to the component.

⚠ Only use light finger pressure when installing the stoplamp switch. Failure to follow this instruction may result in an incorrectly adjusted stoplamp switch.

Install the stoplamp switch.

For additional information, refer to: Stoplamp Switch (417-01 Exterior Lighting, Removal and Installation).

3. Check the adjustment of the stoplamp switch by following the **Check** procedure in this procedure and carry out the **Adjust** procedure if required.

OVERVIEW

The ZF 6HP26 transmission is an electronically controlled, six speed unit. The transmission is manufactured by ZF Transmissions GmbH in Saarbrücken, Germany. This transmission represents the latest in automatic transmission technology and incorporates new features to enhance the transmission functionality:

- The hydraulic and electronic control elements of the transmission are now incorporated in a single unit located inside the transmission and is known as 'Mechatronic'
- Another new strategy is Adaptive Shift Strategy (ASIS). ASIS represents the continuous adaptation of shift changes to suit the driving style of the driver which can vary from sporting to economical. Further details of the ASIS function are contained in the 'Driving Modes' section.

The transmission used in the 4.2L V8 Supercharged version of the Range Rover Sport is an uprated derivative of the 6HP26 transmission used in the 4.4L V8 and 2.7L TdV6 models. The uprated transmission includes an additional pinion gear in the planetary gear train and additional clutch plates to enable the transmission to manage the additional power output of the supercharged engine.

The transmission is controlled by a Transmission Control Module (TCM) which contains software to provide operation as a semi-automatic 'CommandShift™' transmission. The TCM allows the transmission to be operated as a conventional automatic unit by selecting P, R, N, D on the selector lever. Movement of the selector lever across the gate to the 'M/S' position puts the transmission into electronic 'Sport' mode. Further movement of the lever in a lateral direction to the + or – position puts the transmission into electronic manual 'CommandShift™' mode.

The 6HP26 transmission has the following features:

- Designed to be maintenance free
- Transmission fluid is 'fill for life'
- The torque converter features a controlled slip feature with electronically regulated control of lock-up, creating a smooth transition to the fully locked condition
- Shift programs controlled by the TCM
- Connected to the ECM via the High Speed CAN for communications
- Default mode if major faults occur
- Diagnostics available from the TCM via the CAN

The gearbox comprises the main casing which houses all of the transmission components. The main case also incorporates an integral bell housing.

A fluid pan is bolted to the lower face of the main case and is secured with bolts. The fluid pan is sealed to the main case with a gasket. Removal of the fluid pan allows access to the Mechatronic valve block. The fluid pan has a magnet located around the drain plug which collects any metallic particles present in the transmission fluid.

A fluid filter is located inside the fluid pan. If the transmission fluid becomes contaminated or after any service work, the fluid pan with integral filter must be replaced.

The integral bell housing provides protection for the torque converter assembly and also provides the attachment for the gearbox to the engine cylinder block. The torque converter is a non-serviceable assembly which also contains the lock-up clutch mechanism. The torque converter drives a crescent type pump via drive tangs. The fluid pump is located in the main case, behind the torque converter.

The main case contains the following major components:

- Input shaft
- Output shaft
- Mechatronic valve block which contains the solenoids, speed sensors and the TCM
- Three rotating multiplate drive clutches
- Two fixed multiplate brake clutches
- A single planetary gear train and a double planetary gear train.

8	-	Drive plate
9	-	Journal - Drive plate/crankshaft location
10	-	Torque converter cover
11	-	Lock-up clutch piston

12	-	Lock-up clutch plate

The torque converter is the coupling element between the engine and the gearbox and is located in the transmission housing, on the engine side of the transmission. The driven power from the engine crankshaft is transmitted hydraulically and mechanically through the torque converter to the transmission. The torque converter is connected to the engine by a drive plate.

The torque converter comprises an impeller, a stator and a turbine. The torque converter is a sealed unit with all components located between the converter housing cover and the impeller. The two components are welded together to form a sealed, fluid filled housing. With the impeller welded to the converter housing cover, the impeller is therefore driven at engine crankshaft speed.

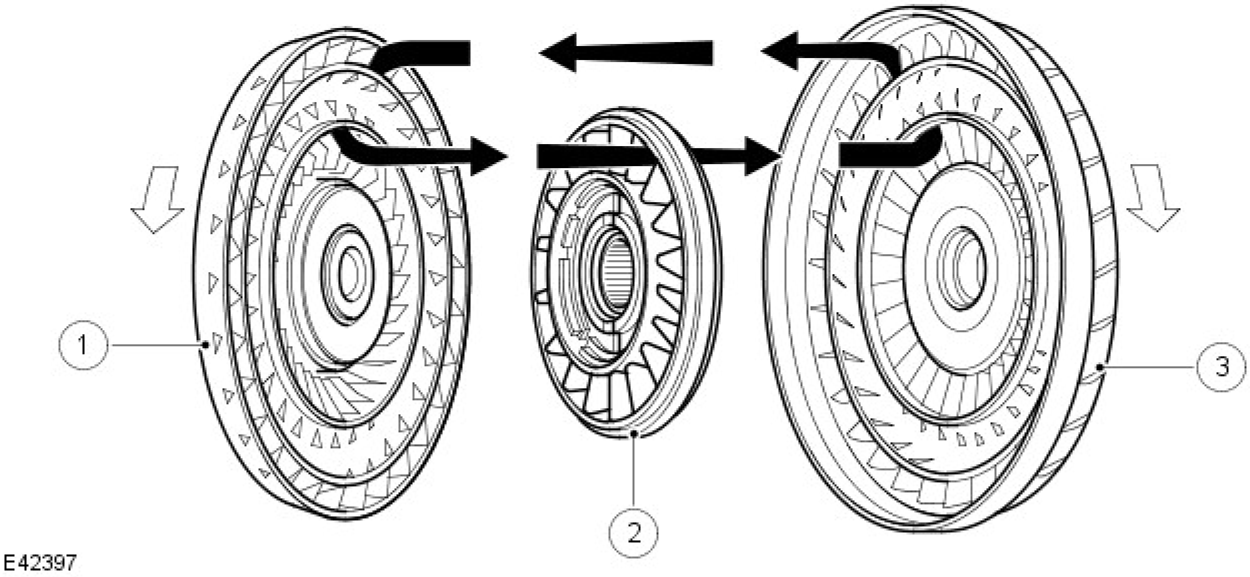
The converter housing cover has threaded bosses which provide for attachment of the engine drive plate which is connected to the engine crankshaft. The threaded bosses also provide for location of special tools which are required to remove the torque converter from the bell housing.

The torque converter used on TdV6 models is similar in construction to the torque converter on petrol models but contains a torsional vibration damper. The damper smooths the output from the engine and prevents unwanted vibration from being passed to the transmission.

Impeller

Fluid Flow

- NOTE: Typical torque converter shown



Item	Part Number	Description
1	-	Turbine
2	-	Stator
3	-	Impeller

When the engine is running the rotating impeller acts as a centrifugal pump, picking up fluid at its centre and discharging it at high velocity through the blades on its outer rim. The design and shape of the blades and the curve of the impeller body cause the fluid to rotate in a clockwise direction as it leaves the impeller. This rotation improves the efficiency of the fluid as it contacts the outer row of blades on the turbine.

The centrifugal force of the fluid leaving the blades of the impeller is passed to the curved inner surface of the turbine via the tip of the blades. The velocity and clockwise rotation of the fluid causes the turbine to rotate.

Turbine

The turbine is similar in design to the impeller with a continuous row of blades. Fluid from the impeller enters the turbine through the tip of the blades and is directed around the curved body of the turbine to the root of the blades. The curved surface redirects the fluid back in the opposite direction to which it entered the turbine, effectively increasing the turning force applied to the turbine from the impeller. This principle is known as torque multiplication.

When engine speed increases, turbine speed also increases. The fluid leaving the inner row of the turbine blades is rotated in an anti-clockwise direction due to the curve of the turbine and the shape of the blades. The fluid is now flowing in the opposite direction to the engine rotation and therefore the impeller. If the fluid was allowed to hit the impeller in this condition, it would have the effect of applying a brake to the impeller, eliminating the torque multiplication effect. To prevent this, the stator is located between the impeller and the turbine.

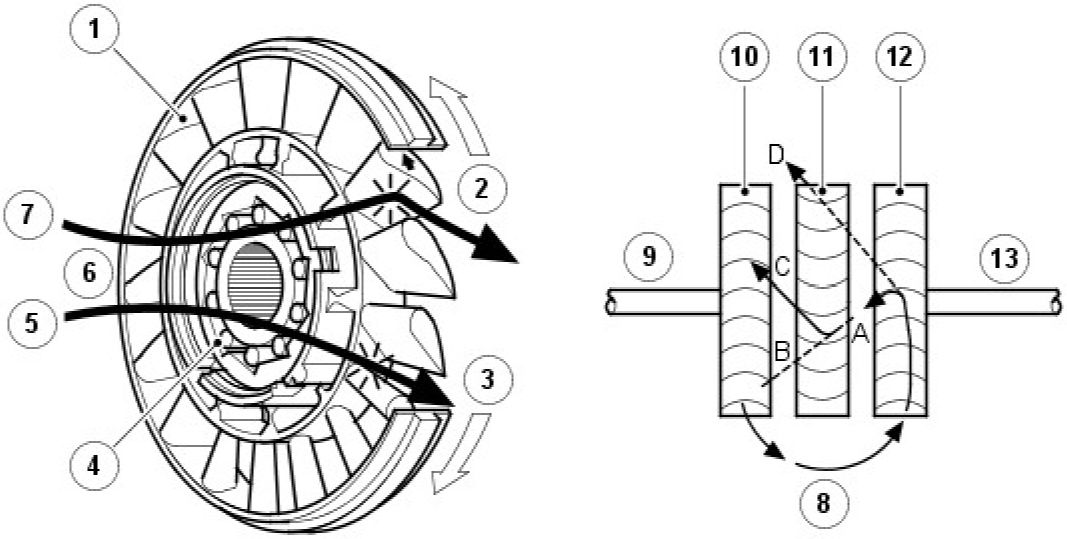
Stator

The stator is located on the splined transmission input shaft via a freewheel clutch. The stator comprises a number of blades which are aligned in an opposite direction to those of the impeller and turbine. The main function of the stator is to redirect the returning fluid from the turbine, changing its direction to that of the impeller.

The redirected fluid from the stator is directed at the inner row of blades of the impeller, assisting the engine in turning the impeller. This sequence increases the force of the fluid emitted from the impeller and thereby increases the torque multiplication effect of the torque converter.

Stator Functions

- NOTE: Typical stator shown



E42398

Item	Part Number	Description
1	-	Blades
2	-	Stator held – fluid flow redirected
3	-	Stator rotates freely
4	-	Roller
5	-	Converter at coupling speed
6	-	Fluid flow from turbine
7	-	Converter multiplying
8	-	Fluid flow from impeller
9	-	Drive from engine
10	-	Impeller
11	-	Stator
12	-	Turbine
13	-	Output to transmission

Refer to the 'Stator Functions' illustration

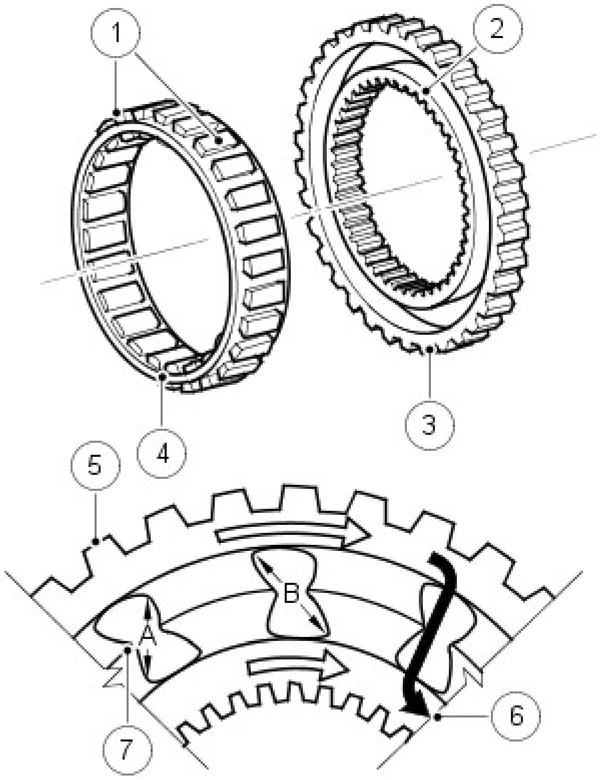
Fluid emitted from the impeller acts on the turbine. If the turbine is rotating at a slower speed than the fluid from the impeller, the fluid will be deflected by the turbine blades in the path '**A**'. The fluid is directed at and deflected by the stator blades from path '**B**' to path '**C**'. This ensures that the fluid is directed back to the pump in the optimum direction. In this condition the sprag clutch is engaged and the force of the fluid on the stator blades assists the engine in rotating the impeller

As the rotational speed of the engine and therefore the turbine increases, the direction of the fluid leaving the turbine changes to path '**D**'. The fluid is now directed from the turbine to the opposite side of the stator blades, rotating the stator in the opposite direction. To prevent the stator from resisting the smooth flow of the fluid from the turbine, the sprag clutch releases, allowing the stator to rotate freely on its shaft.

When the stator becomes inactive, the torque converter no longer multiplies the engine torque. When the torque converter reaches this operational condition it ceases to multiply the engine torque and acts solely as a fluid coupling, with the impeller and the turbine rotating at approximately the same speed.

The stator uses a sprag type, one way, freewheel clutch. When the stator is rotated in a clockwise direction the sprags twist and are wedged between the inner and outer races. In this condition the sprags transfer the rotation of the outer race to the inner race which rotates at the same speed.

One Way Free Wheel Clutch – Typical



E42712

Item	Part Number	Description
1	-	Sprags
2	-	Inner race
3	-	Outer race
4	-	Sprag and cage assembly
5	-	Sprag outer race
6	-	Sprag inner race
7	-	Retaining ring

The free wheel clutch can perform three functions; hold the stator stationary, drive the stator and free wheel allowing the stator to rotate without a drive output. The free wheel clutch used in the 6HP26 transmission is of the sprag type and comprises an inner and outer race and a sprag and cage assembly. The inner and outer races are pressed into their related components with which they rotate. The sprag and cage assembly is located between the inner and outer races.

The sprags are located in a cage which is a spring which holds the sprags in the 'wedge' direction and maintains them in contact with the inner and outer races.

Referring to the illustration, the sprags are designed so that the dimension 'B' is larger than the distance between the inner and outer race bearing surfaces. When the outer race rotates in a clockwise direction, the sprags twist and the edges across the dimension 'B' wedge between the races, providing a positive drive through each sprag to the inner race. The dimension 'A' is smaller than the distance between the inner and outer race bearing surfaces. When the outer race rotates in an anti-clockwise direction, the dimension 'A' is too small to allow the sprags to wedge between the races, allowing the outer race to rotate freely.

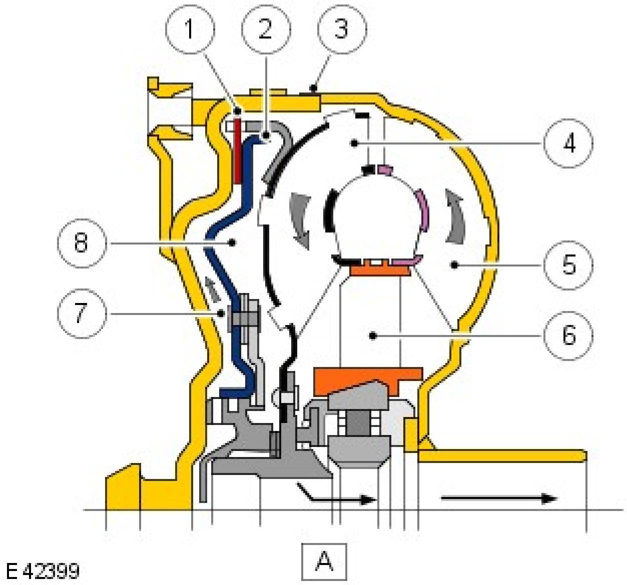
On the illustration shown, when the outer race is rotated in a clockwise direction, the sprags twist and are 'wedged' between the inner and outer races. The sprags then transfer the rotation of the outer race to the inner race, which rotates at the same speed.

Lock-Up Clutch Mechanism

The Torque Converter Clutch (TCC) is hydraulically controlled by an electronic pressure regulating solenoid (EPRS6) which is controlled by the TCM. This allows the torque converter to have three states of operation as follows:

- Fully engaged
- Controlled slip variable engagement
- Fully disengaged

The TCC is controlled by two hydraulic spool valves located in the valve block. These valves are actuated by pilot pressure supplied via a solenoid valve which is also located in the valve block. The solenoid valve is operated by PWM signals from the TCM to give full, partial or no lock-up of the torque converter.



Item	Part Number	Description
A	-	Unlocked condition
B	-	Locked condition
1	-	Clutch plate
2	-	Clutch piston
3	-	Torque converter body
4	-	Turbine
5	-	Impeller
6	-	Stator
7	-	Piston chamber
8	-	Turbine chamber

The lock-up clutch is a hydro-mechanical device which eliminates torque converter slip, improving fuel consumption. The engagement and disengagement is controlled by the TCM to allow a certain amount of controlled 'slip'. This allows a small difference in the rotational speeds of the impeller and the turbine which results in improved shift quality. The lock-up clutch comprises a piston and a clutch friction plate.

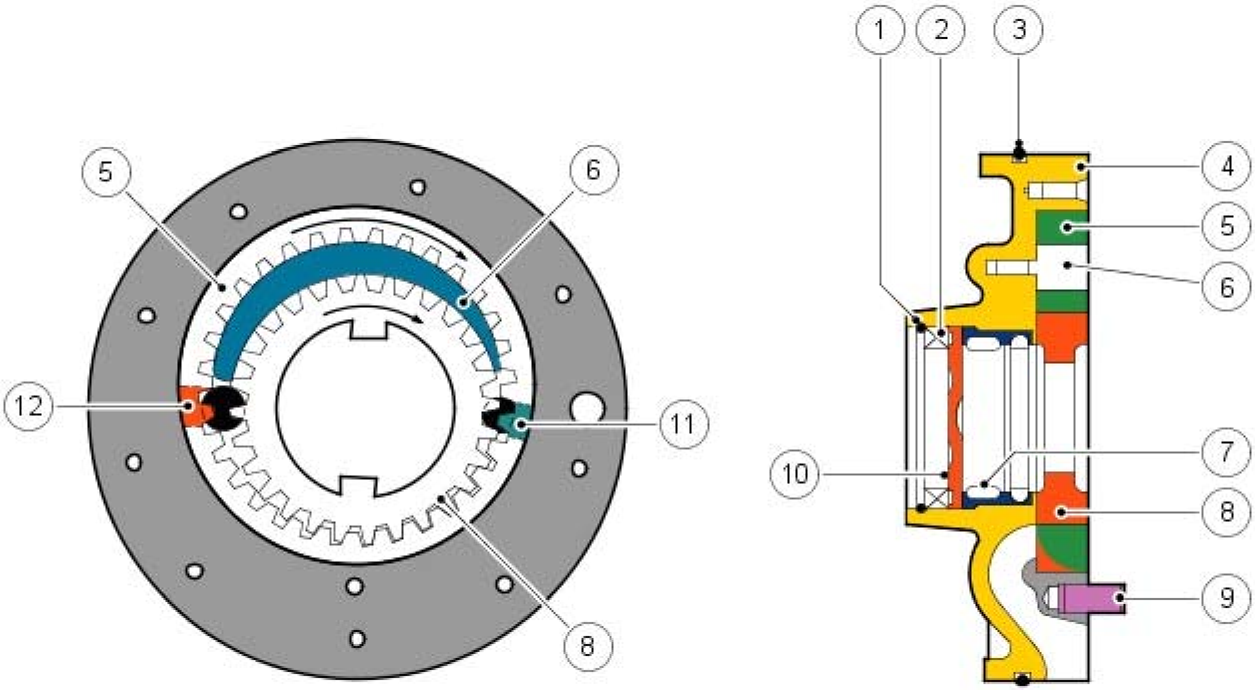
In the unlocked condition, the oil pressure supplied to the piston chamber and the turbine chamber is equal. Pressurised fluid flows through a drilling in the turbine shaft and through the piston chamber to the turbine chamber. In this condition the clutch plate is held away from the torque converter body and torque converter slip is permitted.

In the locked condition, the TCC spool valves are actuated by the electronic pressure regulating solenoid (EPRS6). The fluid flow in the unlocked condition is reversed and the piston chamber is vented. Pressurised fluid is directed into the turbine chamber and is applied to the clutch piston. The piston moves with the pressure and pushes the clutch plate against the torque converter body. As the pressure increases, the friction between the clutch plate and the body increases, finally resulting in full lock-up of the clutch plate with the body. In this condition there is direct mechanical drive from the engine crankshaft to the transmission planetary gear train.

FLUID PUMP

The fluid pump is an integral part of the transmission. The fluid pump is used to supply hydraulic pressure for the operation of the control valves and clutches, to pass the fluid through the transmission cooler and to lubricate the gears and shafts.

The 6HP26 fluid pump is a crescent type pump and is located between the intermediate plate and the torque converter. The pump has a delivery rate of 16cm^3 per revolution.



E42400

Item	Part Number	Description
1	-	Securing ring
2	-	Shaft oil seal
3	-	O-ring seal
4	-	Pump housing
5	-	Ring gear
6	-	Crescent spacer
7	-	Roller bearing
8	-	Impeller
9	-	Centring pin
10	-	Spring washer
11	-	Outlet port (high pressure)
12	-	Inlet port (low pressure)

The pump comprises a housing, a crescent spacer, an impeller and a ring gear. The housing has inlet and outlet ports to direct flow and is located in the intermediate plate by a centring pin. The pump action is achieved by the impeller, ring gear and crescent spacer.

The crescent spacer is fixed in its position by a pin and is located between the ring gear and the impeller. The impeller is driven by the torque converter hub which is located on a needle roller bearing in the pump housing. The impeller teeth mesh with those of the ring gear. When the impeller is rotated, the motion is transferred to the ring gear which rotates in the same direction.

The rotational motion of the ring gear and the impeller collects fluid from the intake port in the spaces between the teeth. When the teeth reach the crescent spacer, the oil is trapped in the spaces between the teeth and is carried with the rotation of the gears. The spacer tapers near the outlet port. This reduces the space between the gear teeth causing a build up of fluid pressure as the oil reaches the outlet port. When the teeth pass the end of the spacer the pressurised fluid is released into the outlet port.

The fluid emerging from the outlet port is passed through the fluid pressure control valve. At high operating speeds the pressure control valve maintains the output pressure to the gearbox at a predetermined maximum level. Excess fluid is relieved from the pressure control valve and is directed, via the main pressure valve in the valve block, back to the pump inlet port. This provides a pressurised feed to the pump inlet which prevents cavitation and reduces pump noise.

MECHATRONIC VALVE BLOCK

The Mechatronic valve block is located in the bottom of the transmission and is covered by the fluid pan. The valve block houses the TCM, electrical actuators, speed sensors and control valves which provide all electro-hydraulic control for all transmission functions. The Mechatronic valve block comprises the following components:

- TCM
- Six pressure regulator solenoids
- One shift control solenoid
- One damper
- Twenty one hydraulic spool valves
- Manually operated selector valve
- Temperature sensor
- Turbine speed sensor
- Output shaft speed sensor.

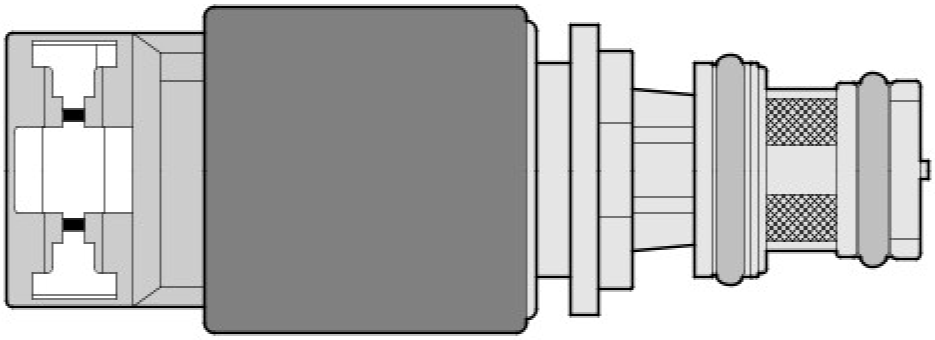
Electronic Pressure Regulator Solenoids (EPRS)



E42713

Six Electronic Pressure Regulator Solenoids (EPRS) are located in the valve block. The solenoids are controlled by Pulse Width Modulation (PWM) signals from the TCM. The solenoids convert the electrical signals into hydraulic control pressure proportional to the signal to actuate the spool valves for precise transmission operation.

The following table shows EPRS and their associated functions:

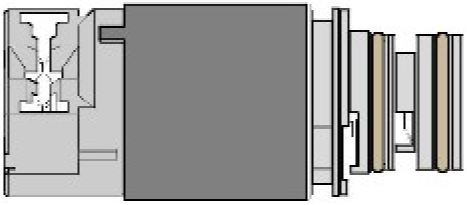
EPRS	Function
1	Clutch A
2	Clutch B
3	Clutch C
4	Brake clutches D and E
5	System pressure control
6	Torque converter lock-up control

Solenoids EPRS 1, 3 and 6 supply a lower control pressure as the signal amperage increases and can be identified by a black connector cap. The TCM operates the solenoids using PWM signals. The TCM monitors engine load and clutch slip and varies the solenoid duty cycle accordingly. The solenoids have a 12V operating voltage and a pressure range of 0 - 4.6 bar (0 - 67 lbf.in^2).

Solenoids EPRS 2, 4 and 5 supply a higher control pressure as the signal amperage increases and can be identified by a green connector cap. The solenoids are normally open, regulating flow solenoid valves. The TCM operates the solenoids using a PWM ground proportional to the required increasing or decreasing clutch pressures. The solenoids have a 12V operating voltage and a pressure range of 4.6 - 0 bar (67 - 0 lbf.in^2).

The resistance of the coil winding for the EPRS solenoids is 5.05 ohms at 20°C (68°F).

Control Solenoid



E42714

A shift control Solenoid Valve (SV) is located in the valve block. The solenoid is controlled by the TCM and converts electrical signals into hydraulic control signals to control clutch application.

The shift control solenoid is an open/closed, on/off solenoid which is controlled by the TCM switching the solenoid to ground. The

TCM also supplies power to the solenoid. The TCM energises the solenoid in a programmed sequence for clutch application for gear ratio changes and shift control.

The resistance of the solenoid coil winding within the solenoid valve is between 26 to 30.4 ohms at 20°C (68°F).

Sensors

Speed Sensors

The turbine speed sensor and the output shaft speed sensor are Hall effect type sensors located in the Mechatronic valve block and are not serviceable items. The TCM monitors the signals from each sensor to determine the input (turbine) speed and the output shaft speed.

The turbine speed is monitored by the TCM to calculate the slip of the torque converter clutch and internal clutch slip. This signal allows the TCM to accurately control the slip timing during shifts and adjust clutch application or release pressure for overlap shift control.

The output shaft speed is monitored by the TCM and compared to engine speed signals received on the CAN bus from the ECM. Using a comparison of the two signals the TCM calculates the transmission slip ratio for plausibility and maintains adaptive pressure control.

Temperature Sensor

The temperature sensor is also located in the Mechatronic valve block. The TCM uses the temperature sensor signals to determine the temperature of the transmission fluid. These signals are used by the TCM to control the transmission operation to promote faster warm-up in cold conditions or to assist with fluid cooling by controlling the transmission operation when high fluid temperatures are experienced. If the sensor fails, the TCM will use a default value and a fault code will be stored in the TCM.

Damper

There is one damper located in the valve housing. The damper is used to regulate and dampen the regulated pressure supplied via EPRS 5. The damper is load dependent through modulation of the damper against return spring pressure.

The damper comprises a piston, a housing bore and a spring. The piston is subject to the pressure applied by the spring. The bore has a connecting port to the function to which it applies. Fluid pressure applied to the applicable component (i.e. a clutch) is also subjected to the full area of the piston, which moves against the opposing force applied by the spring. The movement of the piston creates an action similar to a shock absorber, momentarily delaying the build up of pressure in the circuit. This results in a more gradual application of clutches improving shift quality.

Spool Valves

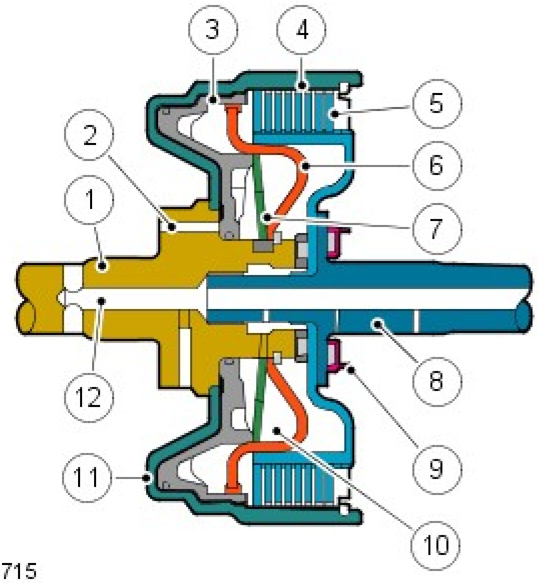
The valve block contains twenty one spool valves which control various functions of the transmission. The spool valves are of conventional design and are operated by fluid pressure.

Each spool valve is located in its spool bore and held in a default (unpressurised) position by a spring. The spool bore has a number of ports which allow fluid to flow to other valves and clutches to enable transmission operation. Each spool has a piston which is waisted to allow fluid to be diverted into the applicable ports when the valve is operated.

When fluid pressure moves a spool, one or more ports in the spool bore are covered or uncovered. Fluid is prevented from flowing or is allowed to flow around the applicable waisted area of the spool and into another uncovered port. The fluid is either passed through galleries to actuate another spool, operate a clutch or is returned to the fluid pan.

DRIVE CLUTCHES

Multiplate Drive or Brake Clutch – Typical



E42715

Item	Part Number	Description
1	-	Input shaft
2	-	Main pressure supply port
3	-	Piston
4	-	Cylinder – External plate carrier
5	-	Clutch plate assembly
6	-	Baffle plate
7	-	Diaphragm spring
8	-	Output shaft
9	-	Bearing
10	-	Dynamic pressure equalisation chamber
11	-	Piston chamber
12	-	Lubrication channel

There are three drive clutches and two brake clutches used in the 6HP26 transmission. Each clutch comprises one or more friction plates dependent on the output controlled. A typical clutch consists of a number of steel outer plates and inner plates with friction material bonded to each face.

The clutch plates are held apart mechanically by a diaphragm spring and hydraulically by dynamic pressure. The pressure is derived from a lubrication channel which supplies fluid to the bearings etc. The fluid is passed via a drilling in the output shaft into the chamber between the baffle plate and the piston. To prevent inadvertent clutch application due to pressure build up produced by centrifugal force, the fluid in the dynamic pressure equalisation chamber overcomes any pressure in the piston chamber and holds the piston off the clutch plate assembly.

When clutch application is required, main pressure from the fluid pump is applied to the piston chamber from the supply port. This main pressure overcomes the low pressure fluid present in the dynamic pressure equalisation chamber. The piston moves, against the pressure applied by the diaphragm spring, and compresses the clutch plate assembly. When the main pressure falls, the diaphragm spring pushes the piston away from the clutch plate assembly, disengaging the clutch.

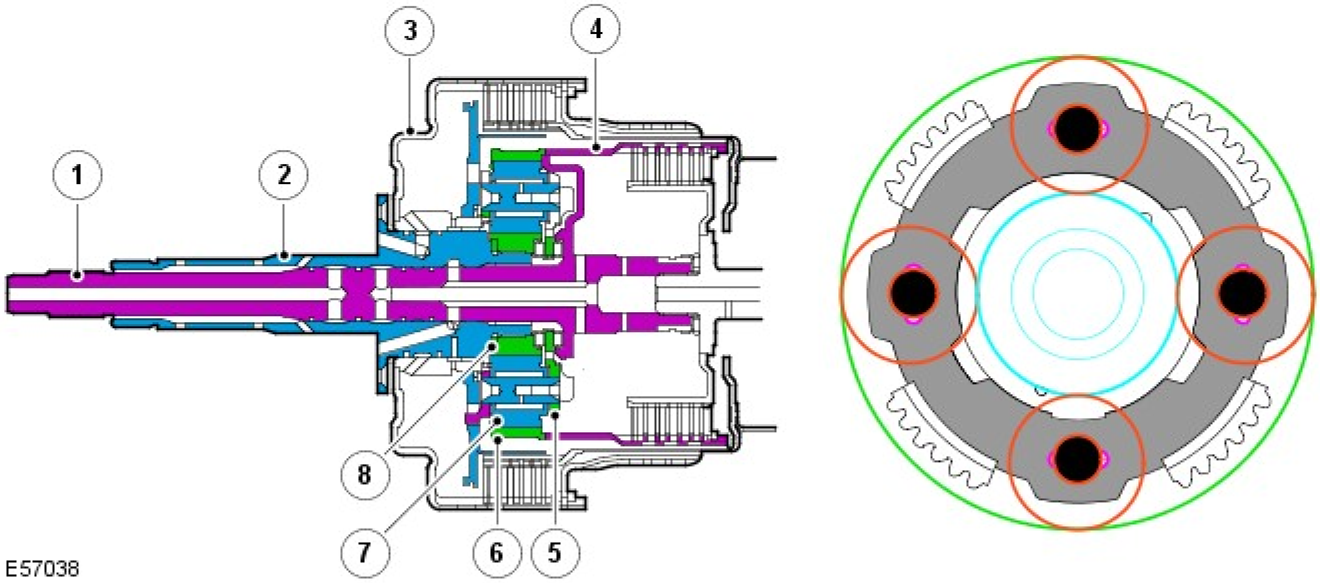
PLANETARY GEAR TRAINS

The planetary gear trains used on the 6HP26 transmission comprise a single web planetary gear train and a double web planetary gear train. These gear trains are known as Lepelletier type gear trains and together produce the six forward gears and the one reverse gear.

Single Web Planetary Gear Train

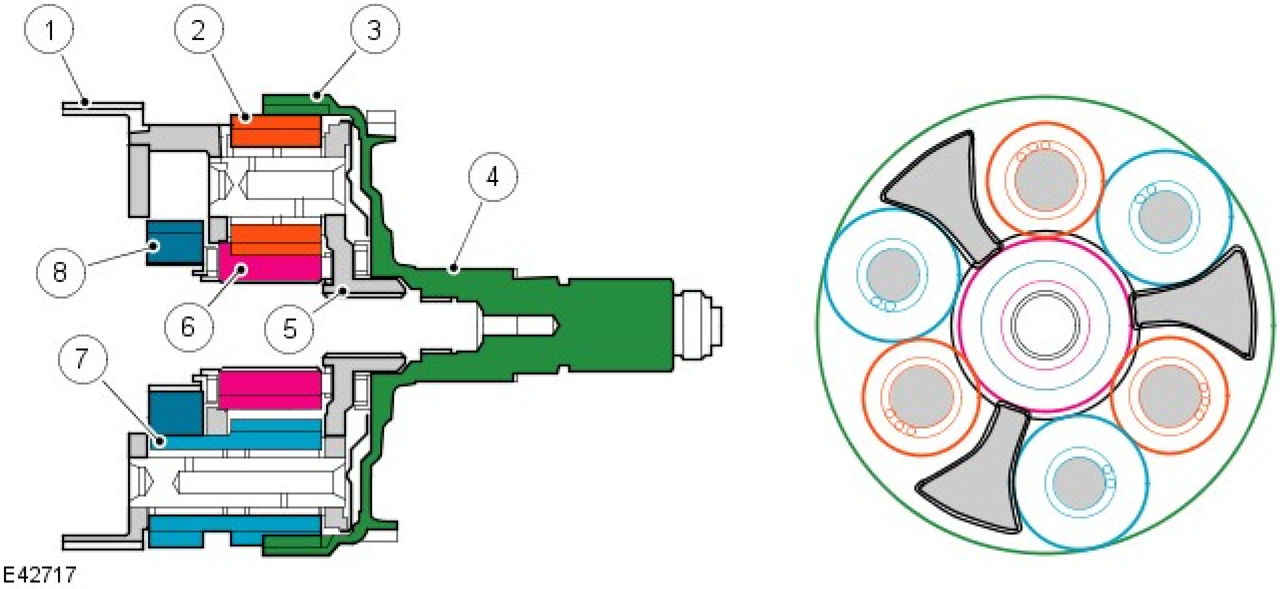
The single web planetary gear train comprises:

- One sunwheel
- Four planetary gears
- One planetary gear carrier (spider)
- One ring gear or annulus



Item	Part Number	Description
1	-	Torque converter input shaft
2	-	Stator shaft
3	-	Multi-disc clutch A
4	-	Multi-disc clutch E
5	-	Planetary gear carrier
6	-	Ring gear 1
7	-	Planetary gear
8	-	Sunwheel 1

Double Web Planetary Gear Train



Item	Part Number	Description
1	-	Planetary gear spider
2	-	Planetary gears (short)
3	-	Ring gear
4	-	Output shaft
5	-	Planetary gear carrier
6	-	Sunwheel
7	-	Double planetary gears (long)
8	-	Sunwheel

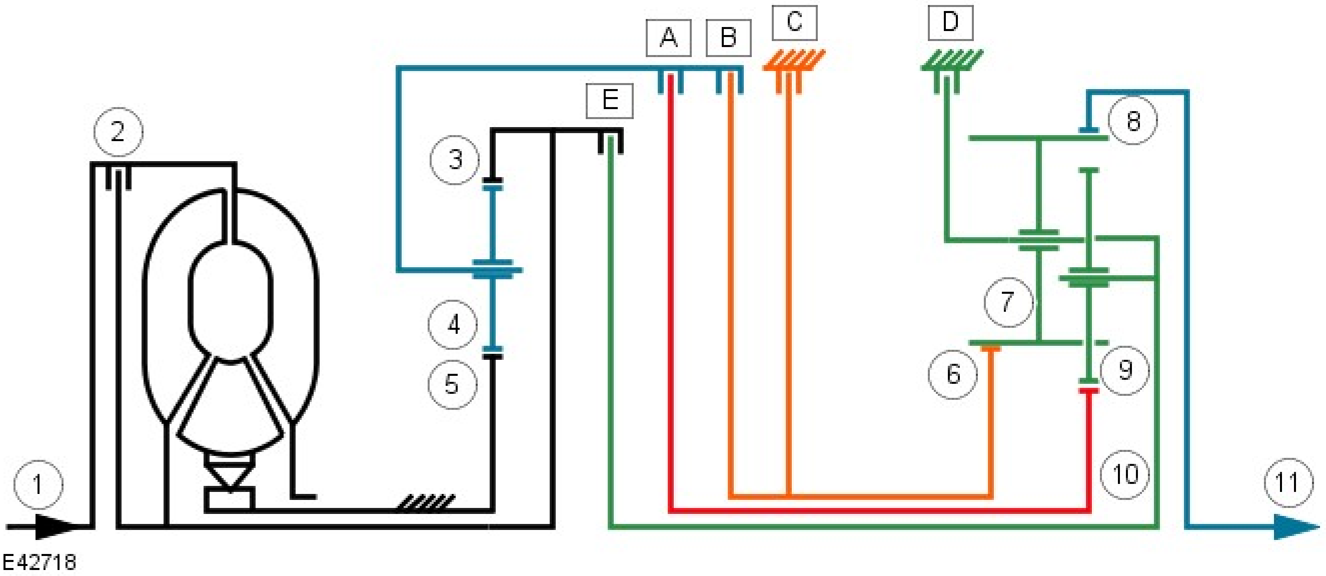
The double planetary gear train comprises:

- Two sunwheels
- Three short planetary gears
- Three long planetary gears
- One planetary gear carrier
- One ring gear or annulus

POWER FLOWS

Operation of the transmission is controlled by the TCM which electrically activates various solenoids to control the transmission gear selection. The sequence of solenoid activation is based on programmed information in the module memory and physical transmission operating conditions such as vehicle speed, throttle position, engine load and selector lever position.

Powerflow Schematic



Item	Part Number	Description
1	-	Torque input from engine
2	-	Torque converter lock-up clutch
3	-	Single web planetary gear carrier
4	-	Single web planetary gears
5	-	Single web sunwheel 1
6	-	Double web sunwheel 2

11	-	Torque output from transmission
A	-	Multiplate clutch
B	-	Multiplate clutch
C	-	Multiplate brake
D	-	Multiplate brake
E	-	Multiplate clutch

Engine torque is transferred, via operation of single or combinations of clutches to the two planetary gear trains. Both gear trains are controlled by reactionary inputs from brake clutches to produce the six forward gears and one reverse gear. The ratios are as follows:

Gear	1st	2nd	3rd	4th	5th	6th	Reverse
Ratio	4.171	2.340	1.521	1.143	0.867	0.691	3.403

The following table shows which solenoids are activated to produce the required torque output from the transmission.

Gear Selector Lever Position	Shift Control Solenoid Valve	Electronic Pressure Regulator Solenoids (EPRS)					
		1	2	3	4	5	6
P					ON	-ON-	
R			ON		ON	-ON-	
N					ON	-ON-

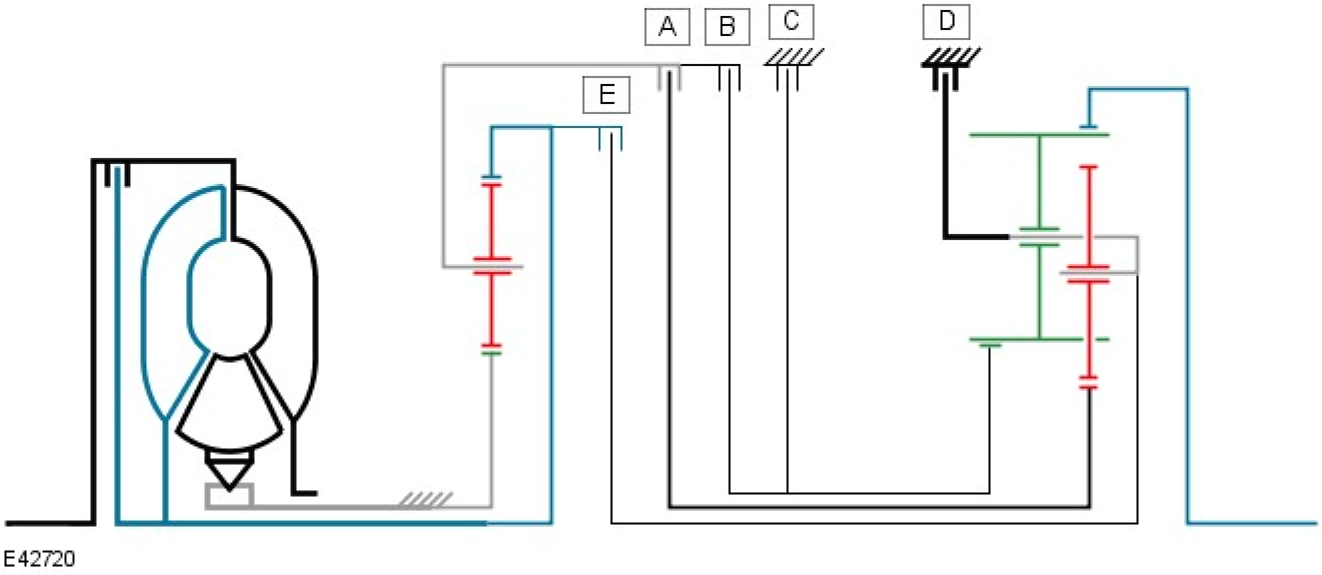
13	-	Planetary gears - Long

14	-	Ring gear 2
15	-	Sunwheel 2
16	-	Sunwheel 3
17	-	Double web planetary gear carrier
18	-	Planetary gears - short
19	-	Single web planetary gear carrier
20	-	Sunwheel 1

The shift elements are three rotating multiplate clutches (A, B and E) and two fixed multiplate brakes © and D). All shifts from 1st to 6th gears are power-on overlapping shifts. Overlapping shifts can be described as one of the clutches continuing to transmit drive at a lower main pressure until the next required clutch is able to accept the input torque.

The shift elements, clutches and brakes are actuated hydraulically. Fluid pressure is applied to the required clutch and/or brake, pressing the plates together and allowing drive to be transmitted through the plates. The purpose of the shift elements is to perform power-on shifts with no interruption to traction and smooth transition between gear ratios.

Power Flow 1st Gear



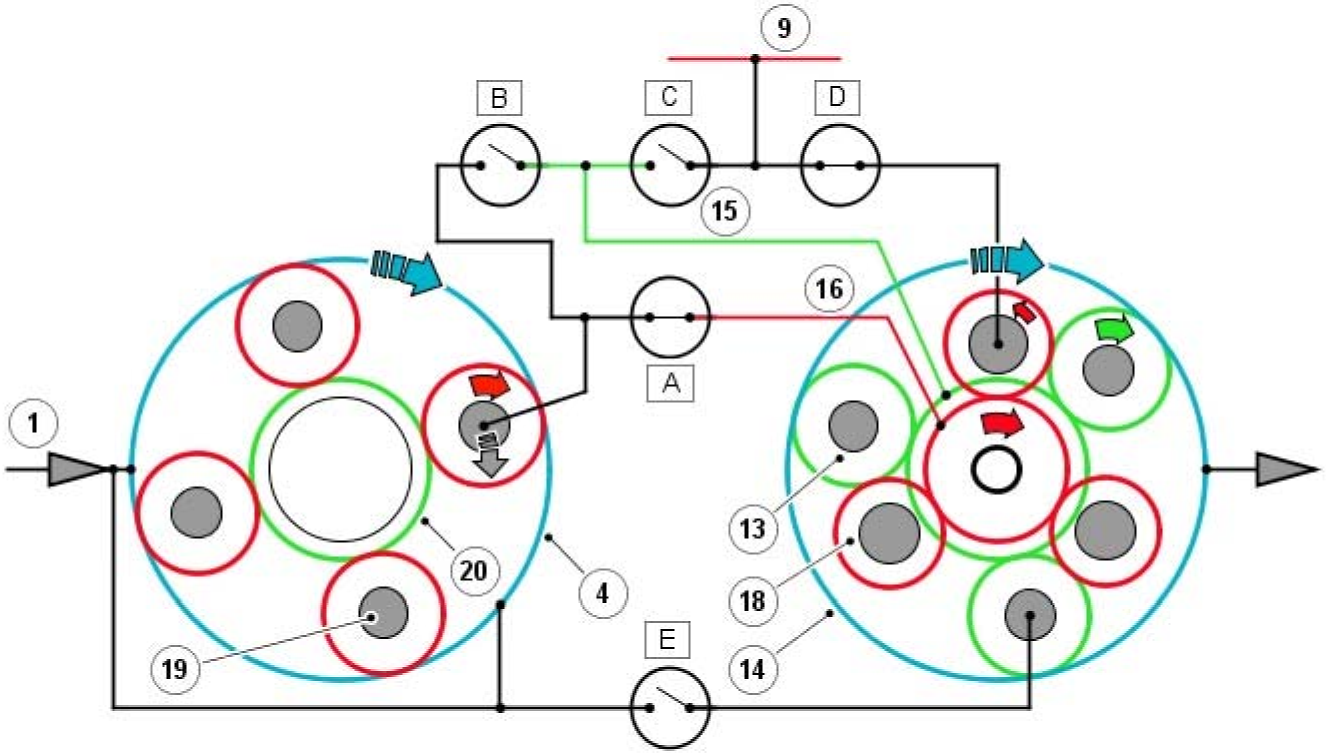
The gear selector lever and the manual selector valve spool are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

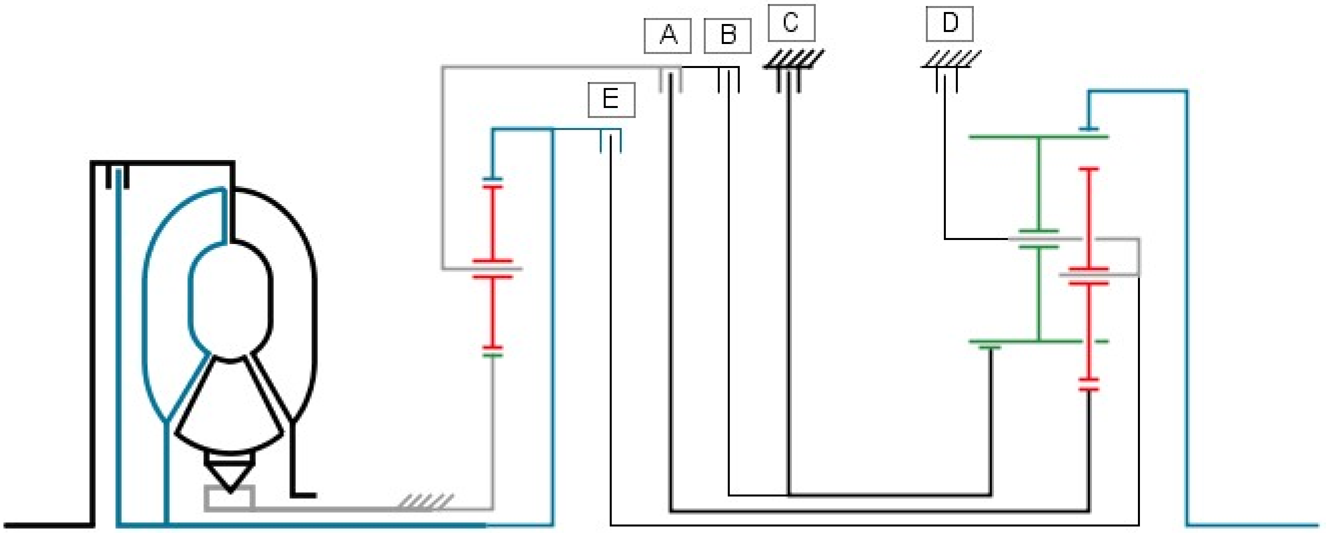
The double web planetary gear train is locked against the transmission housing by brake 'D'. This allows ring gear 2 (output shaft) to be driven in the same direction as the engine via the long planetary gears.

- NOTE: Refer to 'Shift Elements' illustration for key



E56815

Power Flow 2nd Gear



E42722

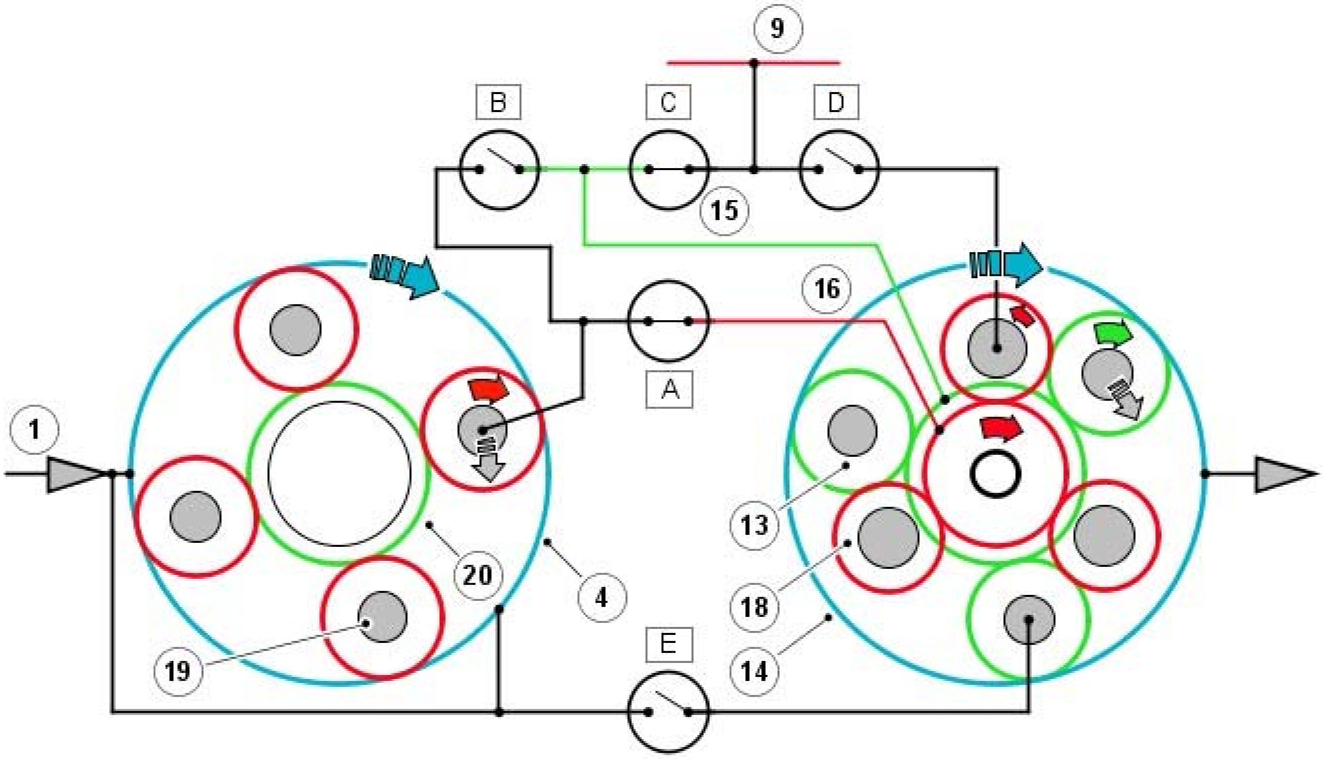
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

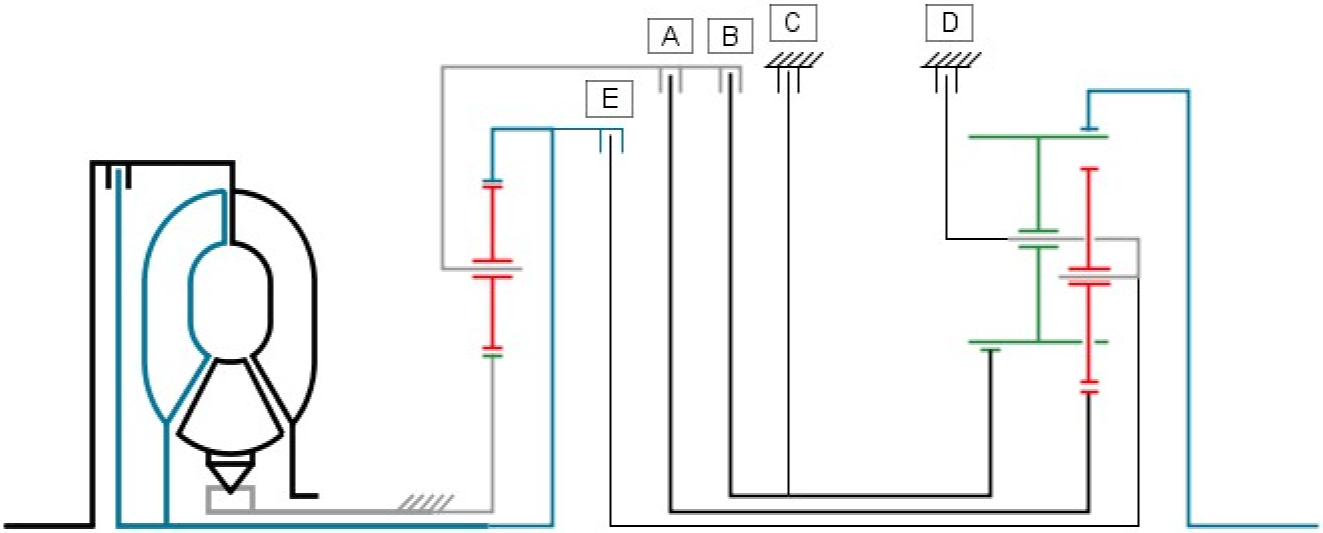
Sunwheel 2 is locked to the transmission housing by brake clutch 'C'. The long planetary gears, which are also meshed with the short planetary gears, roll around the fixed sunwheel 2 and transmit drive to the double web planetary gear train carrier and ring gear 2 in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E56816

Power Flow 3rd Gear



E42724

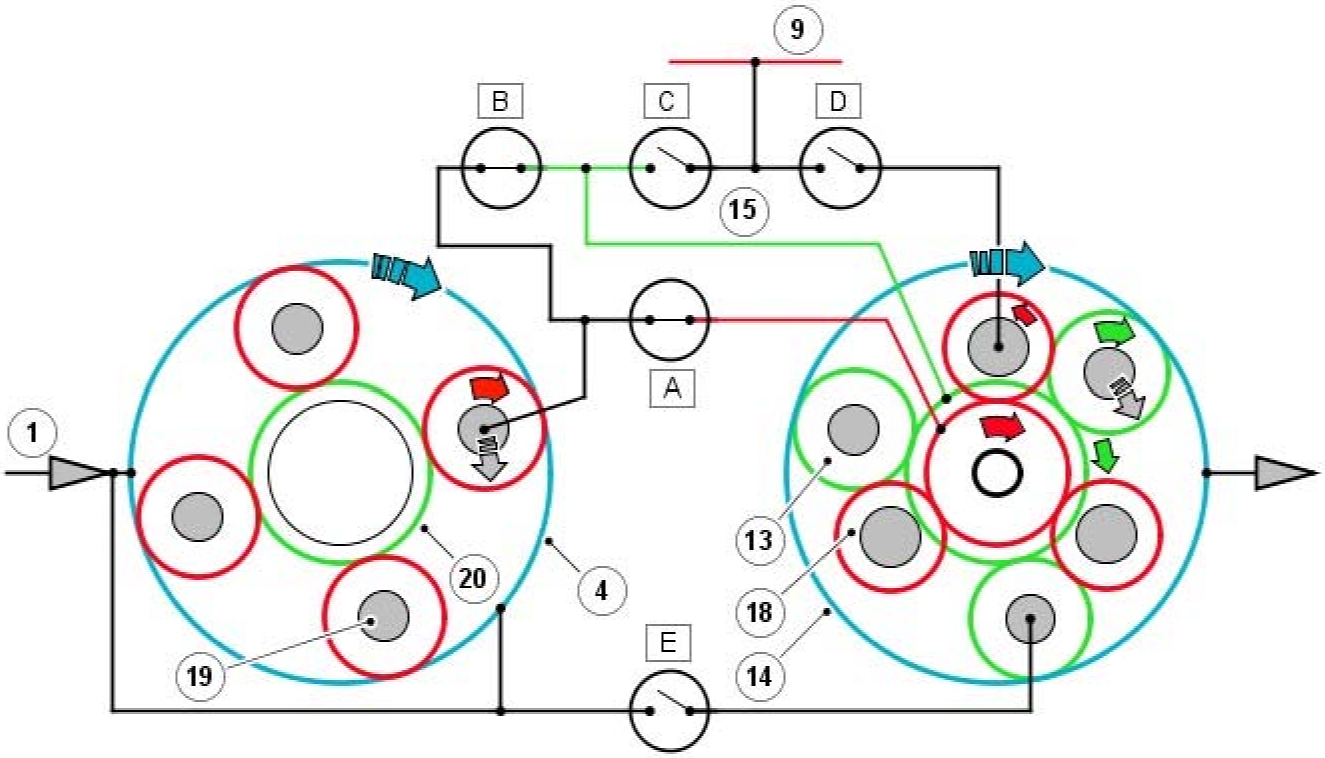
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

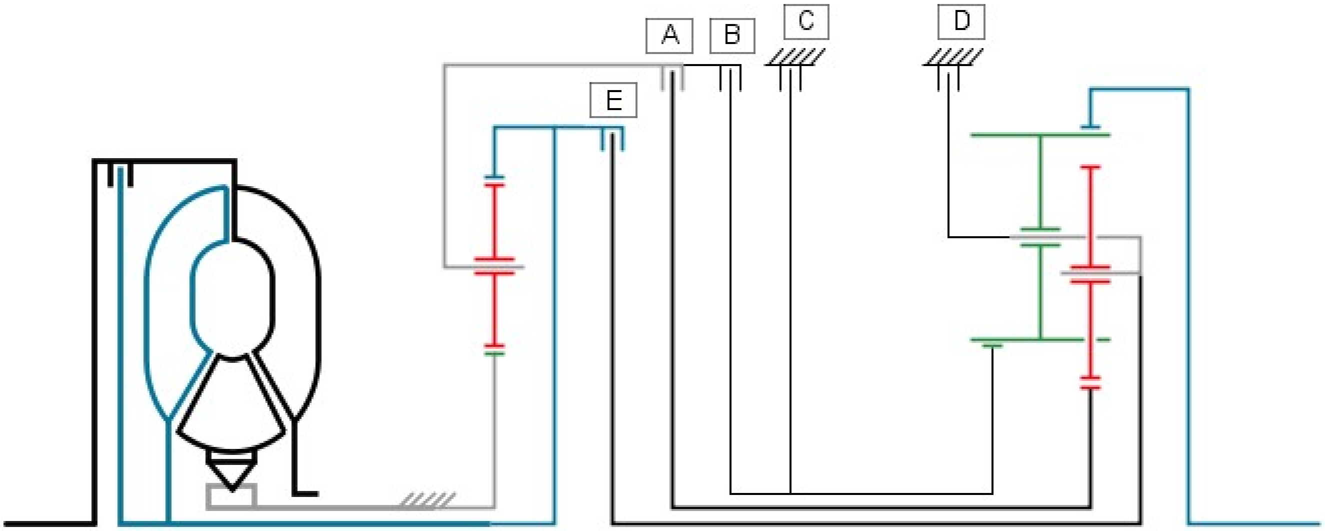
Sunwheel 2 is driven via clutch 'B' which is engaged. The long planetary gears, which are also meshed with the short planetary gears, cannot roll around the fixed sunwheel 2 and transmit drive to the locked double web planetary gear train carrier in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E56817

Power Flow 4th Gear



E42726

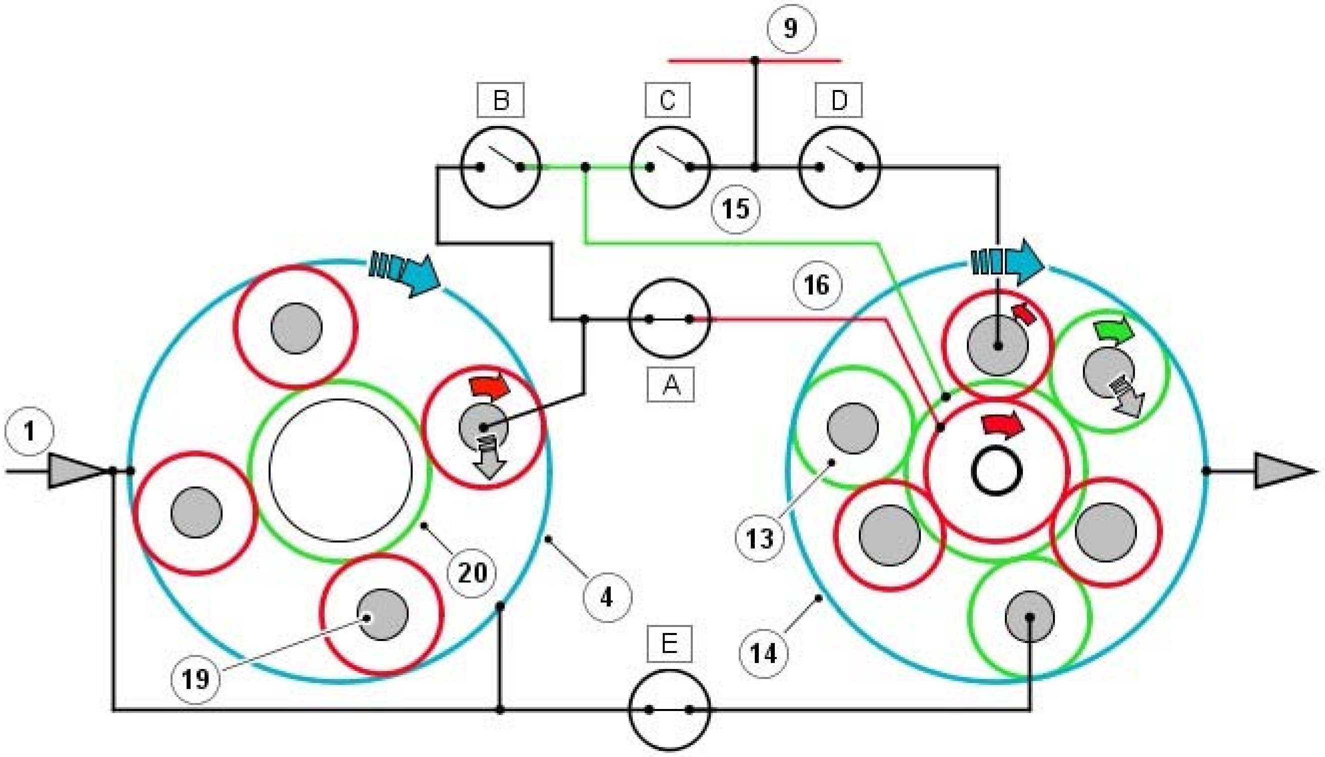
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

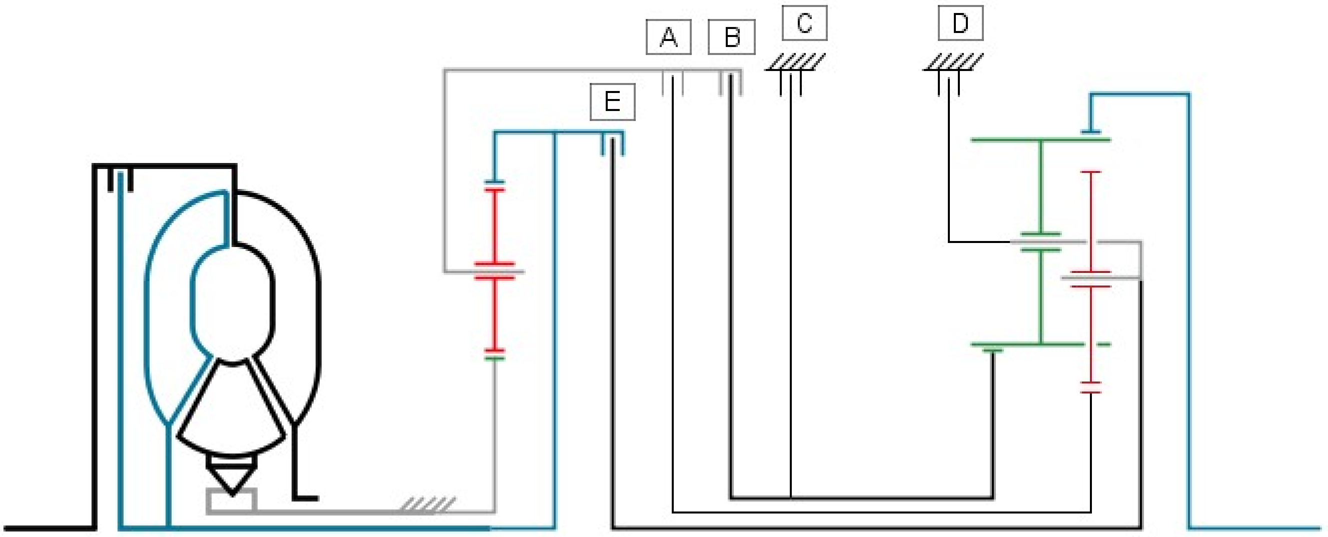
The double web planetary gear carrier is driven via clutch 'E' which is engaged. The long planetary gears, which are also meshed with the short planetary gears, and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E56818

Power Flow 5th Gear



E42728

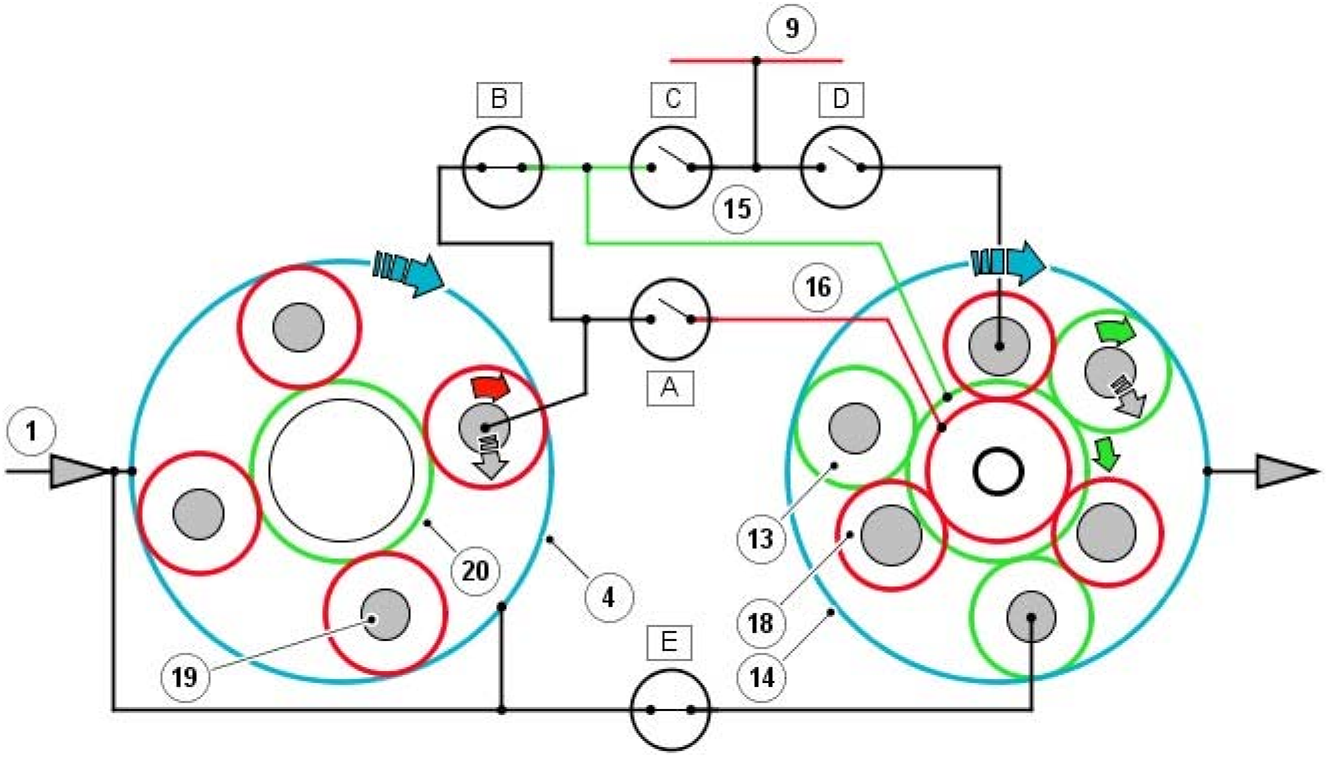
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

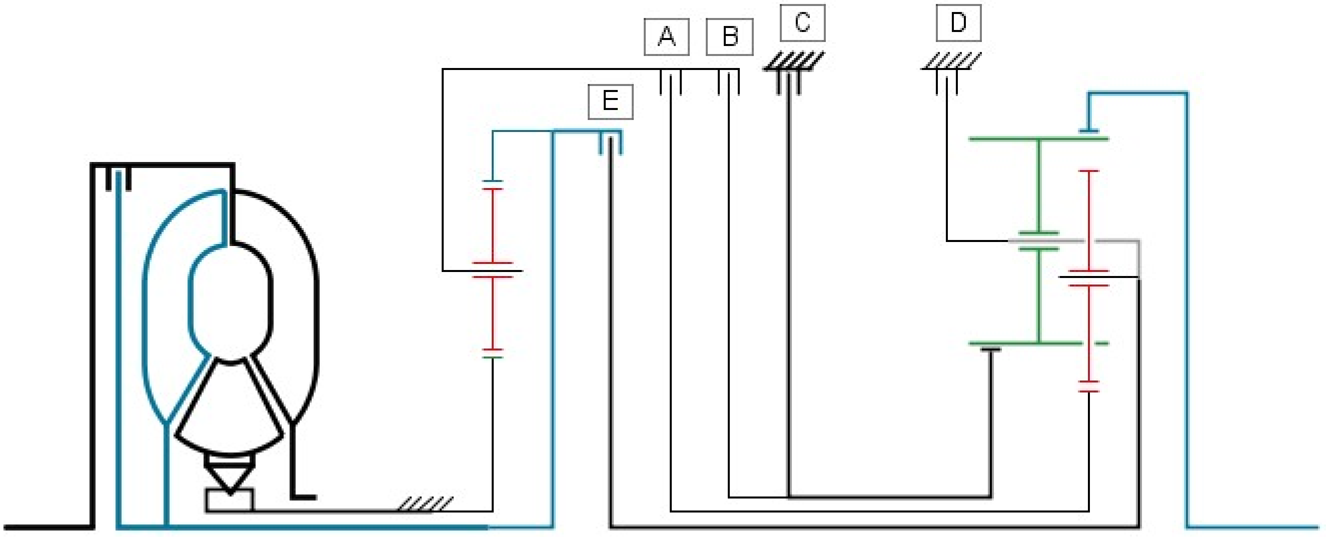
The long planetary gears, which are also meshed with the short planetary gears, and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E56819

Power Flow 6th Gear



E42730

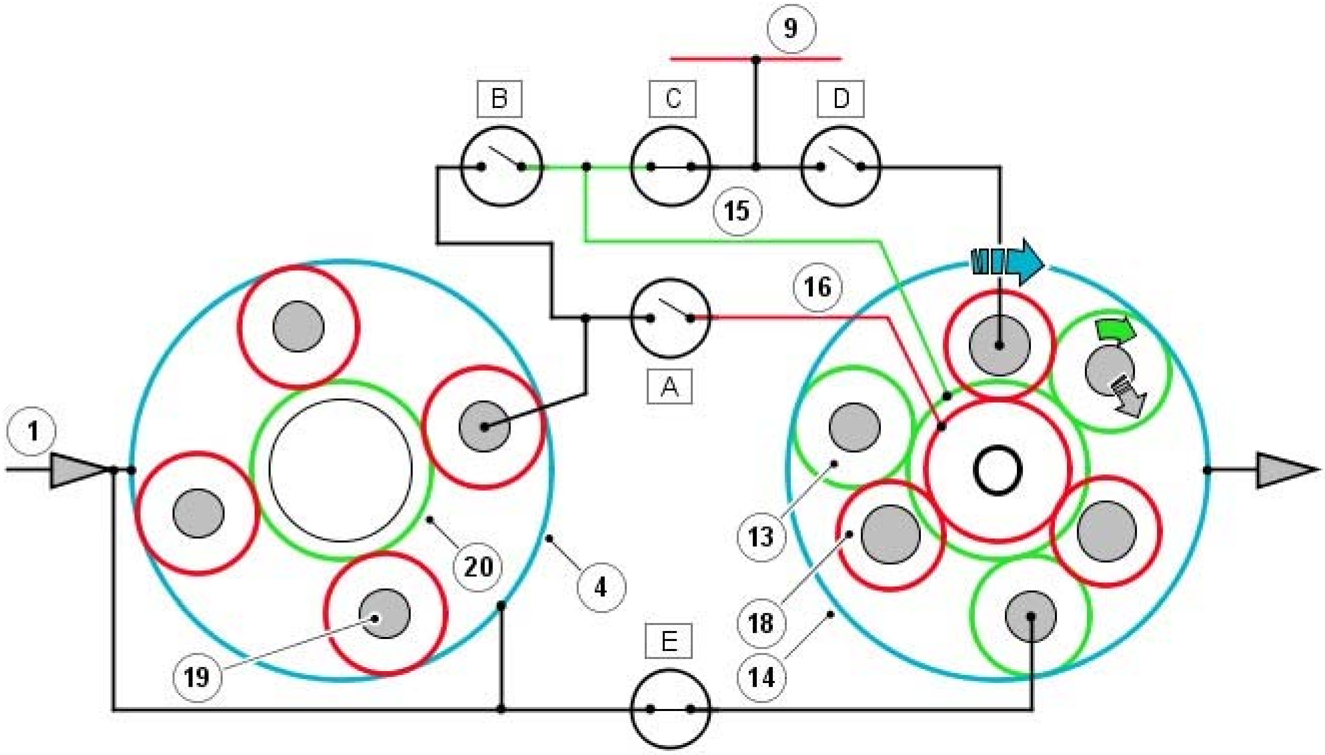
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Clutches 'A' and 'B' are released, removing the effect of the single web planetary gear train.

Clutch brake 'C' is applied which locks sunwheel 2 to the transmission housing.

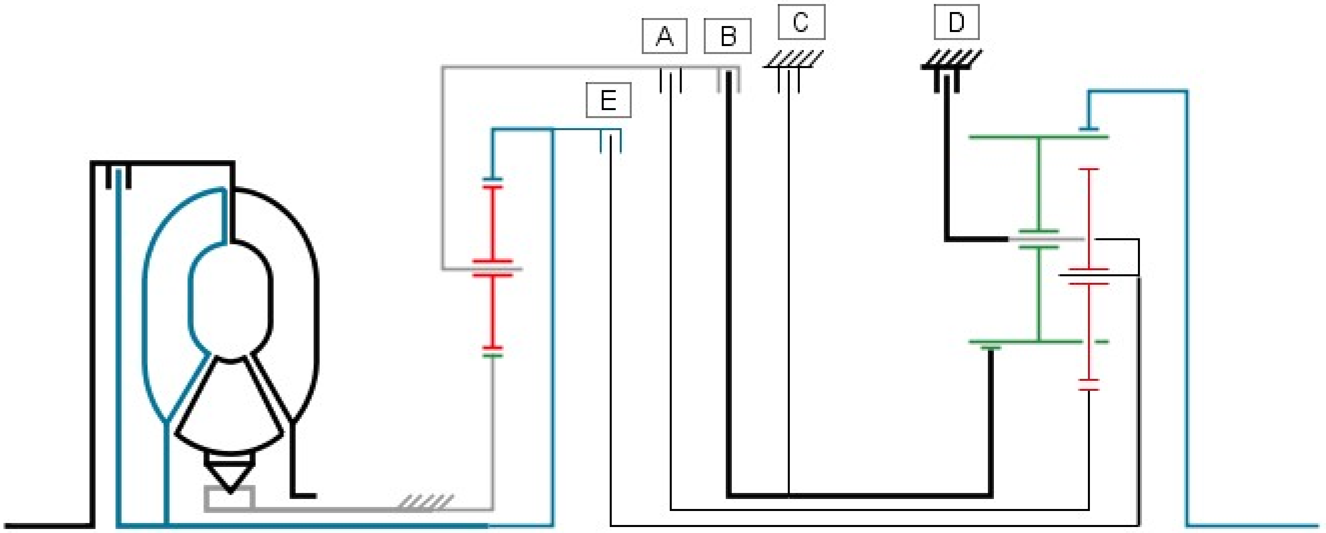
Clutch 'E' is engaged and drives the double web planetary gear carrier. This causes the long planetary gears to rotate around the fixed sunwheel 2 and transmit drive to ring gear 2 which is driven in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E56820

Power Flow Reverse Gear



E42732

The gear selector lever and the manual selector spool valve are in the 'R' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears of the single web planetary gear train which rotate around the fixed sunwheel 1. This transmits the drive to the single web planetary gear carrier, the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

With clutch 'B' applied, sunwheel 2 in the double web planetary gear train is driven and meshes with the long planetary gears.

The double web planetary gear carrier is locked to the transmission housing by brake clutch 'D'. This allows ring gear 2 to be driven in the opposite direction to engine rotation by the long planetary gears.

- NOTE: Refer to 'Shift Elements' illustration for key

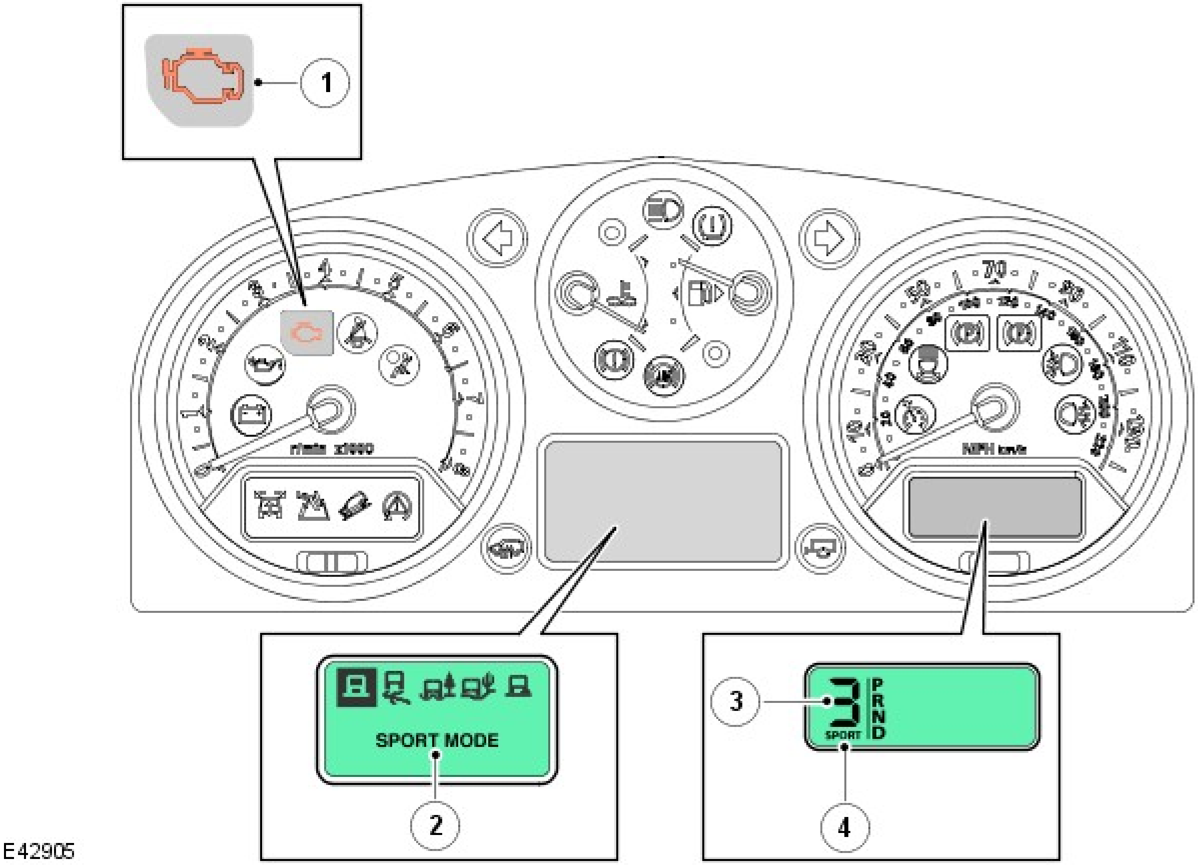
15	-	Starter relay

SELECTOR POSITION SWITCH

The Mechatronic valve block contains a position switch which is mechanically connected to the selector spool valve. The selector spool valve is connected by a selector shaft to the selector lever via a 'Bowden' selector cable.

The signals from the position switch are used by the TCM to determine the P, R, N or D selection made by the driver.

INSTRUMENT CLUSTER



Item	Part Number	Description
1	-	Malfunction Indicator Lamp (MIL)
2	-	Message centre
3	-	Selector lever position indicator
4	-	Mode display

The instrument cluster is connected to the TCM via the high speed CAN bus. Transmission status is transmitted by the TCM and displayed to the driver in one of two displays in the instrument cluster.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

Malfunction Indicator Lamp (MIL)

The MIL is located in the tachometer in the instrument cluster. Transmission related faults which may affect the vehicle emissions output will illuminate the MIL.

The MIL is illuminated by the ECM on receipt of a relevant fault message from the TCM on the high speed CAN. The nature of the fault can be diagnosed using a Land Rover approved diagnostic system which reads the fault codes stored in the TCM memory.

Transmission Status Display

The transmission status display is located in a Liquid Crystal Display (LCD) within the speedometer housing. The LCD shows the selector lever position and the selected transmission mode. When the selector lever is in the manual CommandShift™ position, the selector lever position display will show the selected gear ratio.

The following table shows the displays and their descriptions.

Symbol	Description
P	Park selected
R	Reverse selected
N	Neutral selected
D	Drive selected
1	1st gear selected (Manual CommandShift™ mode)
2	2nd gear selected (Manual CommandShift™ mode)
3	3rd gear selected (Manual CommandShift™ mode)
4	4th gear selected (Manual CommandShift™ mode)
5	5th gear selected (Manual CommandShift™ mode)
6	6th gear selected (Manual CommandShift™ mode)

Message Centre Display

The message centre is located in the lower centre of the instrument cluster. The message centre is a LCD to relay vehicle status and operating information to the driver. The message centre can display messages relating to a number of the vehicle systems. The following list shows the possible transmission related messages:

- TRANSMISSION FAULT LIMITED GEARS AVAILABLE
- TRANSMISSION FAULT AND OVERHEAT
- TRANSMISSION FAULT
- TRANSMISSION OVERHEAT

TRANSMISSION CONTROL MODULE (TCM)

The TCM is an integral part of the Mechatronic valve block which is located at the bottom of the transmission, within the fluid pan. The TCM is the main controlling component of the transmission.

The TCM processes signals from the transmission speed and temperature sensors, engine control module and other vehicle systems. From the received signal inputs and pre-programmed data, the module calculates the correct gear, torque converter clutch setting and optimum pressure settings for gear shift and lock-up clutch control.

The TCM outputs signals to control the shift control solenoid valve and the Electronic Pressure Regulator Solenoids (EPRS) to control the hydraulic operation of the transmission.

The ECM supplies the engine management data on the high speed CAN bus system. The TCM requires engine data to efficiently control the transmission operation, for example; flywheel torque, engine speed, accelerator pedal angle, engine temperature etc.

The steering angle sensor and the ABS module also supply data to the TCM on the high speed CAN bus system. The TCM uses data from these systems to suspend gear changes when the vehicle is cornering and/or the ABS module is controlling braking or traction control.

The selector lever is connected to the automatic transmission and the position switch in the transmission by a Bowden cable. Movement of the selector lever moves the position switch via the Bowden cable and the switch position informs the TCM of the selected position. The sport/manual +/- CommandShift switch passes manual/sport selections to the TCM. An additional switch provides a selector lever in park position signal. Once the selector lever position is confirmed, the TCM outputs appropriate information which is received by the instrument cluster to display the gear selection information in the message centre.

The Mechatronic valve block also contains the speed and temperature sensors. These are integral with the Mechatronic valve block and cannot be serviced individually. The speed sensors measure the transmission input and output speeds and pass signals to the TCM. The fluid temperature sensor is also located in the valve block and measures the fluid temperature of the transmission fluid in the fluid pan.

The TCM is connected to the starter relay coil. When the selector lever is in PARK or NEUTRAL, the module provides a ground for the coil allowing the starter relay to be energised and allow starter motor operation. If the selector lever is in any other position, the module will not provide the ground preventing starter motor operation.

DIAGNOSTICS

The diagnostic socket is located in the lower instrument panel closing panel, on the driver's side, below the steering column.

The diagnostic socket allows the exchange of information between the various modules on the bus systems and a Land Rover approved diagnostic system or a diagnostic tool using ISO14229 protocol. The information is communicated to the socket via the high speed CAN bus from the TCM. This allows the retrieval of diagnostic information and programming of certain functions using a Land Rover approved diagnostic system or a suitable diagnostic tool.

CONTROLLER AREA NETWORK (CAN)

The high speed CAN broadcast bus network is used to connect the powertrain modules. The CAN bus is connected between the following electronic units:

High Speed CAN Bus

- TCM
- Instrument cluster
- Air suspension module
- Steering angle sensor
- Rear differential module
- Centre console switch pack
- Electric park brake module
- Restraints control module
- Engine Control Module (ECM)
- ABS module
- Adaptive front lighting control module
- Transfer box control module
- Adaptive cruise control module
- Diagnostic socket.

The CAN bus allows a fast exchange of data between modules. The CAN bus comprises two wires which are identified as CAN high (H) and CAN low (L). The two wires are coloured yellow/black (H) and yellow/brown (L) and are twisted together to minimise electromagnetic interference (noise) produced by the CAN bus messages.
For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

In the event of CAN bus failure, the following symptoms may be observed:

- Transmission operates in default mode
- Torque converter lock-up clutch control is disabled
- Gear position indication in instrument cluster message centre inoperative (this will also occur with any transmission fault).

DRIVING MODES

There are a number of different driving modes of operation. Some can be selected by the driver and some are automatically initiated by the TCM during driving:

- Normal mode
- Sport mode
- Manual (CommandShift™) mode
- Adaptive Shift Strategy (ASIS)
- Hill Descent Control (HDC) mode
- Cruise mode
- Hill mode
- Default (Limp home) mode
- Reverse lock-out mode
- Cooling strategy.
- Curve recognition mode
- Fast off recognition

Normal Mode

Normal mode is automatically selected by the TCM on power up. In this mode all automatic and adaptive modes are active. Normal mode uses gear shift and lock-up maps to allow for vehicle operation which offers fuel consumption and emissions or driveability depending on the driving style. If the transmission is operated in sport or manual mode and the selector lever is moved to the 'D' position, normal mode is automatically resumed.

Sport Mode

Sport mode operates in high range only and provides enhanced acceleration and responsiveness. In sport mode the TCM uses shift maps which allow the transmission to downshift more readily, hold gears for longer at higher engine speeds, and limits the transmission to the first five gears (6th gear is not used).

Sport mode is selected by moving the selector lever to the left into the 'M/S' position. When the sport mode is first selected, 'SPORT' is displayed in the message centre for 6 seconds and, if 6th gear is currently engaged, the TCM downshifts to 5th.

Manual (CommandShift™) Mode

Manual mode allows the transmission to operate as a semi-automatic 'CommandShift™' unit. The driver can change up and down the six forward gears with the freedom of a manual transmission.

Shift maps are provided for manual mode to protect the engine at high engine speeds. The TCM will automatically change up to a higher gear ratio to prevent engine overspeed and change down to a lower gear ratio to avoid engine labouring and stalling.

When kickdown is requested the TCM downshifts at least 2 gears.

When the vehicle is stationary, to drive off the driver can select 1st , 2nd or 3rd gear in low and high range. Any other gear selection will be rejected by the TCM.

When driving off, upshifts can be pre-selected by making + selections with the selector lever for the number of upshifts required. The TCM then automatically performs a corresponding number of upshifts when the appropriate shift points are reached. So, for example, when starting off in 1st gear, if three + selections are made in quick succession, the TCM will automatically change up through the box to 4th gear as the vehicle accelerates, without any further selections being made.

In manual mode a low gear can be selected to provide engine braking for descending a slope without HDC or continuous use of the brake pedal. The driver can prepare for the end of the descent by moving the selector lever to D. The TCM will maintain the low gear and only revert to automatic shift control when the throttle is opened and vehicle speed increases.

Adaptive Shift Strategy (ASIS)

The ASIS system is a new feature on automatic transmissions. With the TCM linked via the CAN bus to other vehicle systems, signals are received which can allow the TCM to calculate the way in which the vehicle is being driven. The type of signals include the following:

- Longitudinal and lateral acceleration
- Engine speed
- Engine torque
- Oil temperature
- Accelerator pedal position
- Wheel speed.

Using these signals, additional transmission control can be obtained. The TCM can calculate when the vehicle is cornering, all wheels are gripping, the driver is braking or if the driver is accelerating. This is the conventional 'Adaptive' transmission control. ASIS uses this system but adds the continuous adaptation of the gear changes to the individual driving style of the driver.

HDC Mode

The HDC mode assists the ABS module in controlling the downhill speed of the vehicle. When HDC is selected on, the ABS module selects the most appropriate gear for the descent, to maximise engine braking.

Cruise Mode

When speed control is activated, the TCM receives a cruise active message on the CAN bus. The TCM activates a speed control map which prevents locking and unlocking of the torque converter clutch and minimises up and down shifts.

Hill Mode

Hill mode is initiated by the TCM when the engine torque, via ECM signals on the CAN bus, exceeds the theoretical load curve for normal operation. The TCM monitors this signal to determine when the vehicle is travelling up or down a steep gradient.

In hill mode the TCM adopts one of four shift maps, three uphill and one downhill. The shift map chosen depends on the severity of the slope as determined from the engine signals and the appropriate gear is selected to assist with the ascent or descent.

Hill mode can also be initiated when the vehicle is at very high altitudes or ambient temperatures, and also when the vehicle is towing.

Default (Limp Home) Mode

If a transmission fault is detected by the TCM, the TCM adopts a limp home mode strategy. 'TRANS. FAILSAFE' is displayed in the message centre and, if the fault has an effect on engine emissions, the MIL will also be illuminated.

In default mode, P, R and N functions operate normally (if the fault allows these selections) and the TCM locks the transmission in 3rd or 5th gear to allow the driver to take the vehicle to the nearest dealer. The torque converter lock-up clutch is disabled and reverse lock-out will not function.

If the vehicle is stopped and subsequently restarted in the default mode condition, the TCM operates normally until the fault which caused the condition is detected again.

When limp home mode is active, the gear position indicator will show one of the following letters which defines the fault type:

- 'F' - transmission is operating in limp home mode
- 'H' - transmission has reached overheat threshold temperature and transmission is operating in limp home mode
- 'E' - CAN bus is off and transmission is operating in limp home mode.

If electrical power is lost and the transmission is operating in mechanical limp home mode, the selector lever will not be locked in the 'N' position by the shift interlock solenoid. The lever will be locked in the 'P' position and can only be released by using the interlock emergency release lever or by correcting the electrical fault.

Reverse Lock-Out Mode

When the vehicle is travelling forwards, selecting reverse could cause transmission damage. To protect against this, reverse gear is prohibited if the vehicle is travelling forwards at a road speed of 5 mph (8 km/h) or higher.

Cooling Strategy

The purpose of the cooling strategy is to reduce engine and transmission temperatures during high load conditions, when towing a trailer for example. Under these conditions the engine and transmission may generate excessive heat.

If the transmission fluid temperature increases to 125ºC (257ºF) or higher, the TCM employs the cooling strategy. The message 'TRANSMISSION OVERHEAT' is displayed in the message centre.

The strategy uses a specific shift and torque converter lock-up clutch map. This map allows torque converter clutch lock-up and gear shifts to operate outside of their normal operation. This will reduce the engine speed and/or slip in the torque converter, therefore reducing heat generated by the engine and the transmission.

If the transmission fluid temperature increases to 137°C (278ºF) or higher, the transmission will use the default (limp home mode). 'H' is displayed in the gear position indicator. If the temperature exceeds 140ºC (284ºF), CAN bus transmission is disabled and 'E' is displayed in the gear position indicator.

The cooling strategy is cancelled when the transmission fluid temperature decreases to less than 120ºC (248ºF) or below.

Curve Recognition

Curve recognition is activated when high levels of lateral acceleration and/or steering angle are detected via the ABS module and steering angle sensor signals on the CAN bus. When this condition is detected, the TCM prevents the transmission from changing to a higher gear to assist with cornering. When the vehicle completes it manoeuvre, the transmission will shift to the correct ratio.

Fast Off Recognition

Fast off recognition is activated when the TCM detects that the driver has backed off the accelerator pedal quickly in a 'change of mind' manoeuvre. This is detected by monitoring for a high level of negative pedal angle from the engine control module signal on the CAN bus. If this condition is detected, the TCM holds the current gear ratio to allow the driver to complete his original action without the need for a downshift. The mode remains active for a predetermined time period or if the driving style remains passive.

Terrain Response™ Mode

If the vehicle has the Terrain Response system fitted, the following additional modes are available.
For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

Grass/Gravel/Snow

When the driver selects the Terrain Response grass/gravel/snow special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise the delivery of torque to the wheels and to minimise wheel slip in these terrains. To assist with the vehicle moving from a standstill, the TCM automatically selects 2nd gear in high range and 3rd gear in low range. This special program is fully integrated with hill mode to enhance vehicle control during ascents and descents.

Mud/Ruts

When the driver selects the Terrain Response mud/ruts special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise vehicle traction in this terrain.

Sand

When the driver selects the Terrain Response sand special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise the tractive performance in sand by holding onto gears longer and downshifting more readily. This mode is fully integrated with the hill mode to further enhance performance during ascents.

Rock Crawl

When the driver selects the Terrain Response rock crawl special program, which is only available with the transfer box in low range, the TCM uses a specific shift map which maximises torque delivery at slow speeds associated with this type of terrain.

TRANSMISSION FAULT STATUS

If the TCM detects a fault with the transmission system, it will enter a default mode to prevent further damage to the transmission and allow the vehicle to be driven.

When a fault is detected a CAN message is sent from the TCM and is received by the instrument cluster. The instrument cluster illuminates the MIL and displays 'TRANS. FAILSAFE' in the message centre.

Some transmission faults may not illuminate the MIL or display a fault message, but the driver may notice a reduction in shift quality.

ENGINE SPEED AND TORQUE MONITORING

The ECM constantly supplies the TCM with information on engine speed and torque through messages on the CAN bus. The TCM uses this information to calculate the correct and appropriate timing of shift changes.

If the messages are not received by the ECM, the TCM will implement a back-up strategy to protect the transmission from damage and allow the vehicle to be driven.

In the event of an engine speed or torque signal failure, the transmission will adopt the electrical limp home mode with the transmission operating in a fixed gear.

TOWING FOR RECOVERY

The following procedure must be used to ensure that the vehicle is towed in a safe condition and damage to the vehicle transmission system is prevented.

- Secure the towing attachment from the recovery vehicle to the towing eye of the vehicle to be recovered.
- Make sure that the parking brake is on. Turn the ignition key to the ignition position II.
- Apply the footbrake and move the automatic transmission selector lever to the neutral position. If electrical power is not available, use the manual interlock release tab on the selector lever to move the lever to the neutral (N) position.
- Make sure that the ignition is in the auxiliary position I or, if the stop lamps and turn signal indicators are required, in the ignition position II.
- Make sure that the parking brake is released before the vehicle is towed.
- The vehicle can only be towed for a maximum of 31 miles (50 km) at a maximum speed of 30 mph (50 km/h). Towing the vehicle for longer distances and/or faster speeds will damage the transmission.

⚠ WARNING: Do not remove the key or move the ignition switch to position 'O' when the vehicle is being towed. The steering lock will be engaged preventing the steering from being turned.

With the engine not running, the brake booster and power steering pump will be inoperative. Care must be taken to ensure the vehicle is manoeuvred and driven accordingly.

Diagnosis and Testing

Overview

This section is intended to provide a means for the technician to diagnose transmission component faults, rather than replacing the entire unit.

However, there are a number of situations where the replacement of the unit is the only practical solution, and this section will cover the diagnosis necessary to gather the information required for transmission replacement to be authorized by the warranty prior approval program (WPAP) where it applies, as well as covering the diagnostic trouble codes (DTCs) stored by the control module.

The basic checks of the transmission (fluid condition and level, etc) should be carried out first, and this will mean using the approved diagnostic system or other equipment with data logging facility to monitor temperatures, etc.

For information on the operation of the transmission, refer to the relevant workshop manual section.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection Chart

Mechanical	Electrical
● Fluid condition ● Fluid level ● Fluid leaks ● Fluid cooler ● External linkages ● Gear selector lever	● Fuses ● Wiring harnesses ● Electrical connector(s) ● Transmission control module (TCM) ● Engine control module (ECM) ● Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification.

Preliminary inspection

1. **1.** As much information as possible should be obtained from the owner/driver about the fault in order to assist with the diagnosis. Time spent on this will reduce the necessity for extensive road testing and possible missed diagnosis.
    - The information required for WPAP is still useful as an aid to diagnosis, even where the system is not in operation

Required information for WPAP (where applicable)

- The nature of the fault (loss of drive, slip, judder, gear shift quality, noise, etc)
- The frequency with which the fault occurs
- The conditions under which the fault occurs, including temperature (coolant and ambient), selected gear, road speed, engine speed, and any specific conditions
- Check and rectify non-transmission related DTCs before continuing with transmission diagnosis

2. **2.** Record the vehicle details, including:

- Service history
- The transmission serial number
- The transmission software level

3. **3.** Visually inspect the transmission for fluid leaks, damage, etc.
4. **4.** Check the transmission fluid condition.

• NOTE: Fluid condition is a good indicator of the transmission internal condition. If the fluid is burnt and/or contaminated, this would usually mean the internal damage to the transmission is at such a level that unit replacement is the best option. Compare the fluid drained from the transmission with fresh fluid for color and odor.

5. **5.** Check the transmission fluid level. Refer to the relevant workshop manual section.

• NOTE: This is crucial to the operation of the transmission, and the procedure must be closely followed to avoid inaccurate diagnosis, with the resultant possible rejection of a warranty claim.

6. **6.** Check the engine idle speed and throttle sensor using the approved diagnostic system or a scan tool.
7. **7.** Check the transmission selector cable adjustment. Refer to the relevant workshop manual section.
8. **8.** Check the transmission range sensor adjustment.
    - A comprehensive procedure for transmission range sensor setting is accessible through the approved diagnostic system.

If any faults are found and rectified in the above sequence, clear any DTCs and test the vehicle for normal operation.

If a failure condition is found indicating the need to renew the transmission assembly, the request must go through the warranty prior approval program (where applicable) before work is begun.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
P012100	Throttle/Pedal Position Sensor A Circuit Range/Performance	● Throttle position sensor wiring high resistance ● Throttle position sensor sensing circuits (Throttle position 1 or Throttle position 2) short circuit to power ● Throttle position sensor failure ● Range/Performance - Kickdown at low pedal openings	Check for pedal position sensor DTCs. Configure the module using the approved diagnostic system.
P021900	Engine Overspeed Condition	● Engine speed implausible	Check for engine management DTCs.
P050000	Vehicle Speed Sensor A	● Vehicle speed signal not detected	Check for ABS DTCs. Check the CAN circuits. Refer to the electrical guides.
P050100	Vehicle Speed Sensor A Range/Performance	● Range/Performance	Check for input/output sensor DTCs. Check the CAN circuits. Refer to the electrical guides.
P056100	System Voltage Unstable	● Power supply voltage is out of range when the engine is running	Check the battery and charging system. Refer to the relevant workshop manual section.
P056200	System Voltage Low	● Supply voltage to TCM very low	Check the battery condition and state of charge. Check the TCM supply circuits. Refer to the electrical guides.
P056300	System Voltage High	● Power supply voltage is too high if the engine is running and there has been no jump-start or transmission limp-home event	Check the battery and charging system. Refer to the relevant workshop manual section. Check if the vehicle has been jump-started.
P060100	Internal Control Module Memory Check Sum Error	● Checksum error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P060300	Internal Control Module Keep Alive Memory (KAM) Error	● Keep-alive memory (KAM) error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P060500	Internal Control Module Read Only Memory (ROM) Error	● Read only memory (ROM) error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P061300	TCM Processor	● Processor	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P062F00	Internal Control Module EEPROM Error	● EEPROM error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P064200	Sensor Reference Voltage A Circuit Low	● Reference voltage circuit: short circuit to ground ● Reference voltage circuit: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P064300	Sensor Reference Voltage A Circuit High	● Reference voltage circuit: short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P065700	Actuator Supply Voltage A Circuit / Open	● Supply voltage circuit: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P065800	Actuator Supply Voltage A Circuit Low	● Supply voltage circuit: short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P065900	Actuator Supply Voltage A Circuit High	● Supply voltage circuit: short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P066800	PCM / ECM / TCM Internal Temperature Sensor A Circuit Low	● Temperature sensor circuit: high resistance ● Temperature sensor circuit: short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P066900	PCM / ECM / TCM Internal Temperature Sensor A Circuit High	● Temperature sensor circuit: short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P070500	Transmission Range Sensor A Circuit (PRNDL Input)	● Signal implausible	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071000	Transmission Fluid Temperature Sensor A Circuit	● Temperature rise rate too low	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071100	Transmission Fluid Temperature Sensor A Circuit Range/Performance	● Sensor circuits: short circuit to each other	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071200	Transmission Fluid Temperature Sensor A Circuit Low	● Sensor circuit: high resistance ● Sensor circuit: short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071300	Transmission Fluid Temperature Sensor A Circuit High	● Sensor circuit: short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071600	Turbine/Input Shaft Speed Sensor A Circuit Range/Performance	● Sensor circuit: high resistance ● Sensor circuit: short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071700	Turbine/Input Shaft Speed Sensor A Circuit No Signal	● Sensor circuit: short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072000	Output Shaft Speed Sensor Circuit	● Sensor circuit: short circuit to power ● Sensor circuit: high resistance ● Sensor circuit: short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072122	Output Shaft Speed Sensor Circuit Range/Performance	● Range/Performance - Signal amplitude	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072127	Output Shaft Speed Sensor Circuit Range/Performance	● Range/Performance ● Signal rate of change above threshold	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072164	Output Shaft Speed Sensor Circuit Range/Performance	● Range/Performance ● Signal plausibility failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072900	Gear 6 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
P073000	Incorrect Gear Ratio	● Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073100	Gear 1 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073200	Gear 2 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073300	Gear 3 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073400	Gear 4 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073500	Gear 5 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073600	Reverse Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P074000	Torque Converter Clutch Solenoid Circuit / Open	● Solenoid circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P074100	Torque Converter Clutch Solenoid Circuit Performance/Stuck Off	● Solenoid circuit stuck off	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P074800	Pressure Control Solenoid A Electrical	● Solenoid current too high/low	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075113	Shift Solenoid A Performance/Stuck Off	● Performance ● Stuck off ● Solenoid circuit: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075114	Shift Solenoid A Performance/Stuck Off	● Performance ● Stuck off ● Solenoid circuit: high resistance ● Solenoid circuit: short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075200	Shift Solenoid A Stuck On	● Stuck on	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075300	Shift Solenoid A Electrical	● Solenoid circuit: short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P077800	Pressure Control Solenoid B Electrical	● Solenoid current too high	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P078000	Shift malfunction	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078123	1 - 2 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P078162	1 - 2 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078164	1 - 2 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.

DTC	Description	Possible causes	Action
P078262	2 - 3 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078264	2 - 3 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078323	3 - 4 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P078362	3 - 4 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078364	3 - 4 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078423	4 - 5 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P078462	4 - 5 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078464	4 - 5 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P079800	Pressure Control Solenoid C Electrical	● Solenoid current too high	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P081C00	Park Input Circuit	● Park lock signal fault	Check the gear selector input circuits. Refer to the electrical guides.
P082600	Up and Down Switch Circuit	● Implausible signal	Check the up and down switch circuits. Refer to the electrical guides.
P082923	5-6 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P082962	5-6 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P082964	5-6 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P085000	Park / Neutral Switch Input Circuit	● Starter inhibit signal fault	Check the starter inhibit circuits. Refer to the electrical guides.
P089700	Transmission Fluid Deteriorated	● Temperature too high over too long a time	Renew the fluid.
P092800	Gear Shift Lock Solenoid/Actuator Circuit A / Open	● Solenoid circuit: high resistance	Check the solenoid circuits. Refer to the electrical guides.
P092900	Gear Shift Lock Solenoid/Actuator Circuit A Range/Performance	● Solenoid circuit: short circuit to ground ● Solenoid circuit: high resistance	Check the solenoid circuits. Refer to the electrical guides.
P093000	Gear Shift Lock Solenoid/Actuator Circuit A Low	● Solenoid circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P093100	Gear Shift Lock Solenoid/Actuator Circuit A High	● Solenoid circuit: short circuit to power	Check the solenoid circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
P093800	Hydraulic Oil Temperature Sensor Range/Performance	- Range/Performance - Signal not plausible	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P096013	Pressure Control Solenoid A Control Circuit / Open	- Control circuit: high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P096014	Pressure Control Solenoid A Control Circuit / Open	- Control circuit: high resistance - Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096200	Pressure Control Solenoid A Control Circuit Low	- Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096300	Pressure Control Solenoid A Control Circuit High	- Control circuit: short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P096413	Pressure Control Solenoid B Control Circuit / Open	- Control circuit: high resistance	Check the solenoid circuits. Refer to the electrical guides.
P096414	Pressure Control Solenoid B Control Circuit / Open	- Control circuit: high resistance - Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096600	Pressure Control Solenoid B Control Circuit Low	- Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096700	Pressure Control Solenoid B Control Circuit High	- Control circuit: short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P096813	Pressure Control Solenoid C Control Circuit / Open	- Control circuit: high resistance	Check the solenoid circuits. Refer to the electrical guides.
P096814	Pressure Control Solenoid C Control Circuit / Open	- Control circuit: high resistance - Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P097000	Pressure Control Solenoid C Control Circuit Low	- Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P097100	Pressure Control Solenoid C Control Circuit High	- Control circuit: short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P178300	Transmission Overtemperature Condition	- Valve body module shut-down detected on last drive cycle	Check the fluid level and condition. Check for associated DTCs.
P271600	Pressure Control Solenoid D Electrical	- Solenoid current too high	Check the solenoid circuits. Refer to the electrical guides.
P271813	Pressure Control Solenoid D Control Circuit / Open	- Control circuit: high resistance	Check the solenoid circuits. Refer to the electrical guides.
P271814	Pressure Control Solenoid D Control Circuit / Open	- Control circuit: high resistance - Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P272000	Pressure Control Solenoid D Control Circuit Low	- Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P272100	Pressure Control Solenoid D Control Circuit High	- Control circuit: short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P272500	Pressure Control Solenoid E Electrical	- Solenoid current too high	Check the solenoid circuits. Refer to the electrical guides.
P272713	Pressure Control Solenoid E Control Circuit / Open	- Control circuit: high resistance	Check the solenoid circuits. Refer to the electrical guides.
P272714	Pressure Control Solenoid E Control Circuit / Open	- Control circuit: high resistance - Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P272900	Pressure Control Solenoid E Control Circuit Low	- Control circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
P273000	Pressure Control Solenoid E Control Circuit High	● Control circuit: short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P275900	Torque Converter Clutch Pressure Control Solenoid Electrical	● Pressure control solenoid fault	Check the solenoid circuits. Refer to the electrical guides.
P276100	Torque Converter Clutch Pressure Control Solenoid Control Circuit / Open	● Pressure control solenoid circuit: high resistance	Check the solenoid circuits. Refer to the electrical guides.
P276200	Torque Converter Clutch Pressure Control Solenoid Control Circuit Range / Perf	● Pressure control solenoid circuit: current too low	Check the solenoid circuits. Refer to the electrical guides.
P276300	Torque Converter Clutch Pressure Control Solenoid Control Circuit High	● Pressure control solenoid circuit: short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P276400	Torque Converter Clutch Pressure Control Solenoid Control Circuit Low	● Pressure control solenoid circuit: short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
U000188	High Speed CAN Communication Bus	● Bus off	The module setting this code has disabled CAN transmission. Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
U010087	Lost Communication With ECM/PCM "A"	● Missing message	Check the ECM and circuits. Refer to the electrical guides.
U010287	Lost Communication with Transfer Case Control Module	● Missing message	Check the transfer case control module and circuits. Refer to the electrical guides.
U010487	Lost Communication With Cruise Control Module	● Missing message	Check the speed control control module and circuits. Refer to the electrical guides.
U012287	Lost Communication With Vehicle Dynamics Control Module	● Missing message	Check the ABS module and circuits. Refer to the electrical guides.
U012687	Lost Communication With Steering Angle Sensor Module	● Missing message	Check the steering angle sensor and circuits. Refer to the electrical guides.
U012887	Lost Communication With Park Brake Control Module	● Missing message	Check the parking brake control module and circuits. Refer to the electrical guides.
U013887	Lost Communication with All Terrain Control Module	● Missing message	Check the all-terrain control module and circuits. Refer to the electrical guides.
U015587	Lost Communication With Instrument Panel Cluster (IPC) Control Module	● Missing message	Check the instrument cluster and circuits. Refer to the electrical guides.
U030055	Internal Control Module Software Incompatibility	● Module is not configured	Configure the module using the approved diagnostic system.
U040186	Invalid Data Received from ECM/PCM A	● Signal invalid	Check the engine speed at the instrument cluster. Check for ECM DTCs.
U041686	Invalid Data Received From Vehicle Dynamics Control Module	● Signal invalid	Check for ABS DTCs.
U30004A	Control Module	● Incorrect component installed - Mismatch between configuration data and read configuration	Configure the module using the approved diagnostic system.

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Transmission Fluid Drain and Refill

General Procedures

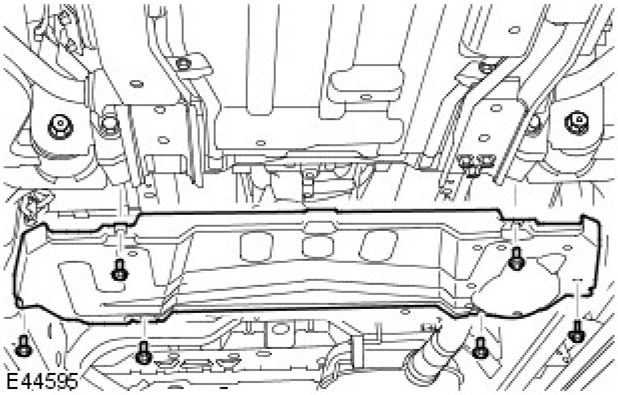
- WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

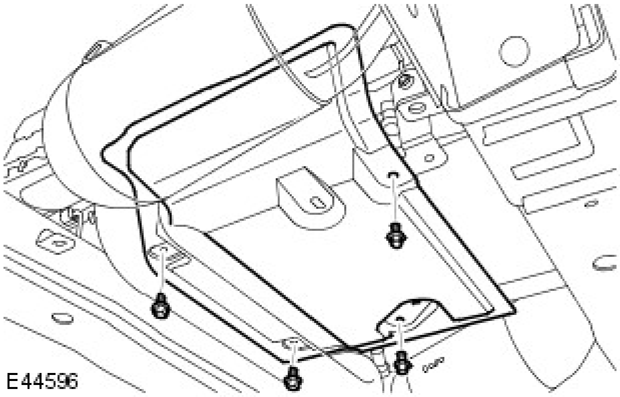
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



2. Remove the transmission undershield.

- Remove the 6 bolts.

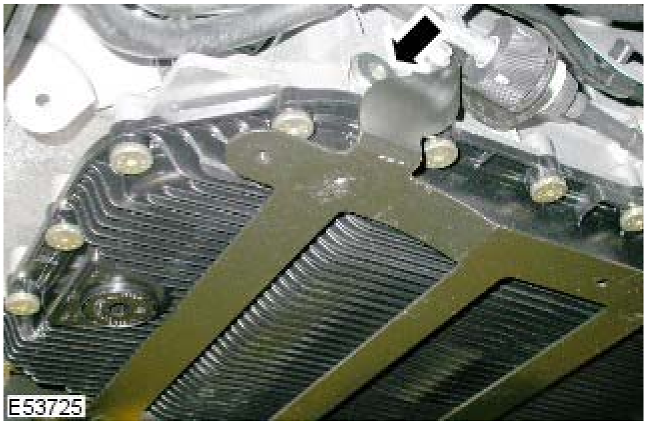


3. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

4. Clean the area around the transmission fluid drain and filler plugs.

5. Place a container under the transmission.



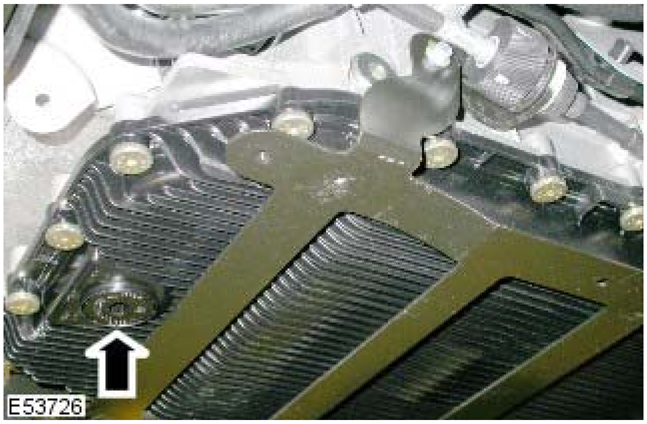
6. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

Remove the transmission fluid filler/level plug.

- Remove and discard the sealing washer.



7. Remove the transmission fluid drain plug.

- Remove and discard the sealing washer.
- Allow the fluid to drain.

8. Install the transmission fluid drain plug and tighten to 9 Nm (7 lb.ft).

- Install a new sealing washer.

9. Add 3.5 to 4 liters of the correct transmission fluid, or until a small thread of fluid runs from the filler/level hole.

10. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Published: 11-May-2011

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Transmission Fluid Level Check

General Procedures

• WARNINGS:

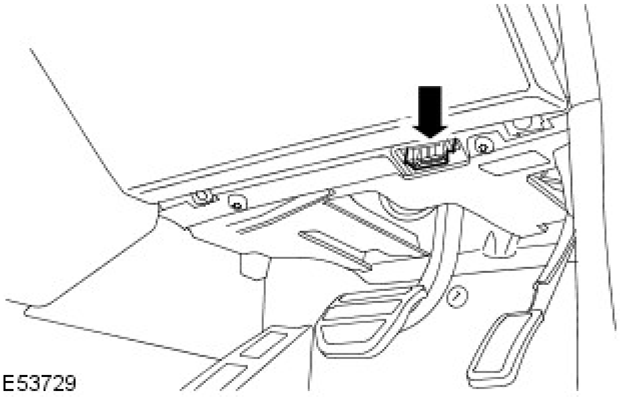
⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

⚠ CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

1. The following steps must be observed before starting the transmission fluid level check and top-up.

- The vehicle must be on a horizontal ramp.
- The parking brake must be applied.
- The wheels must be chocked.



2. ⚠ CAUTION: Make sure the transmission fluid temperature is below 30 degrees before starting the fluid level check.

Using the approved Land Rover diagnostic equipment, monitor the transmission fluid temperature.

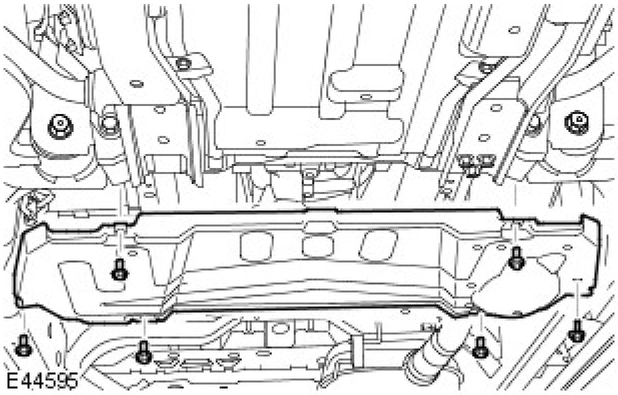
3. Start the engine. Move the selector lever from 'P' through all gear positions, pausing in each gear position for 2-3 seconds and return to the 'P' position.

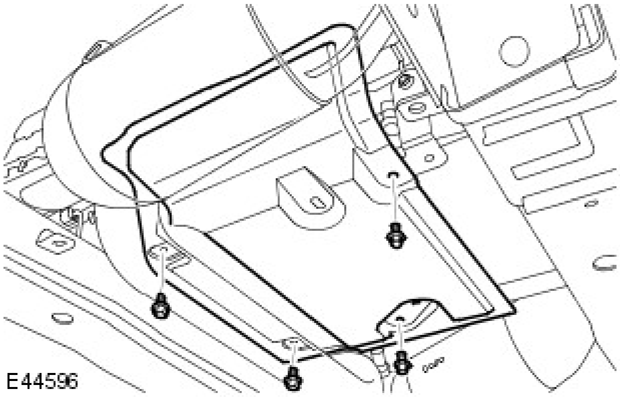
4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the transmission undershield.

- Remove the 6 bolts.

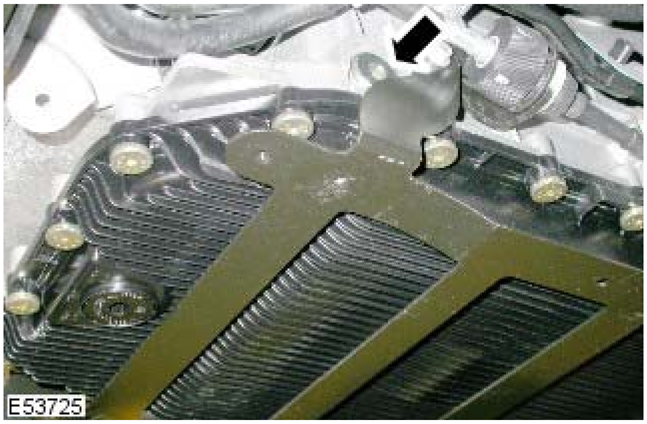




6. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

7. Place a container under the transmission.



8. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

⚠ CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

Remove the transmission fluid filler/level plug.

- Clean the area around the filler/level plug.
- Remove and discard the sealing washer.

9. If no fluid loss is apparent when the filler/level plug is removed, with the engine at idle, continue to fill the transmission until a small thread of oil runs from oil filler/level hole.

10. Install the transmission fluid filler/level plug and tighten to 35 Nm (26 lb.ft).

- Install a new sealing washer.
- Remove the container.

11. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

12. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

13. Disconnect the approved Land Rover diagnostic equipment from the vehicle.

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Selector Shaft Seal

In-vehicle Repair

Special Tool(s)	
	Seal extractor 307-509/1 (LRT-44-033/1)
	Seal extractor 307-509/2 (LRT-44-033/2)
	Seal installer 307-509/3 (LRT-44-033/3)

Removal

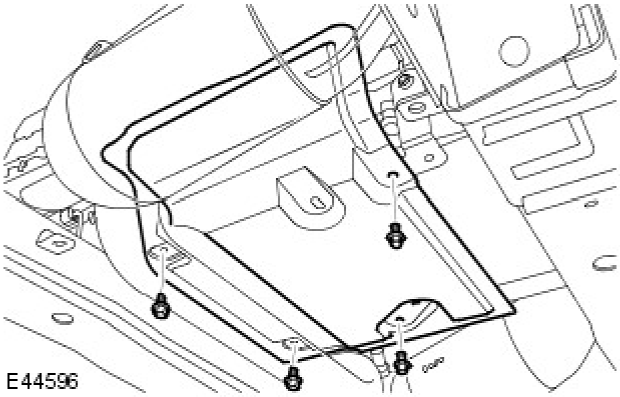
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

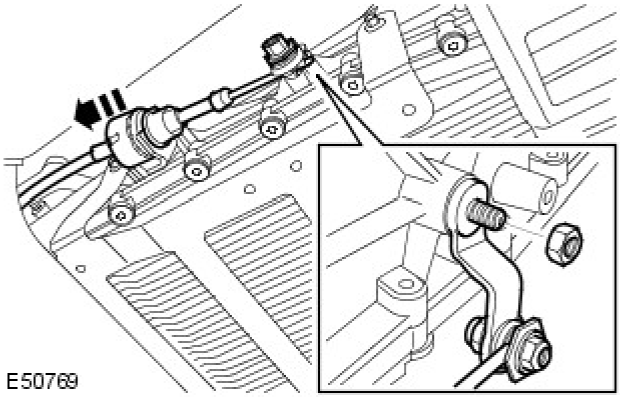
Raise and support the vehicle.

2. Remove the exhaust system.
For additional information, refer to: Exhaust System (309-00A Exhaust System - V8 S/C 4.2L Petrol, Removal and Installation).

3. Remove the transmission heat shield.

- Remove the 4 bolts.

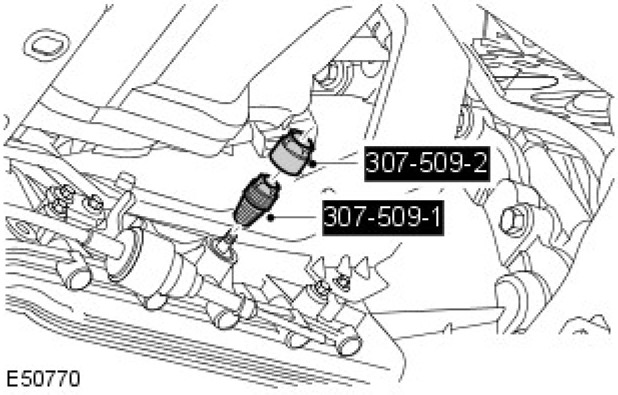




E50769

4. Release the selector cable and lever.

- Remove the nut.
- Compress the latch and release the cable.



E50770

5. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

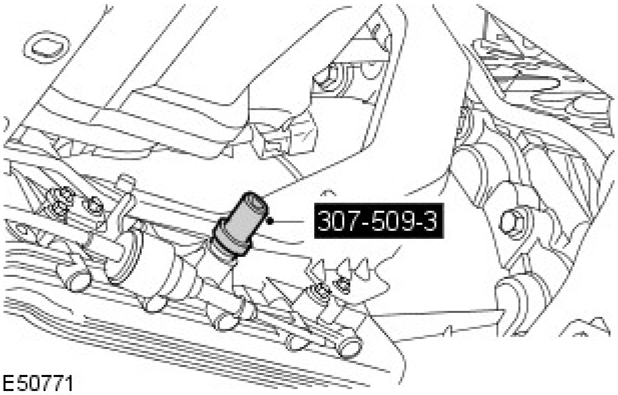
Remove the selector shaft seal.

- Install 307-509-1 to the seal.
- Install 307-509-2 to 307-509-1 and extract the seal.

Installation

1. Using 307-509-3, install the selector shaft seal.

- Clean the components.



E50771

2. Install the selector cable and bracket.

- Secure with the clip.
- Tighten the nut to 12 Nm (9 lb.ft).

3. Install the transmission heat shield.

- Install the bolts.

4. Install the exhaust system.
For additional information, refer to: Exhaust System (309-00A Exhaust System - V8 S/C 4.2L Petrol, Removal and Installation).

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Transmission Control Module (TCM)

In-vehicle Repair

Removal

- NOTE: The transmission control module (TCM) is part of the main control valve body and cannot be serviced separately.

1. Remove the main control valve body.
For additional information, refer to: Main Control Valve Body (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, In-vehicle Repair).

Installation

1. Install the main control valve body.
For additional information, refer to: Main Control Valve Body (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, In-vehicle Repair).

Published: 11-May-2011

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Output Shaft Seal

In-vehicle Repair

Special Tool(s)	
	Oil seal remover (LRT-12-092) 303-903
	Oil seal installer 307-520

Removal

1. Disconnect the battery ground cable.

For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

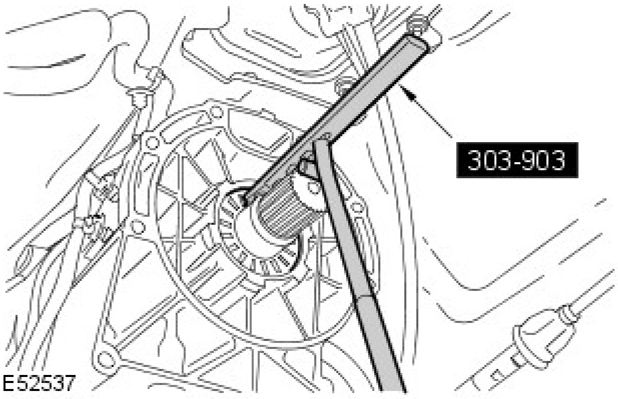
2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transfer case.

For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Removal).

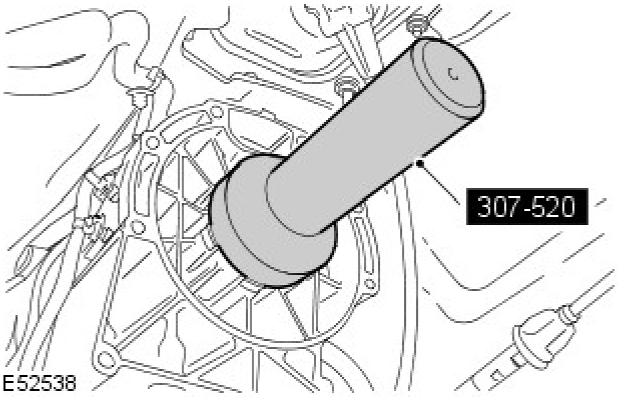
4. ⚠ CAUTION: Care must be taken to avoid damage to the seal register and running surface.



Remove the transmission output shaft oil seal.

- Use the special tool.

Installation



1. ⚠ CAUTION: Oil seals must be fitted dry.

   Install a new transmission output shaft oil seal.

   - Clean the seal register.
   - Use the special tool.

2. Install the transfer case.
   For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Removal).
3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
4. Check and top-up the transmission fluid level.
   For additional information, refer to: Transmission Fluid Level Check (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Fluid Pan, Gasket and Filter

In-vehicle Repair

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. ⚠ CAUTION: Make sure that the area around the component is clean and free of foreign material.

   Remove the main control valve body.
   For additional information, refer to: Main Control Valve Body (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, In-vehicle Repair).

Installation

1. ⚠ CAUTION: Make sure that the area around the component is clean and free of foreign material.

   Install the main control valve body.
   For additional information, refer to: Main Control Valve Body (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, In-vehicle Repair).

In-vehicle Repair

Special Tool(s)	
	Seal extractor 307-492(LRT-44-005)

Removal

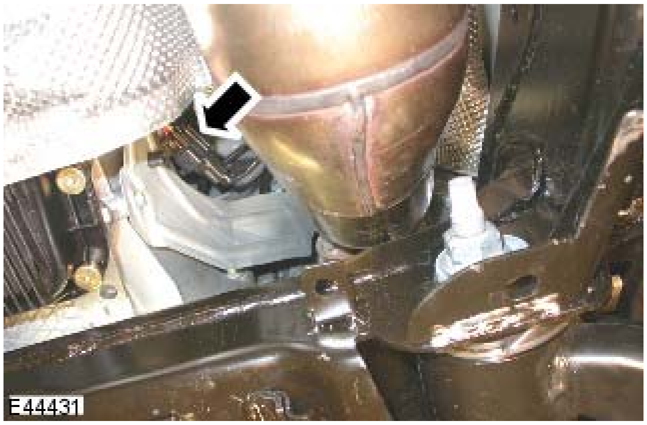
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

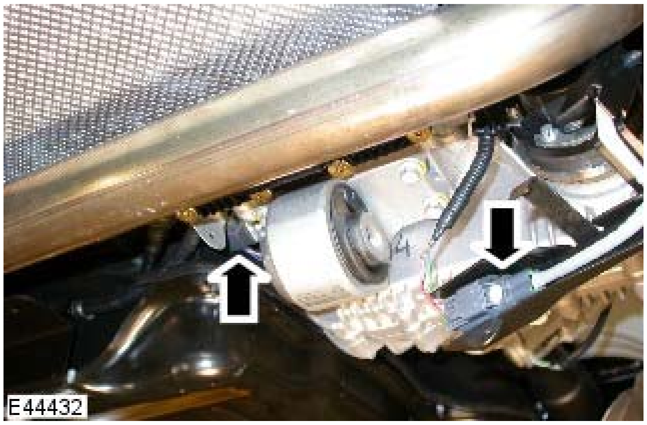
3. Drain the transmission fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

4. Remove the transmission support crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).



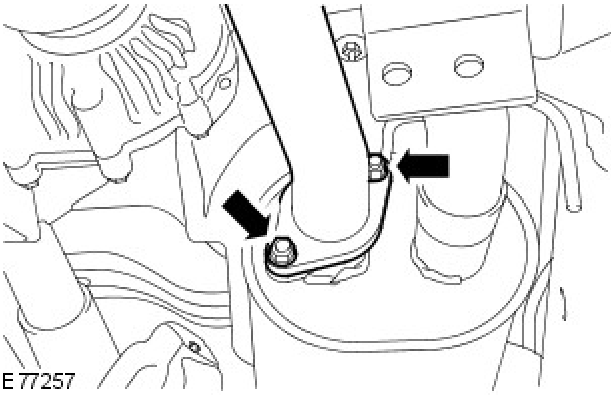
5. Release the RH front HO2S wiring harness.

- Disconnect the electrical connector.



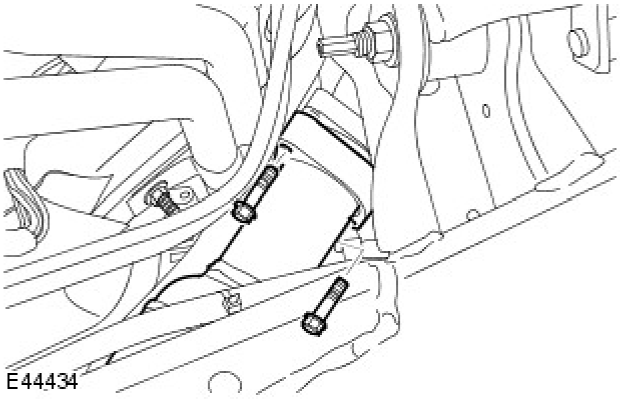
6. Release the RH rear HO2S wiring harness.

- Disconnect the electrical connector.



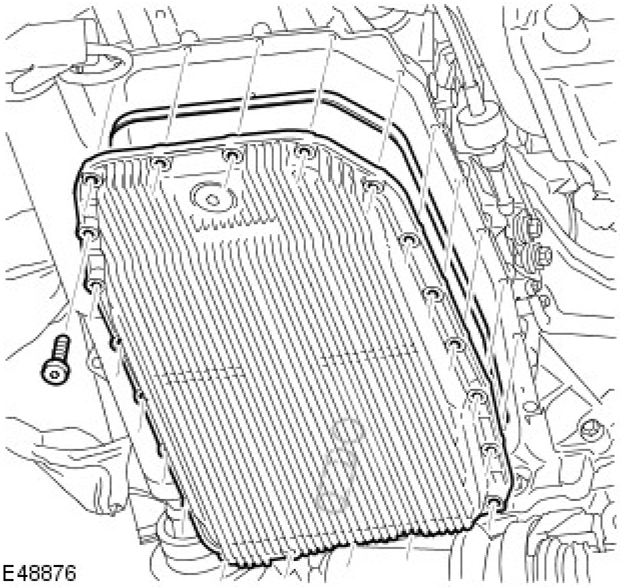
7. Disconnect the RH catalytic converter from the muffler assembly.

- Remove the 2 nuts.
- Discard the gasket.



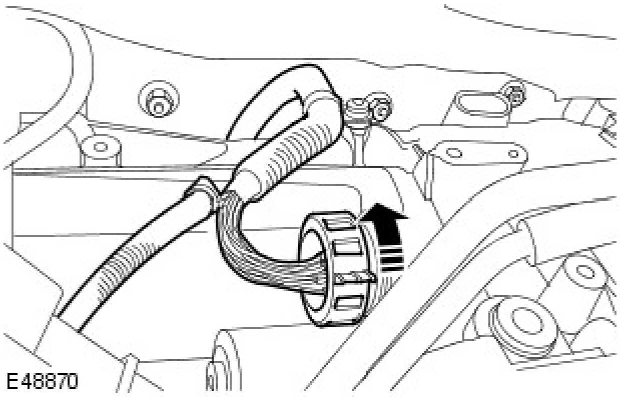
8. Disconnect the RH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.

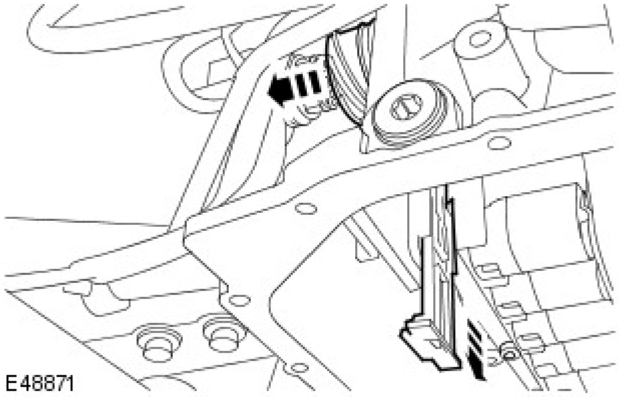


9. Release the oil pan.

- Position a container to collect the oil spillage.
- Remove the 21 Torx screws.



10. Release and disconnect the electrical connector.

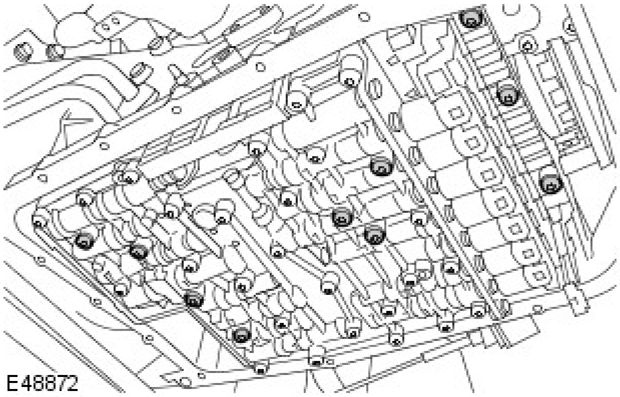


11. Remove and discard the electrical connector sleeve.

- Release the retainer.

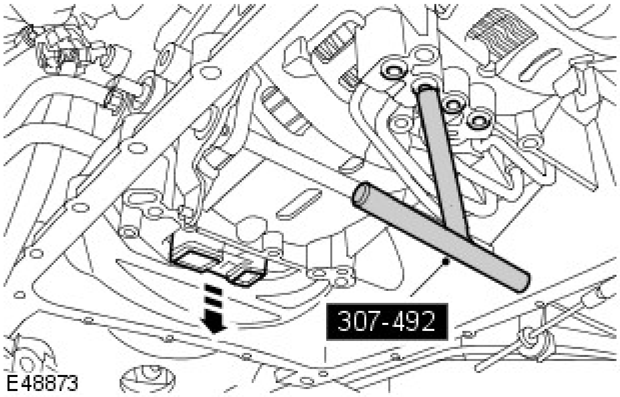
12. Remove the valve block and oil pan.

- Remove the 7 Torx bolts.
- Discard the O-ring seal.



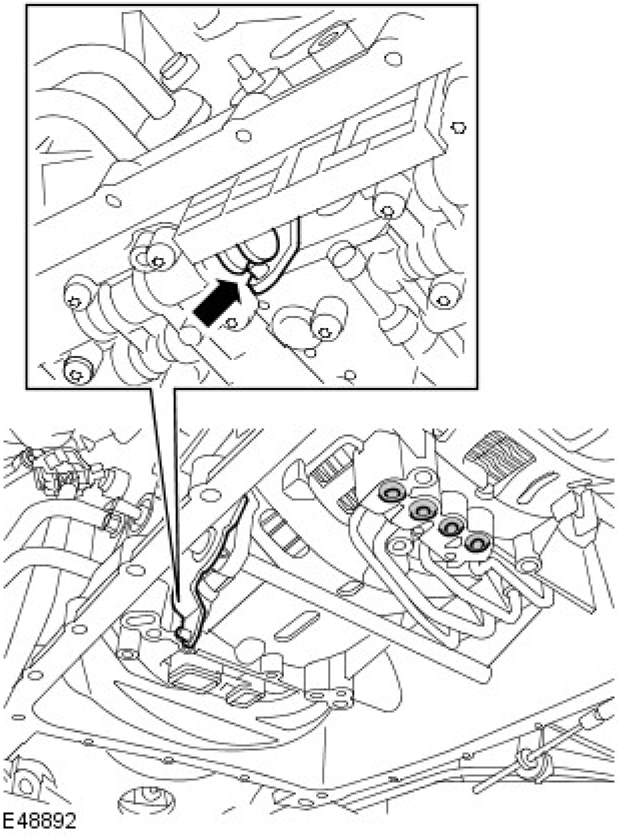
13. Using the special tool, remove the 4 seals.

14. Remove the seal block.



307-492
E48873

Installation



1. CAUTIONS:

⚠ Make sure that when fully fitted, all seals protrude by the same amount.

⚠ Engage the selector lever with the groove in the piston rod.

Install the valve block and oil pan.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).

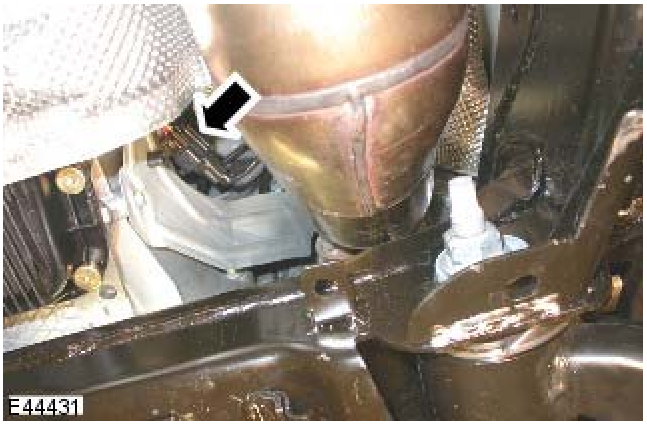
2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

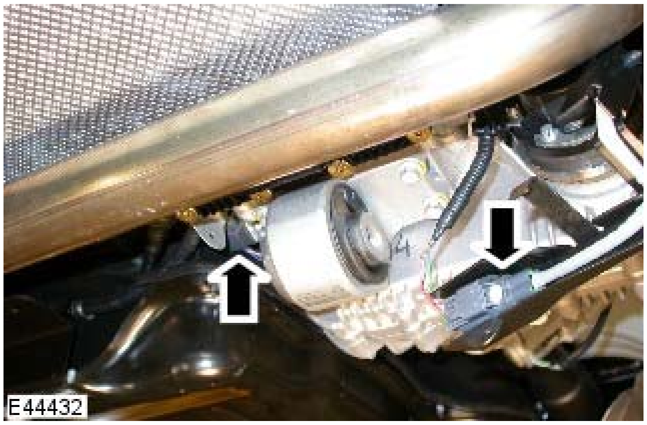
4. Secure the oil pan.

- Tighten the Torx screws to 8 Nm (6 lb.ft).



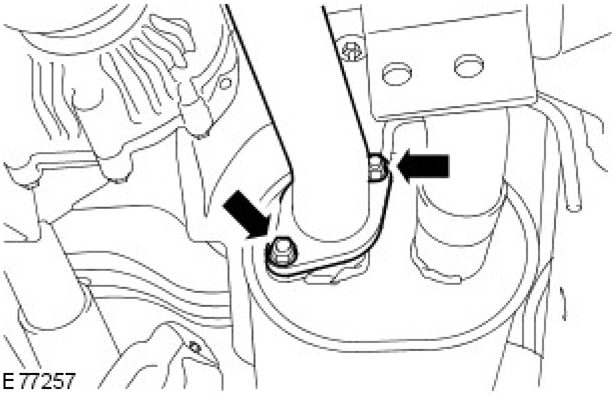
5. Connect the RH front HO2S electrical connector.

- Connect the electrical connector.



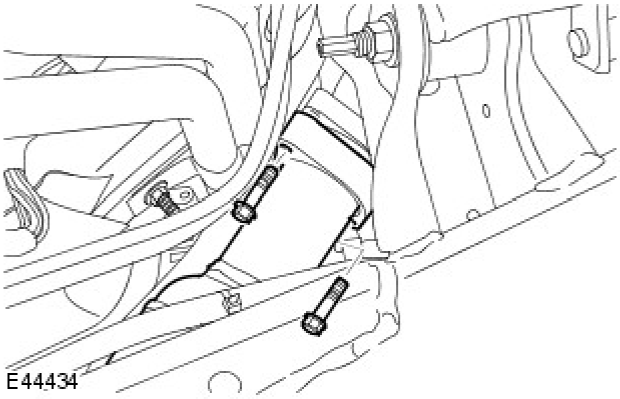
6. Connect the RH front HO2S electrical connector.

- Connect the electrical connector.



7. Secure the RH catalytic converter to the front muffler.

- Install a new gasket.
- Tighten the new bolts to 22 Nm (16 lb.ft).



8. Secure the RH catalytic converter to the exhaust manifold.

- Install and tighten the 2 bolts.

9. Install the transmission support crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

10. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

11. Fill the transmission with fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

12. Using the Land Rover approved diagnostic equipment, calibrate the control valve body.

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Transmission Support Insulator

In-vehicle Repair

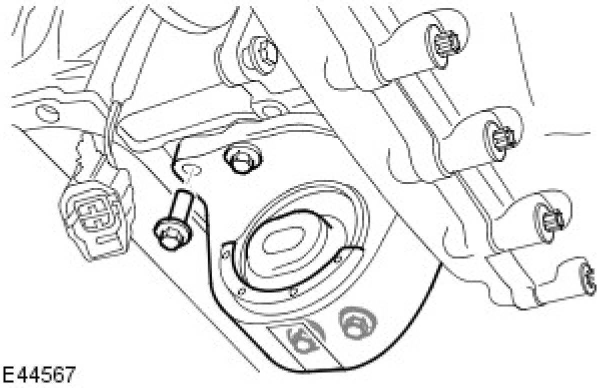
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

3. NOTE: 4.4L illustration shown, 4.0L and 2.7L Diesel are similar.



Remove the transmission support insulator.

- Remove the 4 bolts.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Tighten the bolts to 60 Nm (44 lb.ft).

Published: 11-May-2011

Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol - Transmission

Removal and Installation

Special Tool(s)	
 E46737	Torque converter seal installer 308-246
 E46738	Torque converter support handles (LRT-44-010) 307-497

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

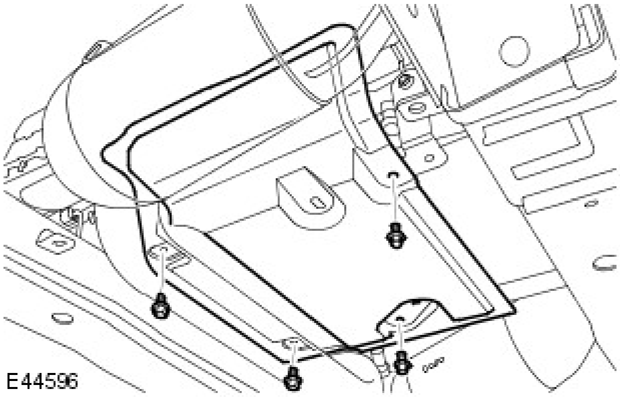
Raise and support the vehicle.

3. Drain the transmission fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

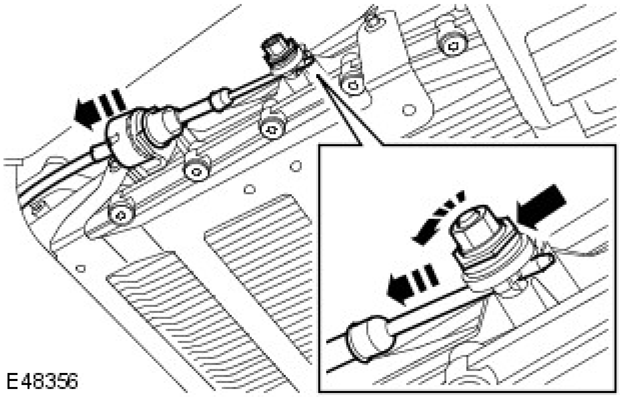
4. Remove the transfer case.
For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Removal).

5. Remove the transmission heat shield.

- Remove the 4 bolts.

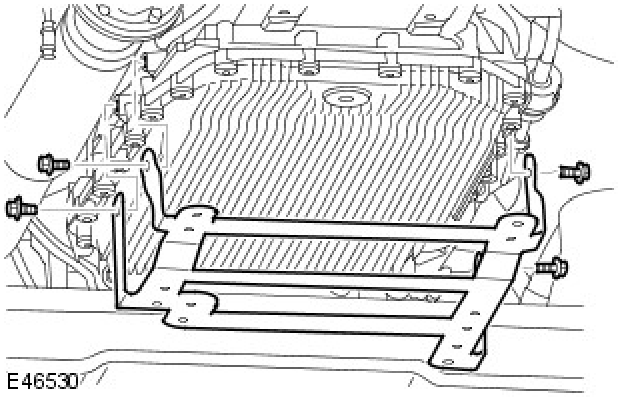


E44596



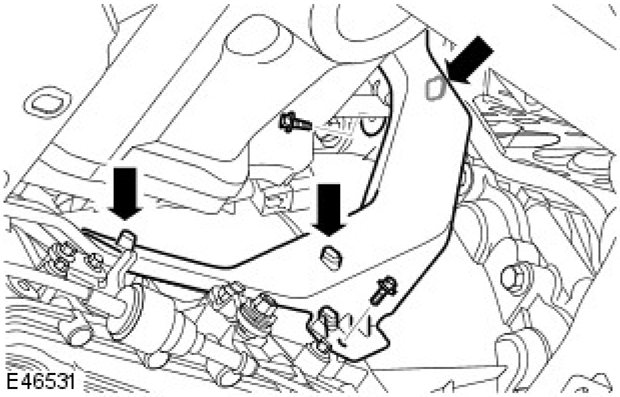
6. Release the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Compress the latch and release the cable.



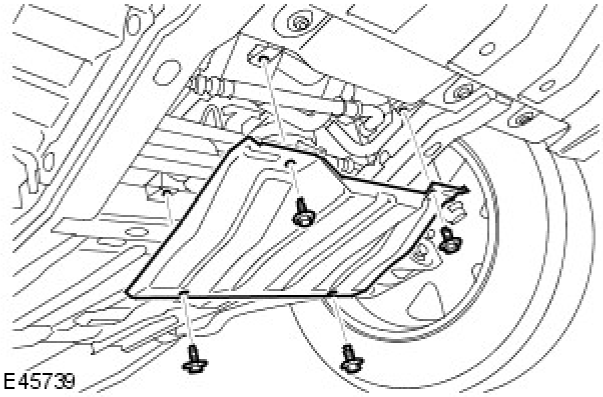
7. Remove the transmission heat shield bracket.

- Remove the 4 bolts.



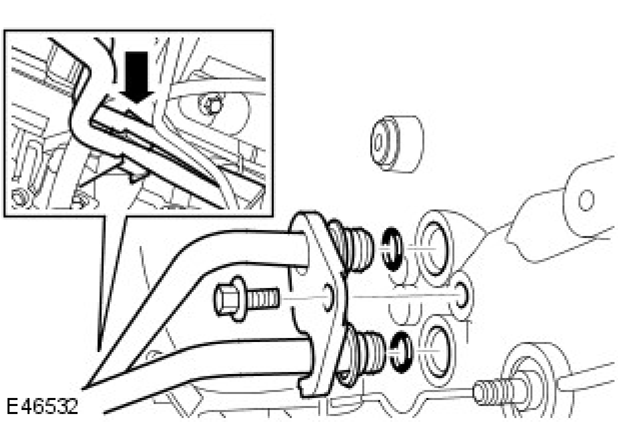
8. Remove the fuel pipe heat shield.

- Remove the 2 bolts.
- Release the fuel pipes from the 3 clips.



9. Remove the radiator access panel.

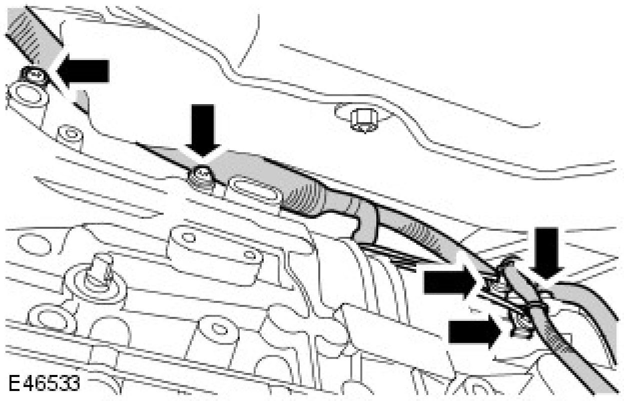
- Remove the 4 bolts.



10. ⚠ CAUTION: Always plug any open connections to prevent contamination.

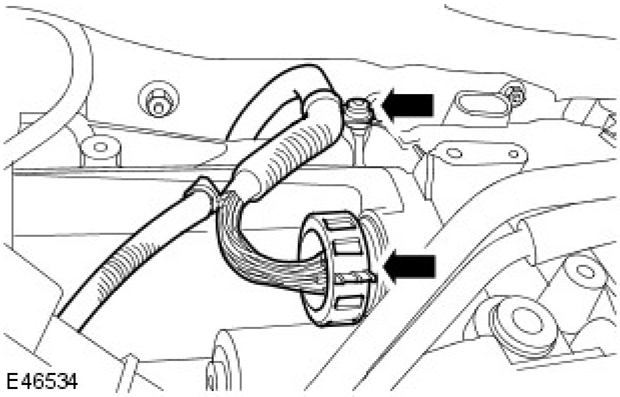
Release the transmission fluid lines.

- Remove the bolt.
- Release the clip.
- Remove and discard both O-ring seals.



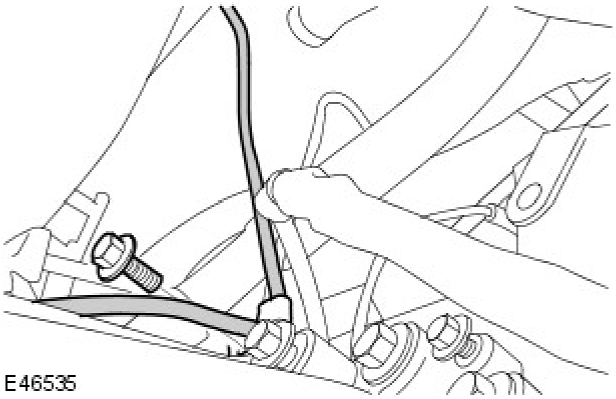
11. Release the wiring harness from the LH side of the transmission.

- Remove the 3 Torx screws.
- Release the 2 clips.



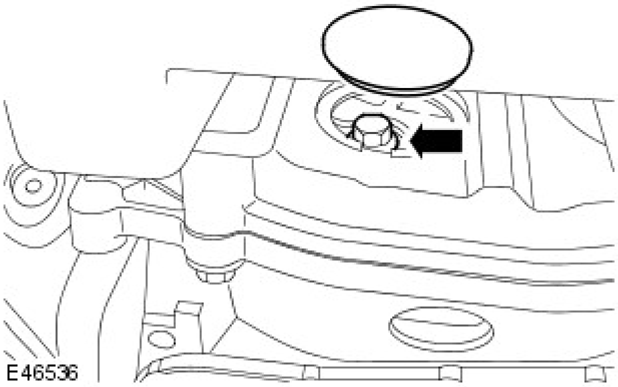
12. Release the wiring harness from the RH side of the transmission.

- Remove the Torx screw.
- Disconnect the electrical connector.



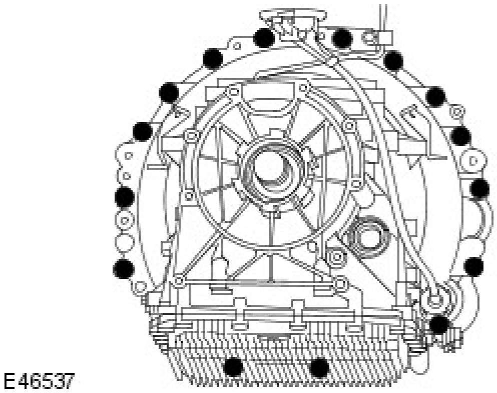
13. Release the transmission breather line clip.

- Remove the bolt.



14. Release the flexplate.

- Remove the access plugs.
- Rotate the crankshaft to access the retaining bolts.
- Remove the 3 bolts.



15. WARNINGS:

Secure the transmission to the transmission jack.

Support the engine. The engine will fall forward when the transmission is removed.

CAUTION: Make sure the torque converter remains connected to the transmission.

With assistance, remove the transmission.

- Using a transmission jack, support the transmission.
- Remove the 16 bolts.

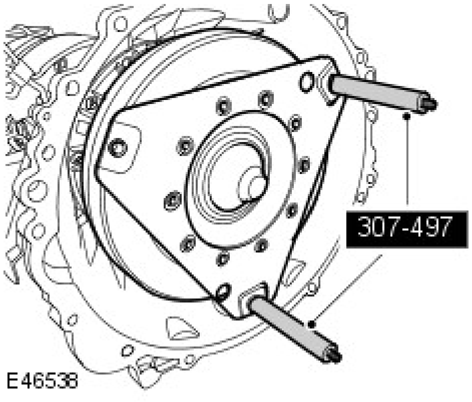
16. Install the torque converter retainer.

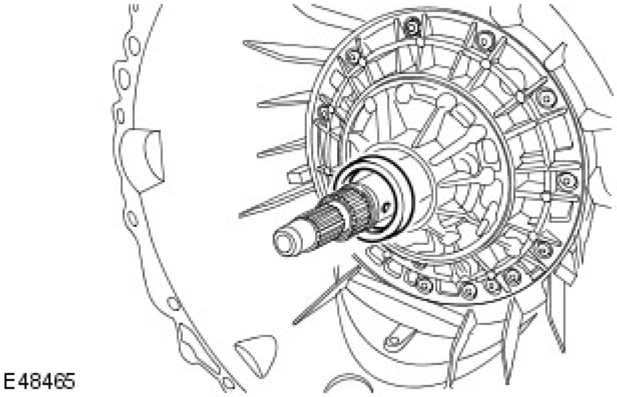
17. NOTE: Do not disassemble further if the component is removed for access only.

Remove the transmission from the transmission jack.

18. Remove the torque converter retainer.

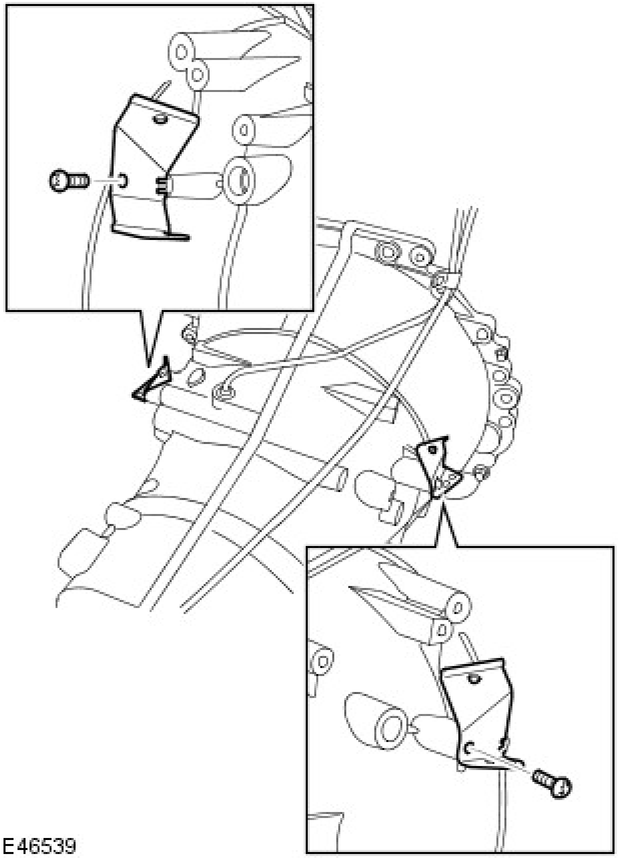
19. Using the special tools, remove the torque converter.





E48465

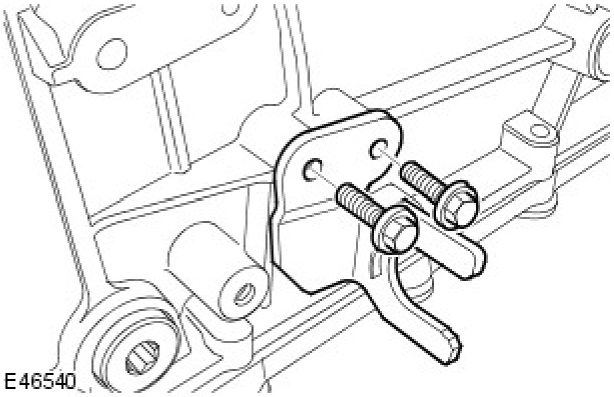
20. Carefully remove and discard the torque converter fluid seal.



E46539

21. Remove the wiring harness bracket.

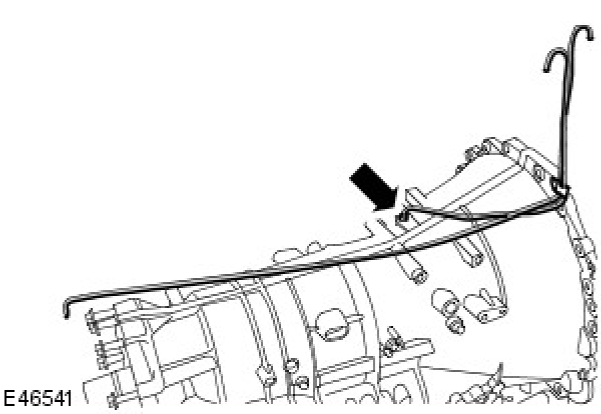
- Remove the Torx screw.
- Repeat the above procedure for the other side.



E46540

22. Remove the selector cable bracket.

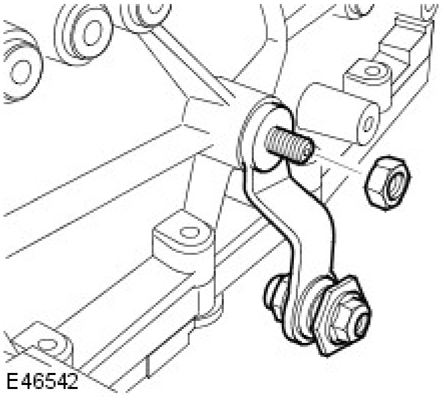
- Remove the 2 bolts.



23. ⚠CAUTION: Always plug any open connections to prevent contamination.

Remove the transmission breather lines.

- Depress the locking ring.



24. Remove the selector lever.

- Remove the nut.

Installation

⚠CAUTION: If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

1. Attach the selector lever.

- Tighten the nut to 12 Nm (9 lb.ft).

2. Attach the transmission breather lines.

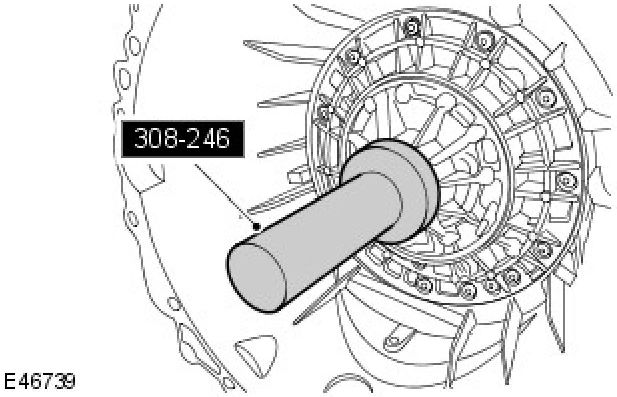
- Secure with the clip.

3. Attach the selector cable bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).

4. Attach the wiring harness bracket.

- Tighten the Torx bolt to 10 Nm (7 lb.ft).
- Repeat the above procedure for the other side.



5. Using the special tool, install a new torque converter fluid seal.

- Clean the seal register.

6. Install the torque converter.

- Clean the seal contact area.
- Remove the special tools.

7. Install the torque converter retainer.

8. Position the transmission to the transmission jack.

9. Remove the torque converter retainer.

10. ⚠ CAUTION: Apply grease of the correct specification to the torque converter spigot.

With assistance, install the transmission.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

11. Attach the flexplate to the torque converter.

- Rotate the crankshaft to access the retaining bolts.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Install the access plugs.

12. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

13. Attach the transmission breather pipe clip.

- Tighten the bolt to 25 Nm (18 lb.ft).

14. Attach the wiring harness.

- Tighten the Torx screws.
- Connect the electrical connector.

15. Attach the transmission fluid lines.

- Clean the components.
- Install the new O-ring seals.
- Secure with the clip.
- Tighten the bolt to 10 Nm (7 lb.ft).

16. Install the fuel pipe heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure with the clips.

17. Install the transmission heat shield bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).

18. NOTE: Do not tighten the locking nut at this stage.

Connect the selector cable to the transmission.

- Engage the inner cable with the lever clamping bush.
- Install the selector cable to its abutment bracket.

19. Install the transfer case.
For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Installation).

20. Refill the transmission with fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

21. Install the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

22. Adjust the selector cable.
For additional information, refer to: Selector Lever Cable Adjustment (307-05A Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol, General Procedures).

23. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

24. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

25. NOTE: For NAS vehicles only.

If fitting new or exchange components, carry out long drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).

Automatic Transmission/Transaxle - V8 4.4L Petrol -

Lubricants

Item	**Specification**
* Recommended lubricant	Shell M13754. Land Rover Part No. TYK500050
+ Torque converter nose	Molybdenum disulphide grease to specification FB180

- CAUTIONS:

⚠ * Do not use any lubricant other than that specified.

⚠ + Do not over lubricate.

Capacity

Item	**Capacity**
+ Initial dry fill	9.5 litres (16.7 pints) (10.0 US qts)

⚠ CAUTION: + A final fluid level check/drain down/top-up must be carried out when the unit has been installed.

OVERVIEW

• NOTE: This section contains information for the 4.4L V8 and the TdV6 transmissions.

4.2L V8 Supercharged is covered in a separate section.
For additional information, refer to: Automatic Transmission (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, Description and Operation).

The ZF 6HP26 transmission is an electronically controlled, six speed unit. The transmission is manufactured by ZF Transmissions GmbH in Saarbrücken, Germany. This transmission represents the latest in automatic transmission technology and incorporates new features to enhance the transmission functionality:

- The hydraulic and electronic control elements of the transmission are now incorporated in a single unit located inside the transmission and is known as 'Mechatronic'
- Another new strategy is Adaptive Shift Strategy (ASIS). ASIS represents the continuous adaptation of shift changes to suit the driving style of the driver which can vary from sporting to economical. Further details of the ASIS function are contained in the 'Driving Modes' section.

The transmission is controlled by a Transmission Control Module (TCM) which contains software to provide operation as a semi-automatic 'CommandShift™' transmission. The TCM allows the transmission to be operated as a conventional automatic unit by selecting P, R, N, D on the selector lever. Movement of the selector lever across the gate to the 'M/S' position puts the transmission into electronic 'Sport' mode. Further movement of the lever in a lateral direction to the + or – position puts the transmission into electronic manual 'CommandShift™' mode.

The 6HP26 transmission has the following features:

- Designed to be maintenance free
- Transmission fluid is 'fill for life'
- The torque converter features a controlled slip feature with electronically regulated control of lock-up, creating a smooth transition to the fully locked condition
- Shift programs controlled by the TCM
- Connected to the ECM via the High Speed CAN for communications
- Default mode if major faults occur
- Diagnostics available from the TCM via the CAN

The gearbox comprises the main casing which houses all of the transmission components. The main case also incorporates an integral bell housing.

A fluid pan is bolted to the lower face of the main case and is secured with bolts. The fluid pan is sealed to the main case with a gasket. Removal of the fluid pan allows access to the Mechatronic valve block. The fluid pan has a magnet located around the drain plug which collects any metallic particles present in the transmission fluid.

A fluid filter is located inside the fluid pan. If the transmission fluid becomes contaminated or after any service work, the fluid pan with integral filter must be replaced.

The integral bell housing provides protection for the torque converter assembly and also provides the attachment for the gearbox to the engine cylinder block. The torque converter is a non-serviceable assembly which also contains the lock-up clutch mechanism. The torque converter drives a crescent type pump via drive tangs. The fluid pump is located in the main case, behind the torque converter.

The main case contains the following major components:

- Input shaft
- Output shaft
- Mechatronic valve block which contains the solenoids, speed sensors and the TCM
- Three rotating multiplate drive clutches
- Two fixed multiplate brake clutches
- A single planetary gear train and a double planetary gear train.

10	-	Lock-up clutch piston
11	-	Drive plate
12	-	Lock-up clutch plate
13	-	Torsional vibration damper

The torque converter is the coupling element between the engine and the gearbox and is located in the bell housing, on the engine side of the transmission. The driven power from the engine crankshaft is transmitted hydraulically and mechanically through the torque converter to the transmission. The torque converter is connected to the engine by a drive plate.

The torque converter comprises an impeller, a stator and a turbine. The torque converter is a sealed unit with all components located between the converter housing cover and the impeller. The two components are welded together to form a sealed, fluid filled housing. With the impeller welded to the converter housing cover, the impeller is therefore driven at engine crankshaft speed.

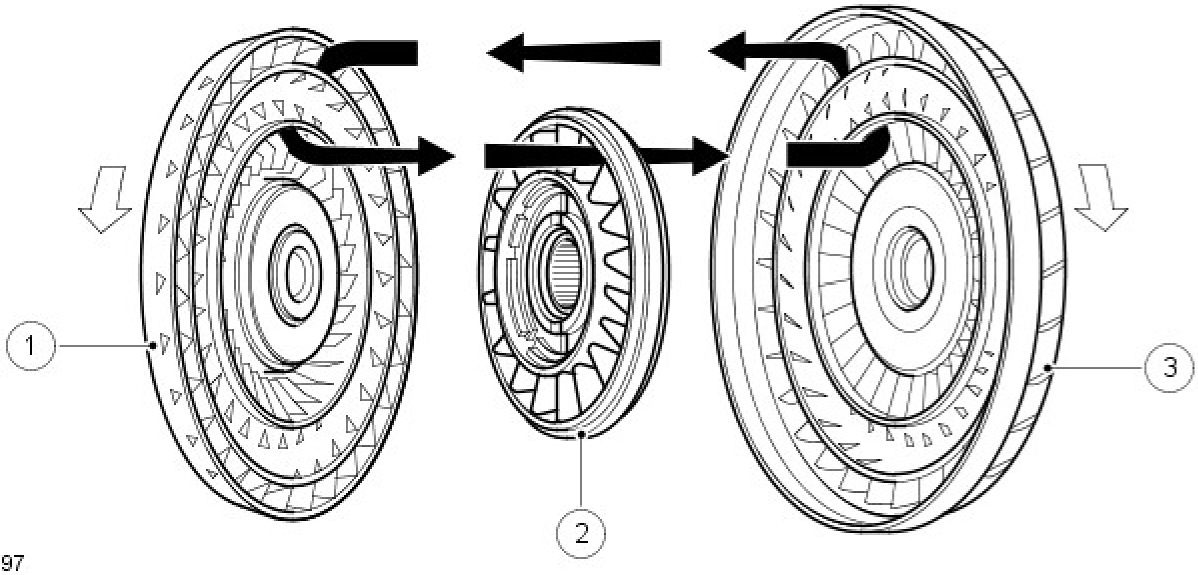
The converter housing cover has four threaded bosses which provide for attachment of the engine drive plate which is connected to the engine crankshaft. The threaded bosses also provide for location of special tools which are required to remove the torque converter from the bell housing.

The torque converter used on TdV6 models is similar in construction to the torque converter on petrol models but contains a torsional vibration damper. The damper smooths the output from the engine and prevents unwanted vibration from being passed to the transmission.

Impeller

Fluid Flow

- NOTE: Typical torque converter shown



E42397

Item	Part Number	Description
1	-	Turbine
2	-	Stator
3	-	Impeller

When the engine is running the rotating impeller acts as a centrifugal pump, picking up fluid at its centre and discharging it at high velocity through the blades on its outer rim. The design and shape of the blades and the curve of the impeller body cause the fluid to rotate in a clockwise direction as it leaves the impeller. This rotation improves the efficiency of the fluid as it contacts the outer row of blades on the turbine.

The centrifugal force of the fluid leaving the blades of the impeller is passed to the curved inner surface of the turbine via the tip of the blades. The velocity and clockwise rotation of the fluid causes the turbine to rotate.

Turbine

The turbine is similar in design to the impeller with a continuous row of blades. Fluid from the impeller enters the turbine through the tip of the blades and is directed around the curved body of the turbine to the root of the blades. The curved surface redirects the fluid back in the opposite direction to which it entered the turbine, effectively increasing the turning force applied to the turbine from the impeller. This principle is known as torque multiplication.

When engine speed increases, turbine speed also increases. The fluid leaving the inner row of the turbine blades is rotated in an anti-clockwise direction due to the curve of the turbine and the shape of the blades. The fluid is now flowing in the opposite direction to the engine rotation and therefore the impeller. If the fluid was allowed to hit the impeller in this condition, it would have the effect of applying a brake to the impeller, eliminating the torque multiplication effect. To prevent this, the stator is located between the impeller and the turbine.

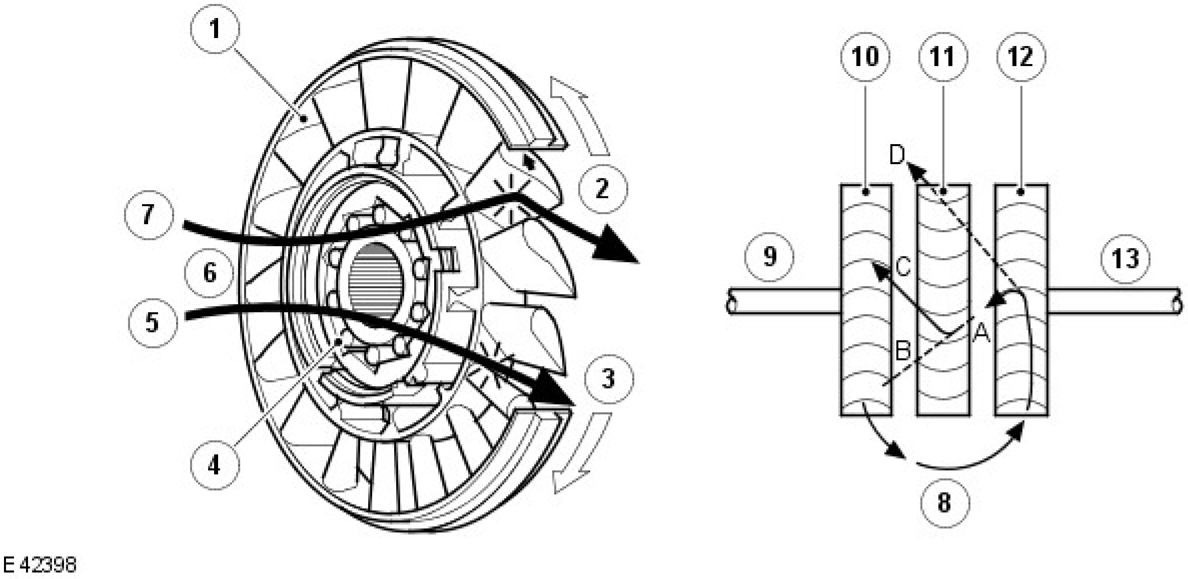
Stator

The stator is located on the splined transmission input shaft via a freewheel clutch. The stator comprises a number of blades which are aligned in an opposite direction to those of the impeller and turbine. The main function of the stator is to redirect the returning fluid from the turbine, changing its direction to that of the impeller.

The redirected fluid from the stator is directed at the inner row of blades of the impeller, assisting the engine in turning the impeller. This sequence increases the force of the fluid emitted from the impeller and thereby increases the torque multiplication effect of the torque converter.

Stator Functions

- NOTE: Typical stator shown



Item	Part Number	Description
1	-	Blades
2	-	Stator held – fluid flow redirected
3	-	Stator rotates freely
4	-	Roller
5	-	Converter at coupling speed
6	-	Fluid flow from turbine
7	-	Converter multiplying
8	-	Fluid flow from impeller
9	-	Drive from engine
10	-	Impeller
11	-	Stator
12	-	Turbine
13	-	Output to transmission

Refer to the 'Stator Functions' illustration

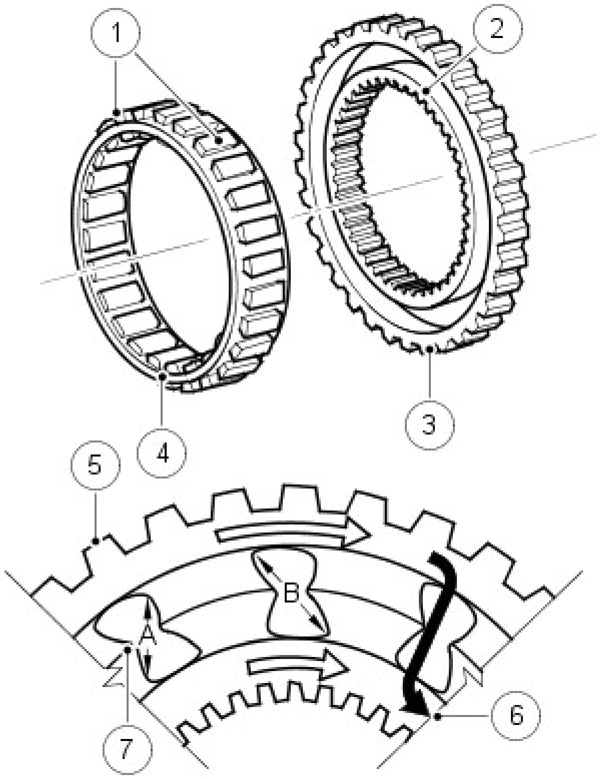
Fluid emitted from the impeller acts on the turbine. If the turbine is rotating at a slower speed than the fluid from the impeller, the fluid will be deflected by the turbine blades in the path '**A**'. The fluid is directed at and deflected by the stator blades from path '**B**' to path '**C**'. This ensures that the fluid is directed back to the pump in the optimum direction. In this condition the sprag clutch is engaged and the force of the fluid on the stator blades assists the engine in rotating the impeller

As the rotational speed of the engine and therefore the turbine increases, the direction of the fluid leaving the turbine changes to path '**D**'. The fluid is now directed from the turbine to the opposite side of the stator blades, rotating the stator in the opposite direction. To prevent the stator from resisting the smooth flow of the fluid from the turbine, the sprag clutch releases, allowing the stator to rotate freely on its shaft.

When the stator becomes inactive, the torque converter no longer multiplies the engine torque. When the torque converter reaches this operational condition it ceases to multiply the engine torque and acts solely as a fluid coupling, with the impeller and the turbine rotating at approximately the same speed.

The stator uses a sprag type, one way, freewheel clutch. When the stator is rotated in a clockwise direction the sprags twist and are wedged between the inner and outer races. In this condition the sprags transfer the rotation of the outer race to the inner race which rotates at the same speed.

One Way Free Wheel Clutch – Typical



E42712

Item	Part Number	Description
1	-	Sprags
2	-	Inner race
3	-	Outer race
4	-	Sprag and cage assembly
5	-	Sprag outer race
6	-	Sprag inner race
7	-	Retaining ring

The free wheel clutch can perform three functions; hold the stator stationary, drive the stator and free wheel allowing the stator to rotate without a drive output. The free wheel clutch used in the 6HP26 transmission is of the sprag type and comprises an inner and outer race and a sprag and cage assembly. The inner and outer races are pressed into their related components with which they rotate. The sprag and cage assembly is located between the inner and outer races.

The sprags are located in a cage which is a spring which holds the sprags in the 'wedge' direction and maintains them in contact with the inner and outer races.

Referring to the illustration, the sprags are designed so that the dimension 'B' is larger than the distance between the inner and outer race bearing surfaces. When the outer race rotates in a clockwise direction, the sprags twist and the edges across the dimension 'B' wedge between the races, providing a positive drive through each sprag to the inner race. The dimension 'A' is smaller than the distance between the inner and outer race bearing surfaces. When the outer race rotates in an anti-clockwise direction, the dimension 'A' is too small to allow the sprags to wedge between the races, allowing the outer race to rotate freely.

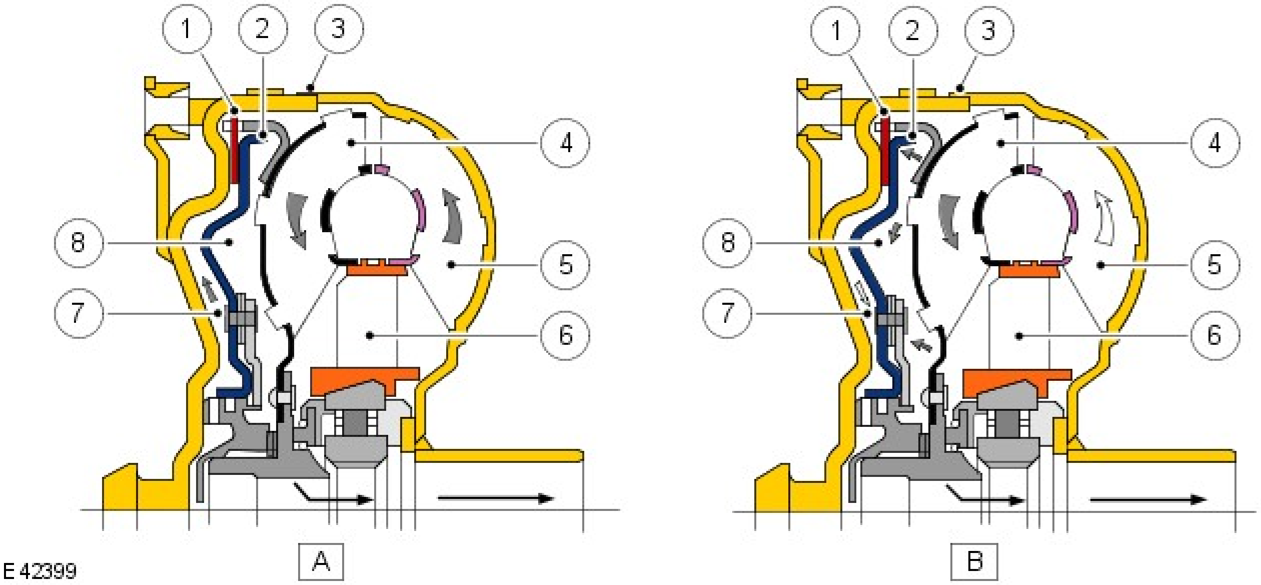
On the illustration shown, when the outer race is rotated in a clockwise direction, the sprags twist and are 'wedged' between the inner and outer races. The sprags then transfer the rotation of the outer race to the inner race, which rotates at the same speed.

Lock-Up Clutch Mechanism

The Torque Converter Clutch (TCC) is hydraulically controlled by an electronic pressure regulating solenoid (EPRS6) which is controlled by the TCM. This allows the torque converter to have three states of operation as follows:

- Fully engaged
- Controlled slip variable engagement
- Fully disengaged.

The TCC is controlled by two hydraulic spool valves located in the valve block. These valves are actuated by pilot pressure supplied via a solenoid valve which is also located in the valve block. The solenoid valve is operated by PWM signals from the TCM to give full, partial or no lock-up of the torque converter.



Item	Part Number	Description
A	-	Unlocked condition
B	-	Locked condition
1	-	Clutch plate
2	-	Clutch piston
3	-	Torque converter body
4	-	Turbine
5	-	Impeller
6	-	Stator
7	-	Piston chamber
8	-	Turbine chamber

The lock-up clutch is a hydro-mechanical device which eliminates torque converter slip, improving fuel consumption. The engagement and disengagement is controlled by the TCM to allow a certain amount of controlled 'slip'. This allows a small difference in the rotational speeds of the impeller and the turbine which results in improved shift quality. The lock-up clutch comprises a piston and a clutch friction plate.

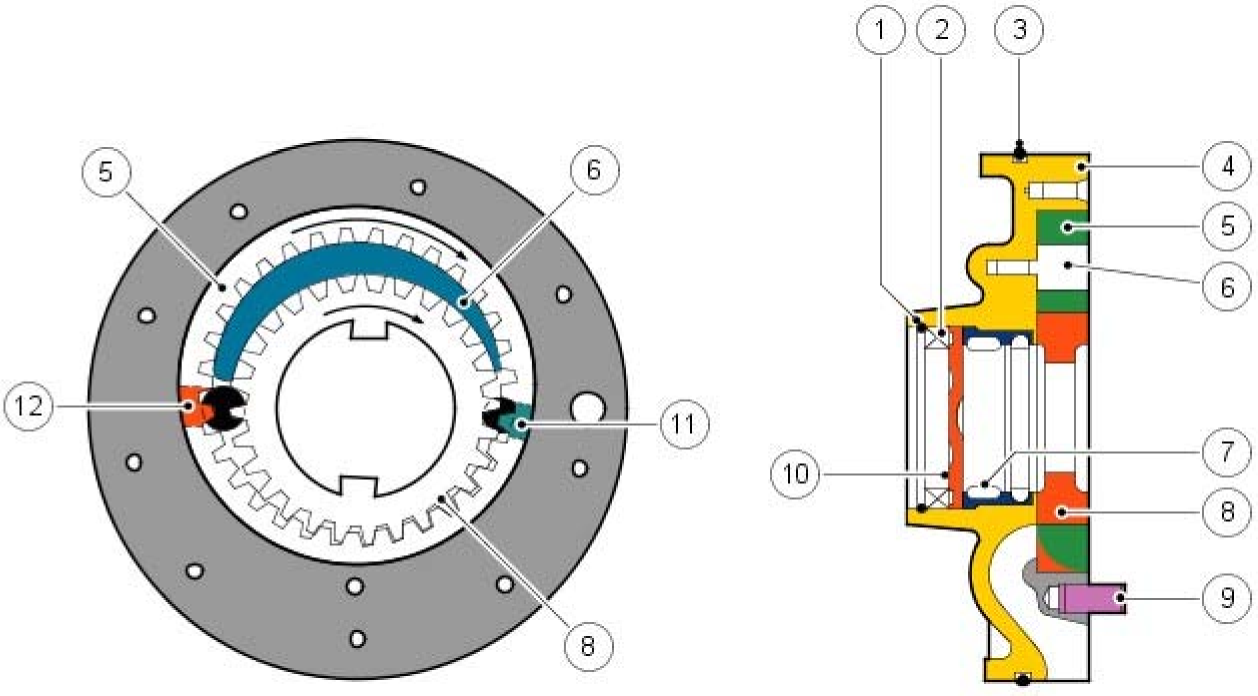
In the unlocked condition, the oil pressure supplied to the piston chamber and the turbine chamber is equal. Pressurised fluid flows through a drilling in the turbine shaft and through the piston chamber to the turbine chamber. In this condition the clutch plate is held away from the torque converter body and torque converter slip is permitted.

In the locked condition, the TCC spool valves are actuated by the electronic pressure regulating solenoid (EPRS6). The fluid flow in the unlocked condition is reversed and the piston chamber is vented. Pressurised fluid is directed into the turbine chamber and is applied to the clutch piston. The piston moves with the pressure and pushes the clutch plate against the torque converter body. As the pressure increases, the friction between the clutch plate and the body increases, finally resulting in full lock-up of the clutch plate with the body. In this condition there is direct mechanical drive from the engine crankshaft to the transmission planetary gear train.

FLUID PUMP

The fluid pump is an integral part of the transmission. The fluid pump is used to supply hydraulic pressure for the operation of the control valves and clutches, to pass the fluid through the transmission cooler and to lubricate the gears and shafts.

The 6HP26 fluid pump is a crescent type pump and is located between the intermediate plate and the torque converter. The pump has a delivery rate of 16cm^3 per revolution.



E42400

Item	Part Number	Description
1	-	Securing ring
2	-	Shaft oil seal
3	-	O-ring seal
4	-	Pump housing
5	-	Ring gear
6	-	Crescent spacer
7	-	Roller bearing
8	-	Impeller
9	-	Centring pin
10	-	Spring washer
11	-	Outlet port (high pressure)
12	-	Inlet port (low pressure)

The pump comprises a housing, a crescent spacer, an impeller and a ring gear. The housing has inlet and outlet ports to direct flow and is located in the intermediate plate by a centring pin. The pump action is achieved by the impeller, ring gear and crescent spacer.

The crescent spacer is fixed in its position by a pin and is located between the ring gear and the impeller. The impeller is driven by drive from the torque converter hub which is located on a needle roller bearing in the pump housing. The impeller teeth mesh with those of the ring gear. When the impeller is rotated, the motion is transferred to the ring gear which rotates in the same direction.

The rotational motion of the ring gear and the impeller collects fluid from the intake port in the spaces between the teeth. When the teeth reach the crescent spacer, the oil is trapped in the spaces between the teeth and is carried with the rotation of the gears. The spacer tapers near the outlet port. This reduces the space between the gear teeth causing a build up of fluid pressure as the oil reaches the outlet port. When the teeth pass the end of the spacer the pressurised fluid is released into the outlet port.

The fluid emerging from the outlet port is passed through the fluid pressure control valve. At high operating speeds the pressure control valve maintains the output pressure to the gearbox at a predetermined maximum level. Excess fluid is relieved from the pressure control valve and is directed, via the main pressure valve in the valve block, back to the pump inlet port. This provides a pressurised feed to the pump inlet which prevents cavitation and reduces pump noise.

MECHATRONIC VALVE BLOCK

The Mechatronic valve block is located in the bottom of the transmission and is covered by the fluid pan. The valve block houses the TCM, electrical actuators, speed sensors and control valves which provide all electro-hydraulic control for all transmission functions. The Mechatronic valve block comprises the following components:

- TCM
- Six pressure regulator solenoids
- One shift control solenoid
- One damper
- Twenty one hydraulic spool valves
- Manually operated selector valve
- Temperature sensor
- Turbine speed sensor
- Output shaft speed sensor.

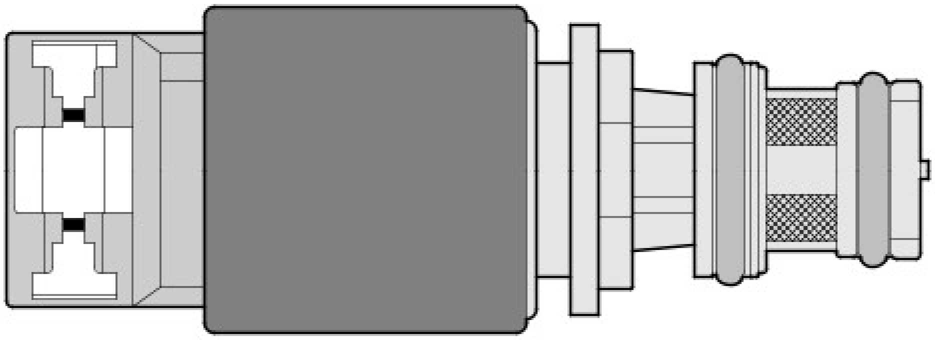
Electronic Pressure Regulator Solenoids (EPRS)



E42713

Six Electronic Pressure Regulator Solenoids (EPRS) are located in the valve block. The solenoids are controlled by Pulse Width Modulation (PWM) signals from the TCM. The solenoids convert the electrical signals into hydraulic control pressure proportional to the signal to actuate the spool valves for precise transmission operation.

The following table shows EPRS and their associated functions:

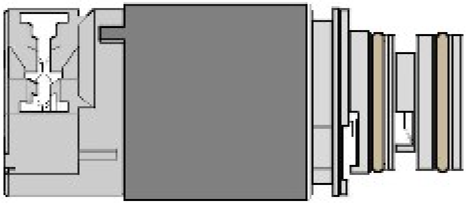
EPRS	Function
1	Clutch A
2	Clutch B
3	Clutch C
4	Brake clutches D and E
5	System pressure control
6	Torque converter lock-up control

Solenoids EPRS 1, 3 and 6 supply a lower control pressure as the signal amperage increases and can be identified by a black connector cap. The TCM operates the solenoids using PWM signals. The TCM monitors engine load and clutch slip and varies the solenoid duty cycle accordingly. The solenoids have a 12V operating voltage and a pressure range of 0 - 4.6 bar (0 - 67 lbf.in^2).

Solenoids EPRS 2, 4 and 5 supply a higher control pressure as the signal amperage increases and can be identified by a green connector cap. The solenoids are normally open, regulating flow solenoid valves. The TCM operates the solenoids using a PWM ground proportional to the required increasing or decreasing clutch pressures. The solenoids have a 12V operating voltage and a pressure range of 4.6 - 0 bar (67 - 0 lbf.in^2).

The resistance of the coil winding for the EPRS solenoids is 5.05 ohms at 20°C (68°F).

Control Solenoid



E42714

A shift control Solenoid Valve (SV) is located in the valve block. The solenoid is controlled by the TCM and converts electrical signals into hydraulic control signals to control clutch application.

The shift control solenoid is an open/closed, on/off solenoid which is controlled by the TCM switching the solenoid to earth. The

TCM also supplies power to the solenoid. The TCM energises the solenoid in a programmed sequence for clutch application for gear ratio changes and shift control.

The resistance of the solenoid coil winding within the solenoid is between 26 to 30.4 ohms at 20°C (68°F).

Sensors

Speed Sensors

The turbine speed sensor and the output shaft speed sensor are Hall effect type sensors located in the Mechatronic valve block and are not serviceable items. The TCM monitors the signals from each sensor to determine the input (turbine) speed and the output shaft speed.

The turbine speed is monitored by the TCM to calculate the slip of the torque converter clutch and internal clutch slip. This signal allows the TCM to accurately control the slip timing during shifts and adjust clutch application or release pressure for overlap shift control.

The output shaft speed is monitored by the TCM and compared to engine speed signals received on the CAN bus from the ECM. Using a comparison of the two signals the TCM calculates the transmission slip ratio for plausibility and maintains adaptive pressure control.

Temperature Sensor

The temperature sensor is also located in the Mechatronic valve block. The TCM uses the temperature sensor signals to determine the temperature of the transmission fluid. These signals are used by the TCM to control the transmission operation to promote faster warm-up in cold conditions or to assist with fluid cooling by controlling the transmission operation when high fluid temperatures are experienced. If the sensor fails, the TCM will use a default value and a fault code will be stored in the TCM.

Damper

There is one damper located in the valve housing. The damper is used to regulate and dampen the regulated pressure supplied via EPRS 5. The damper is load dependent through modulation of the damper against return spring pressure.

The damper comprises a piston, a housing bore and a spring. The piston is subject to the pressure applied by the spring. The bore has a connecting port to the function to which it applies. Fluid pressure applied to the applicable component (i.e. a clutch) is also subjected to the full area of the piston, which moves against the opposing force applied by the spring. The movement of the piston creates an action similar to a shock absorber, momentarily delaying the build up of pressure in the circuit. This results in a more gradual application of clutches improving shift quality.

Spool Valves

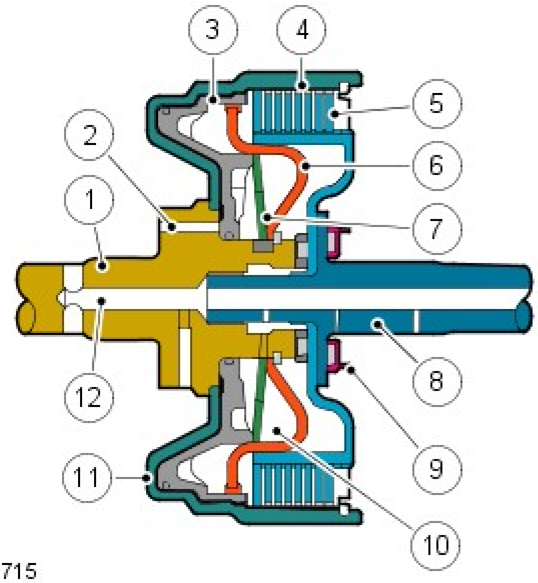
The valve block contains twenty one spool valves which control various functions of the transmission. The spool valves are of conventional design and are operated by fluid pressure.

Each spool valve is located in its spool bore and held in a default (unpressurised) position by a spring. The spool bore has a number of ports which allow fluid to flow to other valves and clutches to enable transmission operation. Each spool has a piston which is waisted to allow fluid to be diverted into the applicable ports when the valve is operated.

When fluid pressure moves a spool, one or more ports in the spool bore are covered or uncovered. Fluid is prevented from flowing or is allowed to flow around the applicable waisted area of the spool and into another uncovered port. The fluid is either passed through galleries to actuate another spool, operate a clutch or is returned to the fluid pan.

DRIVE CLUTCHES

Multiplate Drive or Brake Clutch – Typical



Item	Part Number	Description
1	-	Input shaft
2	-	Main pressure supply port
3	-	Piston
4	-	Cylinder – External plate carrier
5	-	Clutch plate assembly
6	-	Baffle plate
7	-	Diaphragm spring
8	-	Output shaft
9	-	Bearing
10	-	Dynamic pressure equalisation chamber
11	-	Piston chamber
12	-	Lubrication channel

There are three drive clutches and two brake clutches used in the 6HP26 transmission. Each clutch comprises one or more friction plates dependent on the output controlled. A typical clutch consists of a number of steel outer plates and inner plates with friction material bonded to each face.

The clutch plates are held apart mechanically by a diaphragm spring and hydraulically by dynamic pressure. The pressure is derived from a lubrication channel which supplies fluid to the bearings etc. The fluid is passed via a drilling in the output shaft into the chamber between the baffle plate and the piston. To prevent inadvertent clutch application due to pressure build up produced by centrifugal force, the fluid in the dynamic pressure equalisation chamber overcomes any pressure in the piston chamber and holds the piston off the clutch plate assembly.

When clutch application is required, main pressure from the fluid pump is applied to the piston chamber from the supply port. This main pressure overcomes the low pressure fluid present in the dynamic pressure equalisation chamber. The piston moves, against the pressure applied by the diaphragm spring, and compresses the clutch plate assembly. When the main pressure falls, the diaphragm spring pushes the piston away from the clutch plate assembly, disengaging the clutch.

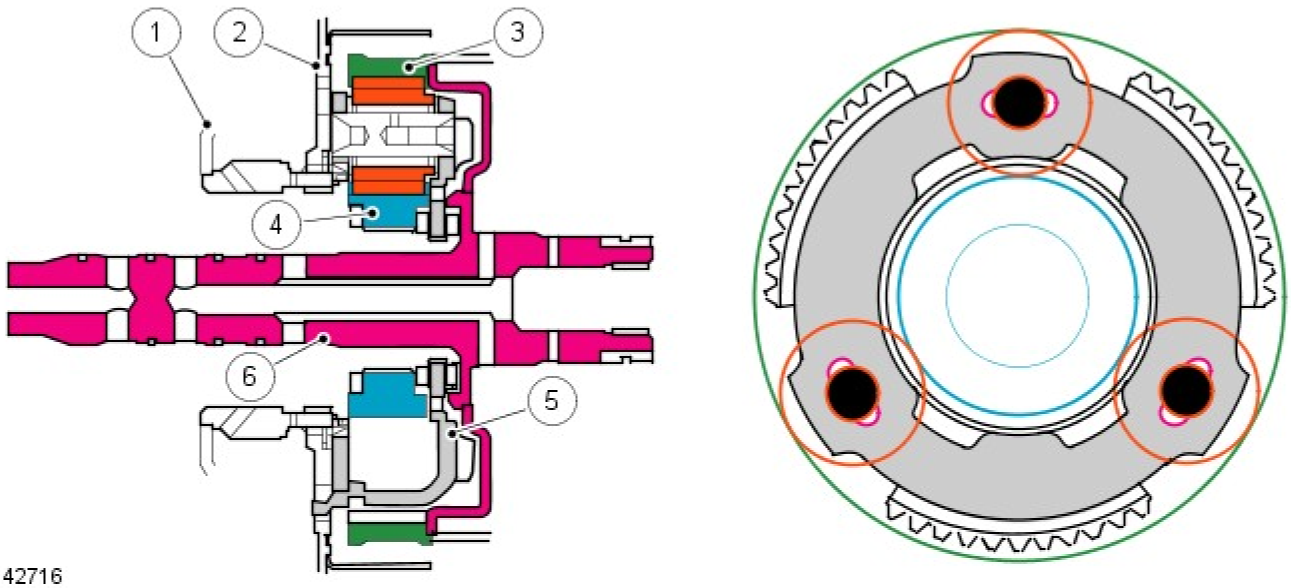
PLANETARY GEAR TRAINS

The planetary gear trains used on the 6HP26 transmission comprise a single web planetary gear train and a double web planetary gear train. These gear trains are known as Lepelletier type gear trains and together produce the six forward gears and the one reverse gear.

Single Web Planetary Gear Train

The single web planetary gear train comprises:

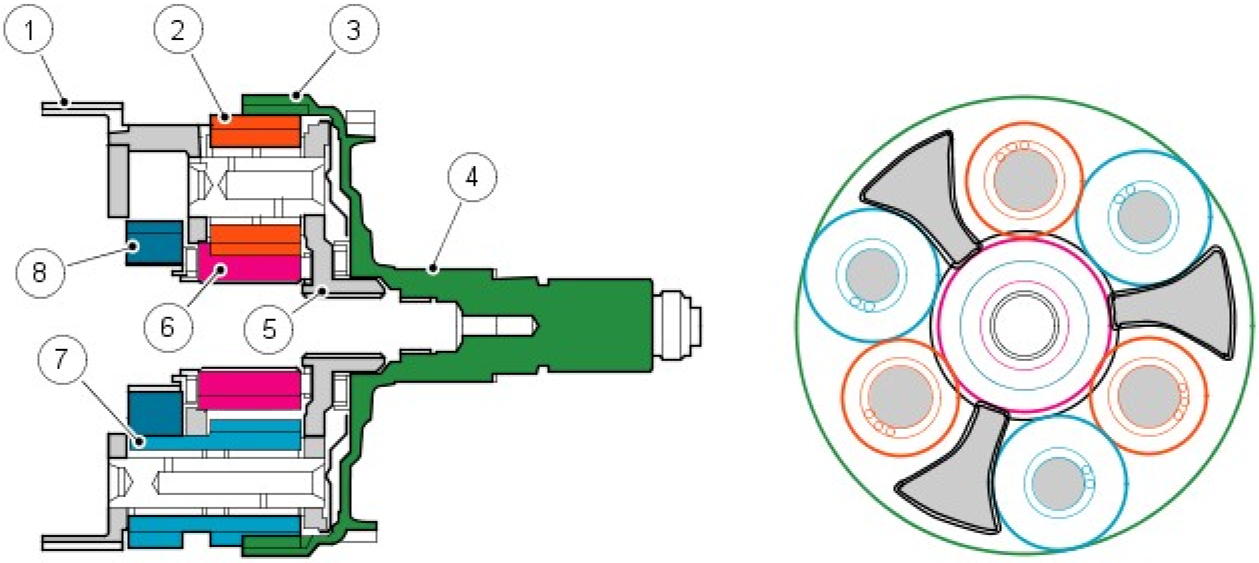
- One sunwheel
- Three planetary gears
- One planetary gear carrier (spider)
- One ring gear or annulus



E42716

Item	Part Number	Description
1	-	Cylinder
2	-	Baffle plate
3	-	Ring gear
4	-	Sun gear
5	-	Planetary gear spider
6	-	Torque converter input shaft

Double Web Planetary Gear Train



E42717

Item	Part Number	Description
1	-	Planetary gear spider
2	-	Planetary gears (short)
3	-	Ring gear
4	-	Output shaft
5	-	Planetary gear carrier
6	-	Sunwheel
7	-	Double planetary gears (long)
8	-	Sunwheel

The double planetary gear train comprises:

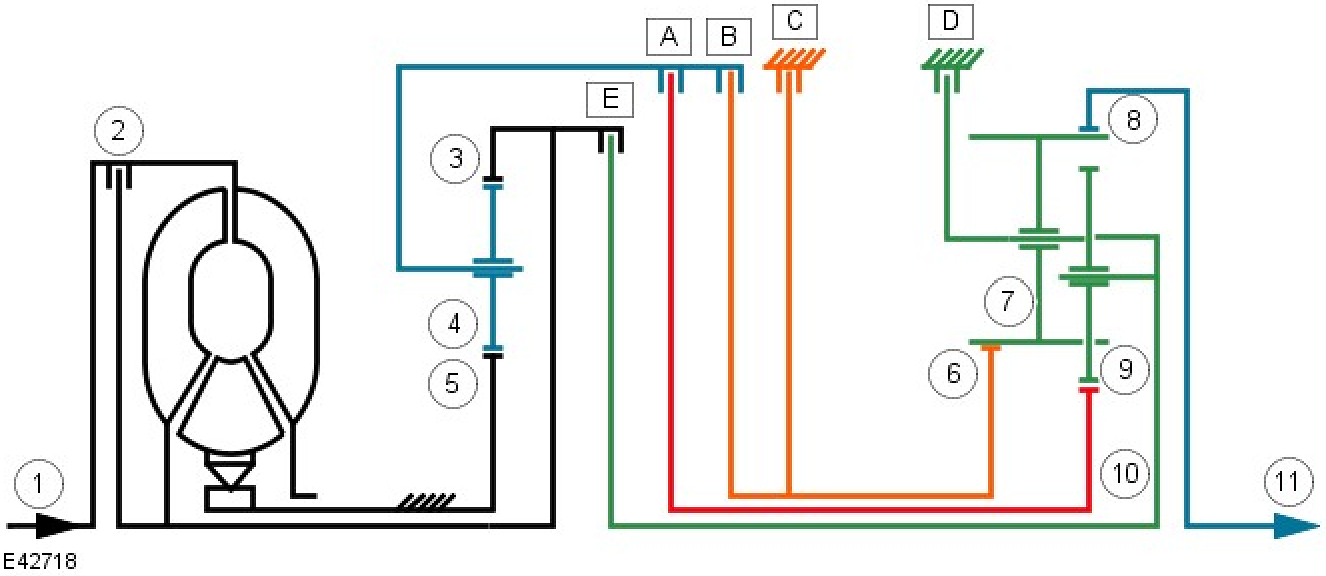
- Two sunwheels

- Three short planetary gears
- Three long planetary gears
- One planetary gear carrier
- One ring gear or annulus

POWER FLOWS

Operation of the transmission is controlled by the TCM which electrically activates various solenoids to control the transmission gear selection. The sequence of solenoid activation is based on programmed information in the module memory and physical transmission operating conditions such as vehicle speed, throttle position, engine load and selector lever position.

Powerflow Schematic



Item	Part Number	Description

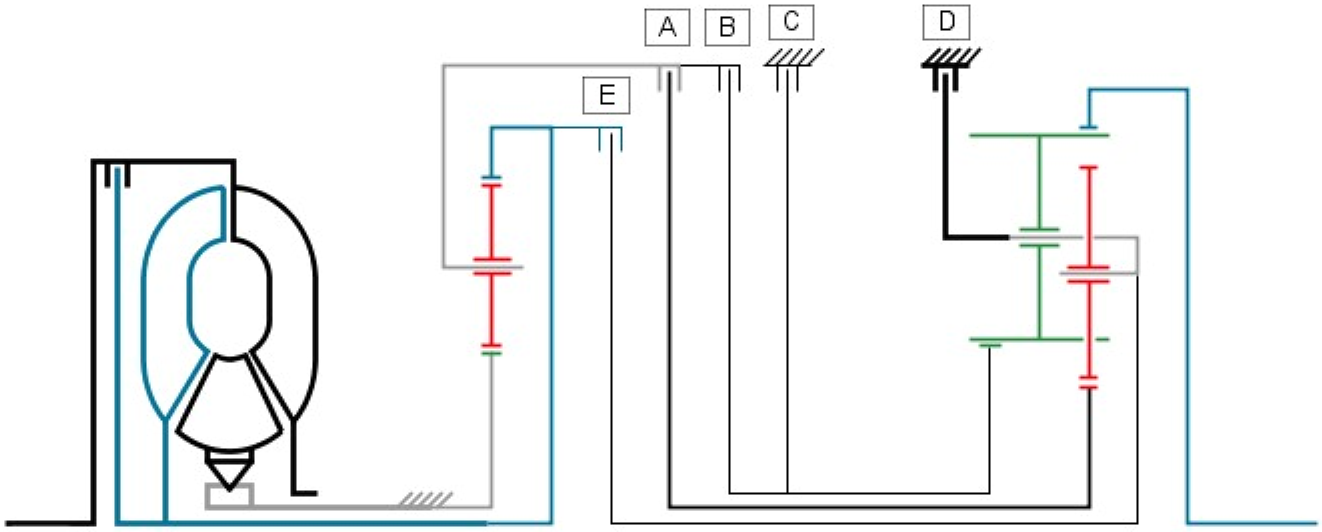
The shift elements are three rotating multiplate clutches (A, B and E) and two fixed multiplate brakes © and D). All shifts from 1st to 6th gears are power-on overlapping shifts. Overlapping shifts can be described as one of the clutches continuing to transmit drive at a lower main pressure until the next required clutch is able to accept the input torque.

The shift elements, clutches and brakes are actuated hydraulically. Fluid pressure is applied to the required clutch and/or brake, pressing the plates together and allowing drive to be transmitted through the plates. The purpose of the shift elements is to perform power-on shifts with no interruption to traction and smooth transition between gear ratios.

Power Flow 1st Gear



E42720

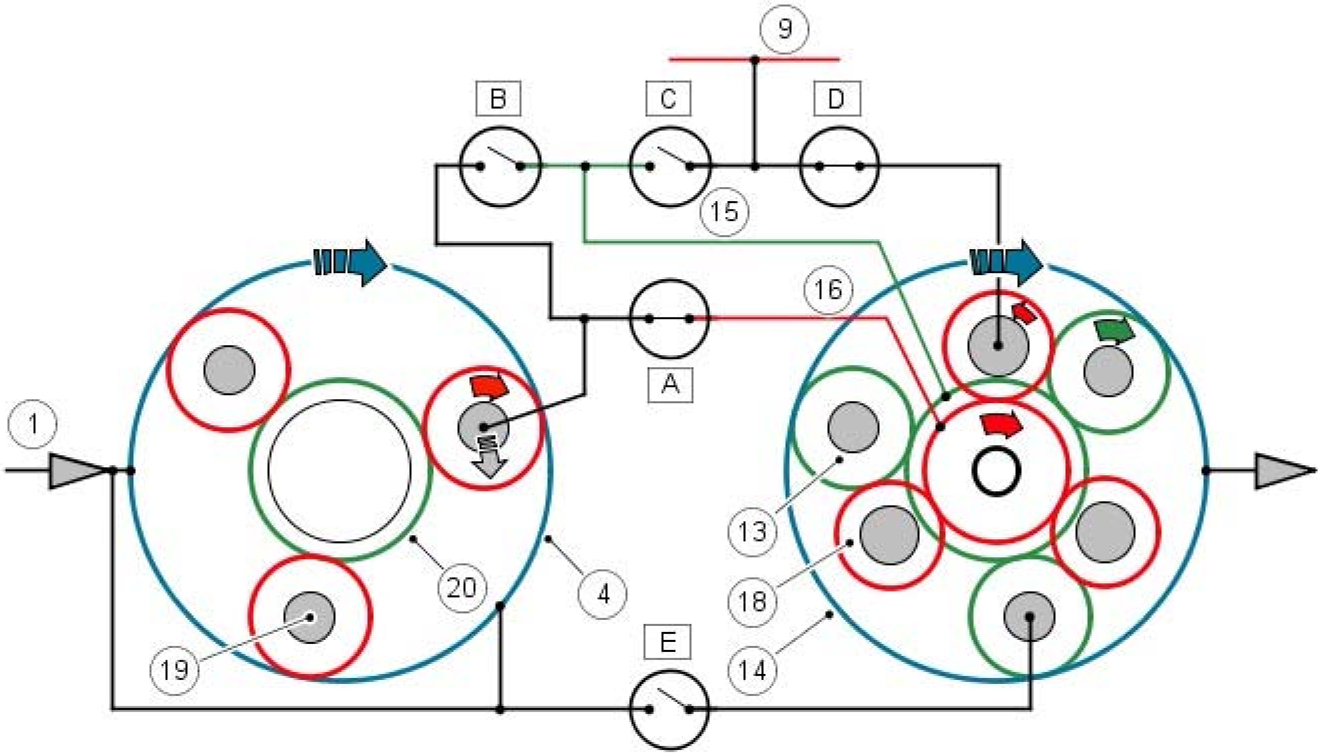
The gear selector lever and the manual selector valve spool are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

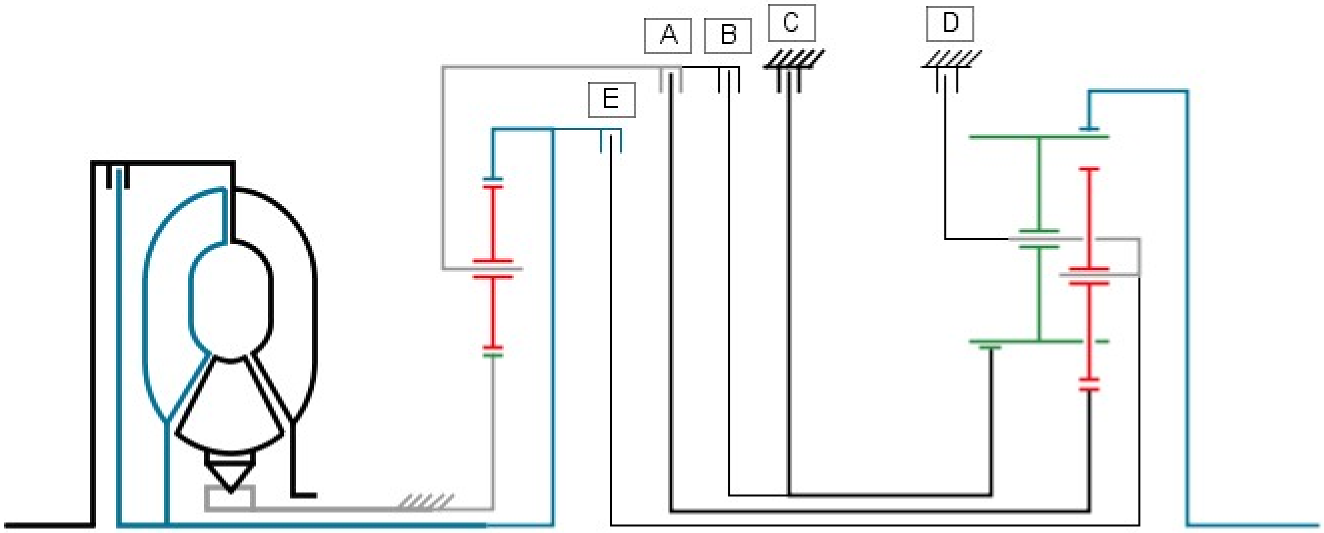
The double web planetary gear train is locked against the transmission housing by brake 'D'. This allows ring gear 2 (output shaft) to be driven in the same direction as the engine via the long planetary gears.

- NOTE: Refer to 'Shift Elements' illustration for key



E42721

Power Flow 2nd Gear



E42722

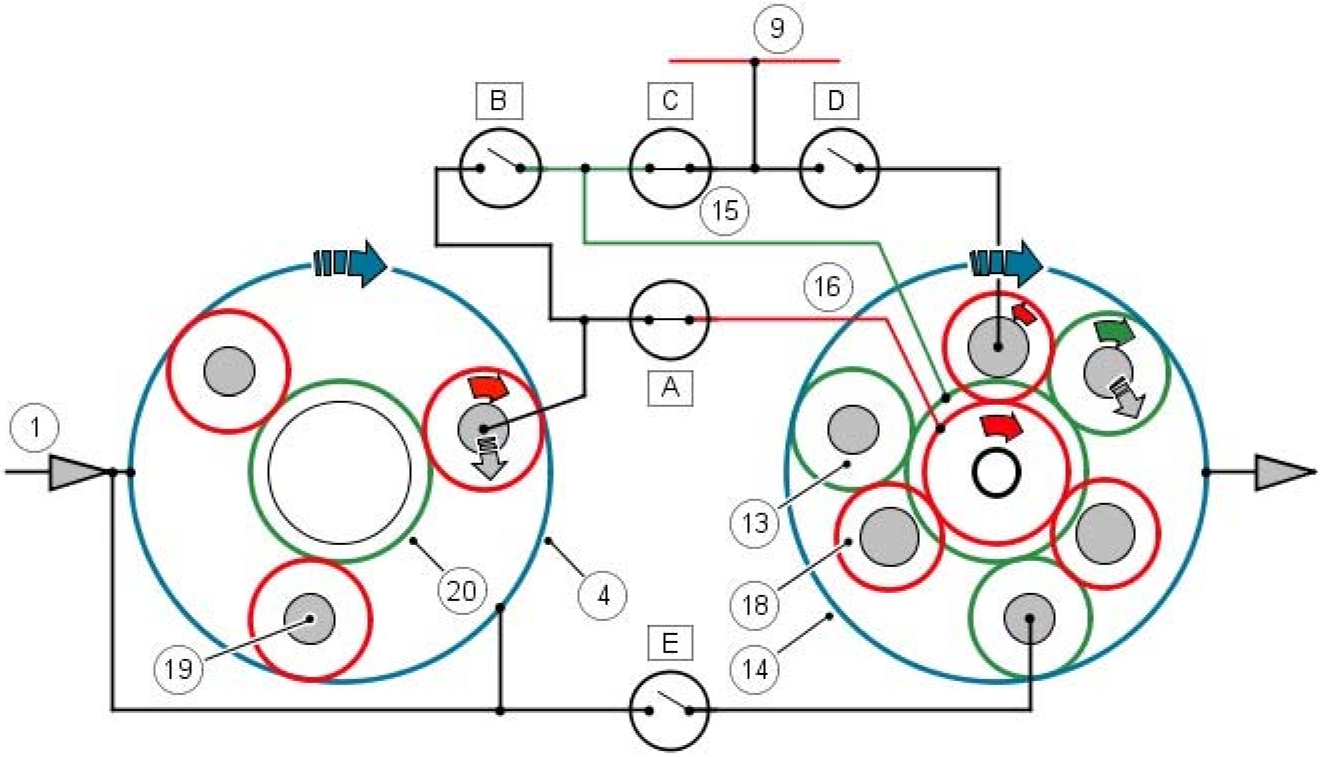
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

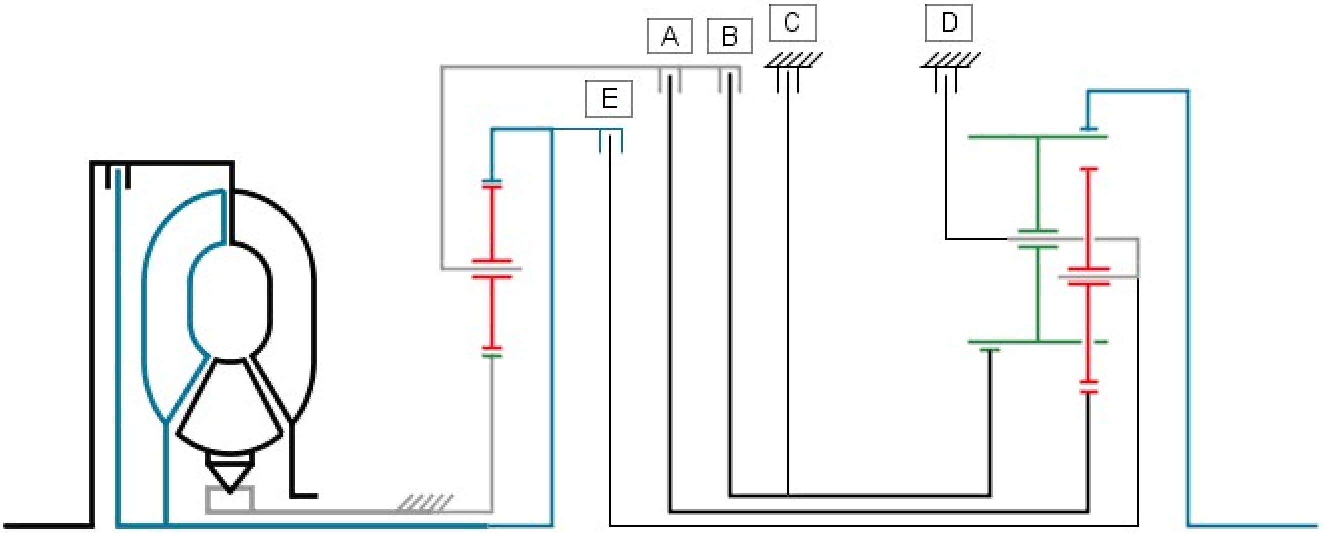
Sunwheel 2 is locked to the transmission housing by brake clutch 'C'. The long planetary gears, which are also meshed with the short planetary gears, roll around the fixed sunwheel 2 and transmit drive to the double web planetary gear train carrier and ring gear 2 in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E42723

Power Flow 3rd Gear



E42724

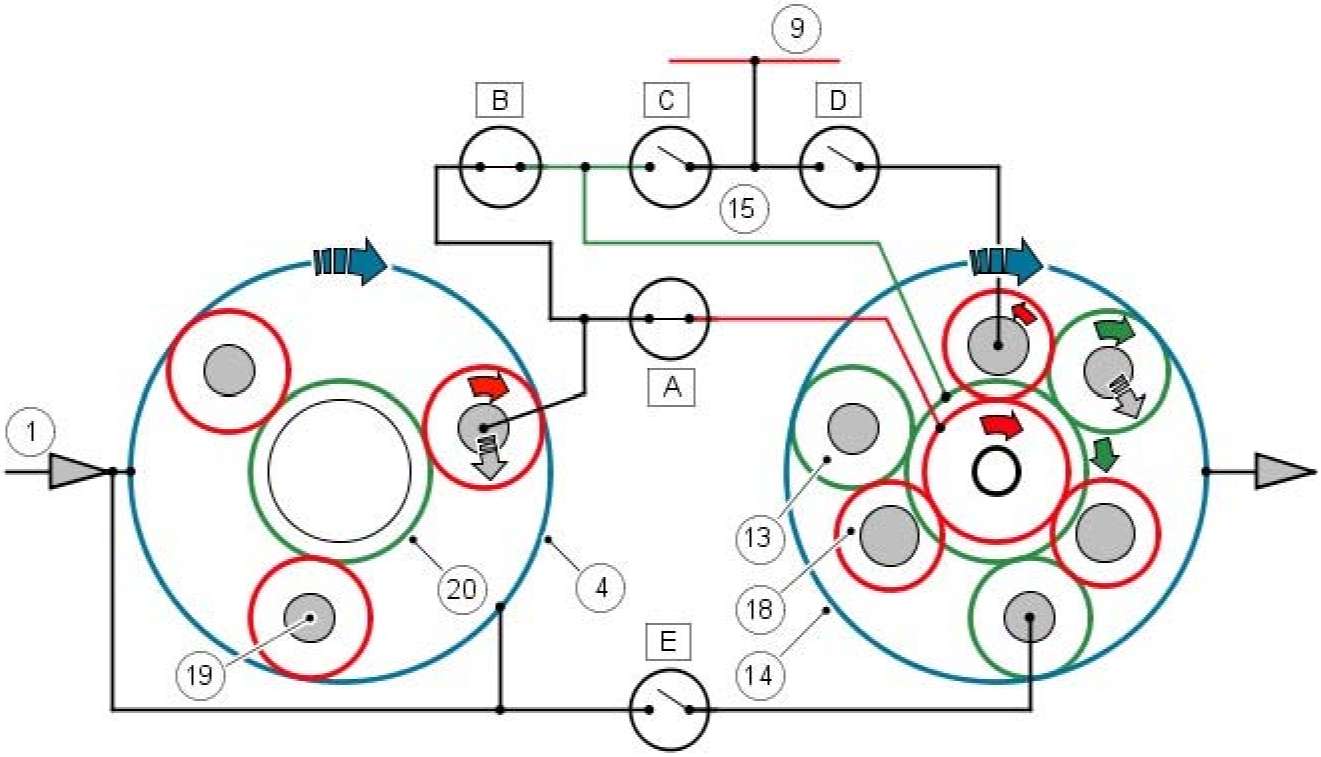
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to the ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

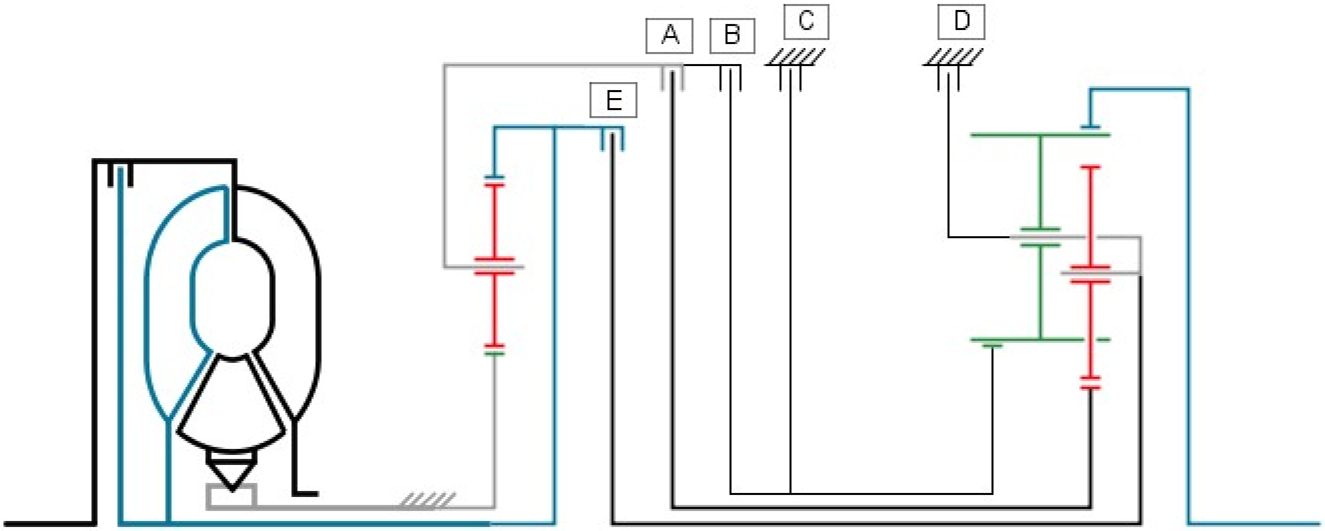
Sunwheel 2 is driven via clutch 'B' which is engaged. The long planetary gears, which are also meshed with the short planetary gears, cannot roll around the fixed sunwheel 2 and transmit drive to the locked double web planetary gear train carrier in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E42725

Power Flow 4th Gear



E42726

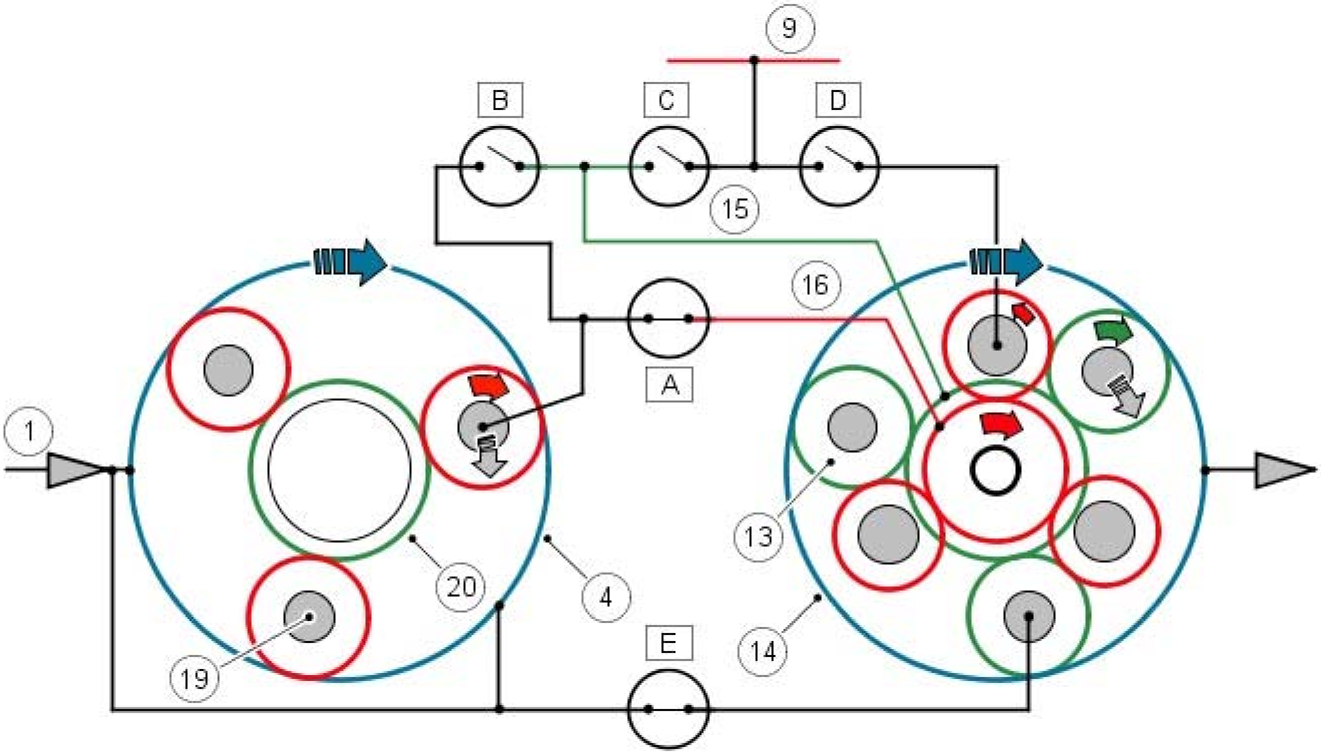
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

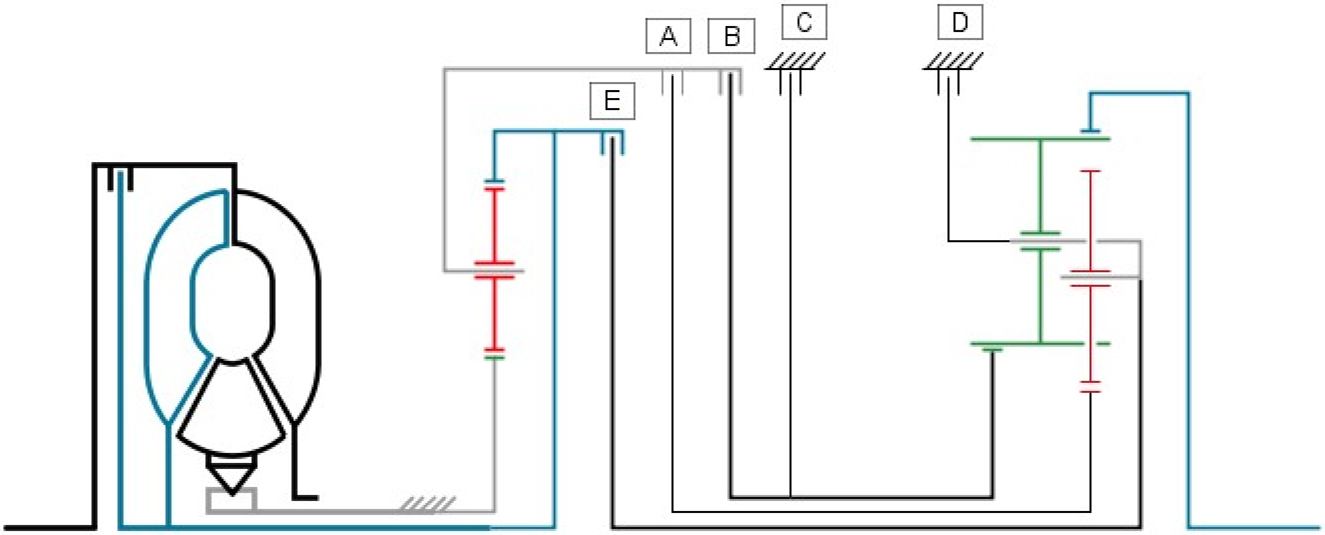
The double web planetary gear carrier is driven via clutch 'E' which is engaged. The long planetary gears, which are also meshed with the short planetary gears, and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E42727

Power Flow 5th Gear



E42728

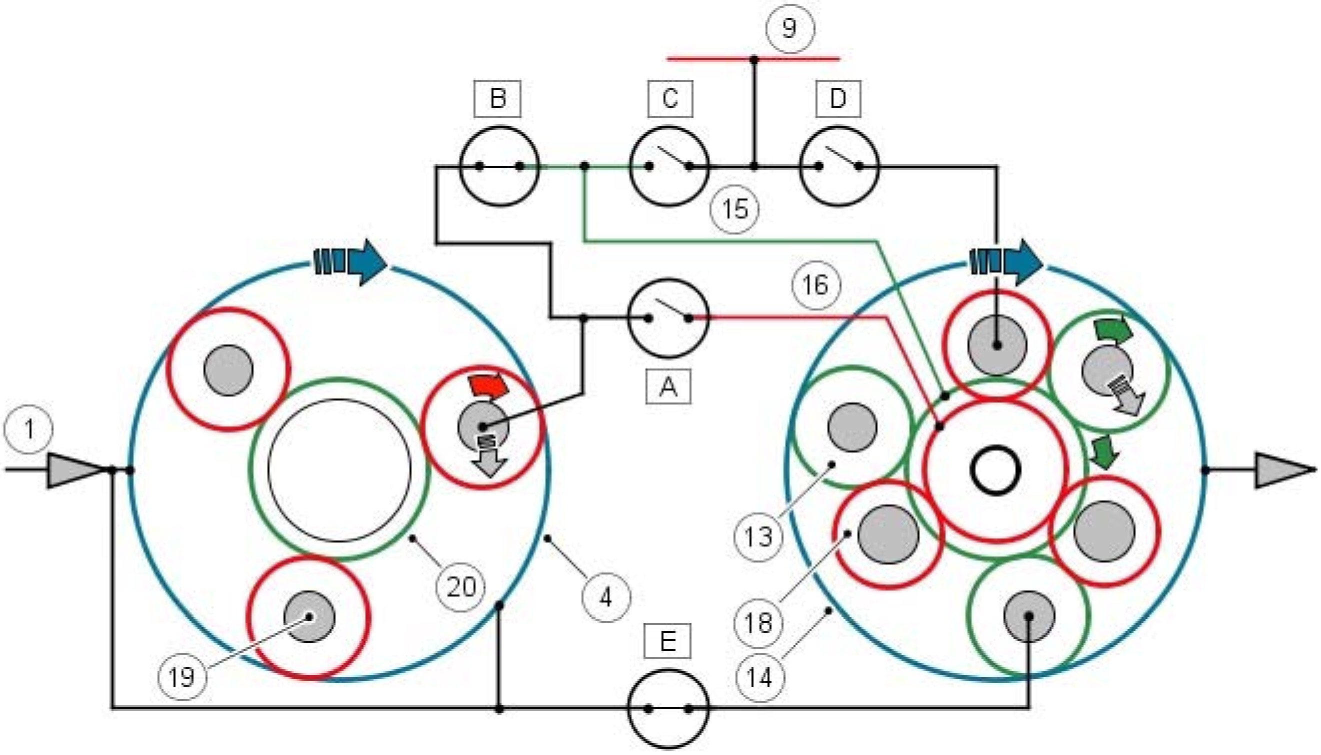
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears which rotate around sunwheel 1. This drives the planetary gear carrier 1 and also the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

When clutch 'A' is engaged, sunwheel 3 in the double web planetary gear train is driven and meshes with the short planetary gears.

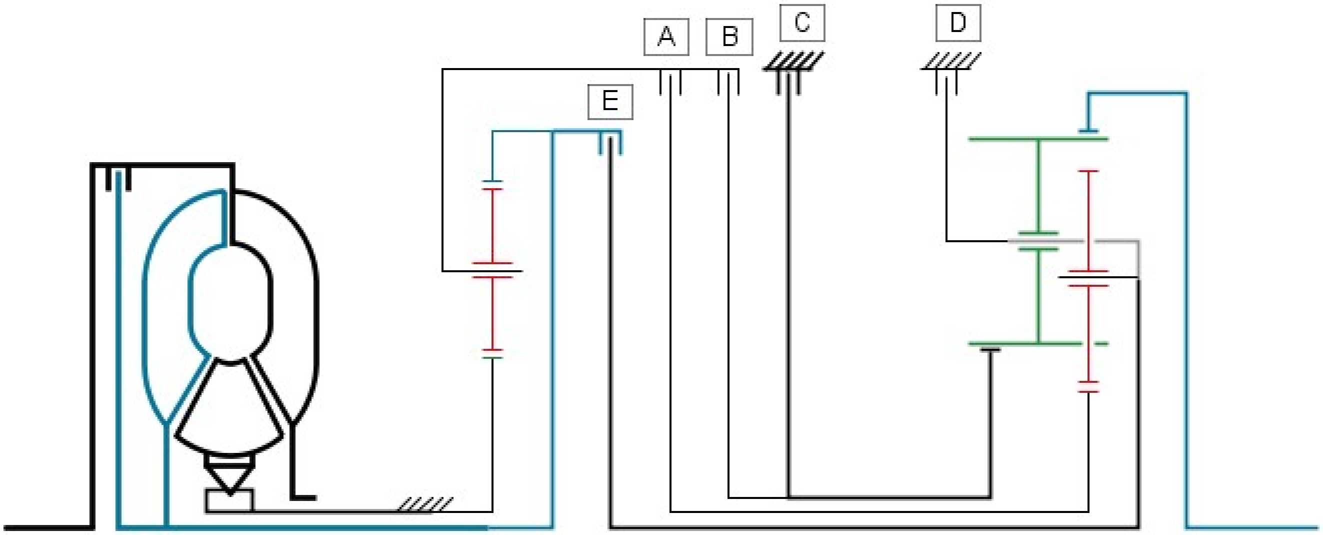
The long planetary gears, which are also meshed with the short planetary gears, and the double web planetary gear carrier, drive ring gear 2 in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E42729

Power Flow 6th Gear



E42730

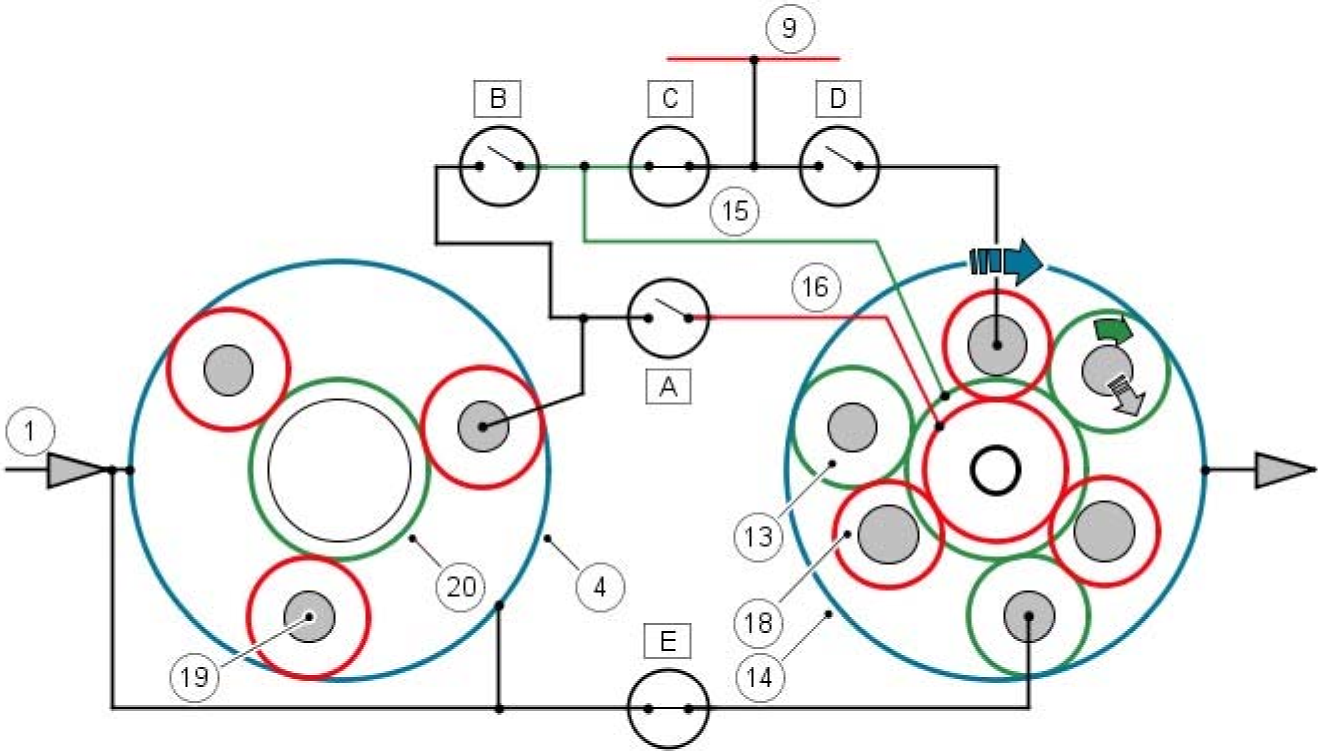
The gear selector lever and the manual selector spool valve are in the 'D' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Clutches 'A' and 'B' are released, removing the effect of the single web planetary gear train.

Clutch brake 'C' is applied which locks sunwheel 2 to the transmission housing.

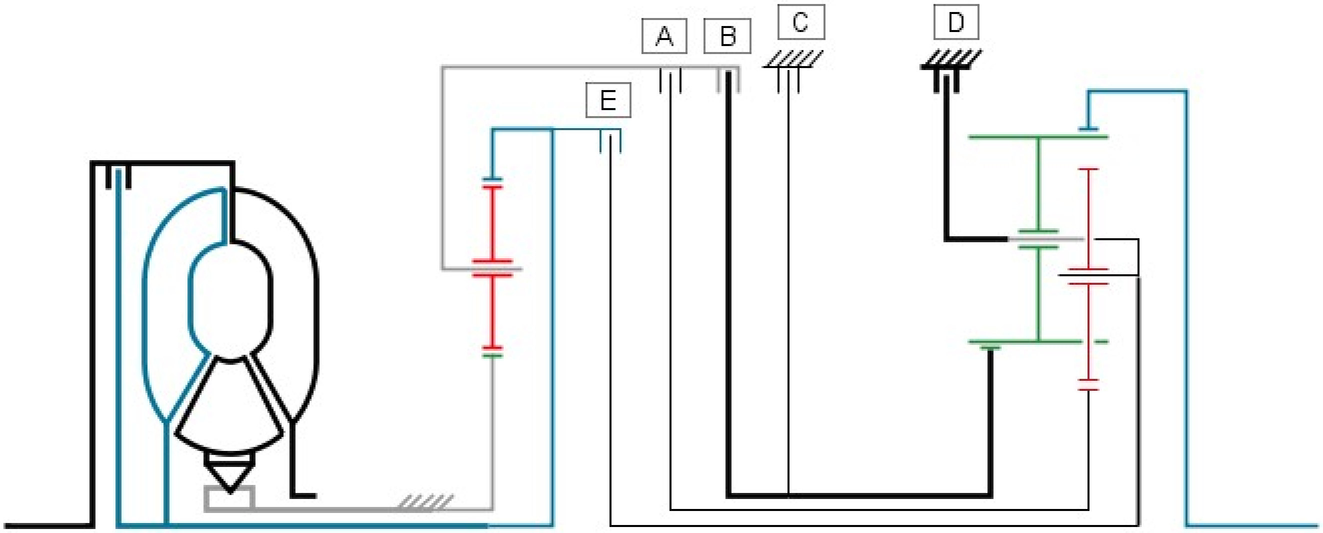
Clutch 'E' is engaged and drives the double web planetary gear carrier. This causes the long planetary gears to rotate around the fixed sunwheel 2 and transmit drive to ring gear 2 which is driven in the direction of engine rotation.

- NOTE: Refer to 'Shift Elements' illustration for key



E42731

Power Flow Reverse Gear



E42732

The gear selector lever and the manual selector spool valve are in the 'R' position. Engine torque is transmitted from the torque converter turbine shaft to ring gear 1 of the single web planetary gear train and the outer plate carrier of clutch 'E'.

Ring gear 1 drives the planetary gears of the single web planetary gear train which rotate around the fixed sunwheel 1. This transmits the drive to the single web planetary gear carrier, the outer plate carrier of clutch 'A' and the inner plate carrier of clutch 'B'.

With clutch 'B' applied, sunwheel 2 in the double web planetary gear train is driven and meshes with the long planetary gears.

The double web planetary gear carrier is locked to the transmission housing by brake clutch 'D'. This allows ring gear 2 to be driven in the opposite direction to engine rotation by the long planetary gears.

- NOTE: Refer to 'Shift Elements' illustration for key

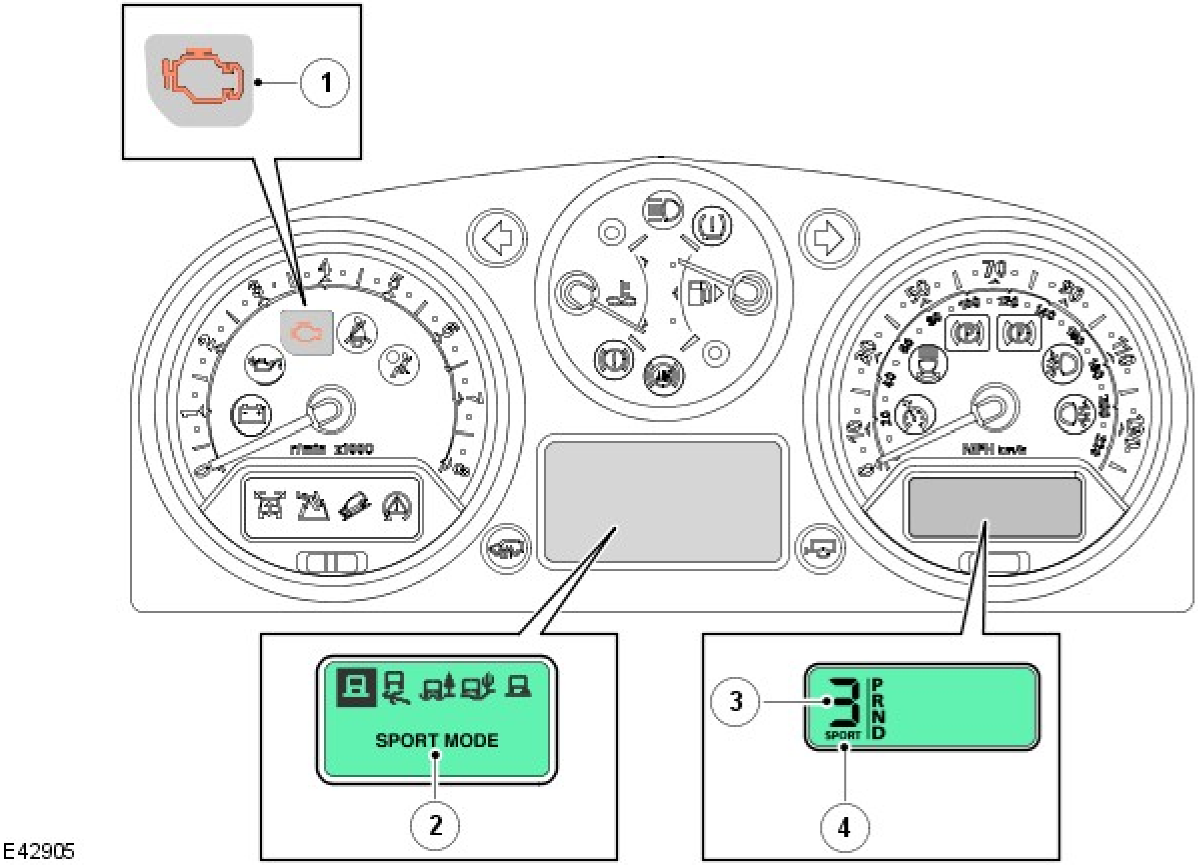
SELECTOR POSITION SWITCH

The Mechatronic valve block contains a position switch which is mechanically connected to the selector spool valve. The selector spool valve is connected by a selector shaft to the selector lever via a 'Bowden' selector cable.

The signals from the position switch are used by the TCM to determine the P, R, N or D selection made by the driver.

INSTRUMENT CLUSTER



Item	Part Number	Description
1	-	Malfunction Indicator Lamp (MIL)
2	-	Message centre
3	-	Selector lever position indicator
4	-	Mode display

The instrument cluster is connected to the TCM via the high speed CAN bus. Transmission status is transmitted by the TCM and displayed to the driver in one of two displays in the instrument cluster.
For additional information, refer to: Instrument Cluster (413-01 Instrument Cluster, Description and Operation).

Malfunction Indicator Lamp (MIL)

The MIL is located in the tachometer in the instrument cluster. Transmission related faults which may affect the vehicle emissions output will illuminate the MIL.

The MIL is illuminated by the ECM on receipt of a relevant fault message from the TCM on the high speed CAN. The nature of the fault can be diagnosed using a Land Rover approved diagnostic system which reads the fault codes stored in the TCM memory.

Transmission Status Display

The transmission status display is located in a Liquid Crystal Display (LCD) within the speedometer housing. The LCD shows the selector lever position and the selected transmission mode. When the selector lever is in the manual CommandShift™ position, the selector lever position display will show the selected gear ratio.

The following table shows the displays and their descriptions.

Symbol	Description
P	Park selected
R	Reverse selected
N	Neutral selected
D	Drive selected
1	1st gear selected (Manual CommandShift™ mode)
2	2nd gear selected (Manual CommandShift™ mode)
3	3rd gear selected (Manual CommandShift™ mode)
4	4th gear selected (Manual CommandShift™ mode)
5	5th gear selected (Manual CommandShift™ mode)
6	6th gear selected (Manual CommandShift™ mode)

Message Centre Display

The message centre is located in the lower centre of the instrument cluster. The message centre is a LCD to relay vehicle status and operating information to the driver. The message centre can display messages relating to a number of the vehicle systems. The following list shows the possible transmission related messages:

- TRANSMISSION FAULT LIMITED GEARS AVAILABLE
- TRANSMISSION FAULT AND OVERHEAT
- TRANSMISSION FAULT
- TRANSMISSION OVERHEAT

TRANSMISSION CONTROL MODULE (TCM)

The TCM is an integral part of the Mechatronic valve block which is located at the bottom of the transmission, within the fluid pan. The TCM is the main controlling component of the transmission.

The TCM processes signals from the transmission speed and temperature sensors, engine control module and other vehicle systems. From the received signal inputs and pre-programmed data, the module calculates the correct gear, torque converter clutch setting and optimum pressure settings for gear shift and lock-up clutch control.

The TCM outputs signals to control the shift control solenoid valve and the Electronic Pressure Regulator Solenoids (EPRS) to control the hydraulic operation of the transmission.

The ECM supplies the engine management data on the high speed CAN bus system. The TCM requires engine data to efficiently control the transmission operation, for example; flywheel torque, engine speed, accelerator pedal angle, engine temperature etc.

The steering angle sensor and the ABS module also supply data to the TCM on the high speed CAN bus system. The TCM uses data from these systems to suspend gear changes when the vehicle is cornering and/or the ABS module is controlling braking or traction control.

The selector lever is connected to the automatic transmission and the position switch in the transmission by a Bowden cable. Movement of the selector lever moves the position switch via the Bowden cable and the switch position informs the TCM of the selected position. The sport/manual +/- CommandShift switch passes manual/sport selections to the TCM. An additional switch provides a selector lever in park position signal. Once the selector lever position is confirmed, the TCM outputs appropriate information which is received by the instrument cluster to display the gear selection information in the message centre.

The Mechatronic valve block also contains the speed and temperature sensors. These are integral with the Mechatronic valve block and cannot be serviced individually. The speed sensors measure the transmission input and output speeds and pass signals to the TCM. The fluid temperature sensor is also located in the valve block and measures the fluid temperature of the transmission fluid in the fluid pan.

The TCM is connected to the starter relay coil. When the selector lever is in PARK or NEUTRAL, the module provides a ground for the coil allowing the starter relay to be energised and allow starter motor operation. If the selector lever is in any other position, the module will not provide the ground preventing starter motor operation.

DIAGNOSTICS

The diagnostic socket is located in the lower instrument panel closing panel, on the driver's side, below the steering column.

The diagnostic socket allows the exchange of information between the various modules on the bus systems and a Land Rover approved diagnostic system or a diagnostic tool using ISO14229 protocol. The information is communicated to the socket via the high speed CAN bus from the TCM. This allows the retrieval of diagnostic information and programming of certain functions using a Land Rover approved diagnostic system or a suitable diagnostic tool.

CONTROLLER AREA NETWORK (CAN)

The high speed CAN broadcast bus network is used to connect the powertrain modules. The CAN bus is connected between the following electronic units:

High Speed CAN Bus

- TCM
- Instrument cluster
- Air suspension module
- Steering angle sensor
- Rear differential module
- Centre console switch pack
- Electric park brake module
- Restraints control module
- Engine Control Module (ECM)
- ABS control module
- Adaptive front lighting control module
- Transfer box control module
- Adaptive cruise control module
- Diagnostic socket.

The CAN bus allows a fast exchange of data between modules. The CAN bus comprises two wires which are identified as CAN high (H) and CAN low (L). The two wires are coloured yellow/black (H) and yellow/brown (L) and are twisted together to minimise electromagnetic interference (noise) produced by the CAN bus messages.
For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

In the event of CAN bus failure, the following symptoms may be observed:

- Transmission operates in default mode
- Torque converter lock-up clutch control is disabled
- Gear position indication in instrument cluster message centre inoperative (this will also occur with any transmission fault).

DRIVING MODES

There are a number of different driving modes of operation. Some can be selected by the driver and some are automatically initiated by the TCM during driving:

- Normal mode
- Sport mode
- Manual (CommandShift™) mode
- Adaptive Shift Strategy (ASIS)
- Hill Descent Control (HDC) mode
- Cruise mode
- Hill mode
- Default (Limp home) mode
- Reverse lock-out mode
- Cooling strategy
- Curve recognition mode
- Fast off recognition.

Normal Mode

Normal mode is automatically selected by the TCM on power up. In this mode all automatic and adaptive modes are active. Normal mode uses gear shift and lock-up maps to allow for vehicle operation which offers fuel consumption and emissions or driveability depending on the driving style. If the transmission is operated in sport or manual mode and the selector lever is moved to the 'D' position, normal mode is automatically resumed.

Sport Mode

The sport mode operates in high range only and provides enhanced acceleration and responsiveness. In sport mode the TCM uses shift maps which allow the transmission to downshift more readily, hold gears for longer at higher engine speeds, and limits the transmission to the first five gears (6th gear is not used).

Sport mode is selected by moving the selector lever to the left into the 'M/S' position. When the sport mode is first selected, 'SPORT' is displayed in the message centre for 6 seconds and, if 6th gear is currently engaged, the TCM downshifts to 5th.

Manual (CommandShift™) Mode

Manual mode allows the transmission to operate as a semi-automatic 'CommandShift™' unit. The driver can change up and down the six forward gears with the freedom of a manual transmission.

Shift maps are provided for manual mode to protect the engine at high engine speeds. The TCM will automatically change up to a higher gear ratio to prevent engine overspeed and change down to a lower gear ratio to avoid engine labouring and stalling.

When kickdown is requested the TCM downshifts at least 2 gears.

When the vehicle is stationary, to drive off the driver can select 1st , 2nd or 3rd gear in low and high range. Any other gear selection will be rejected by the TCM.

When driving off, upshifts can be pre-selected by making + selections with the selector lever for the number of upshifts required. The TCM then automatically performs a corresponding number of upshifts when the appropriate shift points are reached. So, for example, when starting off in 1st gear, if three + selections are made in quick succession, the TCM will automatically change up through the box to 4th gear as the vehicle accelerates, without any further selections being made.

In manual mode a low gear can be selected to provide engine braking for descending a slope without HDC or continuous use of the brake pedal. The driver can prepare for the end of the descent by moving the selector lever to D. The TCM will maintain the low gear and only revert to automatic shift control when the throttle is opened and vehicle speed increases.

Adaptive Shift Strategy (ASIS)

The ASIS system is a new feature on automatic transmissions. With the TCM linked via the CAN bus to other vehicle systems, signals are received which can allow the TCM to calculate the way in which the vehicle is being driven. The type of signals include the following:

- Longitudinal and lateral acceleration
- Engine speed
- Engine torque
- Oil temperature
- Accelerator pedal position
- Wheel speed.

Using these signals, additional transmission control can be obtained. The TCM can calculate when the vehicle is cornering, all wheels are gripping, the driver is braking or if the driver is accelerating. This is the conventional 'Adaptive' transmission control. ASIS uses this system but adds the continuous adaptation of the gear changes to the individual driving style of the driver.

HDC Mode

The HDC mode assists the ABS module in controlling the downhill speed of the vehicle. When HDC is selected on, the ABS module selects the most appropriate gear for the descent, to maximise engine braking.

Cruise Mode

When speed control is activated, the TCM receives a cruise active message on the CAN bus. The TCM activates a speed control map which prevents locking and unlocking of the torque converter clutch and minimises up and down shifts.

Hill Mode

Hill mode is initiated by the TCM when the engine torque, via ECM signals on the CAN bus, exceeds the theoretical load curve for normal operation. The TCM monitors this signal to determine when the vehicle is travelling up or down a steep gradient.

In hill mode the TCM adopts one of four shift maps, three uphill and one downhill. The shift map chosen depends on the severity of the slope as determined from the engine signals and the appropriate gear is selected to assist with the ascent or descent.

Hill mode can also be initiated when the vehicle is at very high altitudes or ambient temperatures, and also when the vehicle is towing.

Default (Limp Home) Mode

If a transmission fault is detected by the TCM, the TCM adopts a limp home mode strategy. 'TRANS. FAILSAFE' is displayed in the message centre and, if the fault has an effect on engine emissions, the MIL will also be illuminated.

In default mode, P, R and N functions operate normally (if the fault allows these selections) and the TCM locks the transmission in 3rd or 5th gear to allow the driver to take the vehicle to the nearest dealer. The torque converter lock-up clutch is disabled and reverse lock-out will not function.

If the vehicle is stopped and subsequently restarted in the default mode condition, the TCM operates normally until the fault which caused the condition is detected again.

When limp home mode is active, the gear position indicator will show one of the following letters which defines the fault type:

- 'F' - transmission is operating in limp home mode
- 'H' - transmission has reached overheat threshold temperature and transmission is operating in limp home mode
- 'E' - CAN bus is off and transmission is operating in limp home mode.

If electrical power is lost and the transmission is operating in mechanical limp home mode, the selector lever will not be locked in the 'N' position by the shift interlock solenoid. The lever will be locked in the 'P' position and can only be released by using the interlock emergency release lever or by correcting the electrical fault.

Reverse Lock-Out Mode

When the vehicle is travelling forwards, selecting reverse could cause transmission damage. To protect against this, reverse gear is prohibited if the vehicle is travelling forwards at a road speed of 5 mph (8 km/h) or higher.

Cooling Strategy

The purpose of the cooling strategy is to reduce engine and transmission temperatures during high load conditions, when towing a trailer for example. Under these conditions the engine and transmission may generate excessive heat.

If the transmission fluid temperature increases to 125ºC (257ºF) or higher, the TCM employs the cooling strategy. The message 'TRANSMISSION OVERHEAT' is displayed in the message centre.

The strategy uses a specific shift and torque converter lock-up clutch map. This map allows torque converter clutch lock-up and gear shifts to operate outside of their normal operation. This will reduce the engine speed and/or slip in the torque converter, therefore reducing heat generated by the engine and the transmission.

If the transmission fluid temperature increases to 137ºC (278ºF) or higher, the transmission will use the default (limp home mode). 'H' is displayed in the gear position indicator. If the temperature exceeds 140ºC (284ºF), CAN bus transmission is disabled and 'E' is displayed in the gear position indicator.

The cooling strategy is cancelled when the transmission fluid temperature decreases to less than 120ºC (248ºF) or below.

Curve Recognition

Curve recognition is activated when high levels of lateral acceleration and/or steering angle are detected via the ABS module and steering angle sensor signals on the CAN bus. When this condition is detected, the TCM prevents the transmission from changing to a higher gear to assist with cornering. When the vehicle completes it manoeuvre, the transmission will shift to the correct ratio.

Fast Off Recognition

Fast off recognition is activated when the TCM detects that the driver has backed off the accelerator pedal quickly in a 'change of mind' manoeuvre. This is detected by monitoring for a high level of negative pedal angle from the engine control module signal on the CAN bus. If this condition is detected, the TCM holds the current gear ratio to allow the driver to complete his original action without the need for a downshift. The mode remains active for a predetermined time period or if the driving style remains passive.

Terrain Response™ Mode

If the vehicle has the Terrain Response system fitted, the following additional modes are available.
For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

Grass/Gravel/Snow

When the driver selects the Terrain Response grass/gravel/snow special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise the delivery of torque to the wheels and to minimise wheel slip in these terrains. To assist with the vehicle moving from a standstill, the TCM automatically selects 2nd gear in high range and 3rd gear in low range. This special program is fully integrated with hill mode to enhance vehicle control during ascents and descents.

Mud/Ruts

When the driver selects the Terrain Response mud/ruts special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise vehicle traction in this terrain.

Sand

When the driver selects the Terrain Response sand special program with the transfer box in either high or low range, the TCM uses a specific set of shift and torque converter maps to optimise the tractive performance in sand by holding onto gears longer and downshifting more readily. This mode is fully integrated with the hill mode to further enhance performance during ascents.

Rock Crawl

When the driver selects the Terrain Response rock crawl special program, which is only available with the transfer box in low range, the TCM uses a specific shift map which maximises torque delivery at slow speeds associated with this type of terrain.

TRANSMISSION FAULT STATUS

If the TCM detects a fault with the transmission system, it will enter a default mode to prevent further damage to the transmission and allow the vehicle to be driven.

When a fault is detected a CAN message is sent from the TCM and is received by the instrument cluster. The instrument cluster illuminates the MIL and displays 'TRANS. FAILSAFE' in the message centre.

Some transmission faults may not illuminate the MIL or display a fault message, but the driver may notice a reduction in shift quality.

ENGINE SPEED AND TORQUE MONITORING

The ECM constantly supplies the TCM with information on engine speed and torque through messages on the CAN bus. The TCM uses this information to calculate the correct and appropriate timing of shift changes.

If the messages are not received by the ECM, the TCM will implement a back-up strategy to protect the transmission from damage and allow the vehicle to be driven.

In the event of an engine speed or torque signal failure, the transmission will adopt the electrical limp home mode with the transmission operating in a fixed gear.

TOWING FOR RECOVERY

The following procedure must be used to ensure that the vehicle is towed in a safe condition and damage to the vehicle transmission systems is prevented.

- Secure the towing attachment from the recovery vehicle to the towing eye of the vehicle to be recovered.
- Make sure that the parking brake is on. Turn the ignition key to the ignition position II.
- Apply the footbrake and move the automatic transmission selector lever to the neutral position. If electrical power is not available, use the manual interlock release tab on the selector lever to move the lever to the neutral (N) position.
- Make sure that the ignition is in the auxiliary position I or, if the stop lamps and turn signal indicators are required, in the ignition position II.
- Make sure that the parking brake is released before the vehicle is towed.
- The vehicle can only be towed for a maximum of 31 miles (50 km) at a maximum speed of 30 mph (50 km/h). Towing the vehicle for longer distances and/or faster speeds will damage the transmission.

WARNING: Do not remove the key or move the ignition switch to position 'O' when the vehicle is being towed. The steering lock will be engaged preventing the steering from being turned.

With the engine not running, the brake booster and power steering pump will be inoperative. Care must be taken to ensure the vehicle is manoeuvred and driven accordingly.

Automatic Transmission/Transaxle - V8 4.4L Petrol - Automatic Transmission

Diagnosis and Testing

Overview

This section is intended to provide a means for the technician to diagnose transmission component faults, rather than replacing the entire unit.

However, there are a number of situations where the replacement of the unit is the only practical solution, and this section will cover the diagnosis necessary to gather the information required for transmission replacement to be authorized by the warranty prior approval program (WPAP) where it applies, as well as covering the diagnostic trouble codes (DTCs) stored by the control module.

The basic checks of the transmission (fluid condition and level, etc) should be carried out first, and this will mean using the approved diagnostic system or other equipment with data logging facility to monitor temperatures, etc.

For information on the operation of the transmission, refer to the relevant workshop manual section.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection Chart

Mechanical	Electrical
Fluid condition Fluid level Fluid leaks Fluid cooler External linkages Gear selector lever	Fuses Wiring harnesses Electrical connector(s) Transmission control module (TCM) Engine control module (ECM) Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification.

Preliminary inspection

1. **1.** As much information as possible should be obtained from the owner/driver about the fault in order to assist with the diagnosis. Time spent on this will reduce the necessity for extensive road testing and possible missed diagnosis.
    - The information required for WPAP is still useful as an aid to diagnosis, even where the system is not in operation

Required information for WPAP (where applicable)

- The nature of the fault (loss of drive, slip, judder, gear shift quality, noise, etc)
- The frequency with which the fault occurs
- The conditions under which the fault occurs, including temperature (coolant and ambient), selected gear, road speed, engine speed, and any specific conditions
- Check and rectify non-transmission related DTCs before continuing with transmission diagnosis

2. **2.** Record the vehicle details, including:

- Service history
- The transmission serial number
- The transmission software level

3. **3.** Visually inspect the transmission for fluid leaks, damage, etc.
4. **4.** Check the transmission fluid condition.

• NOTE: Fluid condition is a good indicator of the transmission internal condition. If the fluid is burnt and/or contaminated, this would usually mean the internal damage to the transmission is at such a level that unit replacement is the best option. Compare the fluid drained from the transmission with fresh fluid for color and odor.

5. **5.** Check the transmission fluid level. Refer to the relevant workshop manual section.

• NOTE: This is crucial to the operation of the transmission, and the procedure must be closely followed to avoid inaccurate diagnosis, with the resultant possible rejection of a warranty claim.

6. **6.** Check the engine idle speed and throttle sensor using the approved diagnostic system or a scan tool.
7. **7.** Check the transmission selector cable adjustment. Refer to the relevant workshop manual section.
8. **8.** Check the transmission range sensor adjustment.
    - A comprehensive procedure for transmission range sensor setting is accessible through the approved diagnostic system.

If any faults are found and rectified in the above sequence, clear any DTCs and test the vehicle for normal operation.

If a failure condition is found indicating the need to renew the transmission assembly, the request must go through the warranty prior approval program (where applicable) before work is begun.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
P012100	Throttle/Pedal Position Sensor A Circuit Range/Performance	● Throttle position sensor wiring high resistance ● Throttle position sensor sensing circuits (Throttle position 1 or Throttle position 2) short circuit to power ● Throttle position sensor failure ● Range/Performance - Kickdown at low pedal openings	Check for pedal position sensor DTCs. Configure the module using the approved diagnostic system.
P021900	Engine Overspeed Condition	● Engine speed implausible	Check for engine management DTCs.
P050000	Vehicle Speed Sensor A	● Vehicle speed signal not detected	Check for ABS DTCs. Check the CAN circuits. Refer to the electrical guides.
P050100	Vehicle Speed Sensor A Range/Performance	● Range/Performance	Check for input/output sensor DTCs. Check the CAN circuits. Refer to the electrical guides.
P056100	System Voltage Unstable	● Power supply voltage is out of range when the engine is running	Check the battery and charging system. Refer to the relevant workshop manual section.
P056200	System Voltage Low	● Supply voltage to TCM very low	Check the battery condition and state of charge. Check the TCM supply circuits. Refer to the electrical guides.
P056300	System Voltage High	● Power supply voltage is too high if the engine is running and there has been no jump-start or transmission limp-home event	Check the battery and charging system. Refer to the relevant workshop manual section. Check if the vehicle has been jump-started.
P060100	Internal Control Module Memory Check Sum Error	● Checksum error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P060300	Internal Control Module Keep Alive Memory (KAM) Error	● Keep-alive memory (KAM) error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P060500	Internal Control Module Read Only Memory (ROM) Error	● Read only memory (ROM) error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P061300	TCM Processor	● Processor	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P062F00	Internal Control Module EEPROM Error	● EEPROM error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P064200	Sensor Reference Voltage A Circuit Low	● Reference voltage circuit short circuit to ground ● Reference voltage circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

Automatic Transmission/Transaxle - V8 4.4L Petrol - Transmission Fluid Drain and Refill

General Procedures

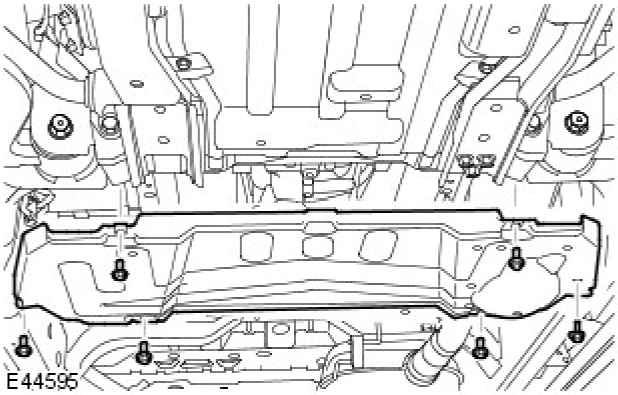
- WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

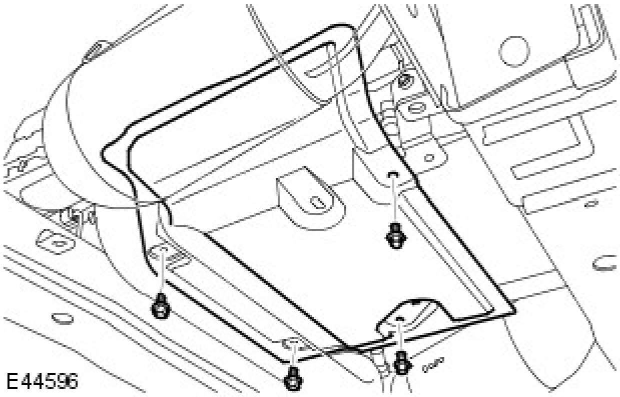
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



2. Remove the transmission undershield.

- Remove the 6 bolts.

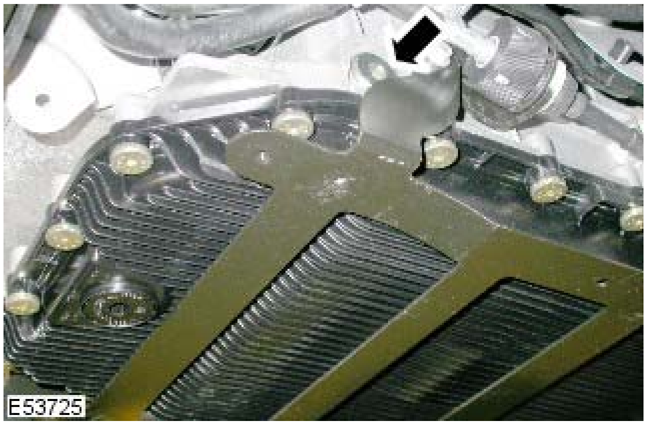


3. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

4. Clean the area around the transmission fluid drain and filler plugs.

5. Place a container under the transmission.



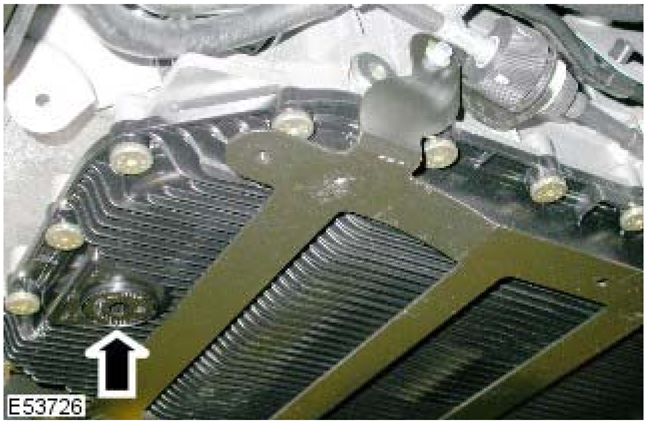
6. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

Remove the transmission fluid filler/level plug.

- Remove and discard the sealing washer.



7. Remove the transmission fluid drain plug.

- Remove and discard the sealing washer.
- Allow the fluid to drain.

8. Install the transmission fluid drain plug and tighten to 9 Nm (7 lb.ft).

- Install a new sealing washer.

9. Add 3.5 to 4 liters of the correct transmission fluid, or until a small thread of fluid runs from the filler/level hole.

10. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Published: 11-May-2011

Automatic Transmission/Transaxle - V8 4.4L Petrol - Transmission Fluid Level Check

General Procedures

- WARNINGS:

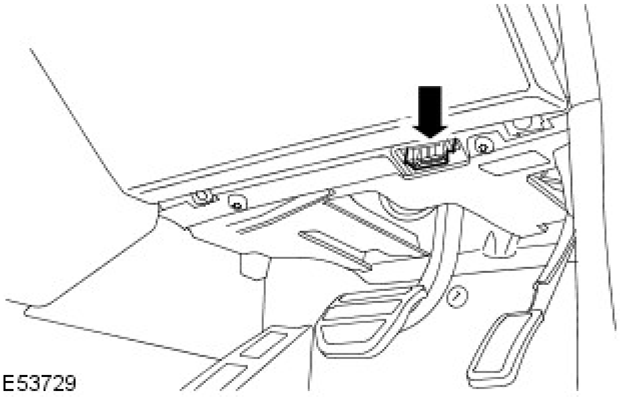
⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

⚠ CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

1. The following steps must be observed before starting the transmission fluid level check and top-up.

- The vehicle must be on a horizontal ramp.
- The parking brake must be applied.
- The wheels must be chocked.



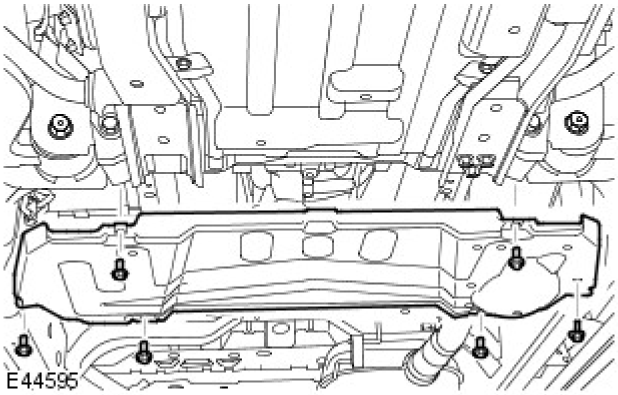
2. ⚠ CAUTION: Make sure the transmission fluid temperature is below 30 degrees before starting the fluid level check.

Using the approved Land Rover diagnostic equipment, monitor the transmission fluid temperature.

3. Start the engine. Move the selector lever from 'P' through all gear positions, pausing in each gear position for 2-3 seconds and return to the 'P' position.

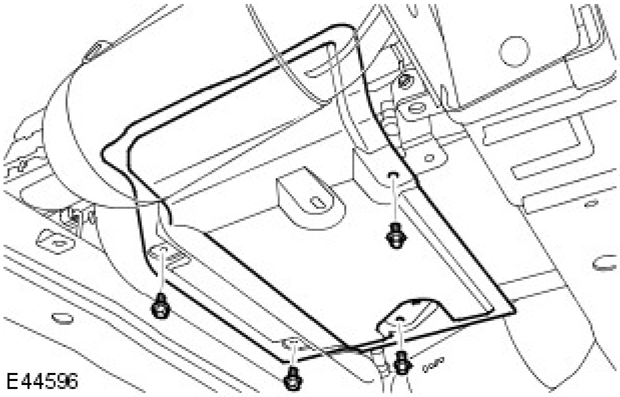
4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



5. Remove the transmission undershield.

- Remove the 6 bolts.

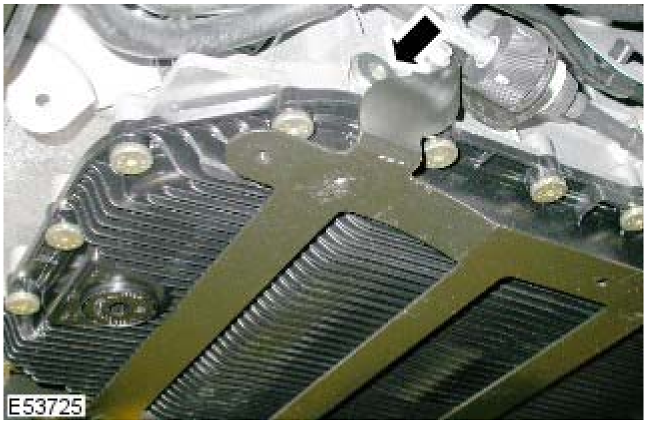


E44596

6. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

7. Place a container under the transmission.



E53725

8. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

⚠ CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

Remove the transmission fluid filler/level plug.

- Clean the area around the filler/level plug.
- Remove and discard the sealing washer.

9. If no fluid loss is apparent when the filler/level plug is removed, with the engine at idle, continue to fill the transmission until a small thread of oil runs from oil filler/level hole.

10. Install the transmission fluid filler/level plug and tighten to 35 Nm (26 lb.ft).

- Install a new sealing washer.
- Remove the container.

11. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

12. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

13. Disconnect the approved Land Rover diagnostic equipment from the vehicle.

Automatic Transmission/Transaxle - V8 4.4L Petrol - Transmission Support Insulator

In-vehicle Repair

Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

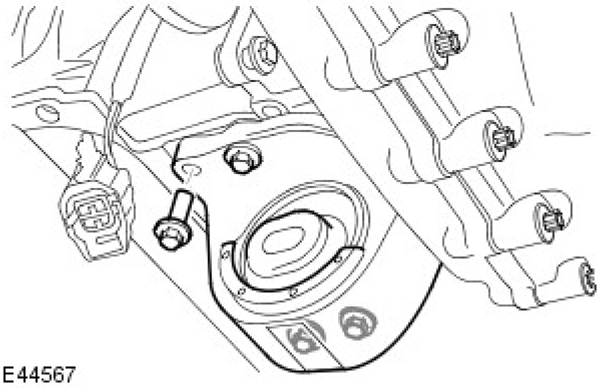
   Raise and support the vehicle.

2. Remove the transmission crossmember.
   For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

3. NOTE: 4.4L illustration shown, 4.0L and 2.7L Diesel are similar.

   Remove the transmission support insulator.

   - Remove the 4 bolts.



Installation

1. To install, reverse the removal procedure.
   - Clean the component mating faces.
   - Tighten the bolts to 60 Nm (44 lb.ft).

Published: 11-May-2011

Automatic Transmission/Transaxle - V8 4.4L Petrol - Selector Shaft Seal

In-vehicle Repair

Special Tool(s)	
	Seal extractor 307-509-1 (LRT-44-033/1)
	Seal extractor 307-509-2 (LRT-44-033/2)
	Seal installer 307-509-3 (LRT-44-033/3)

Removal

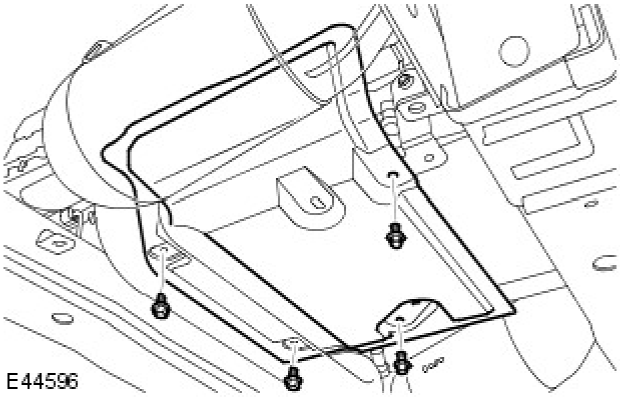
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

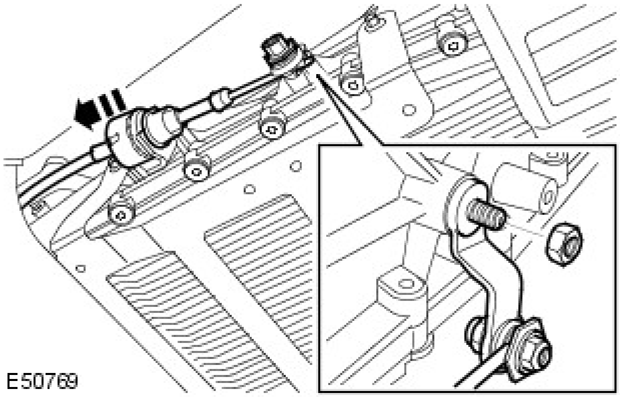
Raise and support the vehicle.

2. Remove the exhaust system.
For additional information, refer to: Exhaust System (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

3. Remove the transmission heat shield.

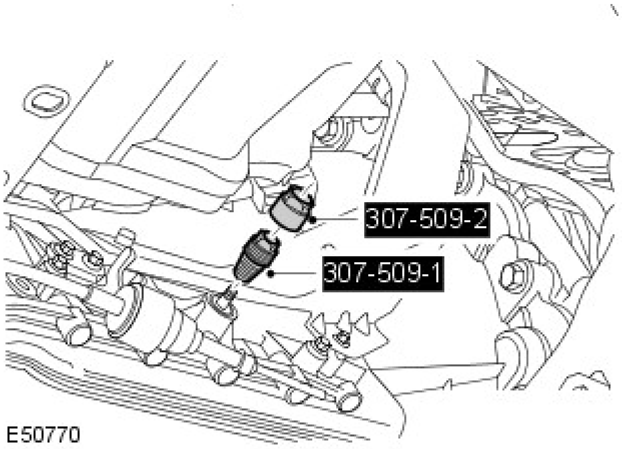
- Remove the 4 bolts.





4. Release the selector cable and lever.

- Remove the nut.
- Compress the latch and release the cable.

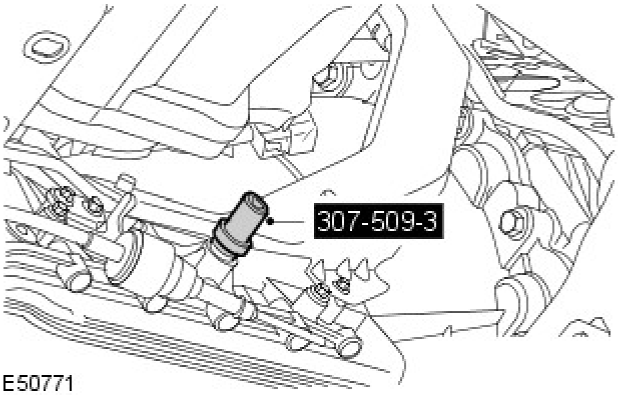


5. ⚠CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the selector shaft seal.

- Install 307-509-1 to the seal.
- Install 307-509-2 to 307-509-1 and extract the seal.

Installation



1. Using 307-509-3, install the selector shaft seal.

- Clean the components.

2. Install the selector cable and bracket.

- Secure with the clip.
- Tighten the nut to 12 Nm (9 lb.ft).

3. Install the transmission heat shield.

- Install the bolts.

4. Install the exhaust system.
For additional information, refer to: Exhaust System (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

Automatic Transmission/Transaxle - V8 4.4L Petrol - Transmission Control Module (TCM)

In-vehicle Repair

Special Tool(s)	
 E48903	ZF Automatic transmission valve block seals remover 307-492 (LRT-44-005)

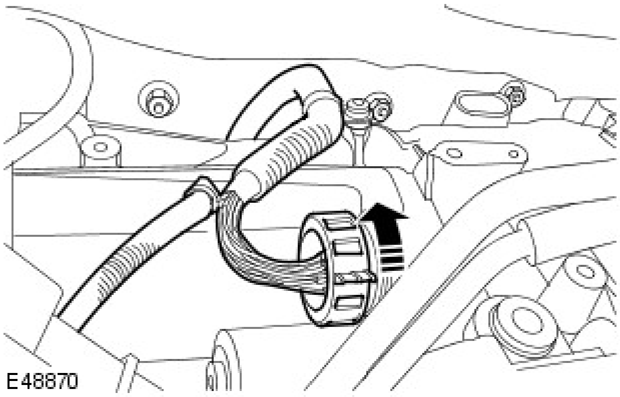
Removal

- NOTE: The transmission control module (TCM) is part of the main control valve body and cannot be serviced separately.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

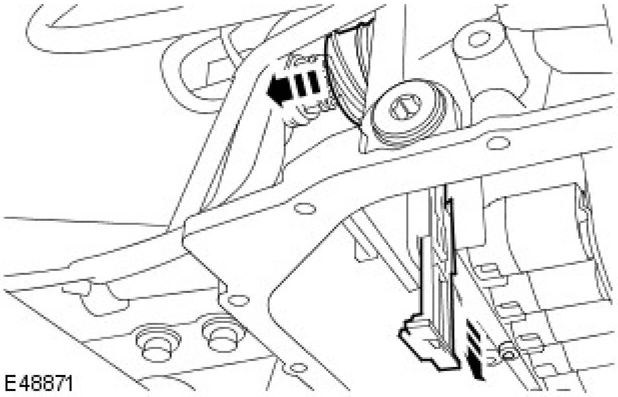
Raise and support the vehicle.

2. Remove the fluid pan.
For additional information, refer to: Fluid Pan, Gasket and Filter (307-01B Automatic Transmission/Transaxle - V8 4.4L Petrol, In-vehicle Repair).



E48870

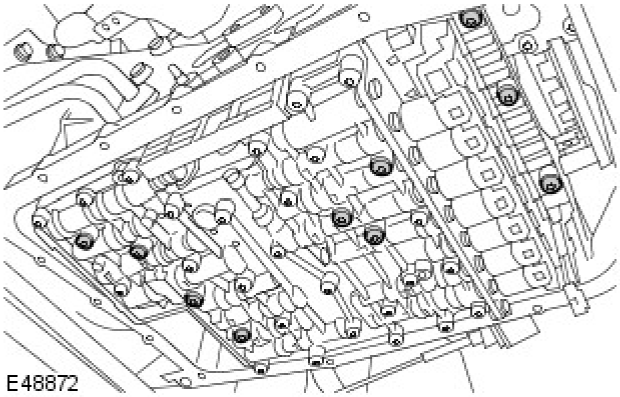
3. Disconnect the electrical connector.



E48871

4. Remove and discard the electrical connector sleeve.

- Release the retainer.

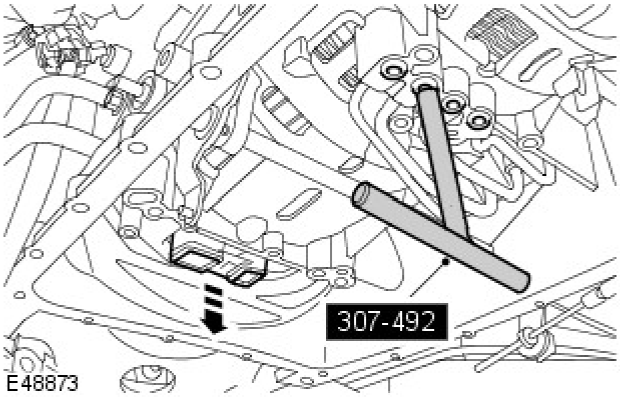


5. Remove the valve body.

- Position a container to collect spillage.
- Remove the 10 Torx screws.

6. Using the special tool, remove the 4 seals.

7. Remove the seal block.



307-492
E48873

Installation

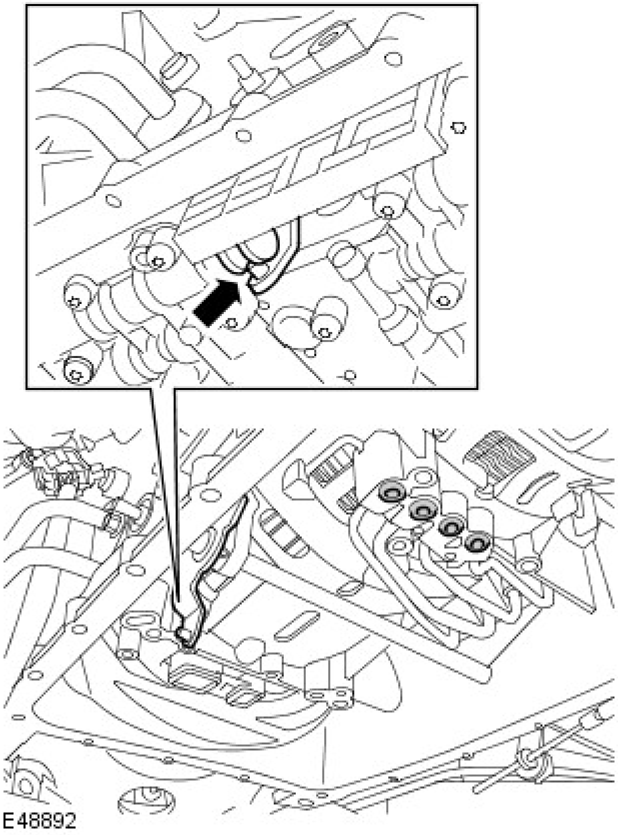
1. CAUTIONS:

⚠ Make sure that when fully fitted, all seals protrude by the same amount.

⚠ Engage the selector lever with the groove in the piston rod.

Install the valve body.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).



2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

4. Install the fluid pan.
For additional information, refer to: Fluid Pan, Gasket and Filter (307-01B Automatic Transmission/Transaxle - V8 4.4L Petrol, In-vehicle Repair).

5. Calibrate a new main control valve body using T4.

In-vehicle Repair

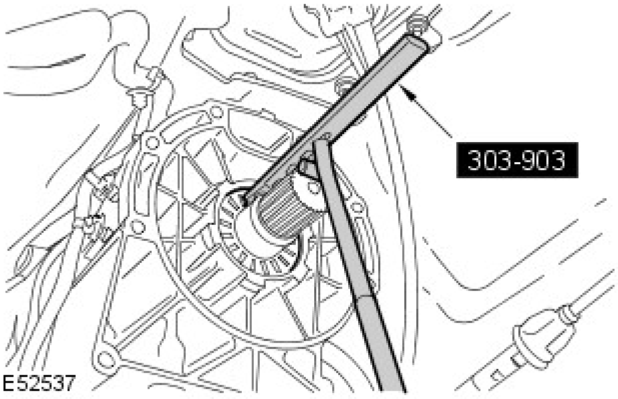
Special Tool(s)	
	Oil seal remover 303-903 (LRT-12-092)
	Oil seal installer 307-520

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the transfer case.
   For additional information, refer to: Transfer Case - V8 4.4L Petrol (308-07B Transfer Case, Removal).

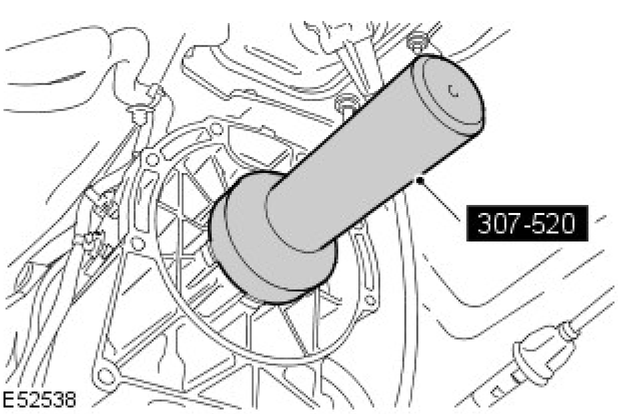


3. ⚠ CAUTION: Care must be taken to avoid damage to the seal register and running surface.

   Remove the transmission output shaft oil seal.

   - Use the special tool.

Installation



1. ⚠ CAUTION: Oil seals must be fitted dry.

   Install a new transmission output shaft oil seal.

   - Clean the seal register.
   - Use the special tool.

2. Install the transfer case.
   For additional information, refer to: Transfer Case - V8 4.4L Petrol (308-07B Transfer Case, Removal).
3. Check and top-up the transmission fluid level.

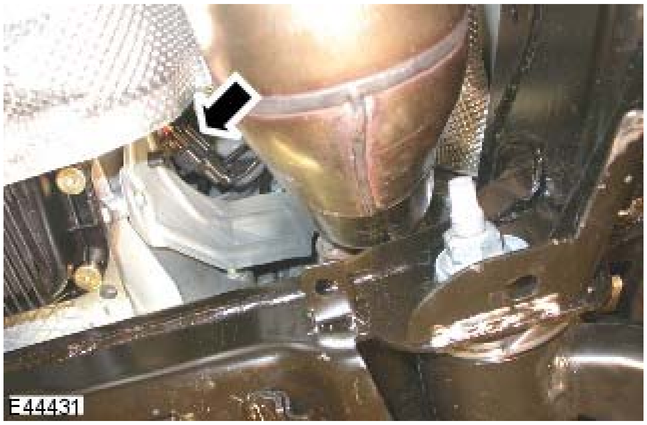
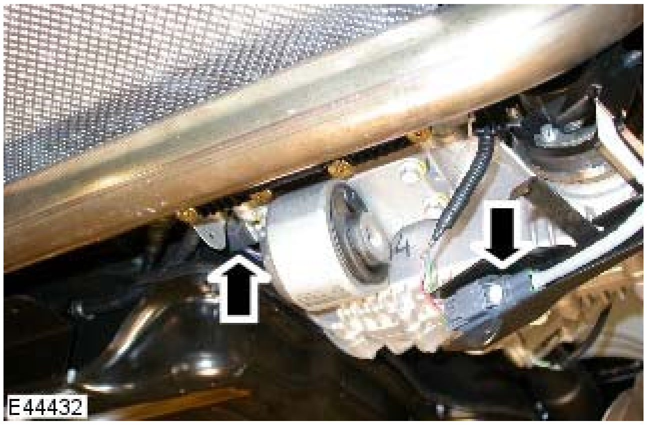
3. Drain the transmission fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01, General Procedures).

4. Remove the transmission support crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

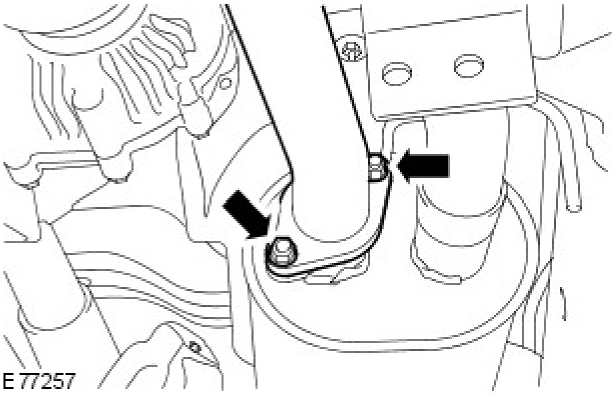


5. Release the RH front HO2S wiring harness.

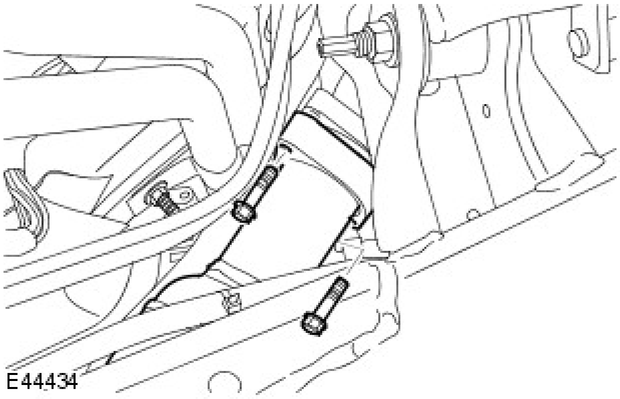
- Disconnect the electrical connector.



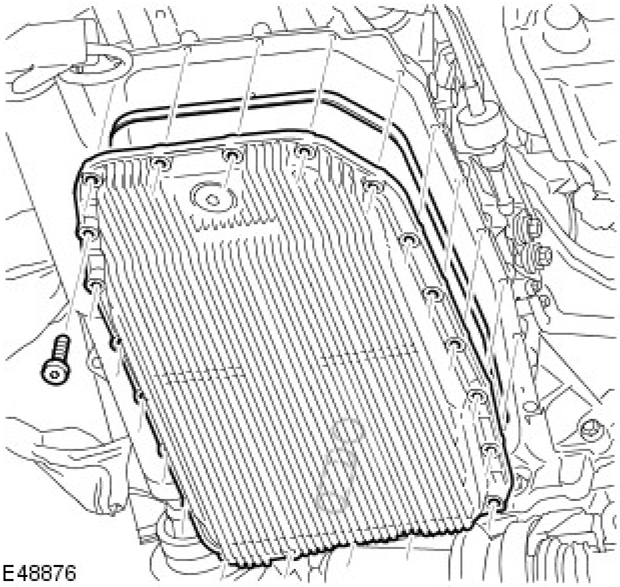
6. Release the RH rear HO2S wiring harness.
   - Disconnect the electrical connector.



7. Disconnect the RH catalytic converter from the muffler assembly.
   - Remove the 2 nuts.
   - Discard the gasket.

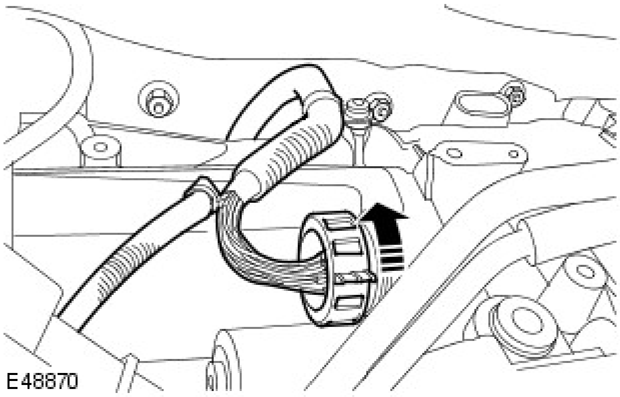


8. Disconnect the RH catalytic converter from the exhaust manifold.
   - Remove and discard the 2 bolts.

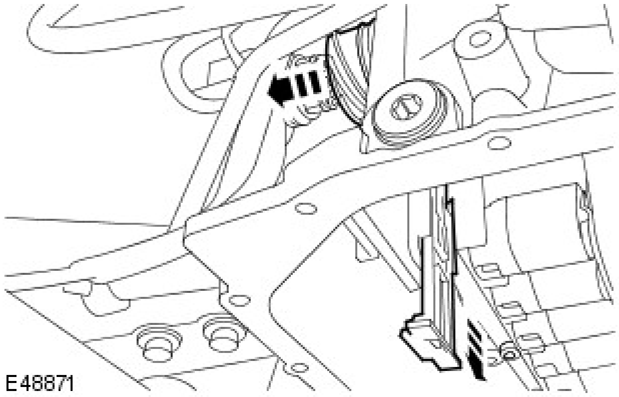


9. Release the oil pan.

- Position a container to collect the oil spillage.
- Remove the 21 Torx screws.

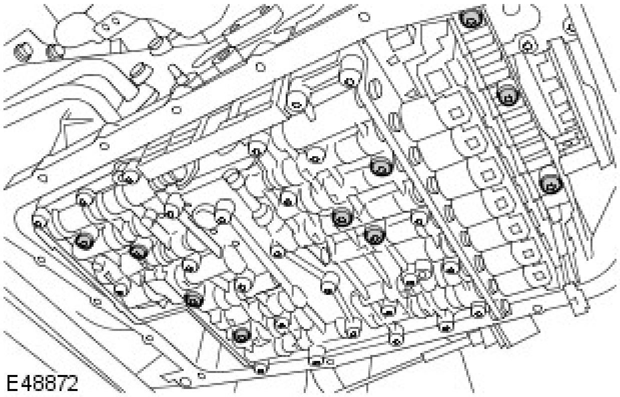


10. Release and disconnect the electrical connector.



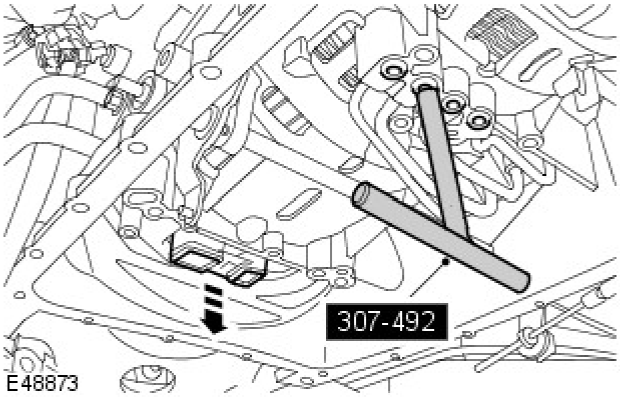
11. Remove and discard the electrical connector sleeve.

- Release the retainer.



12. Remove the valve block and oil pan.

- Remove the 7 Torx bolts.
- Discard the O-ring seal.

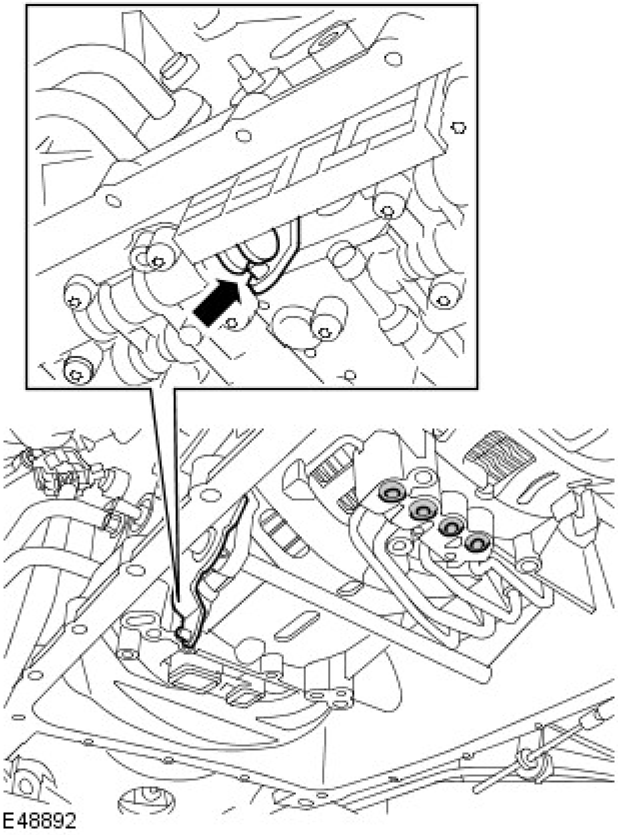


307-492
E48873

13. Using the special tool, remove the 4 seals.

14. Remove the seal block.

Installation



1. CAUTIONS:

⚠ Make sure that when fully fitted, all seals protrude by the same amount.

⚠ Engage the selector lever with the groove in the piston rod.

Install the valve block and oil pan.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).

2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

4. Secure the oil pan.

- Tighten the Torx screws to 8 Nm (6 lb.ft).

5. Install the transmission support crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

6. Reconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

7. Fill the transmission with fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01, General Procedures).

8. Using the Land Rover approved diagnostic equipment, calibrate the control valve body.

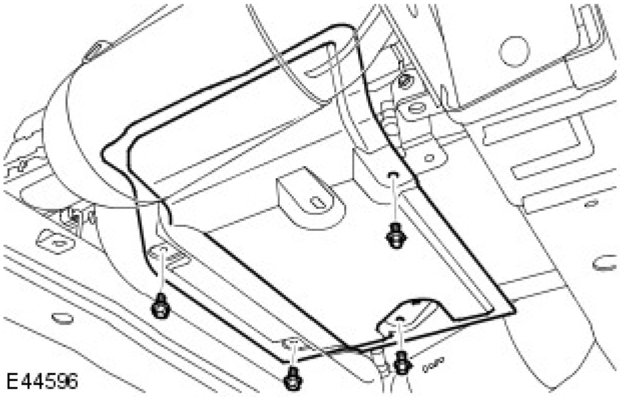
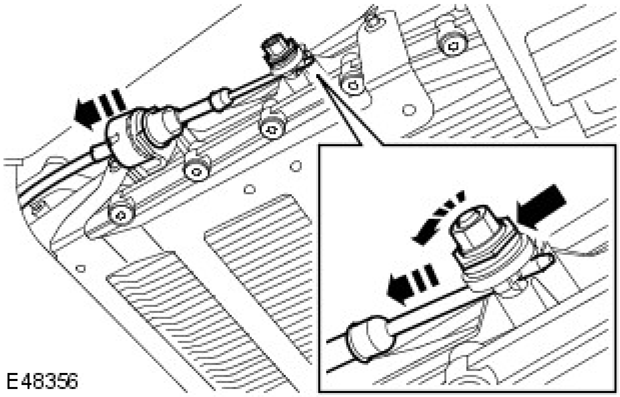
3. Remove the transmission heat shield.

   - Remove the 4 bolts.

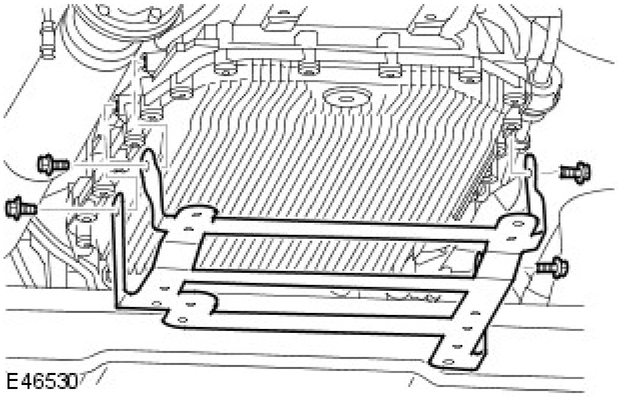


E44596



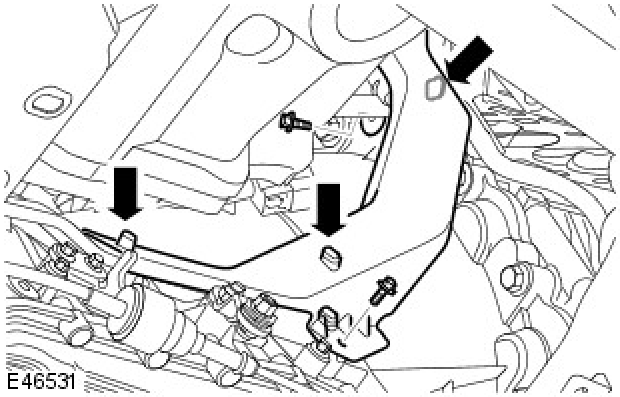
4. Release the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Compress the latch and release the cable.



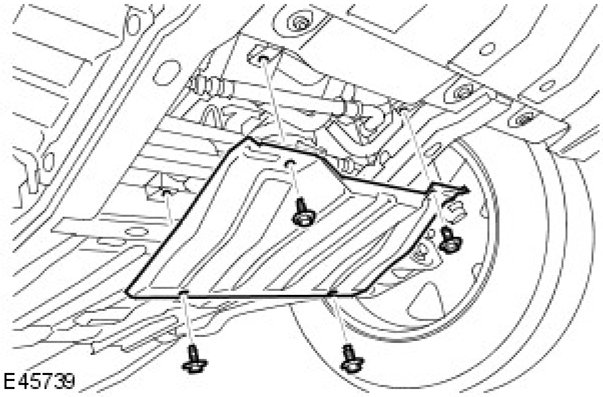
5. Remove the transmission heat shield bracket.

- Remove the 4 bolts.



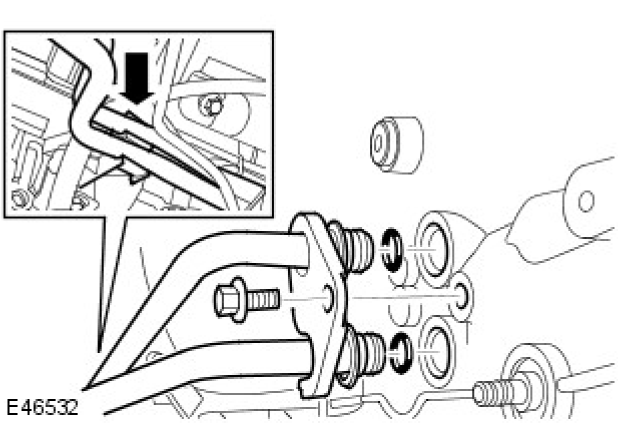
6. Remove the fuel pipe heat shield.

- Remove the 2 bolts.
- Release the fuel pipes from the 3 clips.



7. Remove the radiator access panel.

- Remove the 4 bolts.

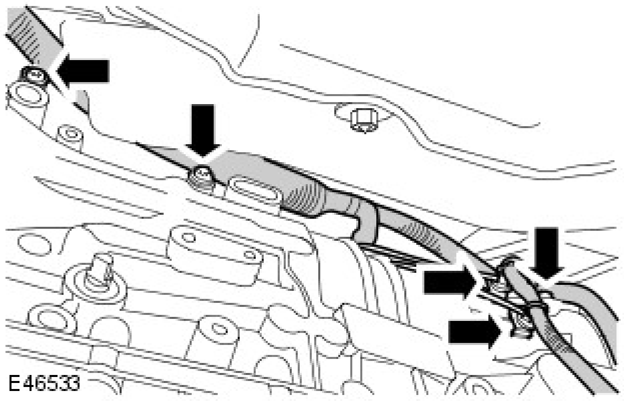


E46532

8. CAUTION: Always plug any open connections to prevent contamination.

Release the transmission fluid lines.

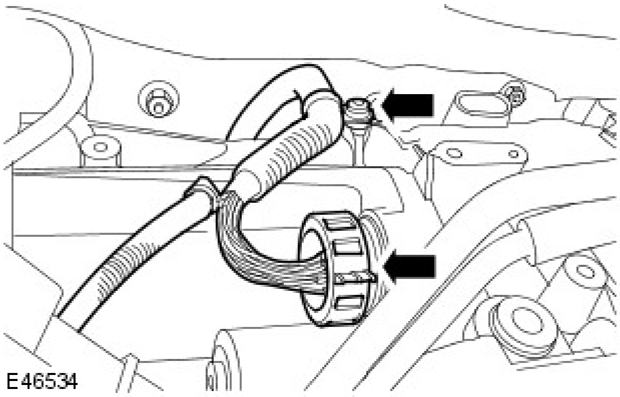
- Remove the bolt.
- Release the clip.
- Remove and discard both O-ring seals.



E46533

9. Release the wiring harness from the LH side of the transmission.

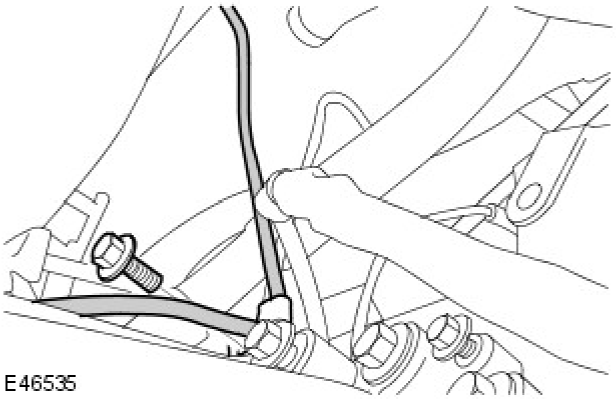
- Remove the 3 Torx screws.
- Release the 2 clips.



E46534

10. Release the wiring harness from the RH side of the transmission.

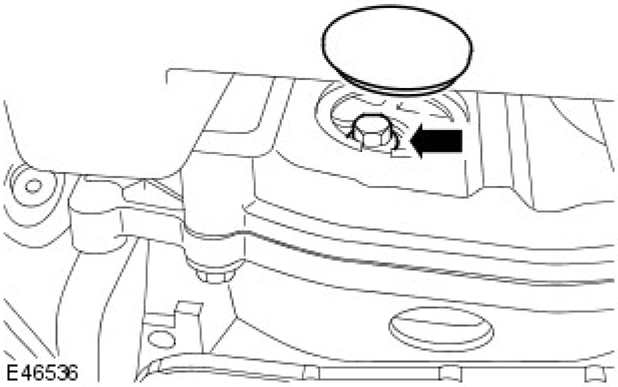
- Remove the Torx screw.
- Disconnect the electrical connector.



E46535

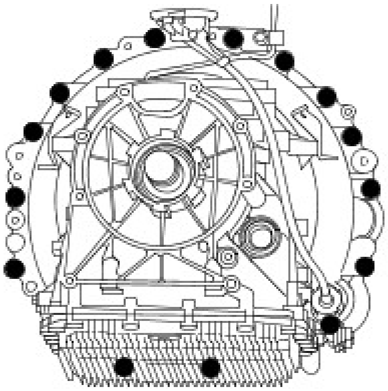
11. Release the transmission breather pipe clip.

- Remove the bolt.



12. Release the flexplate.

- Remove access plugs.
- Rotate the crankshaft to access the bolts.
- Remove the 3 bolts.



13. WARNINGS:

⚠ Secure the transmission to the transmission jack.

⚠ Support the engine. The engine will fall forward when the transmission is removed.

⚠CAUTION: Make sure the torque converter remains connected to the transmission.

With assistance, remove the transmission.

- Using a transmission jack, support the transmission.
- Remove the 15 bolts.

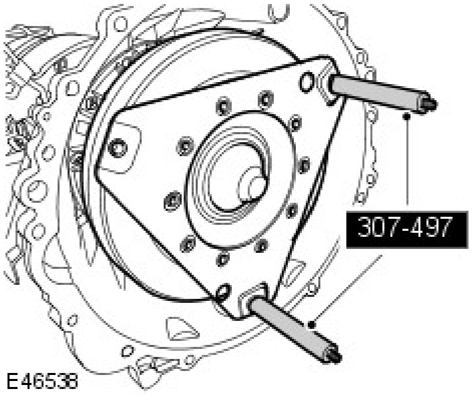
14. Install the torque converter retainer.

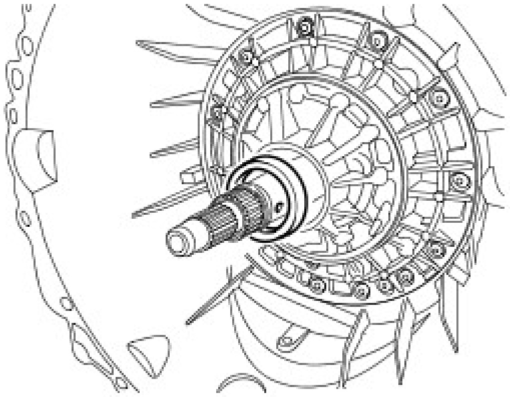
15. NOTE: Do not disassemble further if the component is removed for access only.

Remove the transmission from the transmission jack.

16. Remove the torque converter retainer.

17. Using the special tools, remove the torque converter.

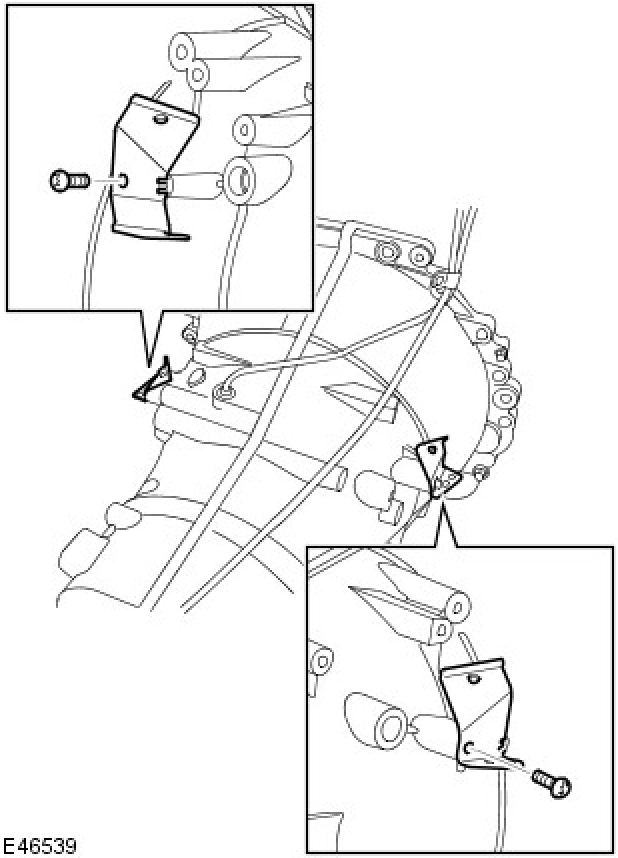




E48465

18. ⚠ CAUTION: Care must be taken to avoid damage to the seal register and running surface.

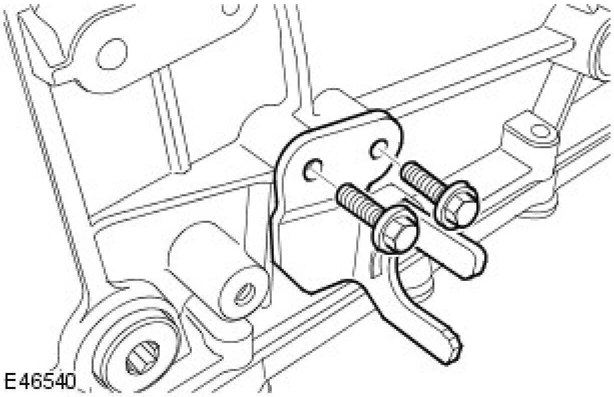
Carefully remove and discard the torque converter fluid seal.



E46539

19. Remove the wiring harness bracket.

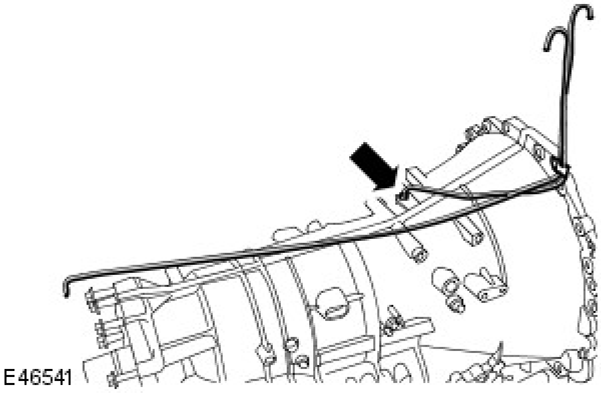
- Remove the Torx screw.
- Repeat the above procedure for the other side.



E46540

20. Remove the selector cable bracket.

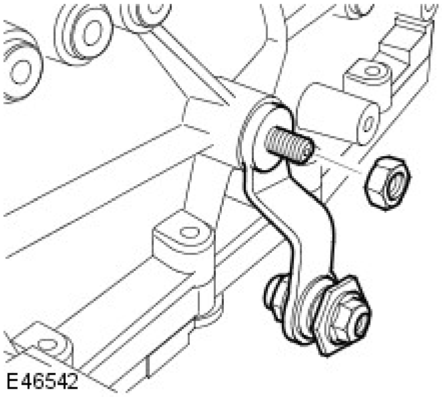
- Remove the 2 bolts.



21. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Remove the transmission breather lines.

- Depress the locking ring.



22. Remove the selector lever.

- Remove the nut.

Installation

⚠ CAUTION: If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

1. Attach the selector lever.

- Tighten the nut to 12 Nm (9 lb.ft).

2. Attach the transmission breather lines.

- Secure with the clip.

3. Attach the selector cable bracket.

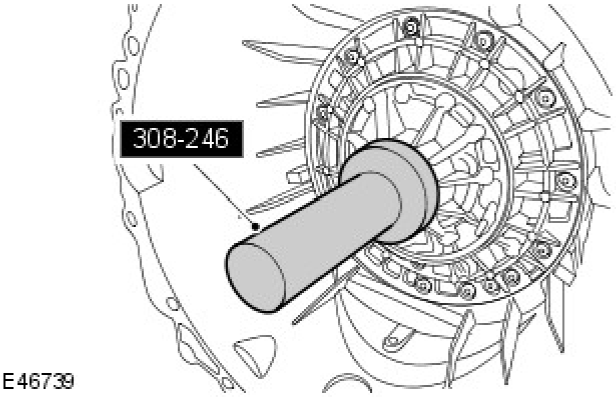
- Tighten the bolts to 10 Nm (7 lb.ft).

4. Attach the wiring harness bracket.

- Tighten the Torx bolt to 10 Nm (7 lb.ft).
- Repeat the above procedure for the other side.

5. Using the special tool, install a new torque converter oil seal.

- Clean the seal register.



6. Install the torque converter.

- Clean the seal contact area.
- Remove the special tools.

7. Install the torque converter retainer.

8. Position the transmission to the transmission jack.

9. Remove the torque converter retainer.

10. ⚠ CAUTION: Apply grease of the correct specification to the torque converter spigot.

With assistance, install the transmission.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

11. Attach the flexplate to the torque converter.

- Rotate the crankshaft to access the bolts.
- Tighten the bolts to 45 Nm (33 lb.ft).
- Install the access plugs.

12. Install the radiator access panel.

- Tighten the 4 bolts to 10 Nm (7 lb.ft).

13. Attach the transmission breather pipe clip.

- Tighten the bolt to 25 Nm (18 lb.ft).

14. Attach the wiring harness.

- Tighten the Torx screws.
- Connect the electrical connector.

15. Attach the transmission fluid lines.

- Clean the components.
- Install the new O-ring seals.
- Secure with the clip.
- Tighten the bolt to 10 Nm (7 lb.ft).

16. Install the fuel pipe heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure with the clips.

17. Install the transmission heat shield bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).

18. NOTE: Do not tighten the locking nut at this stage.

Connect the selector cable to the transmission.

- Engage the inner cable with the lever clamping bush.
- Install the selector cable to its abutment bracket.

19. Install the transfer case. For additional information, refer to: Transfer Case - V8 4.4L Petrol (308-07B Transfer Case, Installation).

20. Adjust the selector cable.
For additional information, refer to: Selector Lever Cable Adjustment (307-05A Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol, General Procedures).

21. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

22. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

23. NOTE: For NAS vehicles only.

If fitting new or exchange components, carry out long drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel -

Item	Specification
* Recommended lubricant	Shell M13754
+ Torque converter nose	Molybdenum disulphide grease to specification FB180

- CAUTIONS:

⚠ * Do not use any lubricant other than that specified.

⚠ + Do not over lubricate.

Capacity

Item	Capacity
+ Initial dry fill	9.5 litres (16.7 pints) (10.0 US qts)

⚠ CAUTION: + A final oil level check/drain down/top-up must be carried out when the unit has been installed.

General Specification

Item	Specification
Automatic transmission	ZF 6HP26
Speeds	6 Forward, 1 Reverse
Gear ratios:	
First	4.17:1
Second	2.340:1
Third	1.521:1
Fourth	1.143:1
Fifth	0.867:1
Sixth	0.691:1
Reverse	3.403:1
Torque converter	Sachs W255 2GWK with turbine torsional damper and slip controlled, dual friction faced lock-up clutch
Transmission control module:	
Location	Located in gearbox casing
Type	1904

Torque Specifications

Description	Nm	lb-ft
Main control valve body Torx screws	8	6
Transmission heat shield bolts	10	7
Transmission heat shield bracket bolts	10	7
Selector cable bracket nut	12	9
Selector cable bracket bolts	10	7
Wiring harness bracket Torx bolt	10	7
Fluid pan Torx screws	8	6
Engine RH support nut	90	66
Transmission support insulator bolts	60	44
Selector shaft nut	12	9
Selector cable bracket bolts	10	7
Flexplate to torque converter bolts	45	33
Transmission bolts	45	33
Transmission breather pipe clip bolt	25	18
Transmission fluid lines clip bolt	10	7
Radiator access panel bolts	10	7
Exhaust cross-over pipe center support bracket bolts	25	18
Exhaust cross-over pipe LH/RH support bracket bolts	25	18
Turbocharger support bracket nut and bolts	22	16
Transmission fluid drain plug	9	6.5
Transmission fluid filler/level plug	35	26
transmission heat shield bolts	10	7
Transmission under shield bolts	10	7

Description	Nm	lb-ft

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Automatic Transmission

Diagnosis and Testing

Overview

This section is intended to provide a means for the technician to diagnose transmission component faults, rather than replacing the entire unit.

However, there are a number of situations where the replacement of the unit is the only practical solution, and this section will cover the diagnosis necessary to gather the information required for transmission replacement to be authorized by the warranty prior approval program (WPAP) where it applies, as well as covering the diagnostic trouble codes (DTCs) stored by the control module.

The basic checks of the transmission (fluid condition and level, etc) should be carried out first, and this will mean using the approved diagnostic system or other equipment with data logging facility to monitor temperatures, etc.

For information on the operation of the transmission, refer to the relevant workshop manual section.

Inspection and verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection Chart

Mechanical	Electrical
• Fluid condition • Fluid level • Fluid leaks • Fluid cooler • External linkages • Gear selector lever	• Fuses • Wiring harnesses • Electrical connector(s) • Transmission control module (TCM) • Engine control module (ECM) • Controller area network (CAN) circuits

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the DTC index.
    - Because the DTCs are stored in more than one module, a complete vehicle read is recommended
    - Make sure that all DTCs are cleared following rectification.

Preliminary inspection

1. **1.** As much information as possible should be obtained from the owner/driver about the fault in order to assist with the diagnosis. Time spent on this will reduce the necessity for extensive road testing and possible missed diagnosis.
    - The information required for WPAP is still useful as an aid to diagnosis, even where the system is not in operation

   Required information for WPAP (where applicable)

- The nature of the fault (loss of drive, slip, judder, gear shift quality, noise, etc)
- The frequency with which the fault occurs
- The conditions under which the fault occurs, including temperature (coolant and ambient), selected gear, road speed, engine speed, and any specific conditions
- Check and rectify non-transmission related DTCs before continuing with transmission diagnosis

2. **2.** Record the vehicle details, including:

- Service history
- The transmission serial number
- The transmission software level

3. **3.** Visually inspect the transmission for fluid leaks, damage, etc.
4. **4.** Check the transmission fluid condition.

• NOTE: Fluid condition is a good indicator of the transmission internal condition. If the fluid is burnt and/or contaminated, this would usually mean the internal damage to the transmission is at such a level that unit replacement is the best option. Compare the fluid drained from the transmission with fresh fluid for color and odor.

5. **5.** Check the transmission fluid level. Refer to the relevant workshop manual section.

• NOTE: This is crucial to the operation of the transmission, and the procedure must be closely followed to avoid inaccurate diagnosis, with the resultant possible rejection of a warranty claim.

6. **6.** Check the engine idle speed and throttle sensor using the approved diagnostic system or a scan tool.
7. **7.** Check the transmission selector cable adjustment. Refer to the relevant workshop manual section.
8. **8.** Check the transmission range sensor adjustment.
    - A comprehensive procedure for transmission range sensor setting is accessible through the approved diagnostic system.

If any faults are found and rectified in the above sequence, clear any DTCs and test the vehicle for normal operation.

If a failure condition is found indicating the need to renew the transmission assembly, the request must go through the warranty prior approval program (where applicable) before work is begun.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

DTC	Description	Possible causes	Action
P012100	Throttle/Pedal Position Sensor A Circuit Range/Performance	● Throttle position sensor wiring high resistance ● Throttle position sensor sensing circuits (Throttle position 1 or Throttle position 2) short circuit to power ● Throttle position sensor failure ● Range/Performance - Kickdown at low pedal openings	Check for pedal position sensor DTCs. Configure the module using the approved diagnostic system.
P021900	Engine Overspeed Condition	● Engine speed implausible	Check for engine management DTCs.
P050000	Vehicle Speed Sensor A	● Vehicle speed signal not detected	Check for ABS DTCs. Check the CAN circuits. Refer to the electrical guides.
P050100	Vehicle Speed Sensor A Range/Performance	● Range/Performance	Check for input/output sensor DTCs. Check the CAN circuits. Refer to the electrical guides.
P056100	System Voltage Unstable	● Power supply voltage is out of range when the engine is running	Check the battery and charging system. Refer to the relevant workshop manual section.
P056200	System Voltage Low	● Supply voltage to TCM very low	Check the battery condition and state of charge. Check the TCM supply circuits. Refer to the electrical guides.
P056300	System Voltage High	● Power supply voltage is too high if the engine is running and there has been no jump-start or transmission limp-home event	Check the battery and charging system. Refer to the relevant workshop manual section. Check if the vehicle has been jump-started.
P060100	Internal Control Module Memory Check Sum Error	● Checksum error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P060300	Internal Control Module Keep Alive Memory (KAM) Error	● Keep-alive memory (KAM) error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P060500	Internal Control Module Read Only Memory (ROM) Error	● Read only memory (ROM) error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P061300	TCM Processor	● Processor	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P062F00	Internal Control Module EEPROM Error	● EEPROM error	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P064200	Sensor Reference Voltage A Circuit Low	● Reference voltage circuit short circuit to ground ● Reference voltage circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P064300	Sensor Reference Voltage A Circuit High	● Reference voltage circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P065700	Actuator Supply Voltage A Circuit / Open	● Supply voltage circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P065800	Actuator Supply Voltage A Circuit Low	● Supply voltage circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P065900	Actuator Supply Voltage A Circuit High	● Supply voltage circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P066800	PCM / ECM / TCM Internal Temperature Sensor A Circuit Low	● Temperature sensor circuit high resistance ● Temperature sensor circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P066900	PCM / ECM / TCM Internal Temperature Sensor A Circuit High	● Temperature sensor circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P070500	Transmission Range Sensor A Circuit (PRNDL Input)	● Signal implausible	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071000	Transmission Fluid Temperature Sensor A Circuit	● Temperature rise rate too low	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071100	Transmission Fluid Temperature Sensor A Circuit Range/Performance	● Sensor circuits: short circuit to each other	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071200	Transmission Fluid Temperature Sensor A Circuit Low	● Sensor circuit high resistance ● Sensor circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071300	Transmission Fluid Temperature Sensor A Circuit High	● Sensor circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071600	Turbine/Input Shaft Speed Sensor A Circuit Range/Performance	● Sensor circuit high resistance ● Sensor circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P071700	Turbine/Input Shaft Speed Sensor A Circuit No Signal	● Sensor circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072000	Output Shaft Speed Sensor Circuit	● Sensor circuit short circuit to power ● Sensor circuit high resistance ● Sensor circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072122	Output Shaft Speed Sensor Circuit Range/Performance	● Range/Performance - Signal amplitude	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072127	Output Shaft Speed Sensor Circuit Range/Performance	● Range/Performance ● Signal rate of change above threshold	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072164	Output Shaft Speed Sensor Circuit Range/Performance	● Range/Performance ● Signal plausibility failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P072900	Gear 6 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073000	Incorrect Gear Ratio	● Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
P073100	Gear 1 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073200	Gear 2 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073300	Gear 3 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073400	Gear 4 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073500	Gear 5 Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P073600	Reverse Incorrect Ratio	● Incorrect ratio - Slip too high between input and output shaft speeds	Check for speed sensor DTCs. Check the sensor circuits. Refer to the electrical guides.
P074000	Torque Converter Clutch Solenoid Circuit / Open	● Solenoid circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P074100	Torque Converter Clutch Solenoid Circuit Performance/Stuck Off	● Solenoid circuit stuck off	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P074800	Pressure Control Solenoid A Electrical	● Solenoid current too high/low	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075113	Shift Solenoid A Performance/Stuck Off	● Performance ● Stuck off ● Solenoid circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075114	Shift Solenoid A Performance/Stuck Off	● Performance ● Stuck off ● Solenoid circuit high resistance ● Solenoid circuit short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075200	Shift Solenoid A Stuck On	● Stuck on	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P075300	Shift Solenoid A Electrical	● Solenoid circuit short circuit to power	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P077800	Pressure Control Solenoid B Electrical	● Solenoid current too high	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P078000	Shift malfunction	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078123	1 - 2 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P078162	1 - 2 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078164	1 - 2 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078262	2 - 3 Shift	● Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.

DTC	Description	Possible causes	Action
P078264	2 - 3 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078323	3 - 4 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P078362	3 - 4 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078364	3 - 4 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078423	4 - 5 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P078462	4 - 5 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P078464	4 - 5 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P079800	Pressure Control Solenoid C Electrical	- Solenoid current too high	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P081C00	Park Input Circuit	- Park lock signal fault	Check the gear selector input circuits. Refer to the electrical guides.
P082600	Up and Down Switch Circuit	- Implausible signal	Check the up and down switch circuits. Refer to the electrical guides.
P082923	5-6 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open	Check the fluid level and condition. Check for associated DTCs.
P082962	5-6 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P082964	5-6 Shift	- Input/Output shaft ratio too high during a shift - Clutch does not open or close	Check the fluid level and condition. Check for associated DTCs.
P085000	Park / Neutral Switch Input Circuit	- Starter inhibit signal fault	Check the starter inhibit circuits. Refer to the electrical guides.
P089700	Transmission Fluid Deteriorated	- Temperature too high over too long a time	Renew the fluid.
P092800	Gear Shift Lock Solenoid/Actuator Circuit A / Open	- Solenoid circuit high resistance	Check the solenoid circuits. Refer to the electrical guides.
P092900	Gear Shift Lock Solenoid/Actuator Circuit A Range/Performance	- Solenoid circuit short circuit to ground - Solenoid circuit high resistance	Check the solenoid circuits. Refer to the electrical guides.
P093000	Gear Shift Lock Solenoid/Actuator Circuit A Low	- Solenoid circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P093100	Gear Shift Lock Solenoid/Actuator Circuit A High	- Solenoid circuit short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P093800	Hydraulic Oil Temperature Sensor Range/Performance	- Range/Performance - Signal not plausible	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P096013	Pressure Control Solenoid A Control Circuit / Open	- Control circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P096014	Pressure Control Solenoid A Control Circuit / Open	- Control circuit high resistance - Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096200	Pressure Control Solenoid A Control Circuit Low	- Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096300	Pressure Control Solenoid A Control Circuit High	- Control circuit short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P096413	Pressure Control Solenoid B Control Circuit / Open	- Control circuit high resistance	Check the solenoid circuits. Refer to the electrical guides.
P096414	Pressure Control Solenoid B Control Circuit / Open	- Control circuit high resistance - Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096600	Pressure Control Solenoid B Control Circuit Low	- Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P096700	Pressure Control Solenoid B Control Circuit High	- Control circuit short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P096813	Pressure Control Solenoid C Control Circuit / Open	- Control circuit high resistance	Check the solenoid circuits. Refer to the electrical guides.
P096814	Pressure Control Solenoid C Control Circuit / Open	- Control circuit high resistance - Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P097000	Pressure Control Solenoid C Control Circuit Low	- Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P097100	Pressure Control Solenoid C Control Circuit High	- Control circuit short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P178300	Transmission Overtemperature Condition	- Valve body module shut-down detected on last drive cycle	Check the fluid level and condition. Check for associated DTCs.
P271600	Pressure Control Solenoid D Electrical	- Solenoid current too high	Check the solenoid circuits. Refer to the electrical guides.
P271813	Pressure Control Solenoid D Control Circuit / Open	- Control circuit high resistance	Check the solenoid circuits. Refer to the electrical guides.
P271814	Pressure Control Solenoid D Control Circuit / Open	- Control circuit high resistance - Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P272000	Pressure Control Solenoid D Control Circuit Low	- Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P272100	Pressure Control Solenoid D Control Circuit High	- Control circuit short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P272500	Pressure Control Solenoid E Electrical	- Solenoid current too high	Check the solenoid circuits. Refer to the electrical guides.
P272713	Pressure Control Solenoid E Control Circuit / Open	- Control circuit high resistance	Check the solenoid circuits. Refer to the electrical guides.
P272714	Pressure Control Solenoid E Control Circuit / Open	- Control circuit high resistance - Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P272900	Pressure Control Solenoid E Control Circuit Low	- Control circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
P273000	Pressure Control Solenoid E Control Circuit High	- Control circuit short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P275900	Torque Converter Clutch Pressure Control Solenoid Electrical	- Pressure control solenoid fault	Check the solenoid circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
P276100	Torque Converter Clutch Pressure Control Solenoid Control Circuit / Open	- Pressure control solenoid circuit high resistance	Check the solenoid circuits. Refer to the electrical guides.
P276200	Torque Converter Clutch Pressure Control Solenoid Control Circuit Range / Perf	- Pressure control solenoid circuit current too low	Check the solenoid circuits. Refer to the electrical guides.
P276300	Torque Converter Clutch Pressure Control Solenoid Control Circuit High	- Pressure control solenoid circuit short circuit to power	Check the solenoid circuits. Refer to the electrical guides.
P276400	Torque Converter Clutch Pressure Control Solenoid Control Circuit Low	- Pressure control solenoid circuit short circuit to ground	Check the solenoid circuits. Refer to the electrical guides.
U000188	High Speed CAN Communication Bus	- Bus off	The module setting this code has disabled CAN transmission. Check for other bus off codes. Check the module and circuits. Refer to the electrical guides. Refer to the warranty policy and procedures manual if a module is suspect.
U010087	Lost Communication With ECM/PCM "A"	- Missing message	Check the ECM and circuits. Refer to the electrical guides.
U010287	Lost Communication with Transfer Case Control Module	- Missing message	Check the transfer case control module and circuits. Refer to the electrical guides.
U010487	Lost Communication With Cruise Control Module	- Missing message	Check the speed control module and circuits. Refer to the electrical guides.
U012287	Lost Communication With Vehicle Dynamics Control Module	- Missing message	Check the ABS module and circuits. Refer to the electrical guides.
U012687	Lost Communication With Steering Angle Sensor Module	- Missing message	Check the steering angle sensor and circuits. Refer to the electrical guides.
U012887	Lost Communication With Park Brake Control Module	- Missing message	Check the parking brake control module and circuits. Refer to the electrical guides.
U013887	Lost Communication with All Terrain Control Module	- Missing message	Check the all-terrain control module and circuits. Refer to the electrical guides.
U015587	Lost Communication With Instrument Panel Cluster (IPC) Control Module	- Missing message	Check the instrument cluster and circuits. Refer to the electrical guides.
U030055	Internal Control Module Software Incompatibility	- Module is not configured	Configure the module using the approved diagnostic system.
U040186	Invalid Data Received from ECM/PCM A	- Signal invalid	Check the engine speed at the instrument cluster. Check for ECM DTCs.
U041686	Invalid Data Received From Vehicle Dynamics Control Module	- Signal invalid	Check for ABS DTCs.
U30004A	Control Module	- Incorrect component installed - Mismatch between configuration data and read configuration	Configure the module using the approved diagnostic system.

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Fluid Drain and Refill

General Procedures

- WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

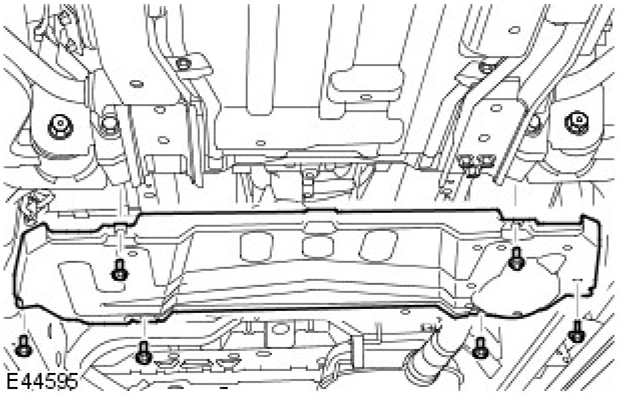
⚠ Observe due care when working near a hot exhaust system.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

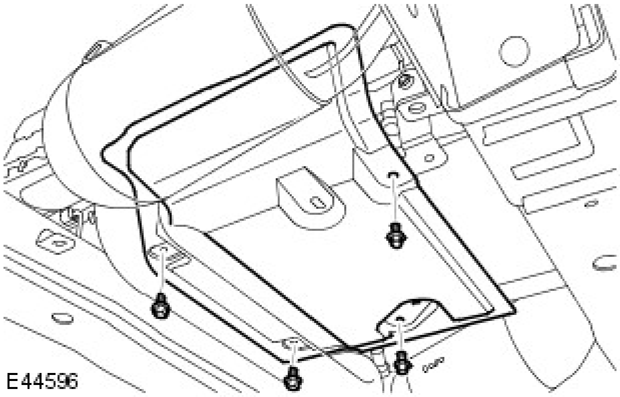
2. Remove the transmission undershield.

- Remove the 6 bolts.



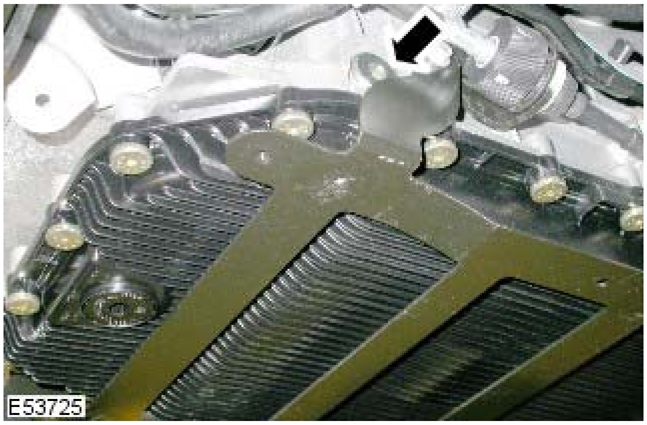
3. If installed, remove the transmission heat shield.

- Remove the 4 bolts.



4. Clean the area around the transmission fluid drain and filler plugs.

5. Place a container under the transmission.



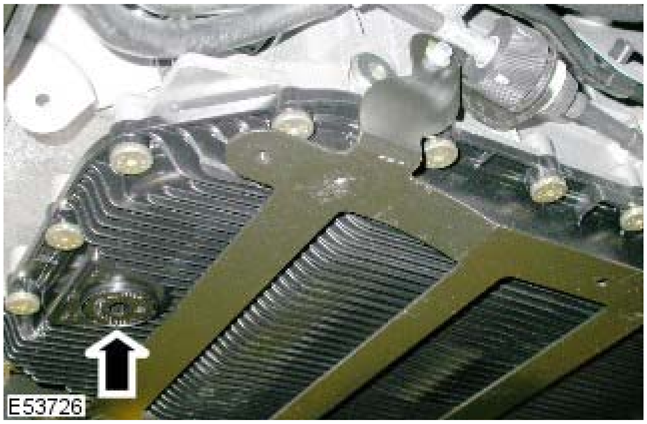
6. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

Remove the transmission fluid filler/level plug.

- Remove and discard the sealing washer.



7. Remove the transmission fluid drain plug.

- Remove and discard the sealing washer.
- Allow the fluid to drain.

8. Install the transmission fluid drain plug and tighten to 9 Nm (7 lb.ft).

- Install a new sealing washer.

9. Add 3.5 to 4 liters of the correct transmission fluid, or until a small thread of fluid runs from the filler/level hole.

10. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Published: 11-May-2011

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Fluid Level Check

General Procedures

- WARNINGS:

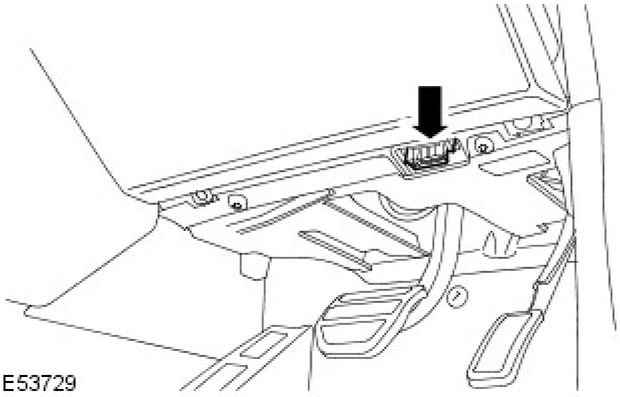
⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

⚠ CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

1. The following steps must be observed before starting the transmission fluid level check and top-up.

- The vehicle must be on a horizontal ramp.
- The parking brake must be applied.
- The wheels must be chocked.



2. ⚠ CAUTION: Make sure the transmission fluid temperature is below 30 degrees before starting the fluid level check.

Using the approved Land Rover diagnostic equipment, monitor the transmission fluid temperature.

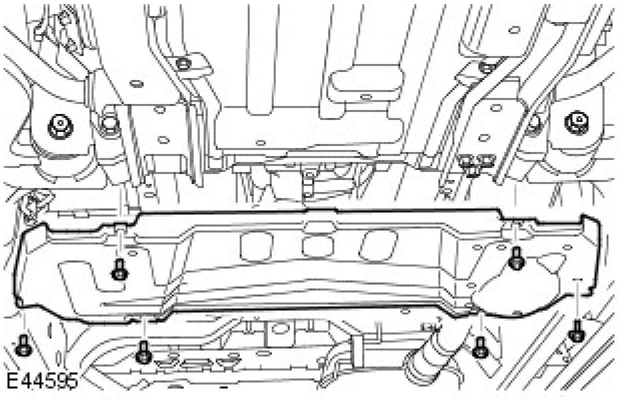
3. Start the engine. Move the selector lever from 'P' through all gear positions, pausing in each gear position for 2-3 seconds and return to the 'P' position.

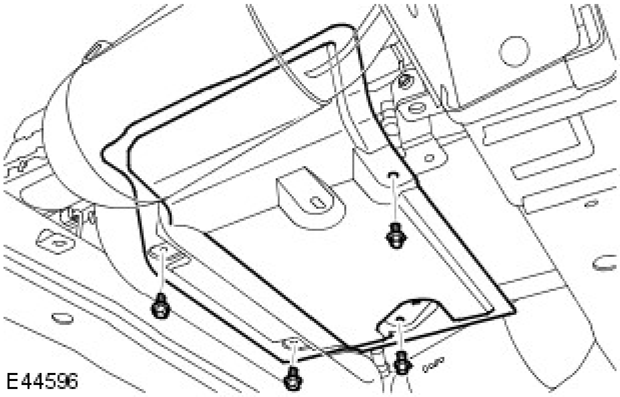
4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the transmission undershield.

- Remove the 6 bolts.

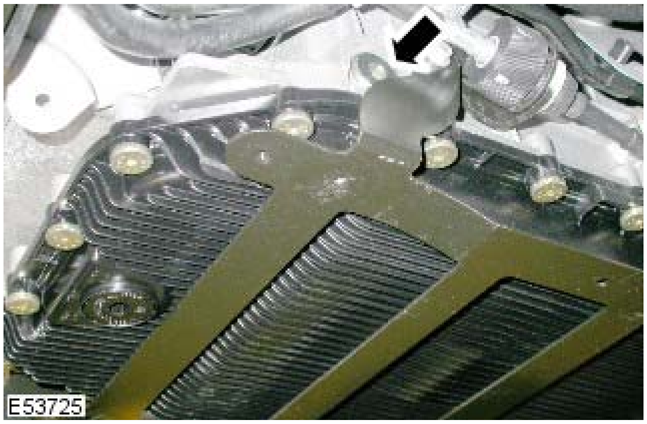




6. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

7. Place a container under the transmission.



8. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

⚠CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

Remove the transmission fluid filler/level plug.

- Clean the area around the filler/level plug.
- Remove and discard the sealing washer.

9. If no fluid loss is apparent when the filler/level plug is removed, with the engine at idle, continue to fill the transmission until a small thread of oil runs from oil filler/level hole.

10. Install the transmission fluid filler/level plug and tighten to 35 Nm (26 lb.ft).

- Install a new sealing washer.
- Remove the container.

11. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

12. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

13. Disconnect the approved Land Rover diagnostic equipment from the vehicle.

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Transmission Support Insulator

In-vehicle Repair

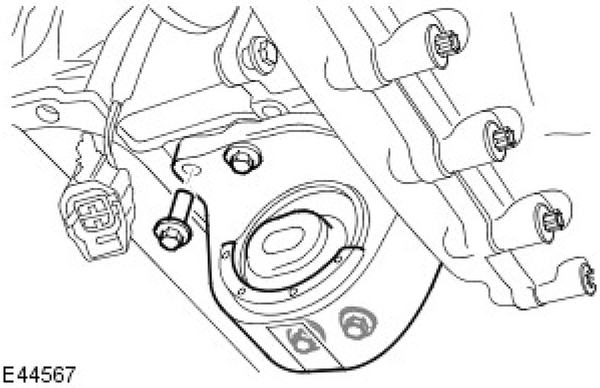
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

3. NOTE: 4.4L illustration shown, 4.0L and 2.7L Diesel are similar.



Remove the transmission support insulator.

- Remove the 4 bolts.

Installation

1. To install, reverse the removal procedure.

- Clean the component mating faces.
- Tighten the bolts to 60 Nm (44 lb.ft).

Automatic Transmission/Transaxle - TDV6 2.7L Diesel - Selector Shaft Seal

In-vehicle Repair

Special Tool(s)	
 E50766	Seal extractor (LRT-44-033/1) 307-509-1
 E50767	Seal extractor (LRT-44-033/2) 307-509-2
 E50768	Seal installer (LRT-44-033/3) 307-509-3

Removal

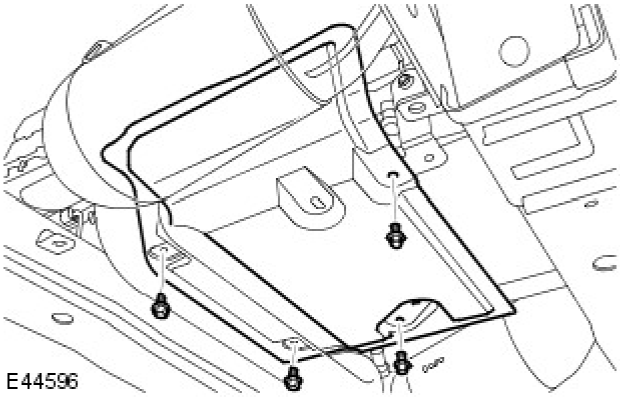
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

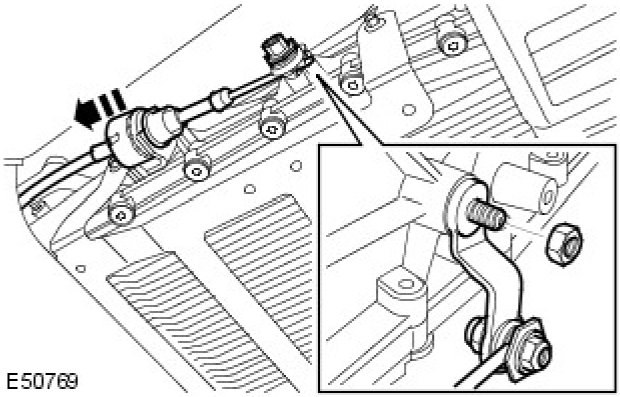
2. Remove the exhaust system.
   For additional information, refer to: Exhaust System - Vehicles Without: Diesel Particulate Filter (DPF) (309-00C Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

3. Remove the transmission heat shield.

   - Remove the 4 bolts.



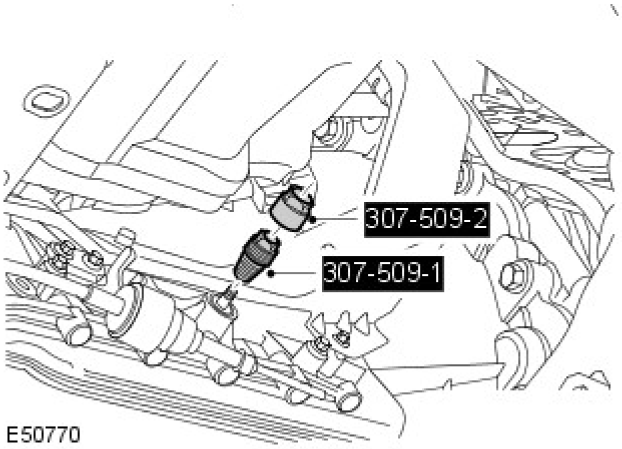
E44596



E50769

4. Release the selector cable and lever.

- Remove the nut.
- Compress the latch and release the cable.



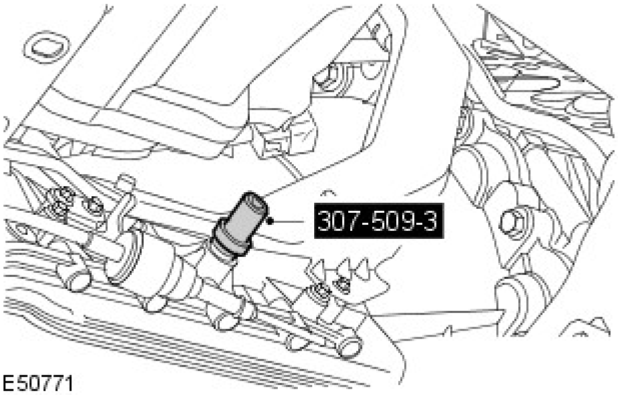
E50770

5. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the selector shaft seal.

- Install 307-509-1 to the seal.
- Install 307-509-2 to 307-509-1 and extract the seal.

Installation



E50771

1. Using 307-509-3, install the selector shaft seal.

- Clean the components.

2. Install the selector cable and bracket.

- Secure with the clip.
- Tighten the nut to 12 Nm (9 lb.ft).

3. Install the transmission heat shield.

- Install the bolts.

4. Install the exhaust system.
For additional information, refer to: Exhaust System - Vehicles Without: Diesel Particulate Filter (DPF) (309-00C Exhaust System

- TDV6 2.7L Diesel, Removal and Installation).

Removal

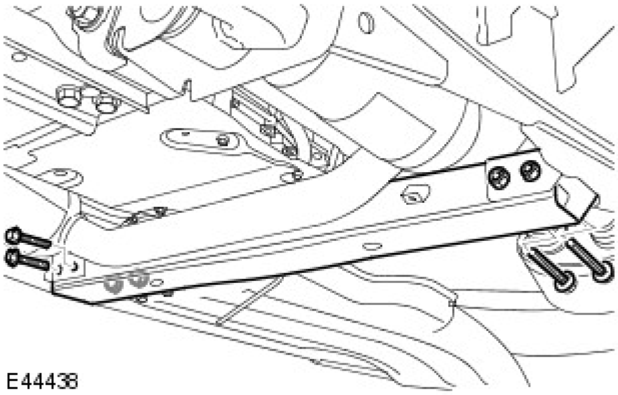
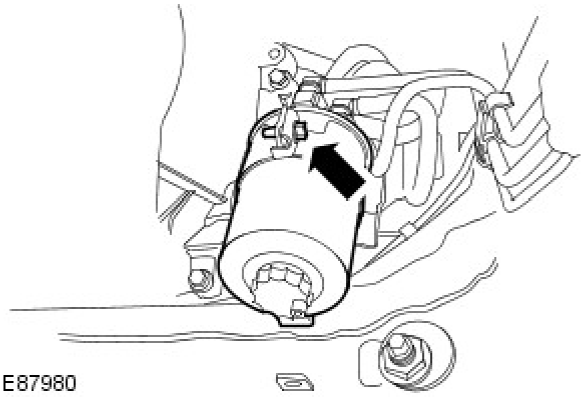
1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Raise and support the vehicle.
3. Drain the transmission fluid.
   For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).



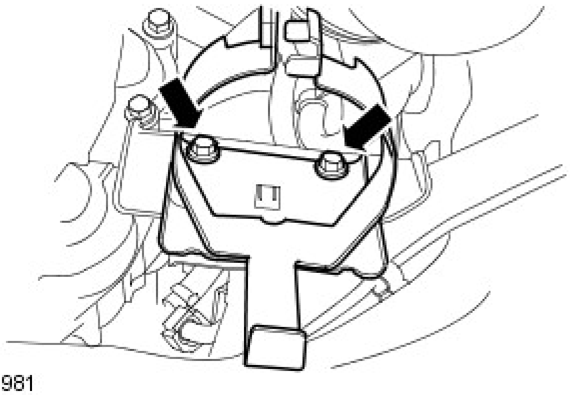
E44438

4. Remove the transmission support crossmember.
   - Support the transmission on a jack.
   - Remove the transmission mounting securing bolt.
   - Remove the 4 bolts.
   - Remove the transmission support insulator through-bolt.



E87980

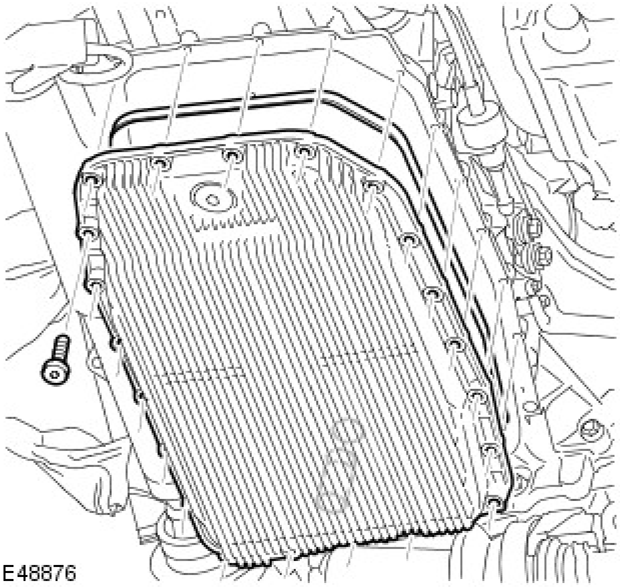
5. Release the fuel filter from its bracket.
   - Tie aside.



E87981

6. Release the support bracket.

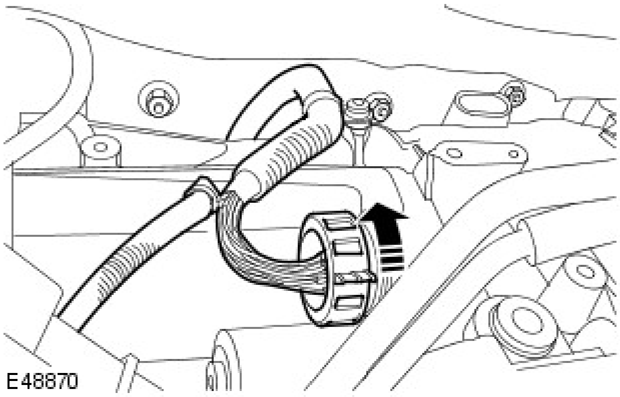
- Remove the bolt closest to the engine.
- Release but do not remove the second bolt.



E48876

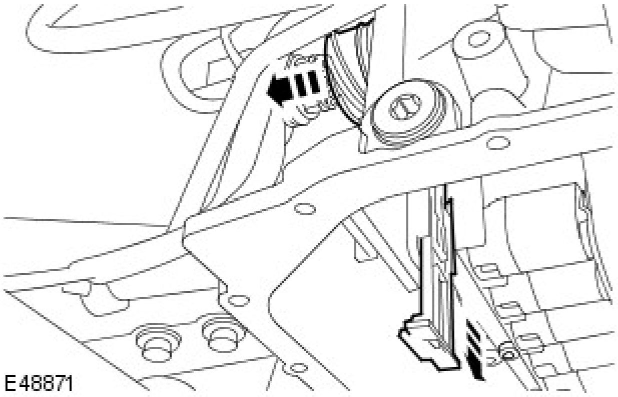
7. Release the oil pan.

- Position a container to collect the oil spillage.
- Remove the 21 Torx screws.



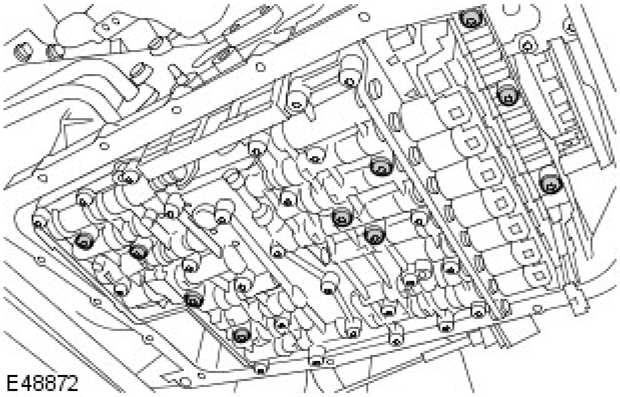
E48870

8. Release and disconnect the electrical connector.



9. Remove and discard the electrical connector sleeve.

- Release the retainer.

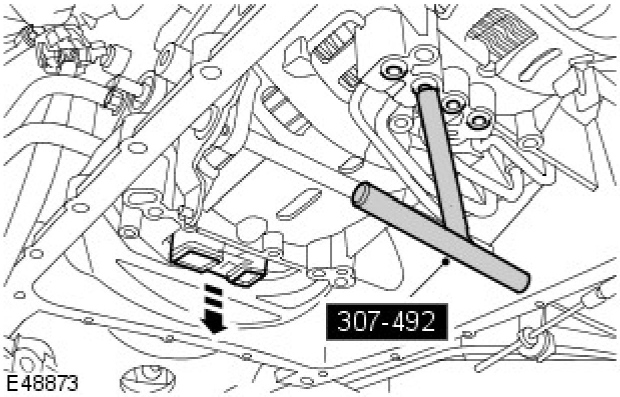


10. Remove the valve block and oil pan.

- Remove the 7 Torx bolts.
- Discard the O-ring seal.

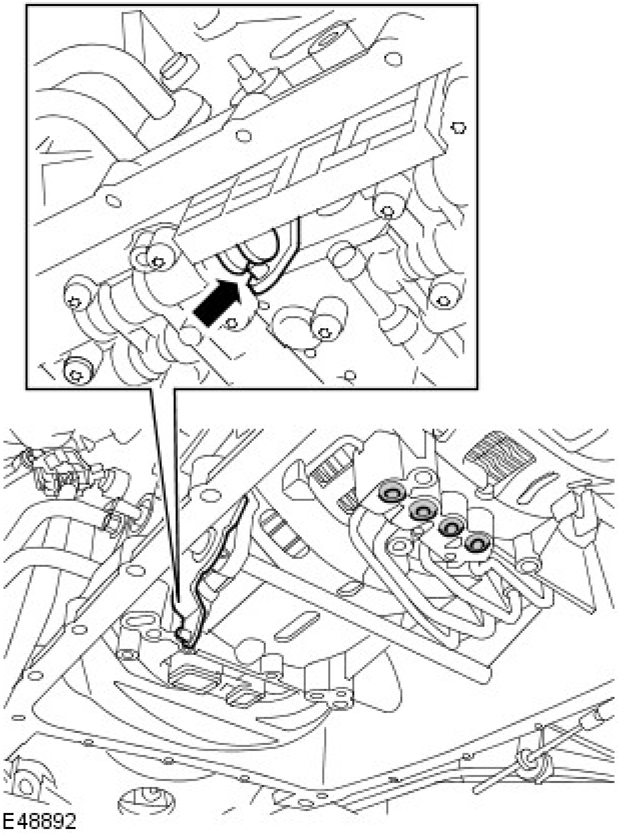
11. Using the special tool, remove the 4 seals.

12. Remove the seal block.



307-492
E48873

Installation



E48892

1. CAUTIONS:

⚠ Make sure that when fully fitted, all seals protrude by the same amount.

⚠ Engage the selector lever with the groove in the piston rod.

Install the valve block and oil pan.

- Clean the component mating faces.
- Install new seals.
- Install a new seal block.
- Tighten the Torx screws to 8 Nm (6 lb.ft).

2. Install a new electrical connector sleeve.

- Secure with retainer.

3. Connect the electrical connector.

4. Secure the oil pan.

- Tighten the Torx screws to 8 Nm (6 lb.ft).

5. Install the fuel filter support bracket.

6. Install the fuel filter.

7. Install the transmission support crossmember.

- Install the transmission support insulator through-bolt and tighten to 175 Nm (129 lb.ft).
- Install the 4 bolts.
- Tighten the nuts and bolts to 90 Nm (66 lb.ft).
- Remove the transmission jack.

8. Fill the transmission with fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

9. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

10. Using the Land Rover approved diagnostic equipment, calibrate the control valve body.

	Torque converter support handles (LRT-44-010) 307-497

Removal

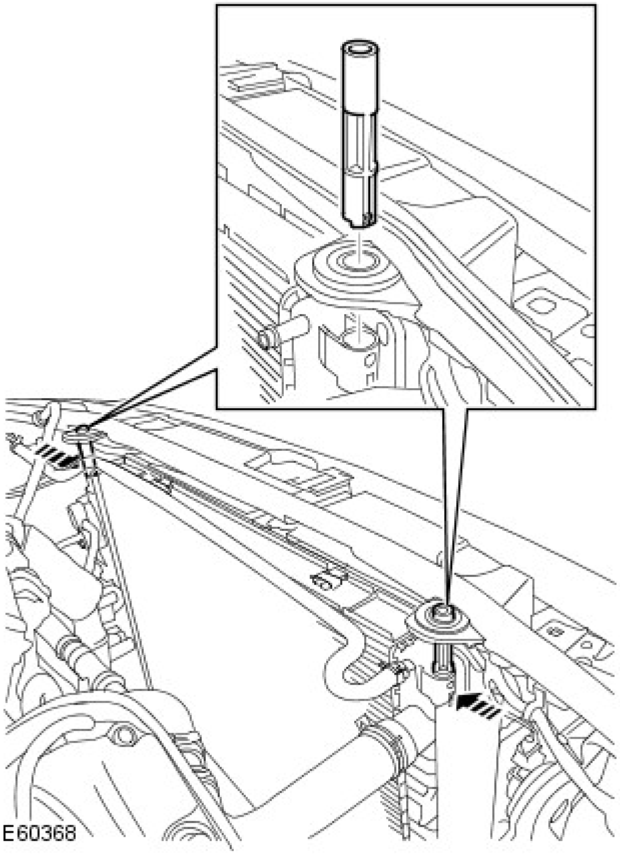
- NOTE: The front end of the body is raised from the integrated body frame to aid removal of the transmission.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

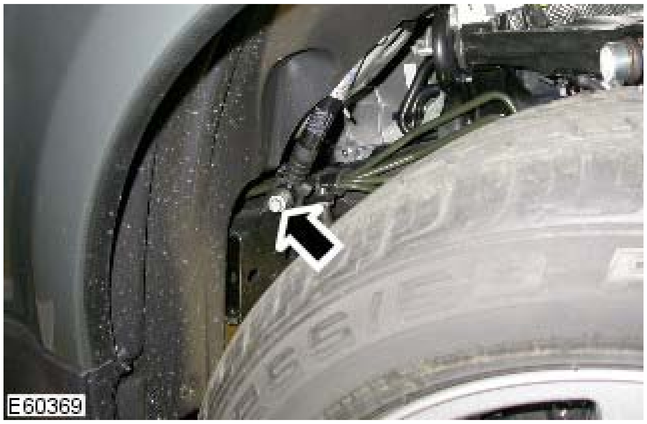
3. Remove the radiator securing pegs.

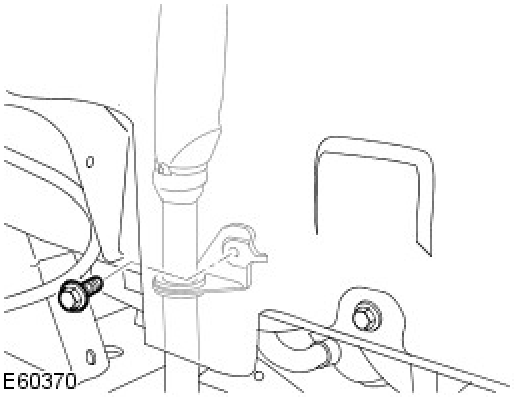


4. Remove the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

5. Release both front absorbers from the integrated body frame.

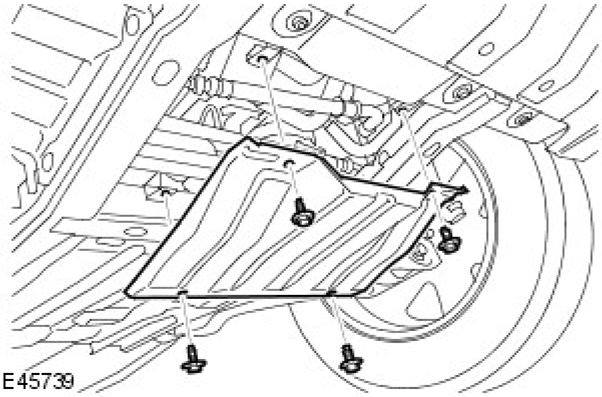
- Remove the 2 bolts.





6. Release the fuel fired booster heater exhaust bracket.

- Remove the bolt.



7. Remove the radiator access panel.

- Remove the 4 bolts.

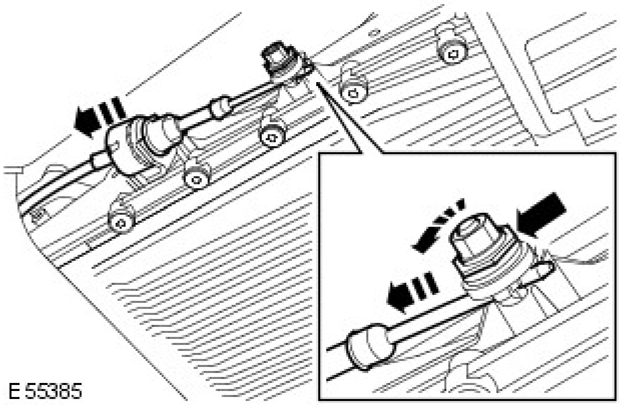
8. Remove the starter motor.
For additional information, refer to: Starter Motor (303-06C Starting System - TDV6 2.7L Diesel, Removal and Installation).

9. Drain the transmission fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

10. Remove the exhaust system.
For additional information, refer to: Exhaust System - Vehicles Without: Diesel Particulate Filter (DPF) (309-00C Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

11. Remove the front driveshaft.
For additional information, refer to: Front Driveshaft - TDV6 2.7L Diesel (205-01 Driveshaft, Removal and Installation).

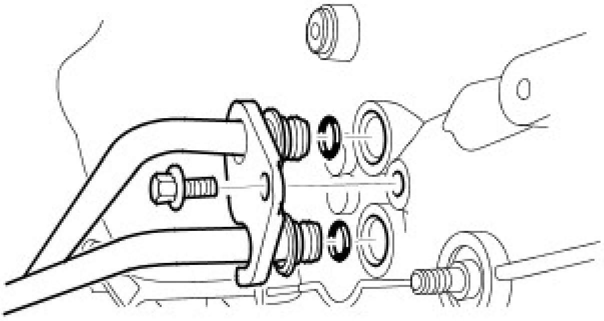
12. Remove the rear driveshaft.
For additional information, refer to: Rear Driveshaft (205-01 Driveshaft, Removal and Installation).



E 55385

13. Release the transmission selector lever cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Compress the latch and release the cable.



E60442

14. ⚠ CAUTION: Always plug any open connections to prevent contamination.

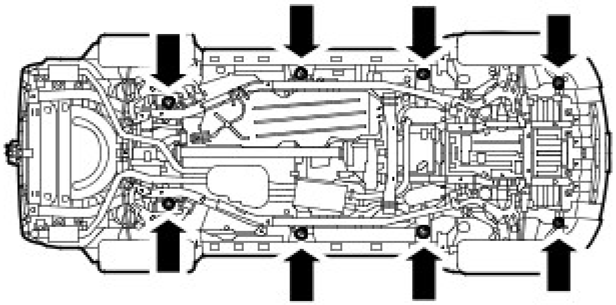
• NOTE: Some fluid spillage is inevitable during this operation.

Release the transmission fluid lines.

- Remove the retaining bolt.
- Remove and discard both O-ring seals.

15. Release the front end of the body from the integrated body frame.

- Remove the 8 bolts.
- Remove the 8 spacing washers.



E60378

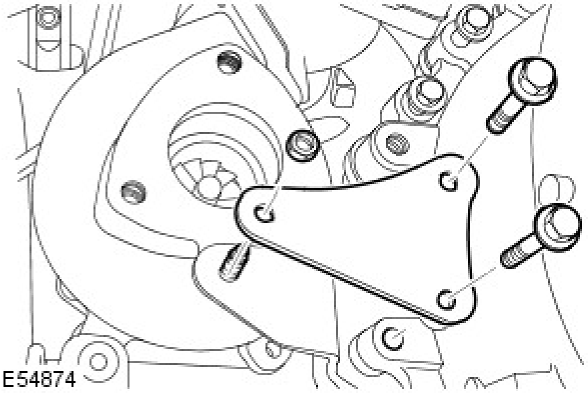
16. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

⚠ CAUTION: Only raise the body sufficiently to remove the transmission.

Carefully raise the body.

17. Remove the turbocharger support bracket.

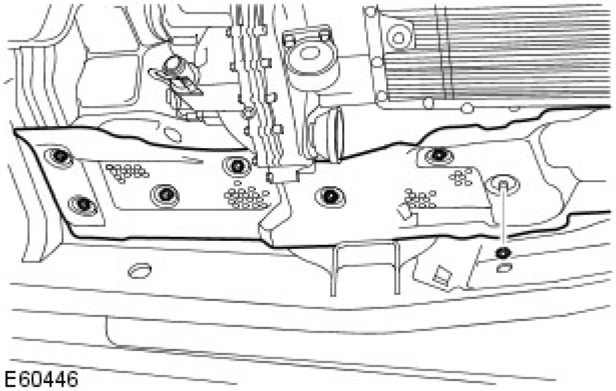
- Remove the nut and 2 bolts.



E54874

18. Remove the exhaust heat shield.

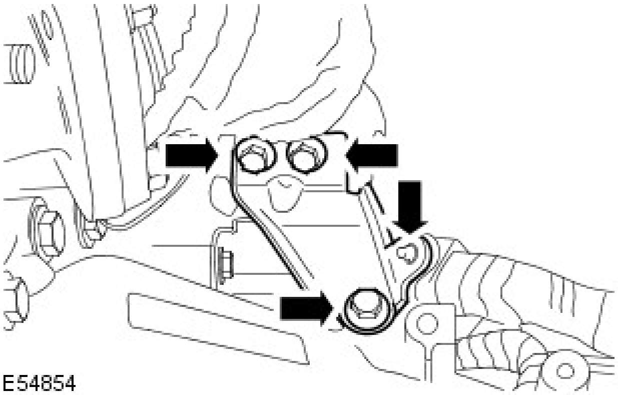
- Remove the 7 nuts.



E60446

19. Remove the exhaust cross-over pipe LH support bracket.

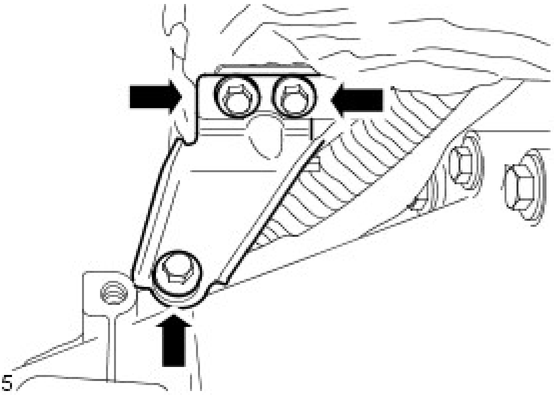
- Remove the 3 bolts.
- Release the transmission wiring harness.



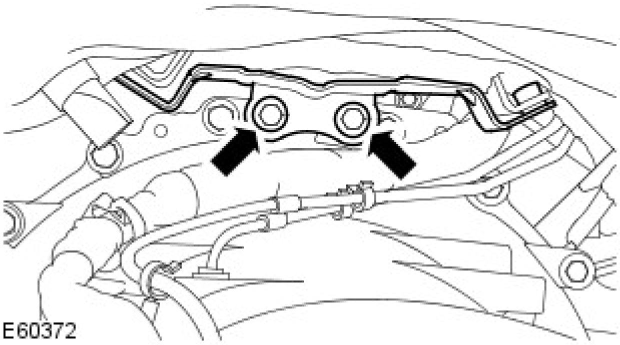
E54854

20. Remove the exhaust cross-over pipe RH support bracket.

- Remove the 3 bolts.



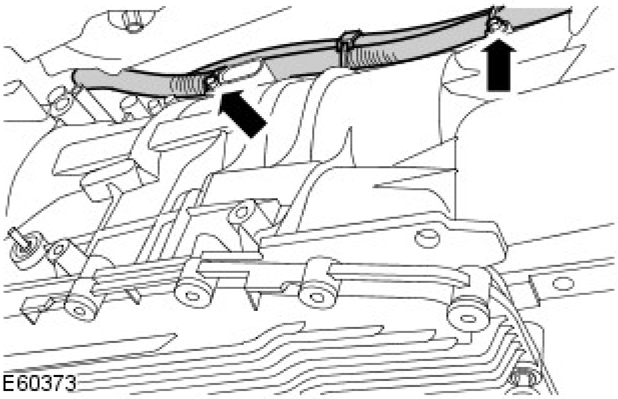
E54855



21. NOTE: The transmission is lowered for access.

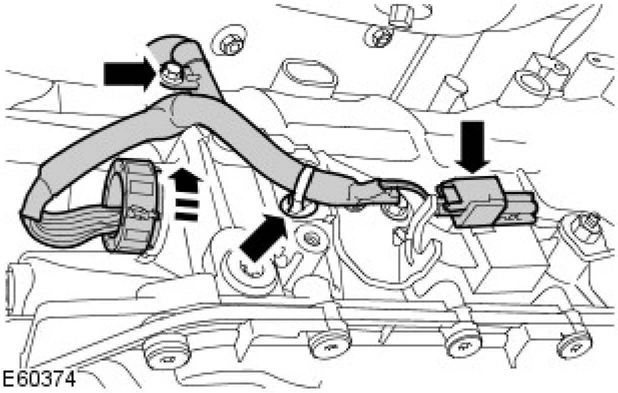
Remove the exhaust cross-over pipe center support bracket.

- Remove the 2 bolts.



22. Release the wiring harness from the LH side of the transmission.

- Remove the 2 bolts.

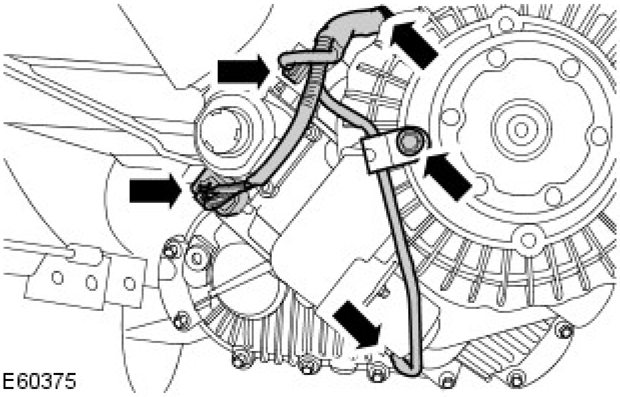


23. Release the wiring harness from the RH side of the transmission.

- Remove the retaining bolt.
- Disconnect the 2 electrical connectors.
- Release the wiring harness retaining clip.

24. Disconnect the transfer case electrical connectors.

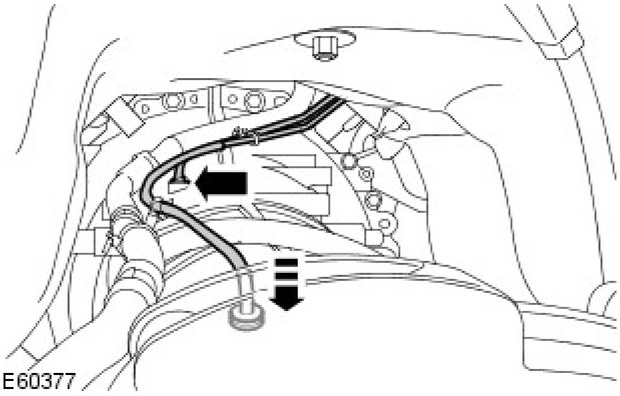
- Disconnect the three electrical connectors.



E60375

25. Release the wiring harness from the transfer case.

- Remove the bolt.
- Release the clip.

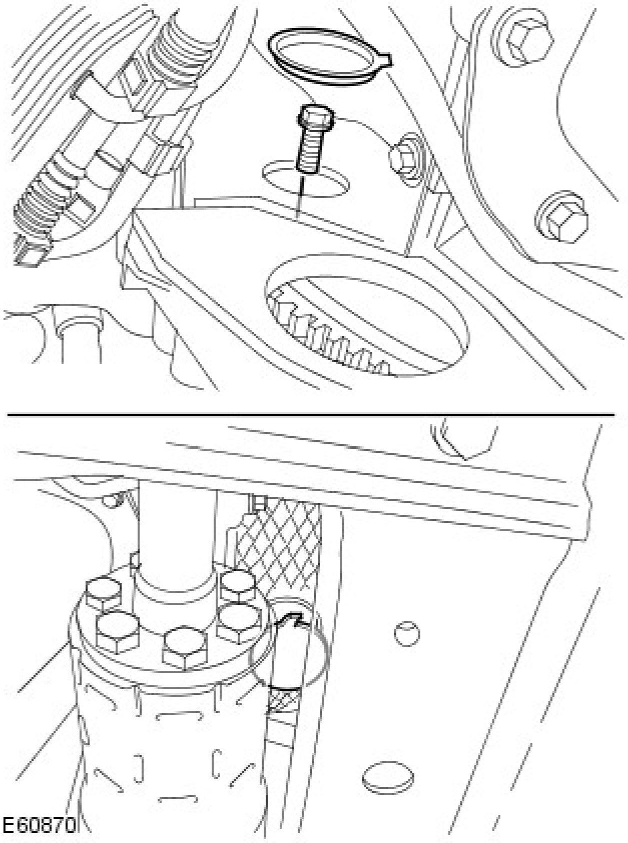


E60377

26. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Disconnect the transmission and transfer case breather lines.

- Depress the locking rings.

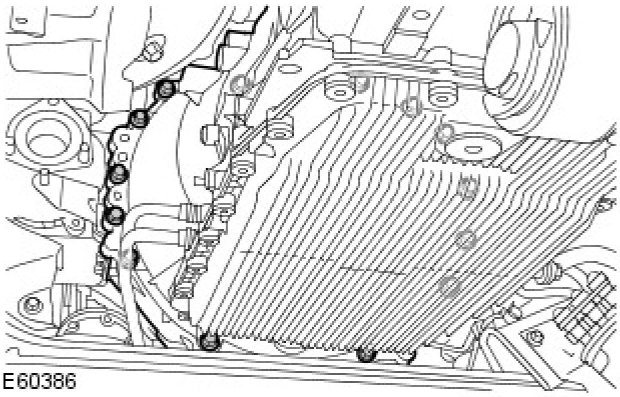


27. Release the flexplate.

- Remove the access plugs.
- Rotate the crankshaft in a clockwise direction to access the retaining bolts.
- Remove and discard the 4 bolts.

28. ⚠ WARNING: Secure the transmission to the transmission jack.

Using a transmission jack, support the transmission.



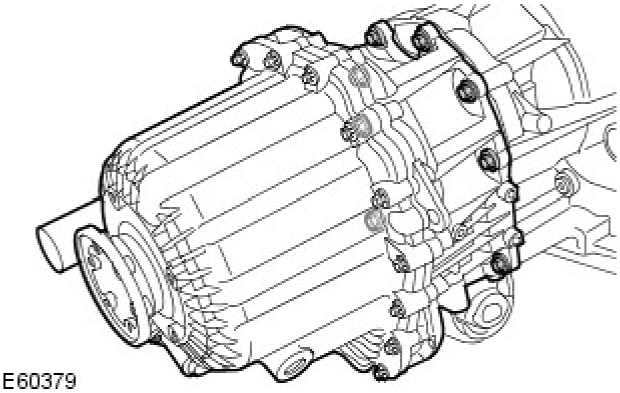
29. ⚠ WARNING: Make sure the torque converter remains with the transmission.

⚠ CAUTION: Support the engine on a jack. The angle may need to be adjusted during this procedure.

With assistance, remove the transmission.

- Remove the 14 bolts.

30. Install the torque converter retainer.



E60379

31. NOTE: Do not disassemble further if the component is removed for access only.

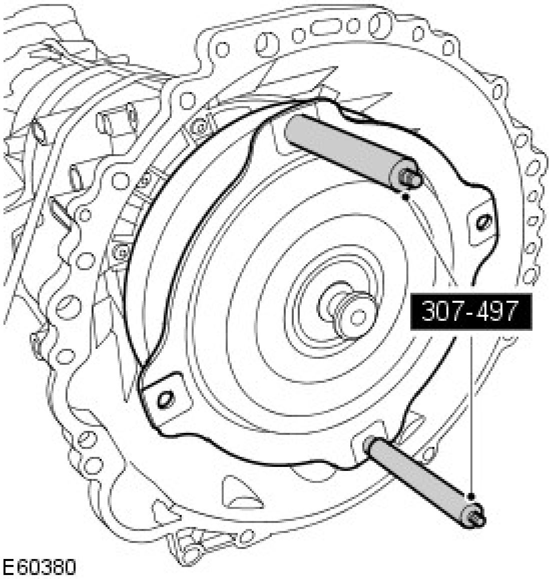
With assistance, remove the transfer case.

- Remove the 8 bolts.
- Remove and discard the O-ring seal.

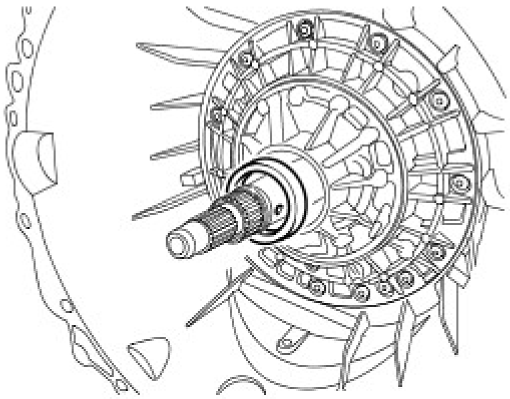
32. Remove the transmission from the transmission jack.

33. Remove the torque converter retainer.

34. Using the special tools, remove the torque converter.



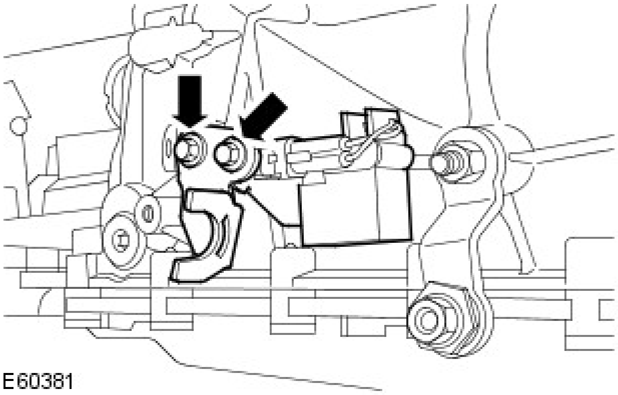
E60380



E48465

35. ⚠CAUTION: Care must be taken to avoid damage to the seal register and running surface.

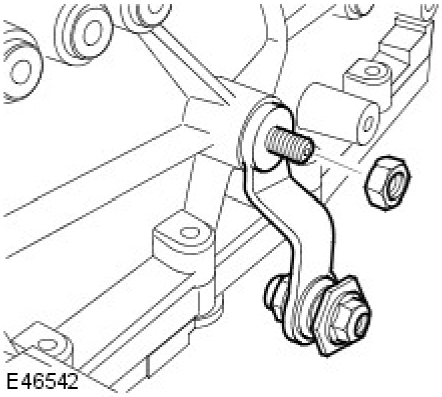
Carefully remove and discard the torque converter fluid seal.



E60381

36. Remove the selector cable bracket and suppressor.

- Remove the 2 bolts.



E46542

37. Remove the selector lever.

- Remove the retaining nut.

Installation

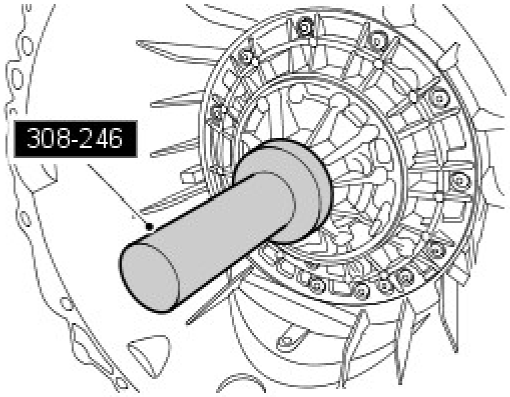
⚠ CAUTION: If the automatic transmission fluid is very dirty or it contains metallic particles, then along with a new transmission, install a new automatic transmission fluid cooler and lines.

1. Install the selector lever.

- Tighten the nut to 12 Nm (9 lb.ft).

2. Install the suppressor and selector cable bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).



E46739

3. Using the special tool, install a new torque converter fluid seal.

- Clean the seal register.

4. Install the torque converter.

- Clean the seal contact area.

- Remove the special tools.

5. Install the torque converter retainer.

6. Position the transmission to the transmission jack.

7. With assistance, install the transfer case.

- Clean the component mating faces.
- Lubricate input shaft splines with 'Weicon TL7391' grease.
- Install the O-ring seal.
- Using the special tool, tighten the bolts to 45 Nm (33 lb.ft).

8. Remove the torque converter retainer.

9. ⚠ CAUTION: Apply grease of the correct specification to the torque converter spigot.

With assistance, install the transmission.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

10. Attach the flexplate to the torque converter.

- Rotate the crankshaft clockwise to align the flexplate bolt holes.
- Rotate the torque converter to align with the flexplate bolt holes.
- Tighten the four retaining bolts to 45 Nm (33 lb.ft).
- Install the access plugs.

11. Attach the transmission and the transfer case breather lines.

- Position transmission and transfer case harness.

12. Secure the wiring harness to the transmission.

- Connect the electrical connectors.
- Secure the clip.
- Tighten the bolts to 10 Nm (7 lb.ft).

13. Secure the wiring harness to the transfer case.

- Tighten the bolt to 10 Nm (7 lb.ft).

14. Connect the transfer case electrical connectors

15. Install the exhaust manifold crossover pipe center support bracket.

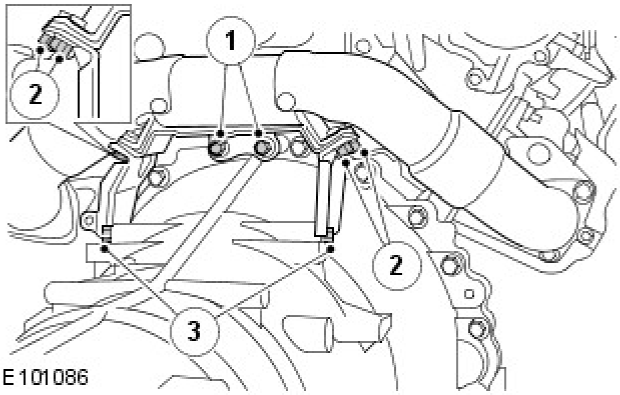
- Loosely install the 2 bolts.

16. Install the exhaust manifold crossover pipe RH support bracket.

- Loosely install the 3 bolts.

17. Install the exhaust manifold crossover pipe LH support bracket.

- Loosely install the 3 bolts.



18. Tighten the exhaust manifold crossover pipe mounting bracket bolts in the following sequence.

- Tighten the 2 bolts marked 1 to 10 Nm (7 lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 2 bolts marked 3 to 10 Nm (7lb.ft).
- Loosen the 2 bolts by 90 degrees.
- Tighten the 4 bolts maked 2 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts maked 1 to 25 Nm (18 lb. ft).
- Tighten the 2 bolts maked 3 to 25 Nm (18 lb. ft).
- Attach the wiring harness.

19. Attach the transmission fluid lines.

- Clean the components mating faces.
- Install the new O-ring seals.
- Tighten the bolt to 10 Nm (7 lb.ft).

20. Install the turbocharger support bracket.

- Tighten the nut and 2 bolts to 22 Nm (16 lb.ft).

21. ⚠CAUTION: Make sure the body mounts are correctly installed.

Secure the body to the integrated body frame.

- Carefully lower the body.
- Install the spacing washers.
- Tighten the bolts to 133 Nm (98 lb.ft).

22. Secure both front absorbers to the integrated body frame.

- Tighten the bolts to 45 Nm (33 lb.ft).

23. Secure the fuel fired booster heater exhaust bracket.

- Tighten the bolt to 10 Nm (7 lb.ft).

24. Install the radiator securing pegs.

25. Install the front bumper cover.
For additional information, refer to: Front Bumper Cover (501-19 Bumpers, Removal and Installation).

26. NOTE: Do not tighten the locking nut at this stage.

Connect the selector cable to the transmission.

- Engage the inner cable with the lever clamping bush.
- Install the selector cable to its abutment bracket.

27. Install the exhaust heat shield.

- Tighten the nuts.

28. Install the front driveshaft.
For additional information, refer to: Front Driveshaft - TDV6 2.7L Diesel (205-01 Driveshaft, Removal and Installation).

29. Install the rear driveshaft.
For additional information, refer to: Rear Driveshaft (205-01 Driveshaft, Removal and Installation).

30. Install the exhaust system.
For additional information, refer to: Exhaust System - Vehicles Without: Diesel Particulate Filter (DPF) (309-00C Exhaust System - TDV6 2.7L Diesel, Removal and Installation).

31. Install the starter motor.
For additional information, refer to: Starter Motor (303-06C Starting System - TDV6 2.7L Diesel, Removal and Installation).

32. Install the radiator access panel.

- Tighten the bolts to 10 Nm (7 lb.ft).

33. Adjust the selector cable.
For additional information, refer to: Selector Lever Cable Adjustment (307-05A Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol, General Procedures).

34. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

35. Refill the transmission with fluid.
For additional information, refer to: Transmission Fluid Drain and Refill (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

36. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

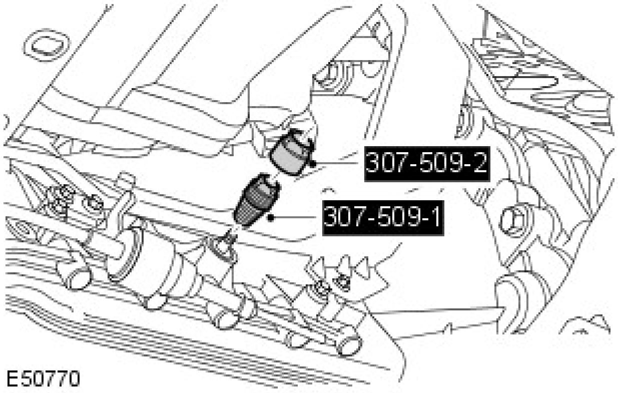
4. Release the selector cable and lever.

- Remove the nut.
- Compress the latch and release the cable.

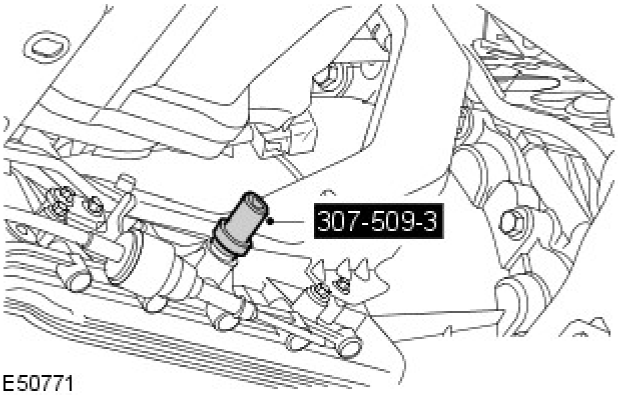


E50770

5. ⚠ CAUTION: Make sure that the area around the component is clean and free of foreign material.

Using the special tools, remove the selector shaft seal.

Installation



E50771

1. Using the special tool, install the selector shaft seal.

- Clean the components.

2. Secure the selector cable and lever.

- Secure with the clip.
- Tighten the nut to 12 Nm (9 lb.ft).

3. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

4. Install the RH catalytic converter.
For additional information, refer to: Catalytic Converter RH - Vehicles Without: Diesel Particulate Filter (DPF) (309-00D Exhaust

System - TDV8 3.6L Diesel, Removal and Installation) / Catalytic Converter RH - Vehicles With: Diesel Particulate Filter (DPF) (309-00D Exhaust System - TDV8 3.6L Diesel, Removal and Installation).

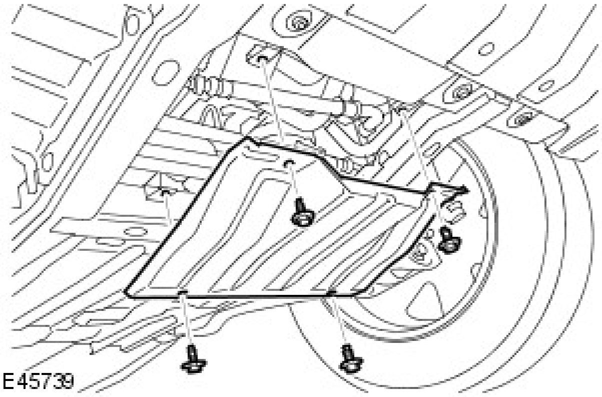
Automatic Transmission/Transaxle - TDV8 3.6L Diesel - Transmission

Removal and Installation

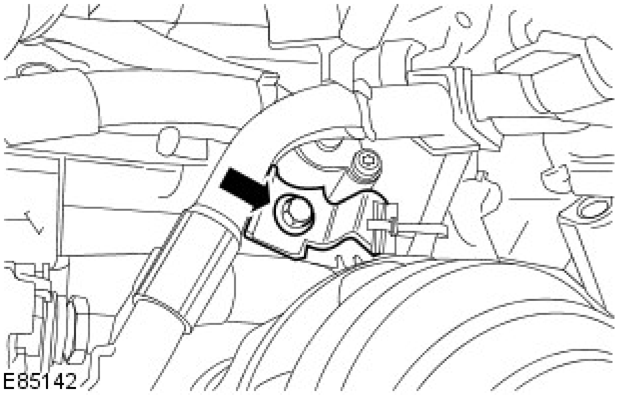
Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).
2. Raise and support the vehicle.
3. Remove the radiator splash shield.



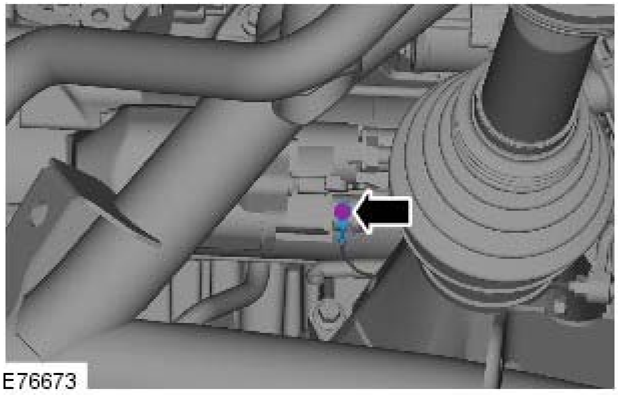
- Remove the 4 bolts.

4. Remove the engine undershield.
   For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).
5. Remove the transfer case.
   For additional information, refer to: Transfer Case - TDV8 3.6L Diesel (308-07B Transfer Case, Removal).
6. Release the battery positive cable support bracket.

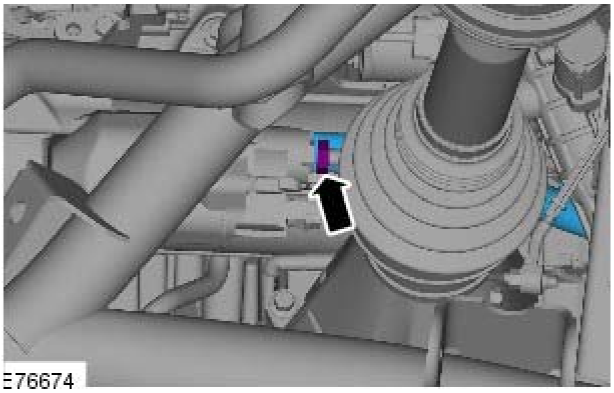


- Remove the bolt.

7. Disconnect the switch lead from the starter motor solenoid.

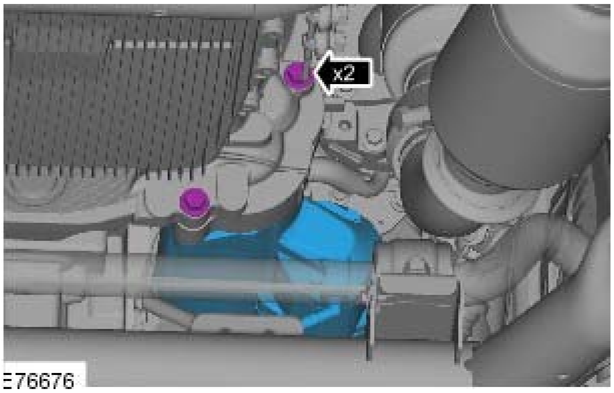


- Remove the bolt.



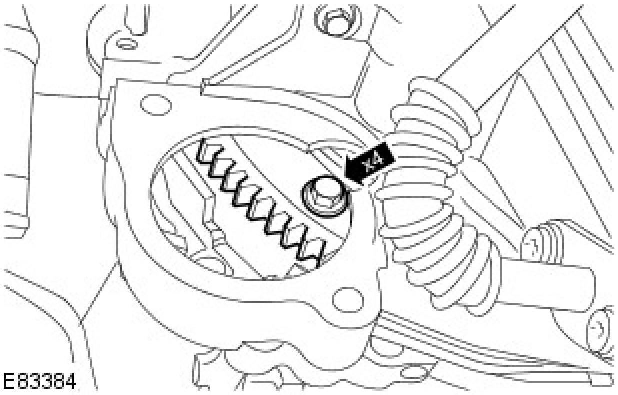
8. Disconnect the battery positive cables from the starter motor solenoid.

- Remove the nut.



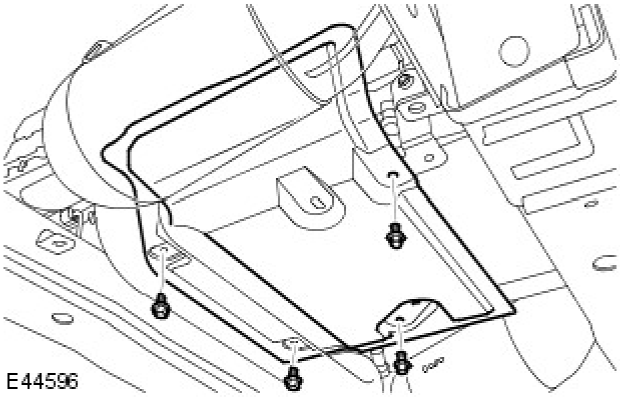
9. Reposition the starter motor.

- Remove the 2 bolts.



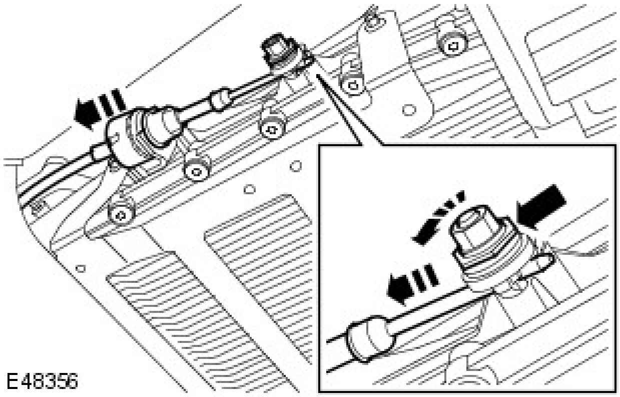
10. Release the flexplate from the torque converter.

- Remove the 4 bolts.



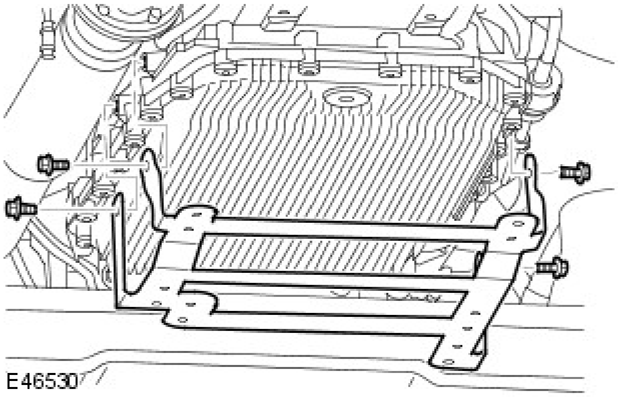
11. Remove the transmission heat shield.

- Remove the 4 bolts.



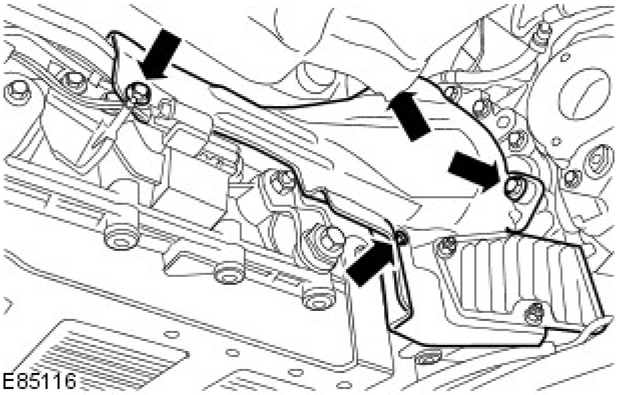
12. Release the selector lever cable.

- Compress the latch and release the cable.
- Loosen the nut.



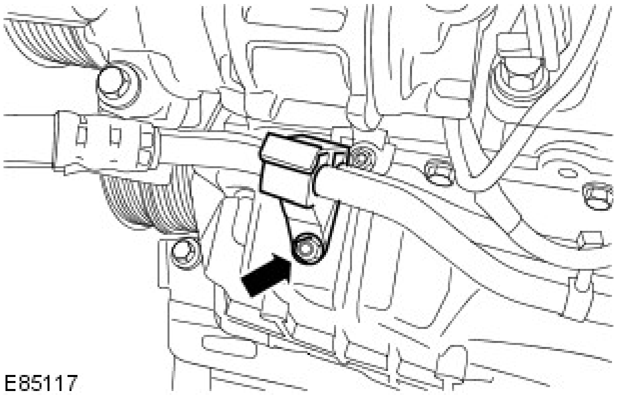
13. Remove the transmission heat shield bracket.

- Remove the 4 bolts.



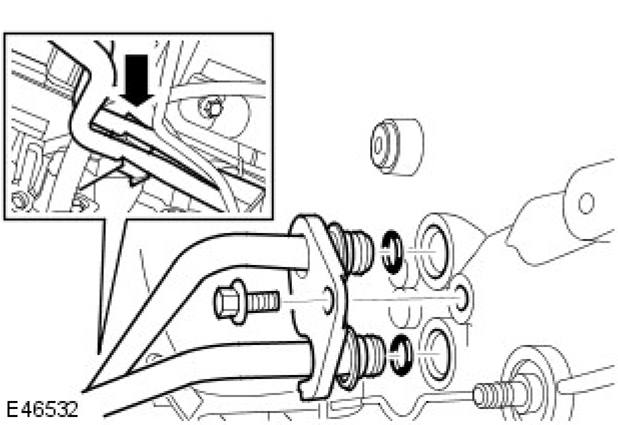
14. Remove the fuel pipe heat shield.

- Remove the 4 bolts.
- Release the fuel pipes from the clips.



15. Release the transmission fluid line bracket.

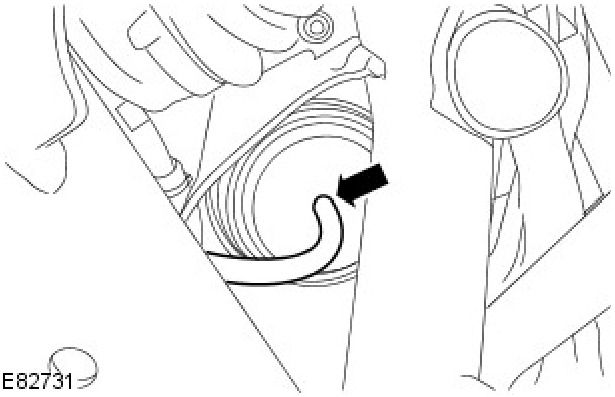
- Remove the nut.



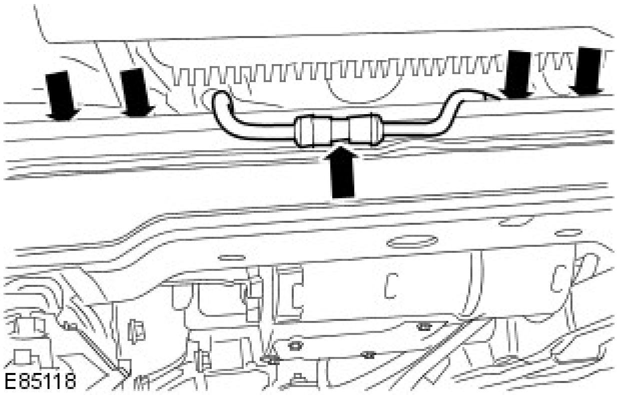
16. ⚠CAUTION: Always plug any open connections to prevent contamination.

Release the transmission fluid lines.

- Remove the bolt.
- Release the clip.
- Remove and discard both O-ring seals.

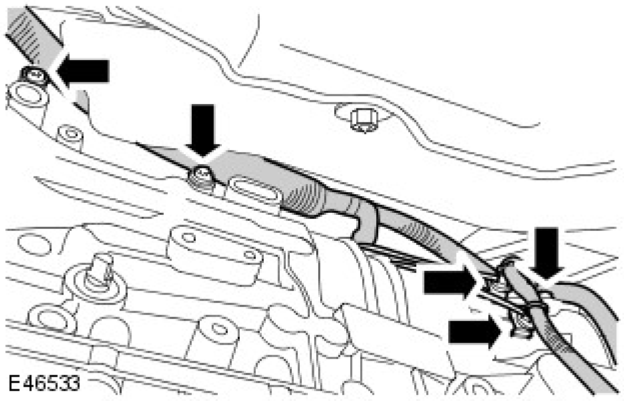


17. Disconnect and reposition the RH engine mount vacuum line.



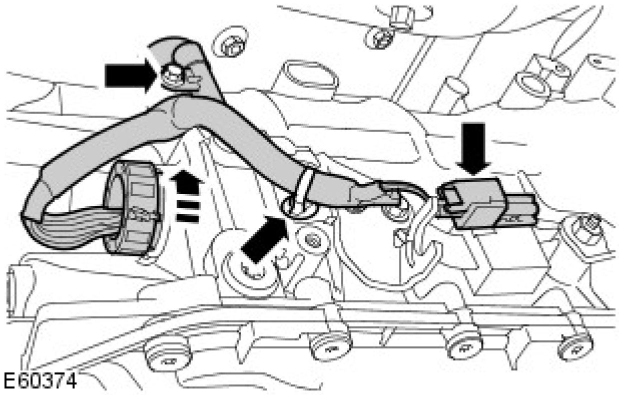
18. ⚠CAUTION: Make sure that all openings are sealed. Use new blanking caps.

Disconnect and reposition the fuel fired booster heater fuel line.



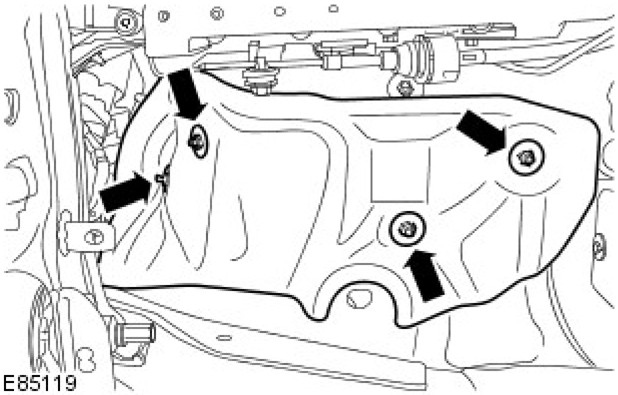
19. Release the wiring harness from the LH side of the transmission.

- Remove the 3 bolts.

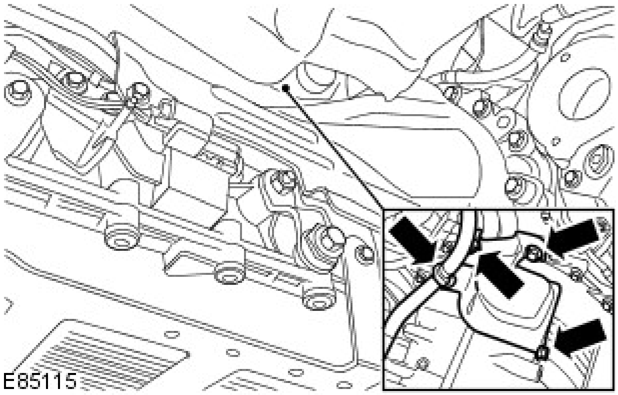


20. Release the wiring harness from the RH side of the transmission.
    - Remove the bolt.
    - Disconnect the 2 electrical connectors.
    - Release the clip.

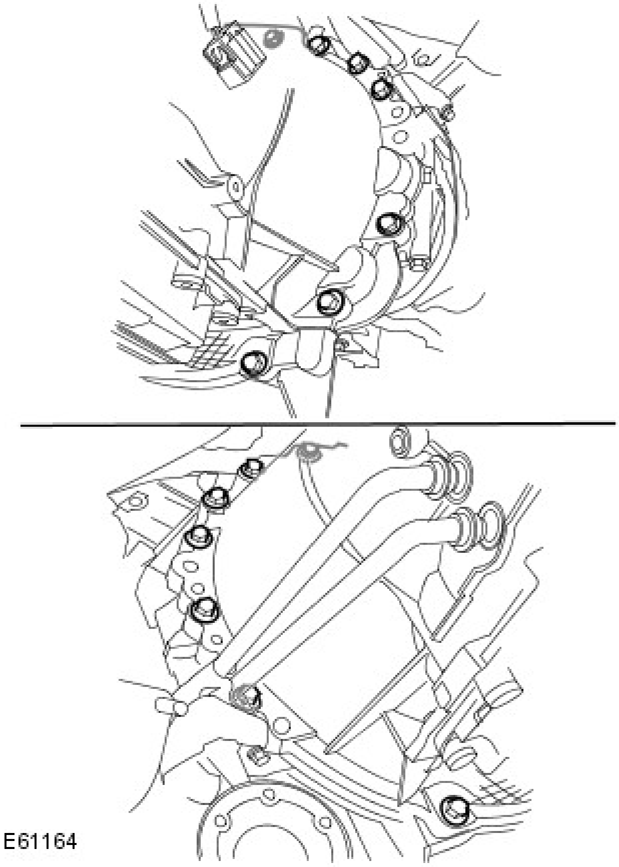
21. Release the transmission breather line clip.
    - Remove the bolt.



22. Remove the RH catalytic converter heat shield.
    - Remove the 4 nuts.



23. Remove the fuel pipe shield.
    - Remove the 3 bolts.
    - Release the wiring harness.
    - Release the fuel pipes from the fuel pipe shield.



24. ⚠ WARNING: Secure the transmission to the transmission jack.

⚠ CAUTION: Make sure the torque converter remains connected to the transmission.

With assistance, remove the transmission.

- Using a transmission jack, support the transmission.
- Remove the 14 bolts.

Installation

1. ⚠ CAUTION: Apply grease of the correct specification to the torque converter spigot.

With assistance, install the transmission.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

2. Install the RH catalytic converter heat shield.

- Tighten the nuts.

3. Install the fuel pipe shield.

- Tighten the bolts.
- Secure the wiring harness.
- Secure the fuel pipes to the fuel pipe shield.

4. Secure the transmission breather pipe clip.

- Tighten the bolt to 25 Nm (18 lb.ft).
- Secure the transmission breather pipe clip.

5. Secure the wiring harness to the RH side of the transmission.

- Tighten the bolts.
- Connect the electrical connectors.

- Secure the clip.

6. Secure the wiring harness to the LH side of the transmission.

- Tighten the bolts.

7. Secure the transmission fluid lines.

- Clean the components.
- Install the new O-ring seals.
- Secure with the clip.
- Tighten the bolt to 10 Nm (7 lb.ft).

8. Secure the transmission fluid line bracket.

- Tighten the nut to 10 Nm (7 lb.ft).

9. Connect and secure the RH engine mount vacuum line.

10. NOTE: Remove and discard the blanking caps.

Connect and secure the fuel fired booster heater fuel line.

11. Install the fuel pipe heat shield.

- Secure the fuel pipes in the clips.
- Tighten the bolts.

12. Install the transmission heat shield bracket.

- Tighten the bolts to 9 Nm (7 lb.ft).

13. NOTE: Do not fully tighten the locking nut at this stage.

Connect the selector cable to the transmission.

14. Install the transmission heat shield.

- Tighten the bolts 9 Nm (7 lb.ft).

15. Secure the flexplate to the torque converter.

- Tighten the bolts to 55 Nm (41 lb.ft).

16. Secure the starter motor.

- Clean the component mating faces.
- Tighten the bolts to 45 Nm (33 lb.ft).

17. Secure the battery positive cable support bracket.

- Tighten the bolt.

18. Connect the battery positive cables.

- Tighten the nut to 22 Nm (16 lb.ft).

19. Connect the switch lead to the starter motor solenoid.

- Tighten the nut to 4 Nm (3 lb.ft).

20. Install the transfer case.
For additional information, refer to: Transfer Case - TDV8 3.6L Diesel (308-07B Transfer Case, Removal).

21. Adjust the selector cable.

For additional information, refer to: Selector Lever Cable Adjustment (307-05A Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol, General Procedures).

22. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

23. Install the radiator splash shield.

- Tighten the bolts.

24. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

25. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

Automatic Transmission/Transaxle - TDV8 3.6L Diesel - Transmission Fluid Drain and Refill

General Procedures

- WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

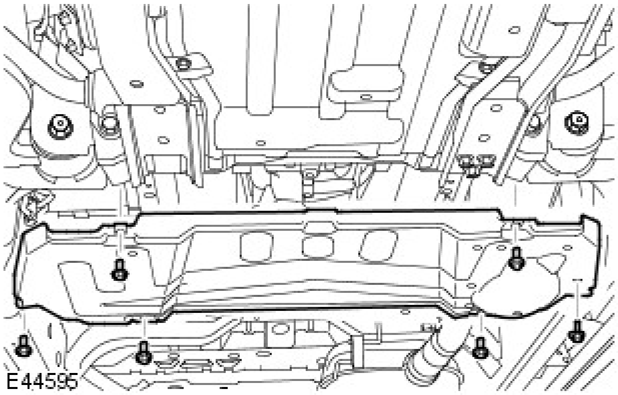
⚠ Observe due care when working near a hot exhaust system.

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

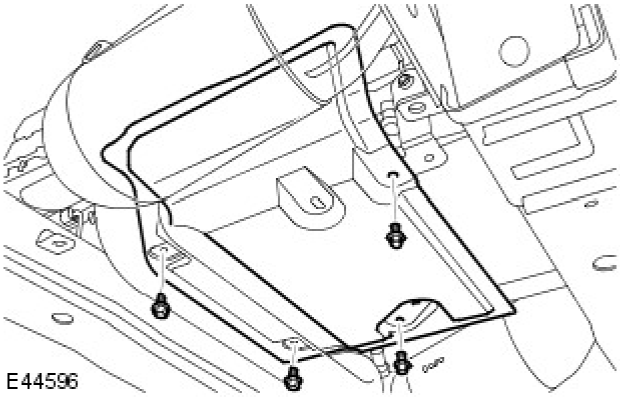
2. Remove the transmission undershield.

- Remove the 6 bolts.



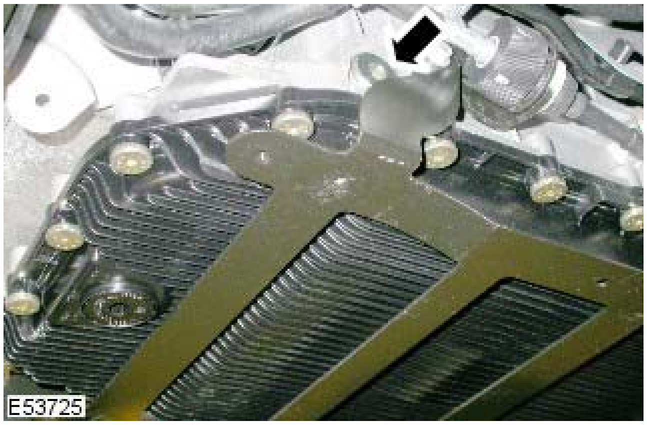
3. If installed, remove the transmission heat shield.

- Remove the 4 bolts.



4. Clean the area around the transmission fluid drain and filler plugs.

5. Place a container under the transmission.



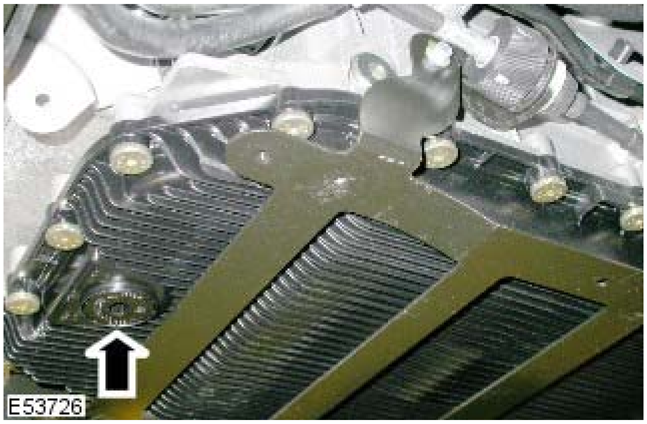
6. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

Remove the transmission fluid filler/level plug.

- Remove and discard the sealing washer.



7. Remove the transmission fluid drain plug.

- Remove and discard the sealing washer.
- Allow the fluid to drain.

8. Install the transmission fluid drain plug and tighten to 9 Nm (7 lb.ft).

- Install a new sealing washer.

9. Add 3.5 to 4 liters of the correct transmission fluid, or until a small thread of fluid runs from the filler/level hole.

10. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, General Procedures).

Published: 11-May-2011

Automatic Transmission/Transaxle - TDV8 3.6L Diesel - Transmission Fluid Level Check

General Procedures

- WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

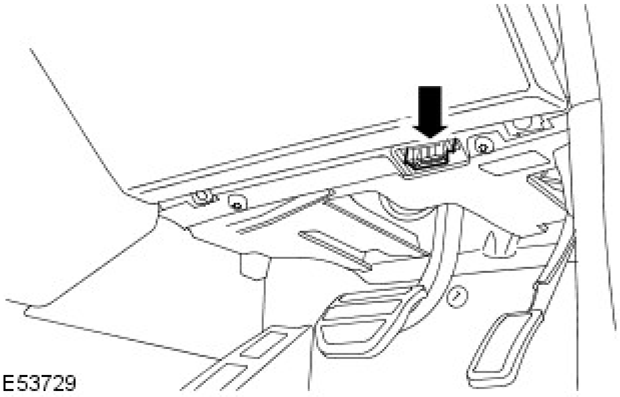
⚠ Observe due care when working near a hot exhaust system.

⚠ CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

1. The following steps must be observed before starting the transmission fluid level check and top-up.

- The vehicle must be on a horizontal ramp.
- The parking brake must be applied.
- The wheels must be chocked.

2. ⚠ CAUTION: Make sure the transmission fluid temperature is below 30 degrees before starting the fluid level check.



Using the approved Land Rover diagnostic equipment, monitor the transmission fluid temperature.

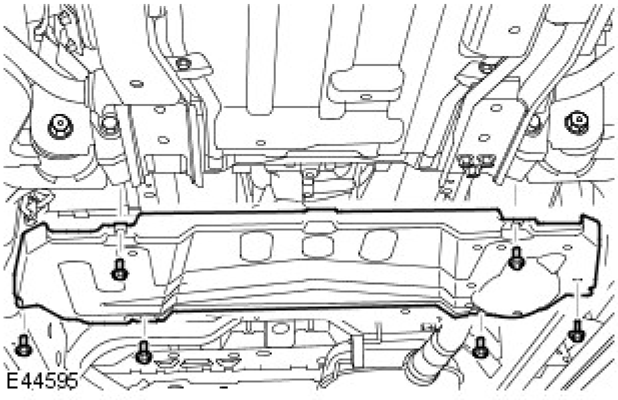
3. Start the engine. Move the selector lever from 'P' through all gear positions, pausing in each gear position for 2-3 seconds and return to the 'P' position.

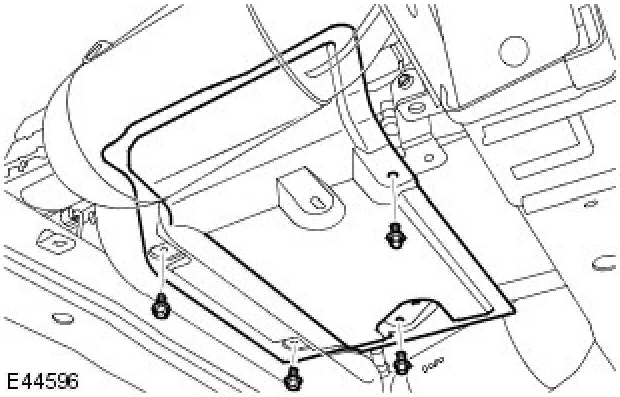
4. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

5. Remove the transmission undershield.

- Remove the 6 bolts.

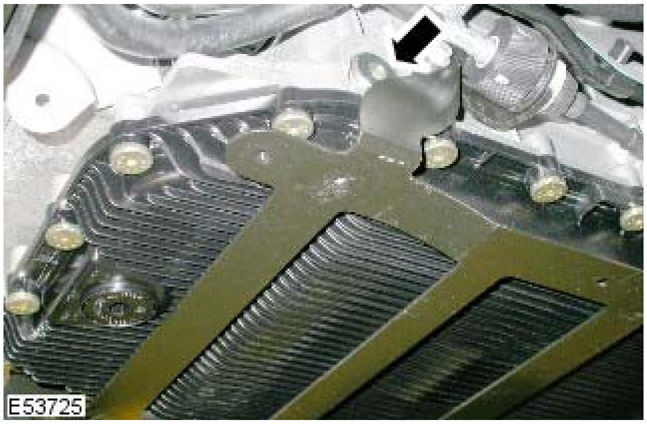




6. If installed, remove the transmission heat shield.

- Remove the 4 bolts.

7. Place a container under the transmission.



8. WARNINGS:

⚠ Observe due care when draining transmission fluid as the fluid can be very hot.

⚠ Observe due care when working near a hot exhaust system.

⚠ CAUTION: The gearbox fluid level must only be checked when the temperature of the fluid is between 30 degrees and 50 degrees. The fluid level obtained will be incorrect if the reading is outside this temperature range.

Remove the transmission fluid filler/level plug.

- Clean the area around the filler/level plug.
- Remove and discard the sealing washer.

9. If no fluid loss is apparent when the filler/level plug is removed, with the engine at idle, continue to fill the transmission until a small thread of oil runs from oil filler/level hole.

10. Install the transmission fluid filler/level plug and tighten to 35 Nm (26 lb.ft).

- Install a new sealing washer.
- Remove the container.

11. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

12. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

13. Disconnect the approved Land Rover diagnostic equipment from the vehicle.

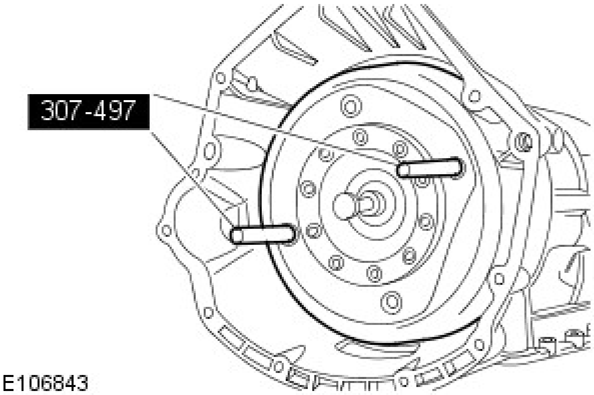
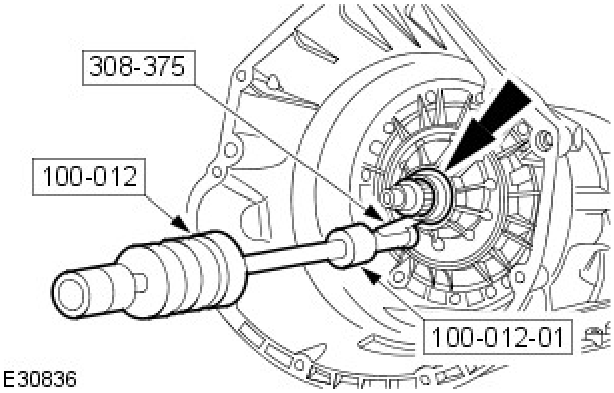
   Refer to: Transmission (307-01D Automatic Transmission/Transaxle - TDV8 3.6L Diesel, Removal and Installation).



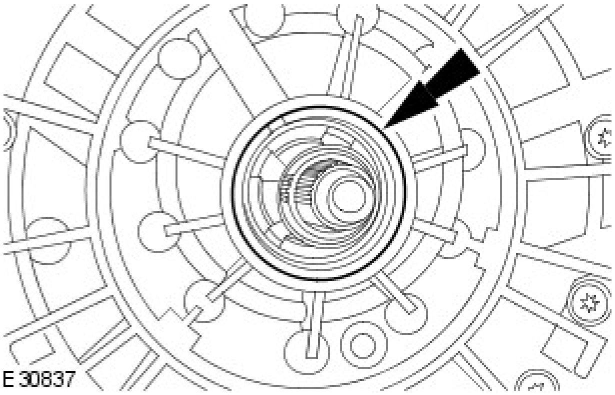
3. **3.** WARNING: Do not let the torque converter drop out of the transmission. Failure to follow this instruction may result in personal injury.

   Using the special tools, remove the torque converter. Drain any remaining fluid into a suitable container.



4. **4.** WARNING: Make sure the transmission housing seal face is not damaged when removing the torque converter seal. Failure to follow this instruction may result in damage to the vehicle.

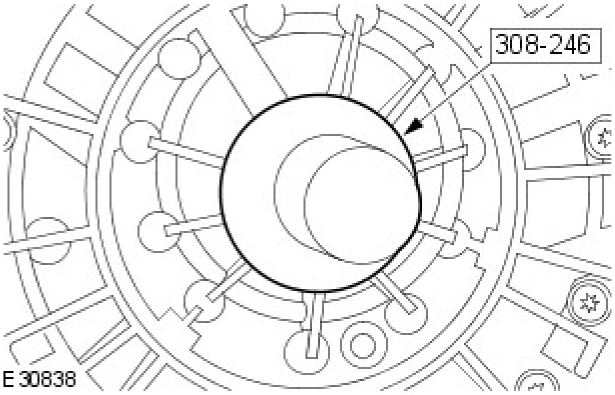
   Using the special tools, remove the input shaft seal.



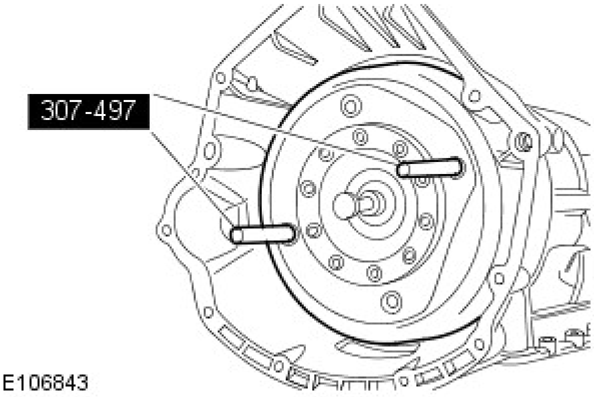
5. **5.** NOTE: Using a suitable metal surface cleaner meeting Jaguar specification. clean the seal face on the housing before fitting the new seal.

   Clean and inspect the transmission housing seal face.

Installation



1. Using the special tool, install a new input shaft seal.



2. **2.** ⚠ WARNING: Do not let the torque converter drop out of the transmission. Failure to follow this instruction may result in personal injury.

   • NOTE: The torque converter hub must engage fully in the oil pump drive gear.

   Using the special tools, install the torque converter. Remove the special tools.

3. Install the transmission assembly.

   Refer to: Transmission (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, Removal and Installation).

Transmission/Transaxle Cooling - V8 S/C 4.2L Petrol - Transmission Cooling

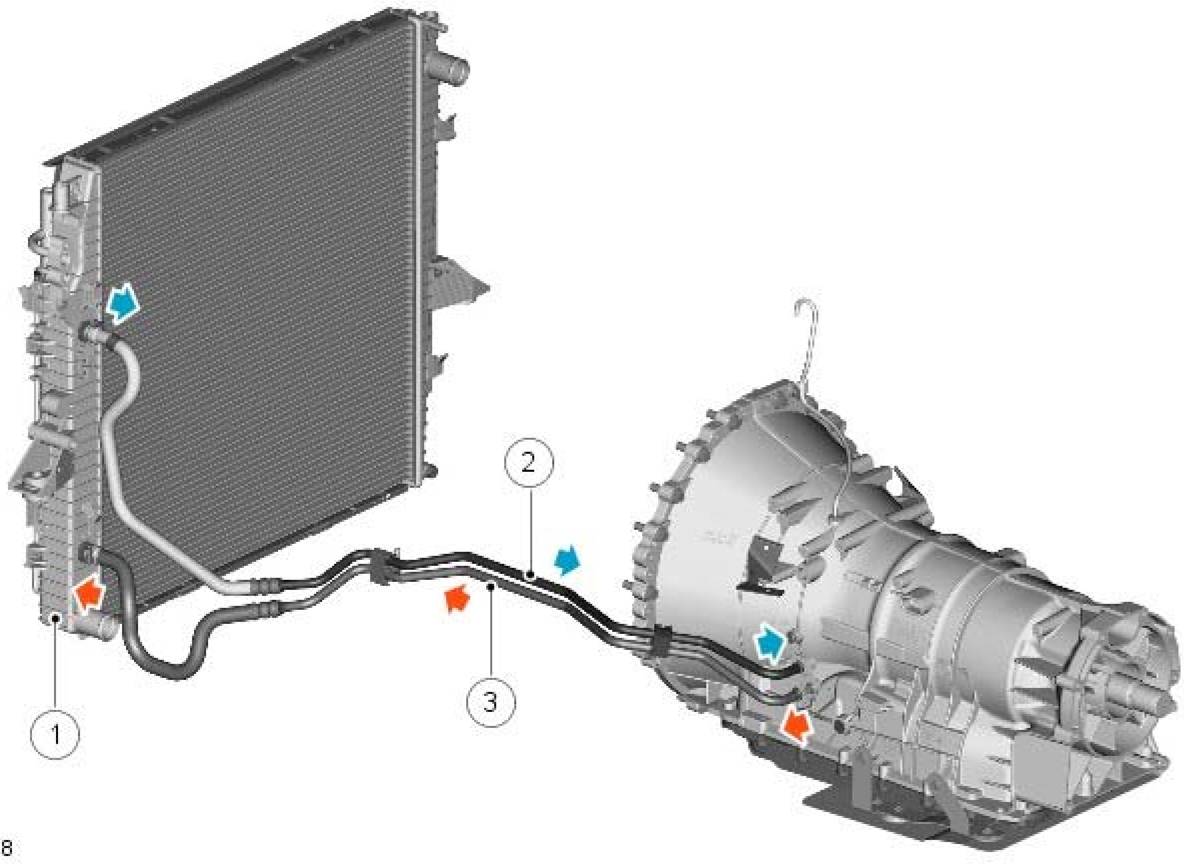
Description and Operation

TRANSMISSION FLUID COOLING - 4.2L V8 SUPERCHARGED

The transmission fluid cooler is an integral part of the engine cooling radiator. The transmission is connected to the fluid cooler via flexible hoses and metal pipes.



Item	Part Number	Description
1	-	Transmission cooler (within radiator)
2	-	Return pipe (To transmission)
3	-	Feed pipe (From transmission)

The transmission cooler is integrated into the left hand end tank of the engine cooling radiator. The transmission fluid is cooled by the temperature differential between the transmission fluid and the engine coolant and also by airflow over cooling fins on the end tank.

Fluid is supplied from the transmission fluid pump into the lower connection of the cooler. After passing through the cooler, the fluid passes out of the upper connection and is returned to the transmission fluid pan.

E86895

Item	Part Number	Description
1	-	Engine cooling radiator
2	-	Transmission fluid cooler
3	-	Feed pipe (From transmission)
4	-	Return pipe (To transmission)

INTRODUCTION

The transmission fluid cooler is a separate cooling unit located behind the engine cooling radiator. The transmission is connected to the fluid cooler via flexible hoses and metal pipes.

The transmission cooler is a dedicated fluid cooler which is connected into the engine cooling system circuit. The transmission fluid is cooled by the temperature differential between the transmission fluid and the engine coolant flowing through the cooler.

Fluid is supplied from the transmission fluid pump into the Right Hand (RH) connection of the cooler. After passing through the cooler, the fluid passes out of the Left Hand (LH) connection and is returned to the transmission fluid pan.

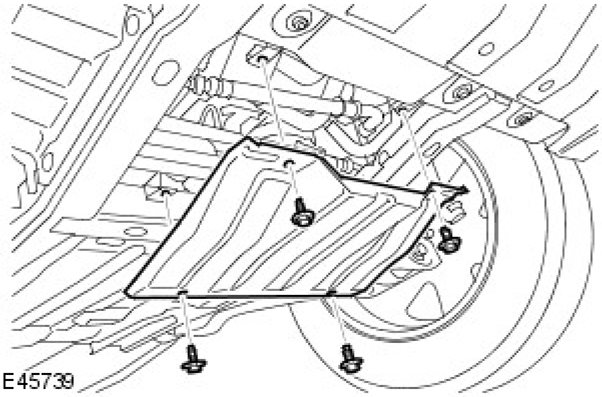
Removal and Installation

Removal

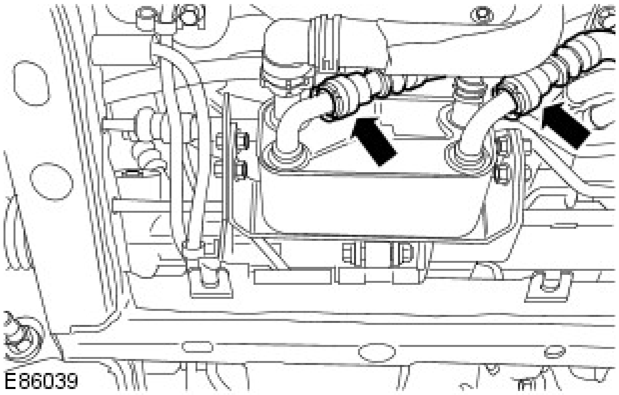
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



2. Remove the radiator splash shield.

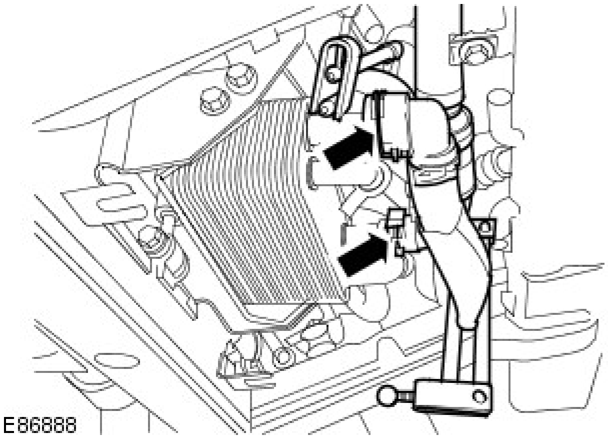
- Remove the 4 bolts.



3. ⚠ CAUTION: Make sure that all openings are sealed. Use new blanking caps.

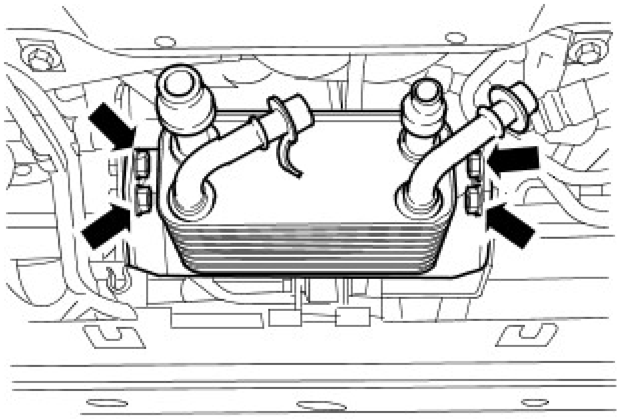
Disconnect the 2 transmission fluid cooler tubes from the transmission fluid cooler.

- Position a container to collect the fluid spillage.
- Release the 2 quick release connectors.



4. Disconnect the 2 transmission fluid cooler coolant hoses.

- Clamp 2 the coolant hoses to minimize coolant loss.
- Release the 2 clips.



E86889

5. Remove the transmission fluid cooler.
   - Remove the 4 nuts and bolts.

Installation

1. Install the transmission fluid cooler.
   - Tighten the nuts and bolts to 20 Nm (15 lb.ft).
2. Connect the transmission fluid cooler coolant hoses.
   - Secure the clips.
   - Remove the coolant hose clamps.
3. NOTE: Remove and discard the blanking caps.

   Connect the transmission fluid cooler tubes to the transmission fluid cooler.
   - Remove the container.
4. Install the radiator splash shield.
   - Tighten the M6 bolts to 10 Nm (7 lb.ft).
   - Tighten the M10 bolts to 62 Nm (46 lb.ft).
5. Check and top-up the transmission fluid level.
   For additional information, refer to: Transmission Fluid Level Check (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).
6. Check and top-up the coolant.

Transmission/Transaxle Cooling - TDV8 3.6L Diesel - Transmission Fluid Cooler Tubes

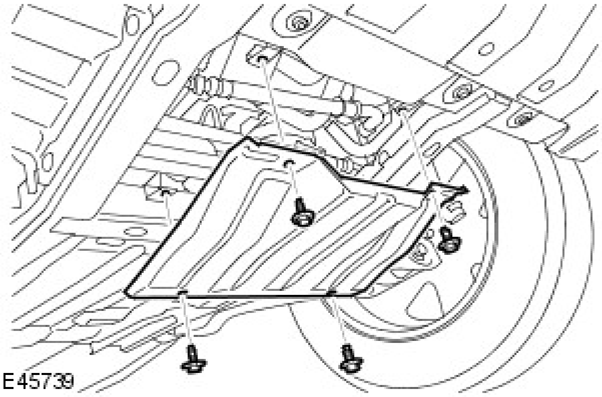
Removal and Installation

Removal

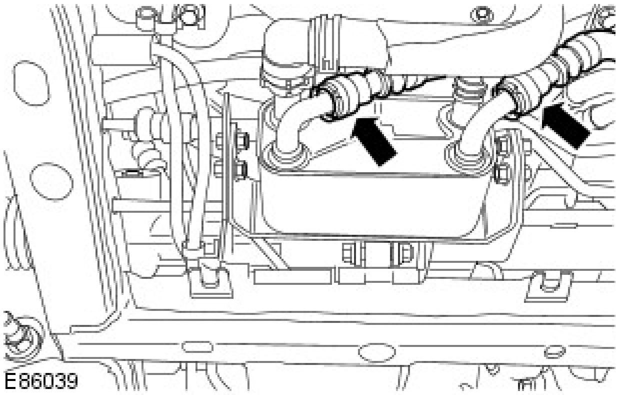
1. Raise and support the vehicle.

2. Remove the front axle assembly.
For additional information, refer to: Axle Assembly - TDV8 3.6L Diesel (205-03 Front Drive Axle/Differential, Removal and Installation).

3. Remove the radiator splash shield.



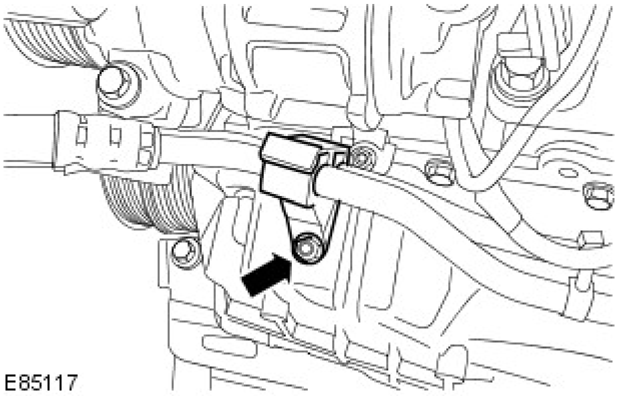
- Remove the 4 bolts.



4. ⚠CAUTION: Make sure that all openings are sealed. Use new blanking caps.

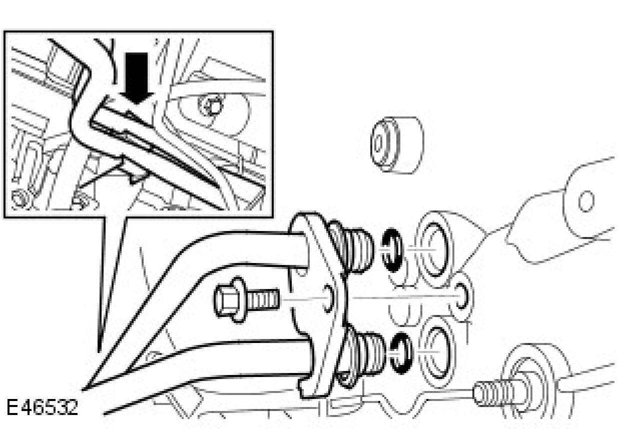
Disconnect the 2 transmission fluid cooler tubes from the transmission fluid cooler.

- Position a container to collect the fluid spillage.
- Release the 2 quick release connectors.



5. Release the transmission fluid cooler tubes bracket.

- Remove the nut.



6. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Remove the 2 transmission fluid cooler tubes.

- Remove the bolt.
- Remove and discard both O-ring seals.

Installation

1. NOTE: Remove and discard the blanking caps.

Install the transmission fluid cooler tubes.

- Clean the components.
- Install the new O-ring seals.
- Tighten the bolt to 10 Nm (7 lb.ft).

2. Secure the transmission fluid cooler tubes bracket.

- Tighten the nut to 10 Nm (7 lb.ft).

3. NOTE: Remove and discard the blanking caps.

Connect the transmission fluid cooler tubes to the transmission fluid cooler.

- Remove the container.

4. Install the radiator splash shield.

- Tighten the M6 bolts to 10 Nm (7 lb.ft).
- Tighten the M10 bolts to 62 Nm (46 lb.ft).

5. Check and top-up the transmission fluid level.
For additional information, refer to: Transmission Fluid Level Check (307-01A Automatic Transmission/Transaxle - V8 S/C 4.2L Petrol, General Procedures).

Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol - Selector Lever Cable Adjustment

General Procedures

1. ⚠ WARNING: The hand brake and foot brake MUST BE applied.

Check for correct cable adjustment.

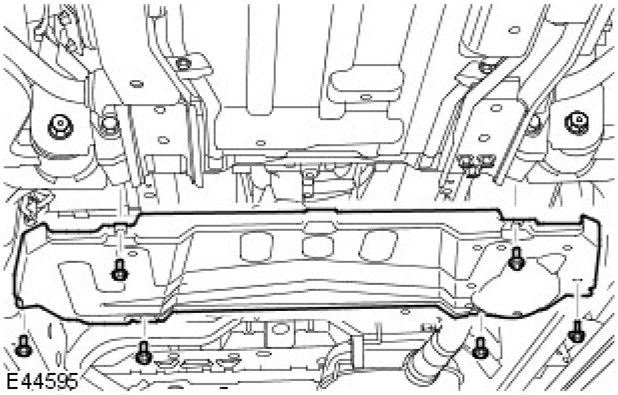
- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

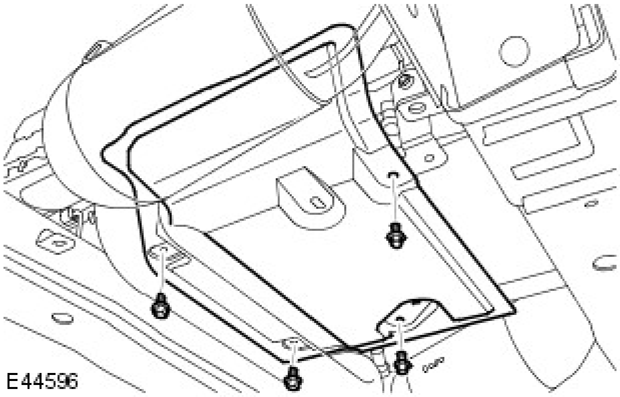
3. Remove the transmission undershield.

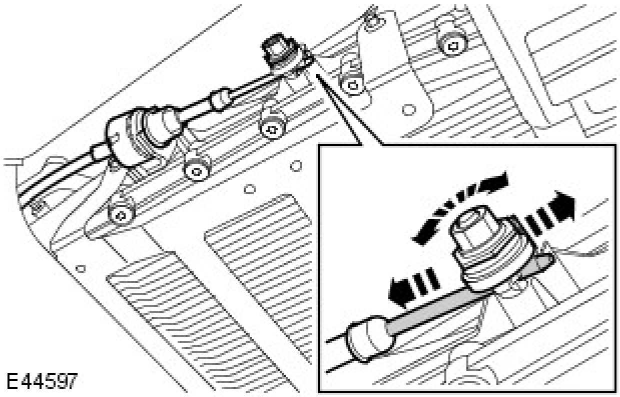
- Remove the 6 bolts.



4. If installed, remove the transmission heat shield.

- Remove the 4 bolts.





5. Adjust the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Move the selector lever on the gearbox fully forward and release it. The lever will return to the 'P' position.
- Make sure the selector lever is in the 'P' position.
- Push the cable inner rearward then release it.
- Tighten the locknut to 14 Nm (10 lb.ft).

6. ⚠ WARNING: The hand brake and foot brake MUST BE applied.

Check for correct cable adjustment.

- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

7. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

Removal and Installation

Removal

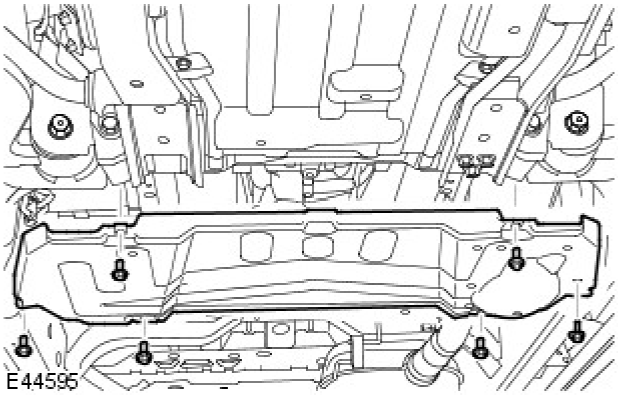
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

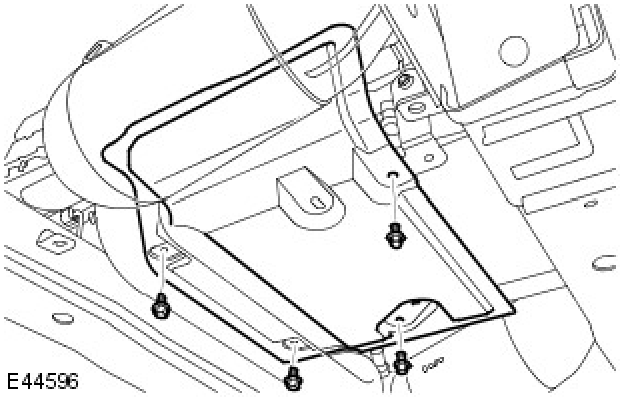
3. Remove the transmission undershield.

- Remove the 6 bolts.



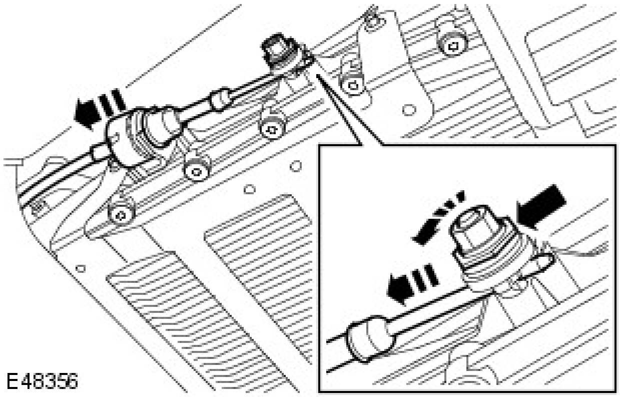
4. If installed, remove the transmission heat shield.

- Remove the 4 bolts.



5. Release the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Compress the latch and release the cable.



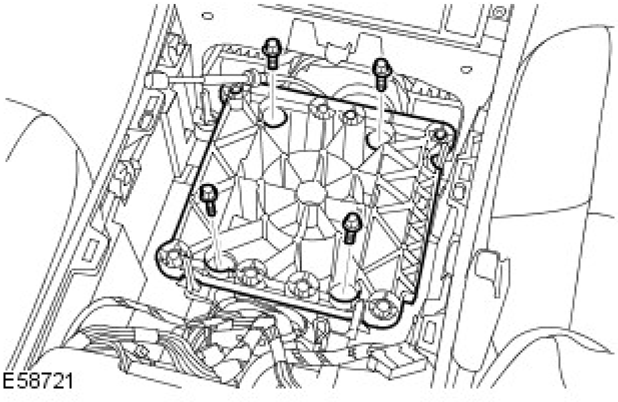
6. Remove the floor console upper panel.
For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).

7. Release the transmission selector lever.

- Disconnect the electrical connector.
- Remove the 4 bolts.

8. Remove the transmission selector lever mount bracket.

- Remove the 4 bolts.



9. Remove the transmission selector lever.

- Release the selector cable from the body.

Installation

1. Install the selector lever cable.

2. Install the transmission selector lever mount bracket.

- Tighten the bolts to 12 Nm (8 lb.ft).

• NOTE: Discard old fixings and replace with new on all vehicles.

3. Install to the selector lever.

- Connect and secure the electrical connector.
- Install the bolts and tighten to 10 Nm (7 lb.ft).

4. NOTE: Do not tighten the locking nut at this stage.

Connect the selector cable to the transmission.

- Engage the inner cable with the lever clamping bush.
- Install the selector cable to its abutment bracket.

5. Install the floor console upper panel.
For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).

6. Adjust the selector cable.
For additional information, refer to: Selector Lever Cable Adjustment (307-05A Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol, General Procedures).

7. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

9. Connect the battery ground cable.

13	-	Selector cable

The gear selector lever assembly is located in a central position on the transmission tunnel, between the front driver and passenger seats and is secured to the transmission tunnel closure plate. The selector lever assembly comprises a moulded plastic housing which provides for the location of the selector components.

The lever is connected to a crosspiece which allows for the selection of P, R, N, D in a forward or backward direction and selection between automatic and manual/sport mode in a left/right transverse direction.

When manual/sport mode is selected the lever can be moved in a forward or backward direction to select + or - for manual (CommandShift™) operation. If left in Sport mode all gear changes are performed automatically.

If Manual (CommandShift™) mode is selected, all gear changes are based on inputs received by the TCM from the manual +/- hall effect sensors located on the PCB.

The selector lever mechanism houses the following components:

- Electronic Printed Circuit Board (PCB)
- Shift Interlock solenoid
- Park and Neutral locking levers.

There are four selector lever positions and two additional positions for manual/sport operation:

- P (Park) - Prevents the vehicle from moving by locking the transmission
- R (Reverse) - Select only when the vehicle is stationary and the engine is at idle
- N (Neutral) - No torque transmitted to drive wheels
- D (Drive) - This position uses all six forward gears in high and low ranges
- M/S (Sport Mode) - This position uses all forward gears in 'D' but will upshift at higher engine speeds to improve acceleration
- + and - (Manual 'CommandShift™' mode) - Movement of the selector lever in the +/- positions, when the lever is in the M/S position, will operate the transmission in manual (CommandShift™) mode allowing the driver to manually select all six forward gears

The selector lever position is displayed to the driver on the selector position LED display and in the instrument cluster. In 'CommandShift™' mode, if a gear is selected but the TCM logic prevents selection of that gear, the requested gear will be initially displayed. The TCM will engage the next allowed gear and then display that gear.

Sport/Manual +/- CommandShift™ Switch

The PCB contains the hall effect sensors to activate the sport/manual mode and also the sensors which provide the +/- signals. When the selector lever is moved to the manual/sport position, the lower magnet located in the selector lever is moved within proximity of the M/S hall effect sensor on the PCB. This provides the momentary signal which is received by the TCM, which in turn initiates sport mode.

When the lever is moved to the + or - position, the magnet is moved within proximity of one of the hall effect sensors positioned either side of the M/S hall effect sensor. When an input from either the + or - sensors is received, manual CommandShift™ mode will be initiated. In this position a spring will move the selector lever back to the centre position when released. To leave the CommandShift™ mode, return the lever to the 'D' position.

Selector Position LED Display

The P, R, N, D LED display is located on the right hand side of the selector lever and the M/S (MANUAL/SPORT) +/- LED display is located on the left hand side of the selector lever. Each LED display is connected via a separate harness to the selector lever position switch. When the lever is moved to the required position, the switch contact for that position is made and the LED is illuminated.

P, R, N, D Position Switch

The P, R, N, D position switch is located within the Mechatronic valve block in the transmission. The switch is operated by movement of the selector lever to the P, R, N or D positions via the Bowden cable which is connected between the selector lever and the transmission selector shaft.

The switch is electrically connected to the TCM which outputs a common power supply to each of the four switch contacts. This power supply is also used by the two speed sensors and the fluid temperature sensor. Each of the four switch contacts have a separate feed input to the TCM which can detect which selector lever position has been selected.

Shift Interlock Solenoid

The shift interlock solenoid is located on the side of the selector lever assembly. The solenoid operates two locking levers which engage in the lower lever and lock it in the Park (P) and Neutral (N) positions. When the ignition is on or the engine is running, the solenoid is de-energised and prevents the lever from moving.

When energised, by the depression of the footbrake, the solenoid is energised and the selector lever may be moved from the P position. If the selector lever is left in the 'N' position for more than 800m/s the solenoid will be energised and the selector lever will become locked in the 'N' position. To move the selector lever from the 'N' position in this condition the footbrake must be applied. This prevents the selector lever from being moved to the 'D' or 'R' position unintentionally and the application of the brakes also prevents the vehicle 'creeping' when the gear is engaged.

Movement of the selector lever from the 'P' or 'N' positions is also prevented if the TCM senses the engine speed is above 2500 rev/min, even if the brake pedal is depressed.

In the event of an electrical failure of the vehicle or failure of the interlock solenoid or its associated wiring, it is possible to move the selector lever from the Park 'P' position by removing the selector lever and the switch pack and finisher and lifting the white coloured tab on the rear of the selector lever assembly. Whilst holding the tab in this position move the selector lever from the 'P' position.

- NOTE: The key cannot be removed from the ignition barrel if the selector lever is not in the 'Park' position. The selector lever cannot be moved from the 'Park' position if the ignition is switched off.

The selector lever will also be locked in the 'N' position during the transfer box changing range from high to low or vice versa.

Selector Cable

A selector cable is used as a mechanical connection between the selector lever and the transmission. The cable is a Bowden type cable which is connected to the selector lever. Movement of the lever in the P, R, N or D positions moves the cable. Movement of the cable is prevented when the selector lever is in the Manual/Sport position.

The cable is passed through a sealing grommet in the floorpan and is attached to a bracket on the transmission. The inner cable is connected to a lever which is positively attached to the transmission selector shaft.

Movement of the selector lever in the P, R, N or D positions moves the inner cable which in turn moves the lever. The lever transforms the linear movement of the cable into rotary movement of the selector shaft. The rotation of the shaft moves the position switch located within the Mechatronic valve block and also moves the manual spool valve to the applicable position.

Automatic Transmission/Transaxle External Controls - V8 4.4L Petrol - Selector Lever Cable Adjustment

General Procedures

1. ⚠ WARNING: The hand brake and foot brake MUST BE applied.

Check for correct cable adjustment.

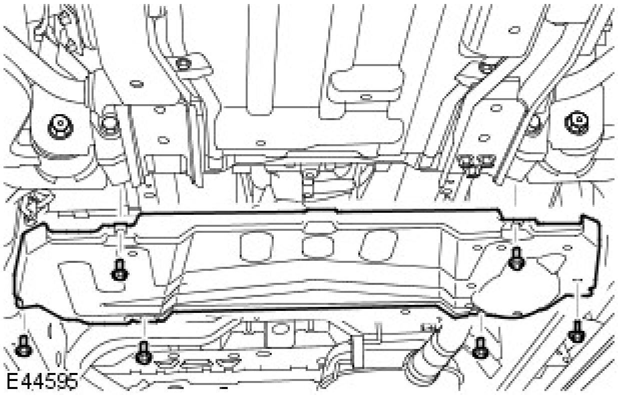
- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

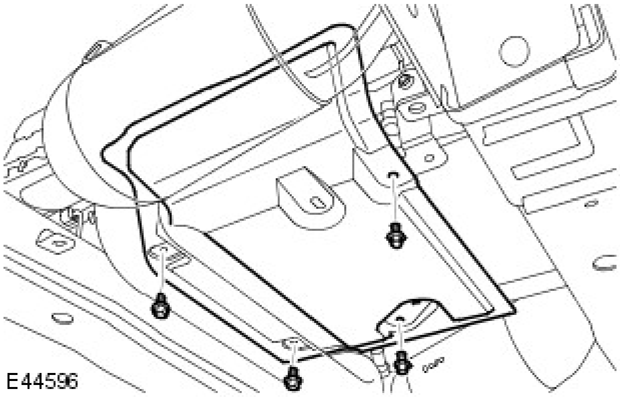
3. Remove the transmission undershield.

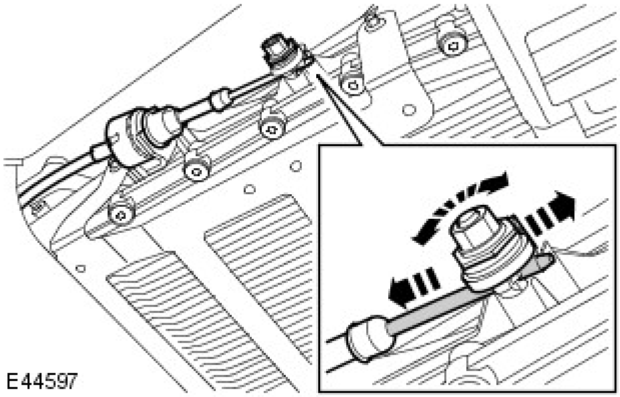
- Remove the 6 bolts.



4. If installed, remove the transmission heat shield.

- Remove the 4 bolts.





5. Adjust the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Move the selector lever on the gearbox fully forward and release it. The lever will return to the 'P' position.
- Make sure the selector lever is in the 'P' position.
- Push the cable inner rearward then release it.
- Tighten the locknut to 14 Nm (10 lb.ft).

6. ⚠ WARNING: The hand brake and foot brake MUST BE applied.

Check for correct cable adjustment.

- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

7. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

The gear selector lever assembly is located in a central position on the transmission tunnel, between the front driver and passenger seats and is secured to the transmission tunnel closure plate. The selector lever assembly comprises a moulded plastic housing which provides for the location of the selector components.

The lever is connected to a crosspiece which allows for the selection of P, R, N, D in a forward or backward direction and selection between automatic and manual/sport mode in a left/right transverse direction.

When manual/sport mode is selected the lever can be moved in a forward or backward direction to select + or - for manual (CommandShift™) operation. If left in Sport mode all gear changes are performed automatically.

If Manual (CommandShift™) mode is selected, all gear changes are based on inputs received by the TCM from the manual +/- hall effect sensors located on the PCB.

The selector lever mechanism houses the following components:

- Electronic Printed Circuit Board (PCB)
- Shift Interlock solenoid
- Park and Neutral locking levers.

There are four selector lever positions and two additional positions for manual/sport operation:

- P (Park) - Prevents the vehicle from moving by locking the transmission
- R (Reverse) - Select only when the vehicle is stationary and the engine is at idle
- N (Neutral) - No torque transmitted to drive wheels
- D (Drive) - This position uses all six forward gears in high and low ranges
- M/S (Sport Mode) - This position uses all forward gears in 'D' but will upshift at higher engine speeds to improve acceleration
- + and - (Manual 'CommandShift™' mode) - Movement of the selector lever in the +/- positions, when the lever is in the M/S position, will operate the transmission in manual (CommandShift™) mode allowing the driver to manually select all six forward gears.

The selector lever position is displayed to the driver on the selector position LED display and in the instrument cluster. In 'CommandShift™' mode, if a gear is selected but the TCM logic prevents selection of that gear, the requested gear will be initially displayed. The TCM will engage the next allowed gear and then display that gear.

Sport/Manual +/- CommandShift™ Switch

The PCB contains the hall effect sensors to activate the sport/manual mode and also the sensors which provide the +/- signals. When the selector lever is moved to the manual/sport position, the lower magnet located in the selector lever is moved within proximity of the M/S hall effect sensor on the PCB. This provides the momentary signal which is received by the TCM, which in turn initiates sport mode.

When the lever is moved to the + or - position, the magnet is moved within proximity of one of the hall effect sensors positioned either side of the M/S hall effect sensor. When an input from either the + or - sensors is received, manual CommandShift™ mode will be initiated. In this position a spring will move the selector lever back to the centre position when released. To leave the CommandShift™ mode, return the lever to the 'D' position.

Selector Position LED Display

The P, R, N, D LED display is located on the right hand side of the selector lever and the M/S (MANUAL/SPORT) +/- LED display is located on the left hand side of the selector lever. Each LED display is connected via a separate harness to the selector lever position switch. When the lever is moved to the required position, the switch contact for that position is made and the LED is illuminated.

P, R, N, D Position Switch

The P, R, N, D position switch is located within the Mechatronic valve block in the transmission. The switch is operated by movement of the selector lever to the P, R, N or D positions via the Bowden cable which is connected between the selector lever and the transmission selector shaft.

The switch is electrically connected to the TCM which outputs a common power supply to each of the four switch contacts. This power supply is also used by the two speed sensors and the fluid temperature sensor. Each of the four switch contacts have a separate feed input to the TCM which can detect which selector lever position has been selected.

Shift Interlock Solenoid

The shift interlock solenoid is located on the side of the selector lever assembly. The solenoid operates two locking levers which engage in the lower lever and lock it in the Park (P) and Neutral (N) positions. When the ignition is on or the engine is running, the solenoid is de-energised and prevents the lever from moving.

When energised, by the depression of the footbrake, the solenoid is energised and the selector lever may be moved from the 'P' position. If the selector lever is left in the 'N' position for more than 800m/s the solenoid will be energised and the selector lever will become locked in the 'N' position. To move the selector lever from the 'N' position in this condition the footbrake must be applied. This prevents the selector lever from being moved to the 'D' or 'R' position unintentionally and the application of the brakes also prevents the vehicle 'creeping' when the gear is engaged.

Movement of the selector lever from the 'P' or 'N' positions is also prevented if the TCM senses the engine speed is above 2500 rev/min, even if the brake pedal is depressed.

In the event of an electrical failure of the vehicle or failure of the interlock solenoid or its associated wiring, it is possible to move the selector lever from the Park 'P' position by removing the selector lever and the switch pack and finisher and lifting the white coloured tab on the rear of the selector lever assembly. Whilst holding the tab in this position move the selector lever from the 'P' position.

- NOTE: The key cannot be removed from the ignition barrel if the selector lever is not in the 'Park' position. The selector lever cannot be moved from the 'Park' position if the ignition is switched off.

The selector lever will also be locked in the 'N' position during the transfer box changing range from high to low or vice versa.

Selector Cable

A selector cable is used as a mechanical connection between the selector lever and the transmission. The cable is a Bowden type cable which is connected to the selector lever. Movement of the lever in the P, R, N or D positions moves the cable. Movement of the cable is prevented when the selector lever is in the Manual/Sport position.

The cable is passed through a sealing grommet in the floorpan and is attached to a bracket on the transmission. The inner cable is connected to a lever which is positively attached to the transmission selector shaft.

Movement of the selector lever in the P, R, N or D positions moves the inner cable which in turn moves the lever. The lever transforms the linear movement of the cable into rotary movement of the selector shaft. The rotation of the shaft moves the position switch located within the Mechatronic valve block and also moves the manual spool valve to the applicable position.

Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel - Selector Lever Cable Adjustment

General Procedures

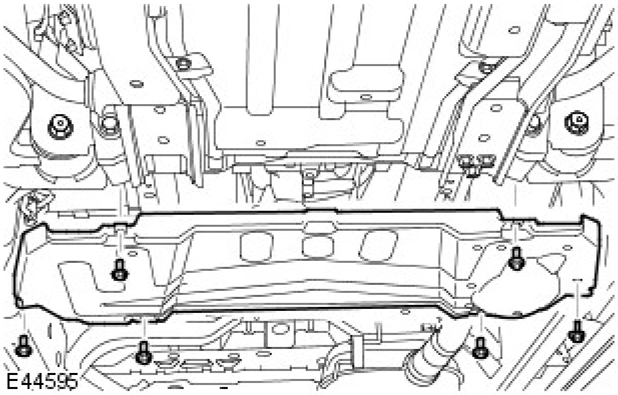
1. ⚠ WARNING: The hand brake and foot brake MUST BE applied.

Check for correct cable adjustment.

- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

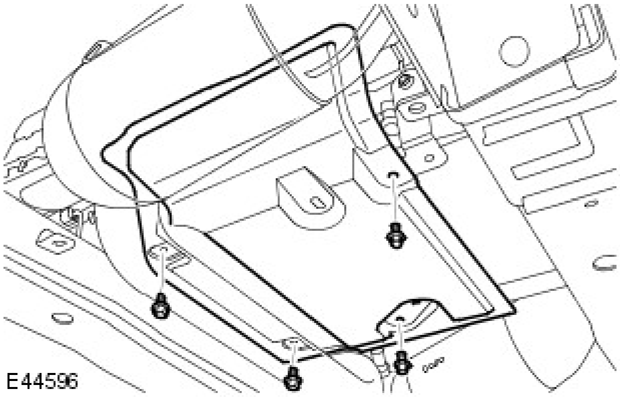
2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



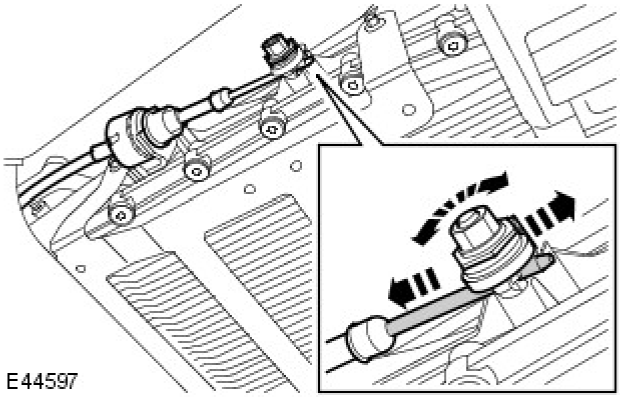
3. Remove the transmission undershield.

- Remove the 6 bolts.



4. If installed, remove the transmission heat shield.

- Remove the 4 bolts.



5. Adjust the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Move the selector lever on the gearbox fully forward and release it. The lever will return to the 'P' position.
- Make sure the selector lever is in the 'P' position.
- Push the cable inner rearward then release it.
- Tighten the locknut to 14 Nm (10 lb.ft).

6. ⚠ WARNING: The hand brake and foot brake MUST BE applied.

Check for correct cable adjustment.

- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

7. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

Automatic Transmission/Transaxle External Controls - TDV6 2.7L Diesel - Selector Lever Assembly

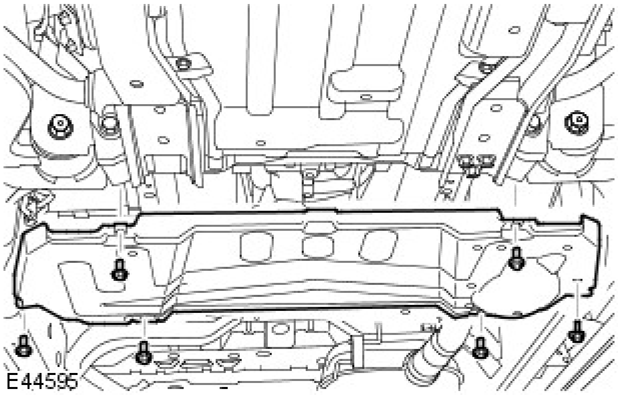
Removal and Installation

Removal

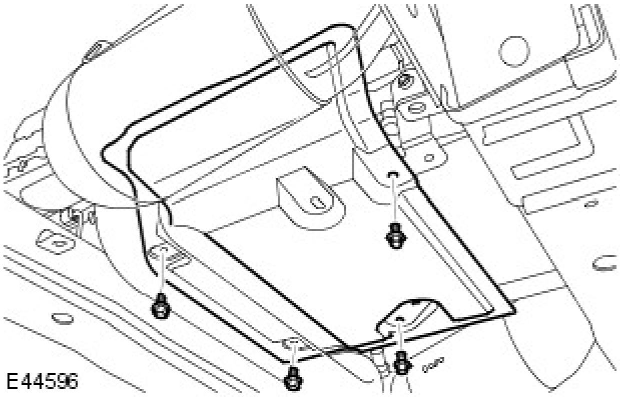
1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

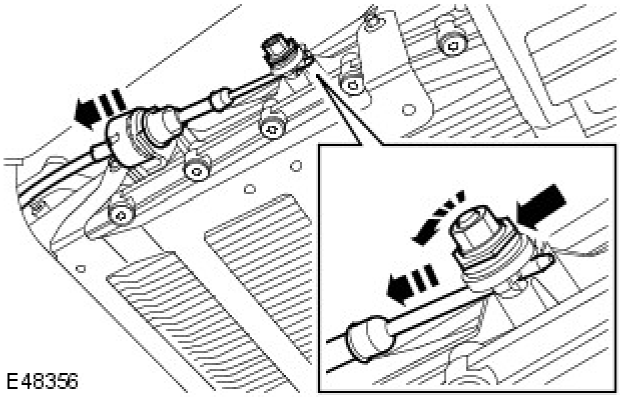
   Raise and support the vehicle.



3. Remove the transmission undershield.
   - Remove the 6 bolts.



4. If installed, remove the transmission heat shield.
   - Remove the 4 bolts.



5. Release the selector cable.
   - Using an additional wrench, restrain the clamping bush and loosen the locknut.
   - Compress the latch and release the cable.

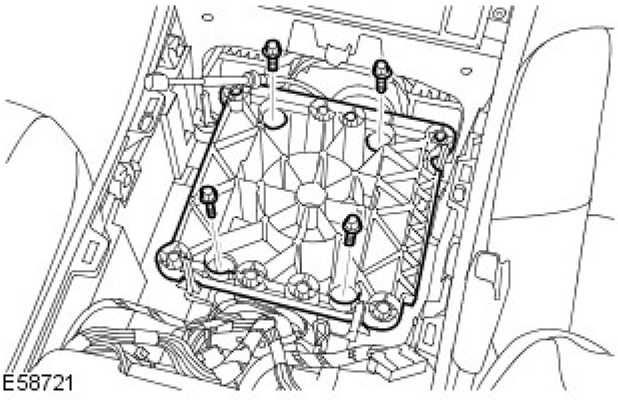
6. Remove the floor console upper panel.
For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).

7. Release the transmission selector lever.

- Disconnect the electrical connector.
- Remove the 4 bolts.

8. Remove the transmission selector lever mount bracket.

- Remove the 4 bolts.



9. Remove the transmission selector lever.

- Release the selector cable from the body.

Installation

1. Install the selector lever cable.

2. Install the transmission selector lever mount bracket.

- Tighten the bolts to 12 Nm (8 lb.ft).

• NOTE: Discard old fixings and replace with new on all vehicles.

3. Install to the selector lever.

- Connect and secure the electrical connector.
- Install the bolts and tighten to 10 Nm (7 lb.ft).

4. NOTE: Do not tighten the locking nut at this stage.

Connect the selector cable to the transmission.

- Engage the inner cable with the lever clamping bush.
- Install the selector cable to its abutment bracket.

5. Install the floor console upper panel.
For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).

6. Adjust the selector cable.
For additional information, refer to: Selector Lever Cable Adjustment (307-05A Automatic Transmission/Transaxle External Controls - V8 S/C 4.2L Petrol, General Procedures).

7. If installed, install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. Install the transmission undershield.

- Tighten the bolts to 10 Nm (7 lb.ft).

9. Connect the battery ground cable.

For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

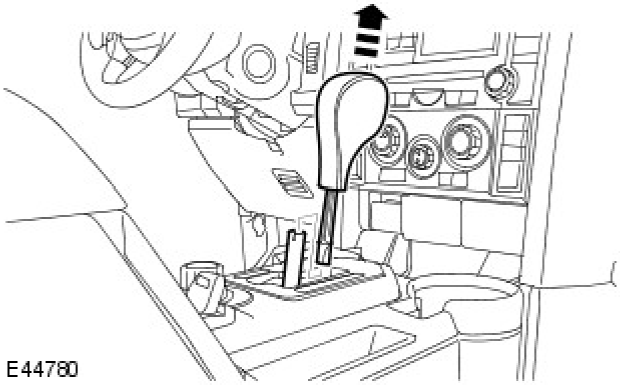
Removal and Installation

Removal



1. ⚠ WARNING: The gear lever knob will be released suddenly, keep face clear during removal.

Remove the selector lever knob.

- Pull the knob upwards.

Installation

1. ⚠ CAUTION: Only fit the selector knob when the selector lever is in the 'P' position.

Install the selector lever knob.

- Engage the locating tang of the knob with the slot in the selector lever.
- Push the knob fully onto the selector lever.

Automatic Transmission/Transaxle External Controls - TDV8 3.6L Diesel - Selector Lever Cable Adjustment

General Procedures

⚠ WARNING: Observe due care when working near a hot exhaust system.

1. NOTE: All vehicles.

Check for correct cable adjustment.

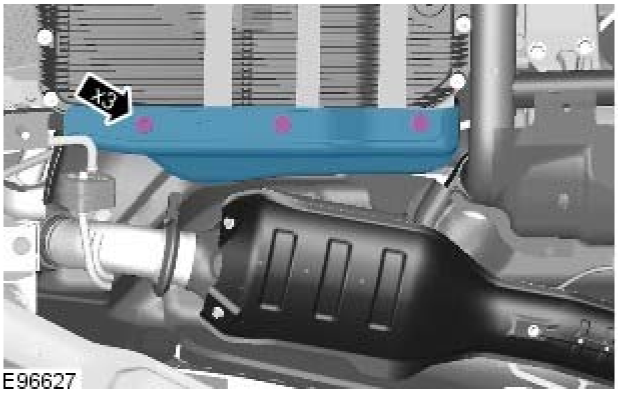
- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

2. Raise and support the vehicle.

3. NOTE: Vehicles with diesel particulate filter (DPF).

Remove the RH heat shield.

- Remove the 2 bolts.

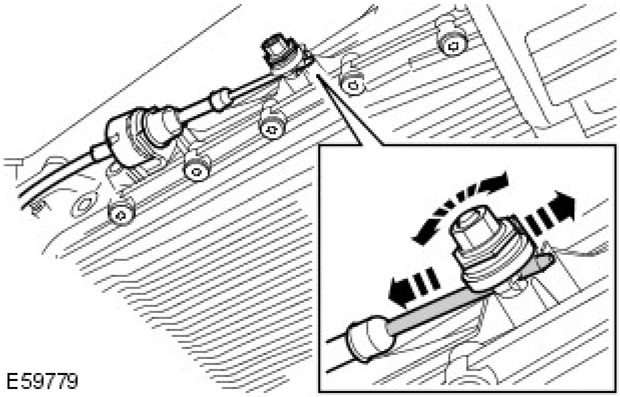


E96627

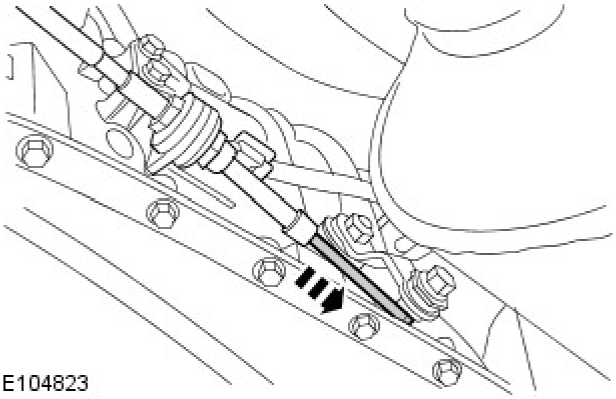
4. NOTE: All vehicles.

Adjust the selector cable.

- Using an additional wrench, restrain the clamping bush and loosen the locknut.
- Move the selector lever on the transmission fully forward and release it. The lever will return to the "P" position.
- Make sure the selector lever within the vehicle is in the "P" position.



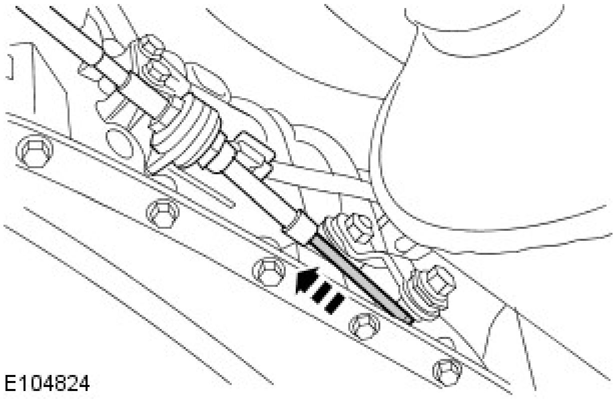
E59779



5. NOTE: Vehicles built up to VIN:284081.

Secure the cable.

- Pull the inner cable forward then release it.
- Tighten the locknut to 10 Nm (7 lb.ft).



6. NOTE: Vehicles built from VIN:284082.

Secure the cable.

- Push the inner cable rearrward then release it.
- Tighten the locknut to 10 Nm (7 lb.ft).

7. NOTE: Vehicles with diesel particulate filter (DPF).

Install the RH heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

8. ⚠ WARNING: The park brake and foot brake MUST BE applied.

• NOTE: All vehicles.

Check for correct cable adjustment.

- Move the selector lever from 'P' position, check engagement in each position and return to 'P'.
- Check that the engine will start in 'P' and 'N' positions and that the engine start is inhibited when drive positions are selected.

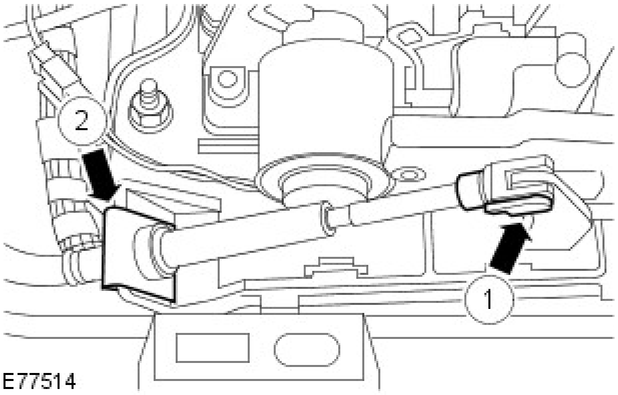
Removal and Installation

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

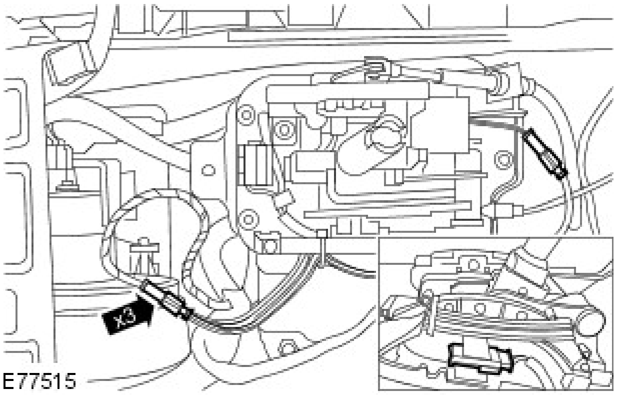
2. Remove the floor console upper panel.
For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).



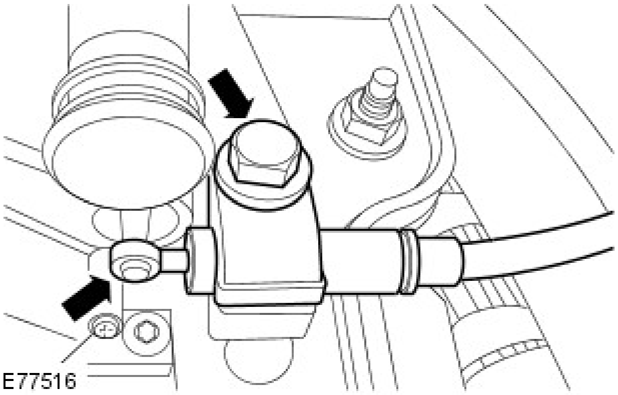
3. NOTE: Collect the plastic spacer from the selector lever cable.

Release the selector lever cable.

1. Remove the selector lever clip from the selector lever inner cable .
2. Remove the selector lever housing clip from the selector cable.

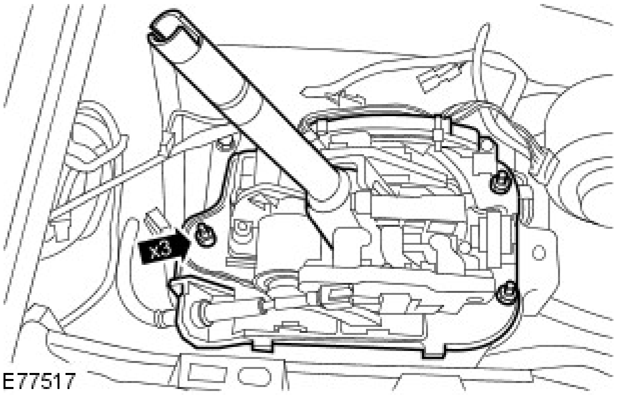


4. Disconnect the 3 electrical connectors.



5. Release the ignition switch interlock cable.

- Remove the bolt.
- Remove the clamp.



6. Remove the selector lever assembly.

- Remove the 3 nuts.

Installation

1. Install the selector lever assembly.

- Tighten the 3 nuts to 9 Nm (7 lb.ft).

2. Install the ignition switch interlock cable.

- Install the clamp.
- Install the bolt.

3. Connect the 3 electrical connectors.

4. Install the selector lever cable.

- Install the selector lever housing clip to the selector lever cable.
- Install the plastic spacer to the selector lever cable.
- Install the selector lever clip to the selector lever inner cable.

5. Install the floor console upper panel.
For additional information, refer to: Floor Console Upper Panel (501-12 Instrument Panel and Console, Removal and Installation).

6. Install the battery ground cable.

GENERAL

The DD295 transfer box is full time, permanent four-wheel-drive unit, with 50/50 torque distribution to the front and rear driveshafts. Magna Steyr Powertrain manufactures the unit, which is identical for all engine derivatives and supports the following features:

- Permanent four-wheel-drive with a bevel gear centre differential, providing a 50:50 torque split
- Selectable high and low range for optimum on-road and off-road performance
- Two-speed, fully synchronized 'shift-on-the-move' system allows the driver to change the range without having to stop the vehicle
- Electronically controlled multi-plate clutch providing a centre differential lock and torque biasing function to give improved traction performance and vehicle dynamic stability.

A strategy, to electronically control the centre differential multi plate clutch assembly, has been developed to provide;

- a pre-loading function, increasing locking torque with increased driving torque
- a slip controller to increase locking torque under off-road conditions and decrease locking torque for optimum comfort, e.g. parking.

The unit is located under the vehicle and is mounted on the cross-member, behind the transmission.

The transfer box receives a torque input from the transmission output shaft, which is passed through the unit to two outputs for the front and rear drive shafts.

The input torque is equally distributed via a bevel gear type differential. In order to provide an optimal torque distribution to each wheel in all driving conditions, the unit is equipped with an electronically controlled locking and torque-biasing device. This device detects wheel slip via various vehicle system inputs to the transfer box control module and locks the differential accordingly. The locking torque is applied through a multi-plate clutch assembly.

A planetary gear set, located in the differential assembly, allows the driver to select high or low range whilst driving, this is known as 'shift on the move'. When in low range, the planetary gear set provides a ratio of 2.93:1, which gives the vehicle an extremely low crawl speed for off road driving and trailer towing. High range is a direct drive from the transmission output shaft and provides a 1:1 ratio.

Both the centre differential locking and biasing and the 'shift on the move' features are actuated via a DC transfer box motor, which is controlled by the transfer box control module, via a Pulse Width Modulation (PWM) signal.

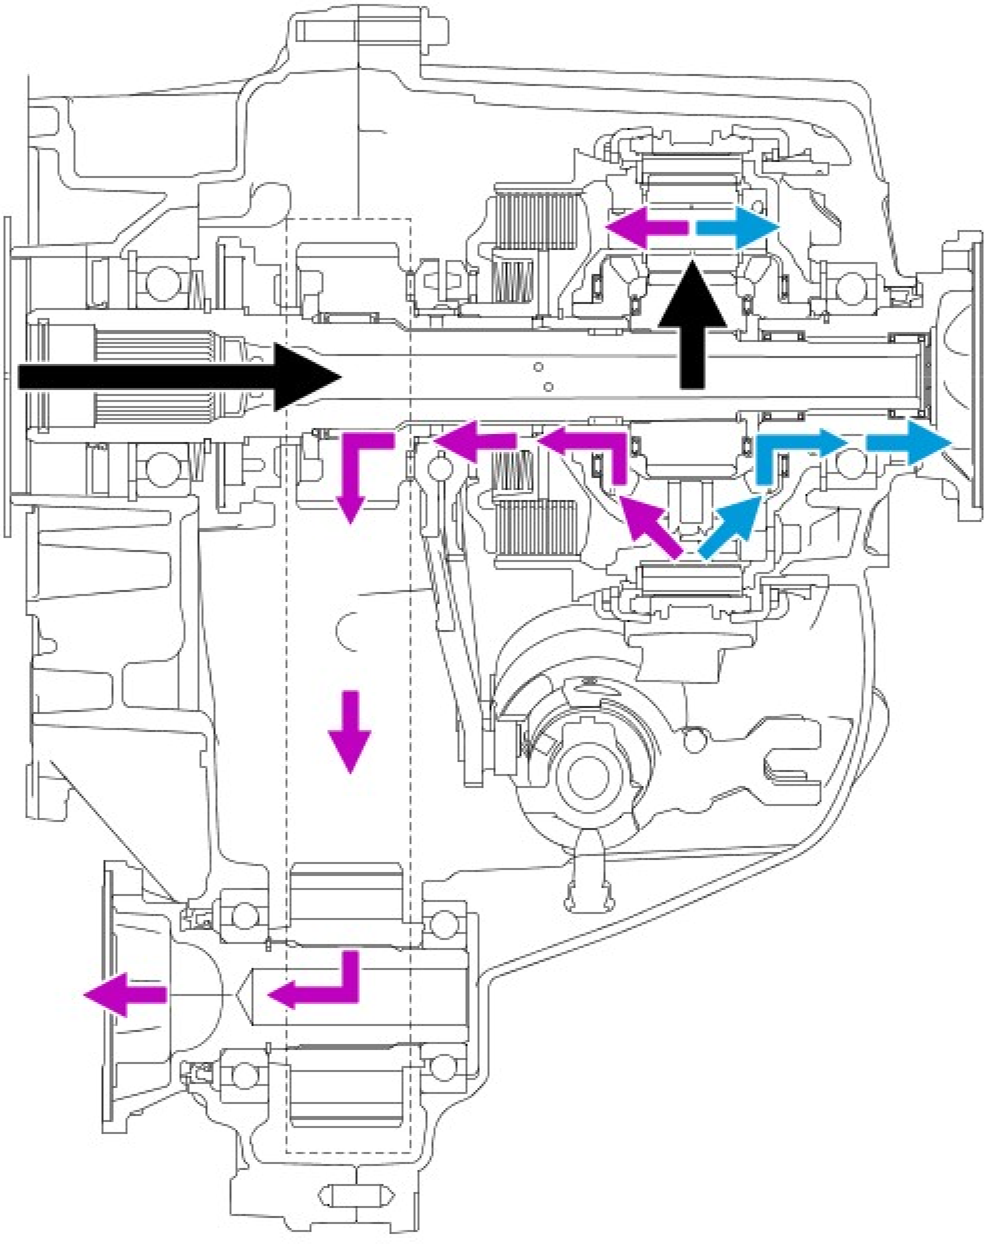
13	-	Input shaft
14	-	Front housing assembly

Transfer Box Power Flow



E49192

Input torque from the transmission is transferred to the input shaft of the transfer box and then onto the planetary sun gear and planetary pinion gears. The planetary pinion gears are held in place by the planet pinion shafts, which are connected to the differential carrier, and drive the differential pinion gears. The torque is then distributed to both the front and rear carriers, which are connected to the outputs of the transfer box. The rear carrier is connected directly to the rear output flange; the front carrier is connected to the sprocket and therefore to the chain drive, which provides front output flange rotation.

TRANSFER BOX CASINGS

The front and rear casing assemblies are manufactured from cast aluminium.

Front Casing Assembly

The front casing assembly provides the location for the input shaft bearing, the front output flange bearing and the oil pump. It is also equipped with threaded holes to mount the chassis mounting bush, two lifting eyes and a breather cartridge for the transfer box breather pipe. The breather pipe allows an equalisation between atmospheric and internal transfer box pressure.

Rear Casing Assembly

The rear casing assembly provides the location for the rear output flange bearing, the transfer box motor and the oil fill and drain plug. Fins are cast into the rear casing assembly to improve heat dissipation. The unit number is also stamped into the rear housing.

OIL PUMP

An oil pump assembly is located in the front casing to provide lubrication for the bearings and rotary components through cross-drillings in the input shaft. A flat-sectioned coupling on the input shaft drives the rotor of the pump; the stator is fixed to the front housing assembly. A tube is attached to the pump, which leads into a calm suction area at the bottom of the two casing assemblies. The collector magnet in the suction area of the pump collects any metallic debris.

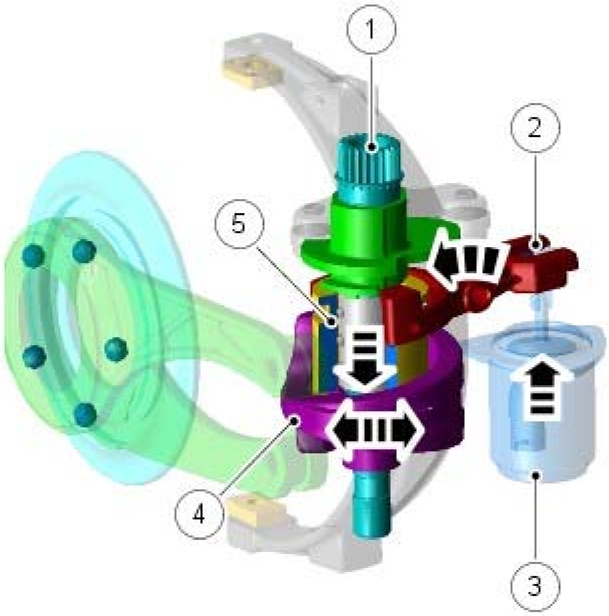
CHAIN DRIVE

The chain-drive transfers drive from the centre differential to the front output flange. A 3/8" pitch chain connects the sprocket on the transfer box input shaft with the sprocket on the front output flange. As both sprockets have the same number of teeth, the rotational speed of both sprockets is identical.

TRANSFER BOX MOTOR

One motor operates both the high/low range change and the differential locking and torque-biasing device (multi-plate clutch). The motor solenoid switches between the two functions, while the motor provides the rotational movement for both operations.

Transfer Box Motor Position For Clutch Control Mode



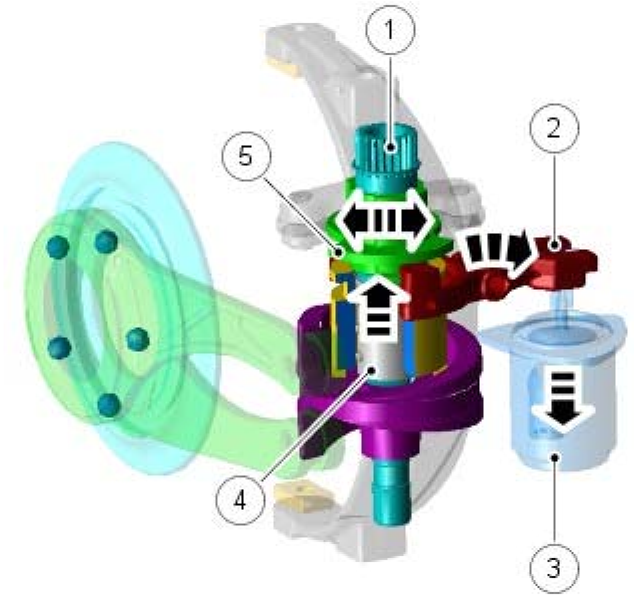
E49193

Item	Part Number	Description
1	-	Motor shaft
2	-	Solenoid shift fork
3	-	Solenoid
4	-	Clutch control disc
5	-	Shifting sleeve

To actuate the multi-plate clutch, the transfer box control module energizes the solenoid (3). The solenoid pin pivots the solenoid shift fork (2), which engages the shifting sleeve (5) into the dogteeth on the clutch control disc (4). The rotational movement of the motor shaft (1) is then linked to the clutch control disc via the shifting sleeve.

This is the normal operating mode of the transfer box. In this position, the range change function is disengaged and mechanically locked.

Transfer Box Motor Position For High/Low Range Mode



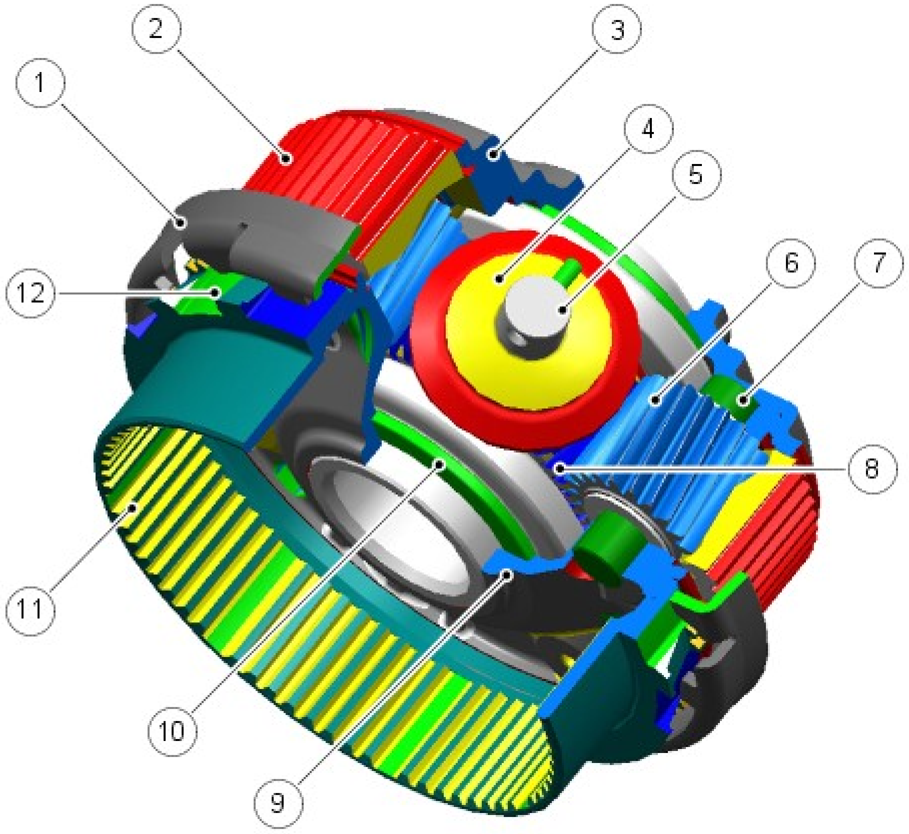
E49194

Item	Part Number	Description
1	-	Motor shaft
2	-	Solenoid shift fork
3	-	Solenoid
4	-	Shifting sleeve
5	-	Actuation cam

To actuate the high/low range change, the transfer box control module de-energizes the solenoid (3). A spring in the solenoid retracts the solenoid pin and rotates the solenoid shift fork (2). This engages the shifting sleeve (4) to the dogteeth on the high/low actuation cam (5). The rotational movement of the motor shaft (1) is then linked to the cam.

In this position, the multi-plate clutch is open, the differential cannot be locked and torque cannot be biased. Once the range change is complete the system returns to clutch control mode. In the event of an electrical failure, the motor will default to this position.

CENTER DIFFERENTIAL ASSEMBLY



E49195

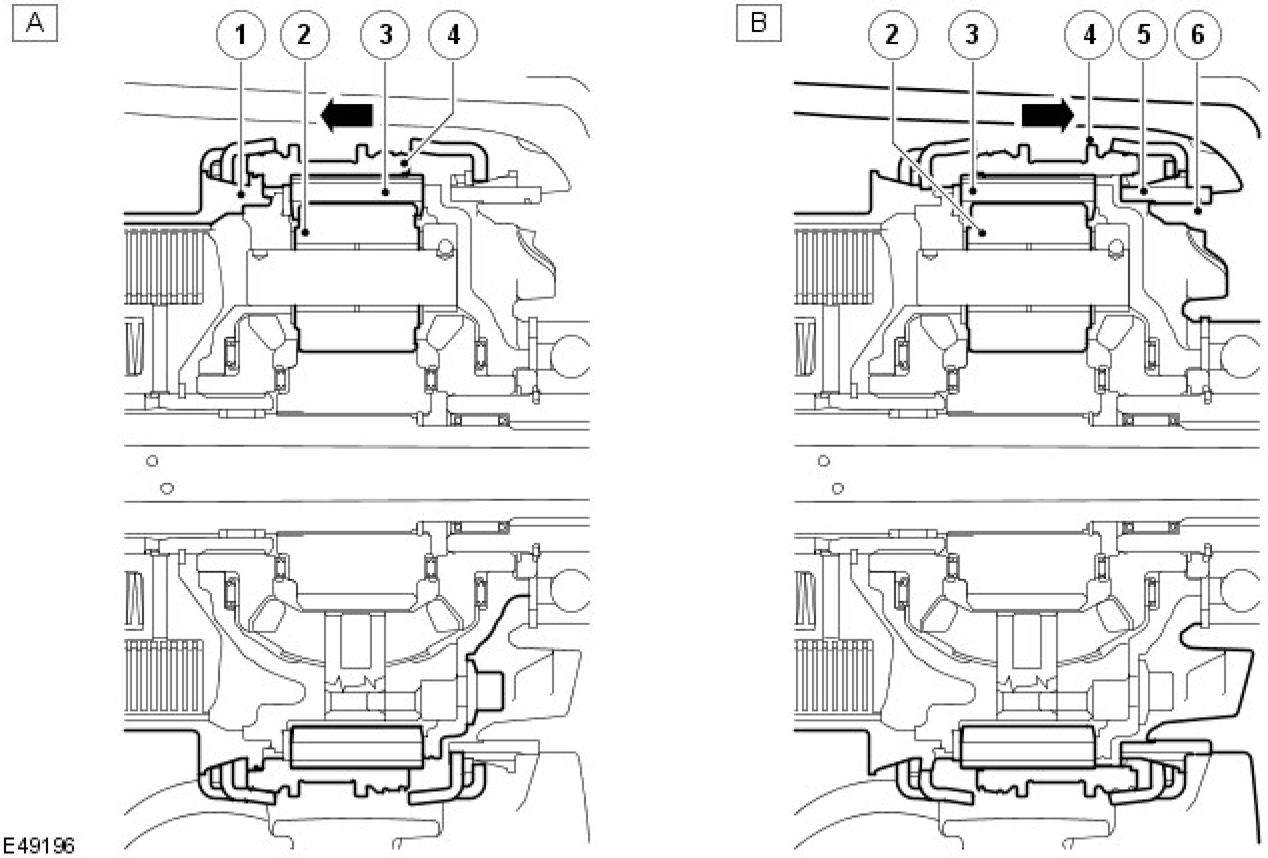
Item	Part Number	Description
1	-	Synchronisation cup and spring
2	-	Planetary ring gear
3	-	Differential carrier
4	-	Pinion gears
5	-	Pinion gear shafts
6	-	Planetary pinion gears
7	-	Planetary pinion gear shafts
8	-	Planetary sun gear
9	-	Differential cover
10	-	Differential side gears
11	-	Multi-plate clutch basket
12	-	Dogteeth

The center differential assembly is the primary feature of the transfer box. Torque is transmitted through the center differential carrier and distributed to the differential gears and the front and rear output flanges. The planetary gear set, for the high/low range change function, is also an integral part of the centre differential assembly.

The assembly comprises 3 differential pinion gears (4) and shafts (5), which are equally spaced within the centre differential carrier (3). The differential shafts have a rigid connection to the differential carrier. Located between the pinion gears are 3 planetary pinion gears (6) and shafts (7). The planetary sun gear (8) and two differential side gears (10) are located in the centre line of the carrier.

The planetary ring gear (2) is supported in both directions by the differential casing and the differential cover (9). The planetary ring gear is connected to a shifting sleeve, which is engaged in either high or low range.

The multi-plate clutch basket (11), which is welded to the differential casing, supports the friction plates, the dogteeth (12) for high range engagement and the synchronisation cup and spring (1) for the 'shift-on-the-move' function.

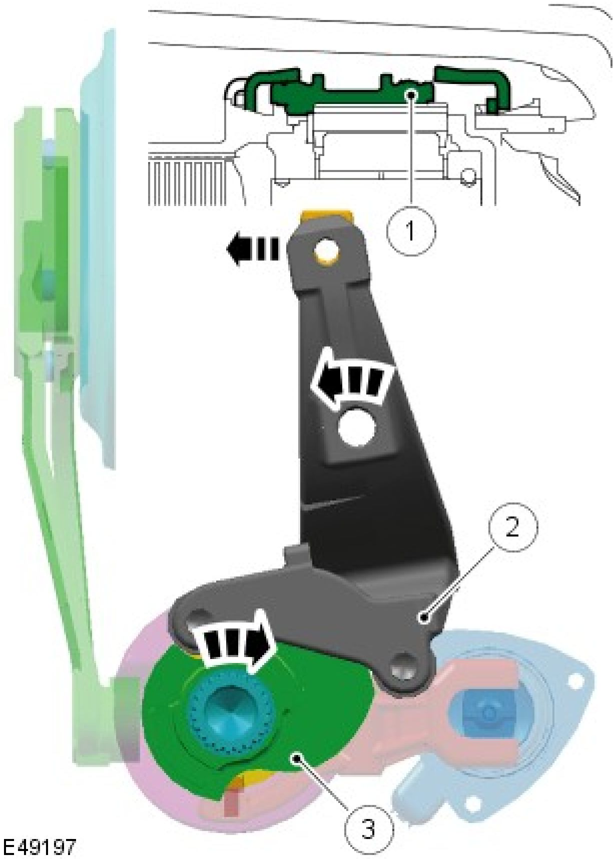


Item	Part Number	Description
A	-	High range position
B	-	Low range position
1	-	Dogteeth
2	-	Planetary pinion gears
3	-	Planetary ring gear
4	-	Shifting sleeve
5	-	Low range dogteeth
6	-	Rear carrier assembly

When high range is engaged, the shifting sleeve (4) connects to the differential carrier via dogteeth (1). The planetary ring gear (3), via the shifting sleeve, and the planetary pinion gears (5), via the planetary shafts, which are also attached to the differential carrier. The planetary gear set rotates as one unit and therefore turns the differential side gear with a 1:1 ratio.

In low range the motor moves the shifting sleeve (4) in the direction of the low range dogteeth (5). The low range dogteeth, with the synchronisation cup and spring, are fixed to the rear carrier assembly (6). When the shifting sleeve is engaged with the low range dogteeth, the planetary ring gear (3), via the shifting sleeve, is stationary and the planetary pinion gears (2), via the planetary bolts, turn the differential side gears with 2.93: 1 ratio.

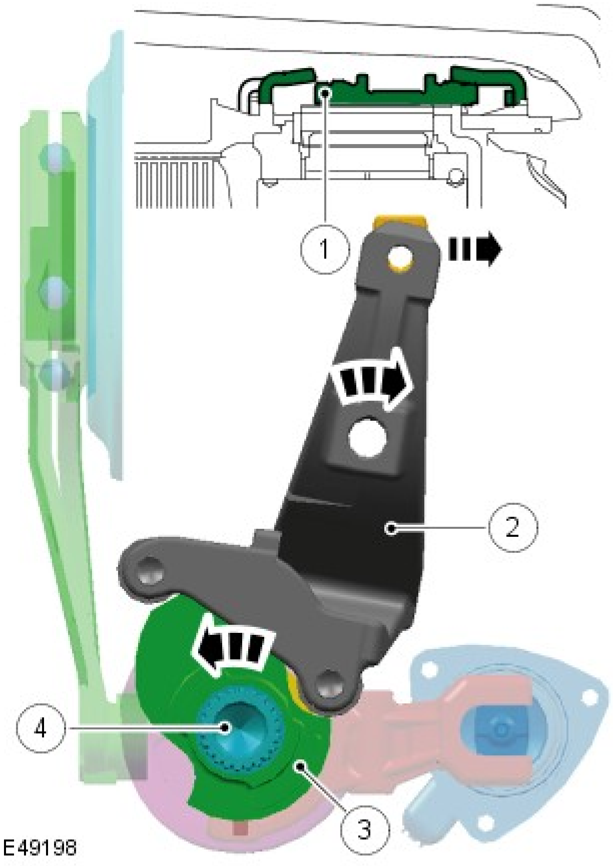
High range actuation sequence



Item	Part Number	Description
1	-	Shifting sleeve
2	-	High/low shifting fork
3	-	Shifting cam

The rotational movement of the motor shaft turns the shifting cam (3) to high range position. The shifting cam then moves the shifting sleeve (1), via the high/low shifting fork (2), into the high range position. After the synchronisation sequence, the planetary ring gear is connected to the high range dogteeth, via the shifting sleeve, on the differential carrier. In this position, the input speed equals the output speed, which equates to a high range ratio of 1:1.

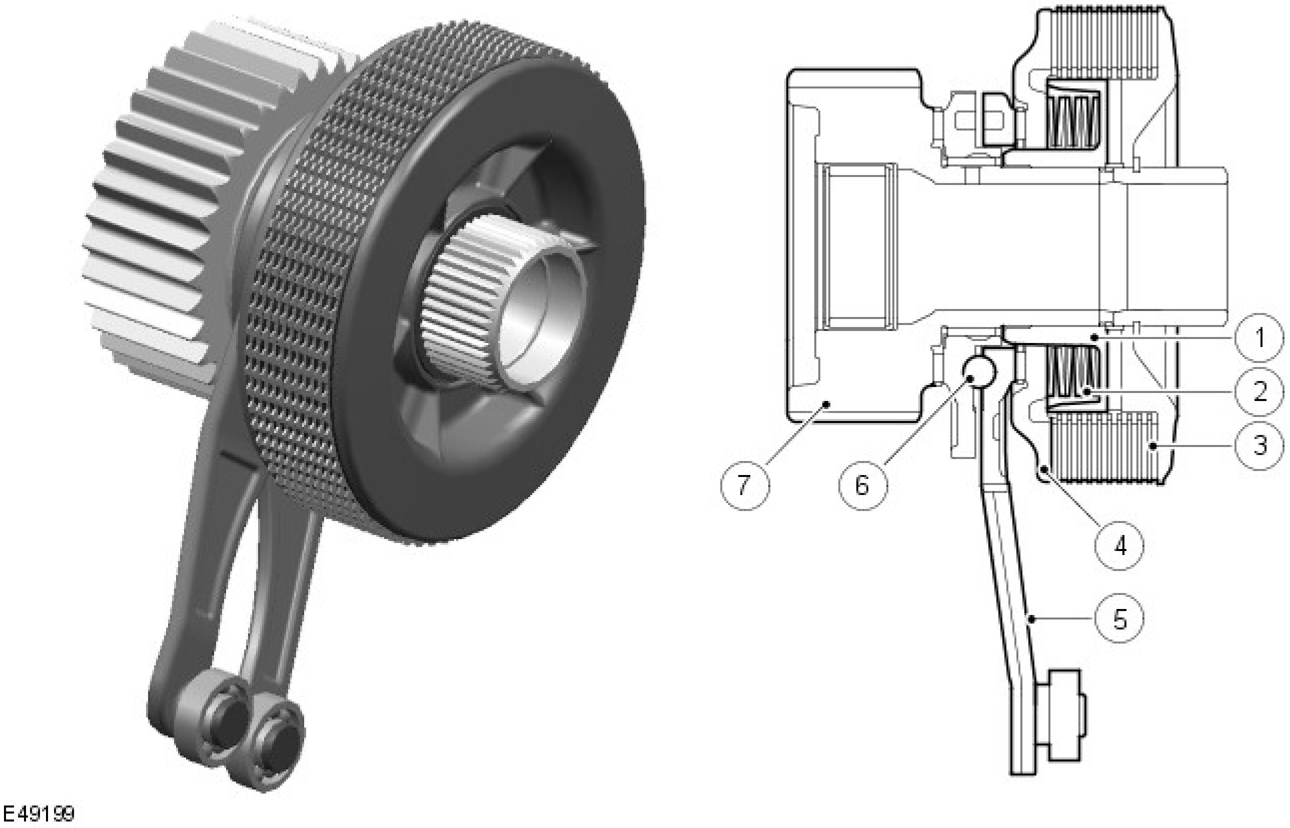
Low range actuation sequence



Item	Part Number	Description
1	-	Shifting sleeve
2	-	High/low shifting fork
3	-	Shifting cam
4	-	Motor shaft

The rotational movement of the motor shaft (4) turns the shifting cam (3) into low range position. The shifting cam then moves the shifting sleeve (1) of the centre differential assembly via the high/low shifting fork (2) into low range position. After the synchronisation sequence, the planetary ring gear is connected to the low range dogteeth, via the shifting sleeve, on the rear carrier assembly. The output speed is then reduced to a ratio of 2.93:1.

MULTI-PLATE CLUTCH ASSEMBLY



Item	Part Number	Description
1	-	Clutch hub
2	-	Cup springs
3	-	Clutch plates
4	-	Clutch piston
5	-	Motor levers
6	-	Ball ramp mechanism
7	-	Sprocket

The multi-plate clutch assembly for both centre and rear differentials act in a similar way. The aim of the multi-plate clutch assembly is to prevent excessive differential slip and therefore maximise the traction performance of the vehicle. This is fundamentally different from the 'braked' traction control, which can only counteract differential slip when it occurs.

A certain amount of differential slip is required to allow the vehicle to turn corners and to remain stable under control of the Anti-lock Braking System (ABS). The transfer box control module monitors the driver's demands through primary vehicle controls and automatically sets the slip torque at the differentials. The system is completely automatic and does not require any special driver input.

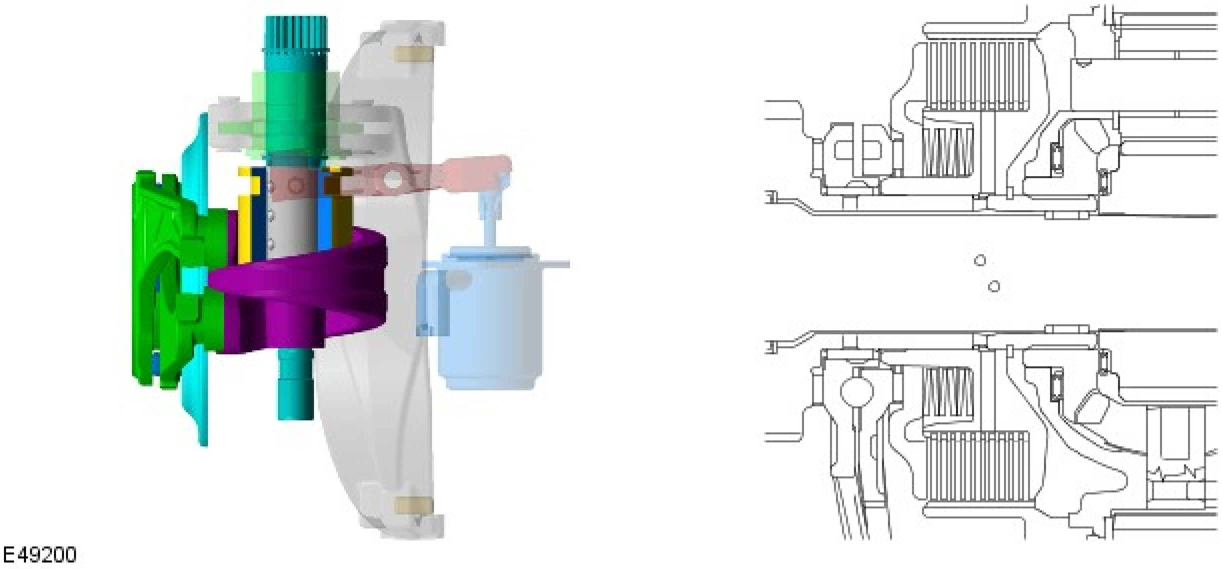
The multi-plate clutch assembly actively controls the torque flow through the centre differential and optimises the torque distribution in the driveline. The clutch assembly biases the torque from the transmission to the axle and wheels with the higher grip and prevents the wheels with the lower grip from spinning.

The multi-plate clutch assembly comprises the sprocket (7), which is connected to the front differential side gear, the motor levers (5) with the ball ramp mechanism (6), the clutch hub (1) as support for the clutch plates (3), the clutch piston (4) to generate friction between the clutch plates, and a pack of cup springs (2) to return the clutch piston into its original position.

One set of friction plates are connected to the clutch hub; the other set of friction plates are connected to the multi-plate clutch basket, which is welded to the centre differential housing.

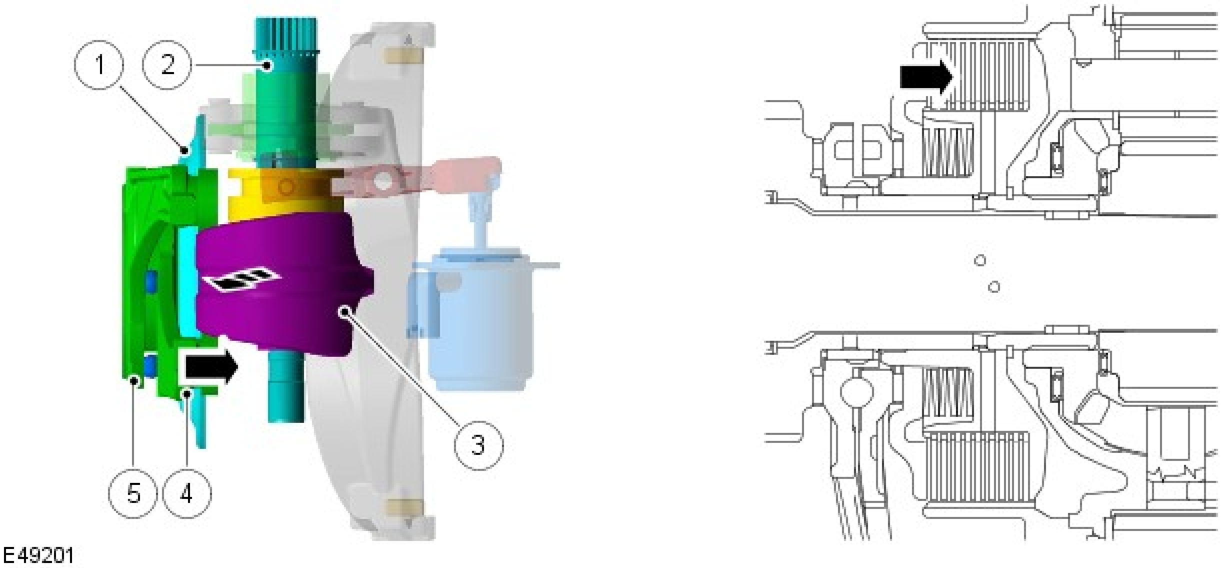
Multi-plate Clutch Actuation

Transfer box motor levers in initial position, multi-plate clutch open condition



E49200

Transfer box motor in end position, multi-plate clutch closed condition



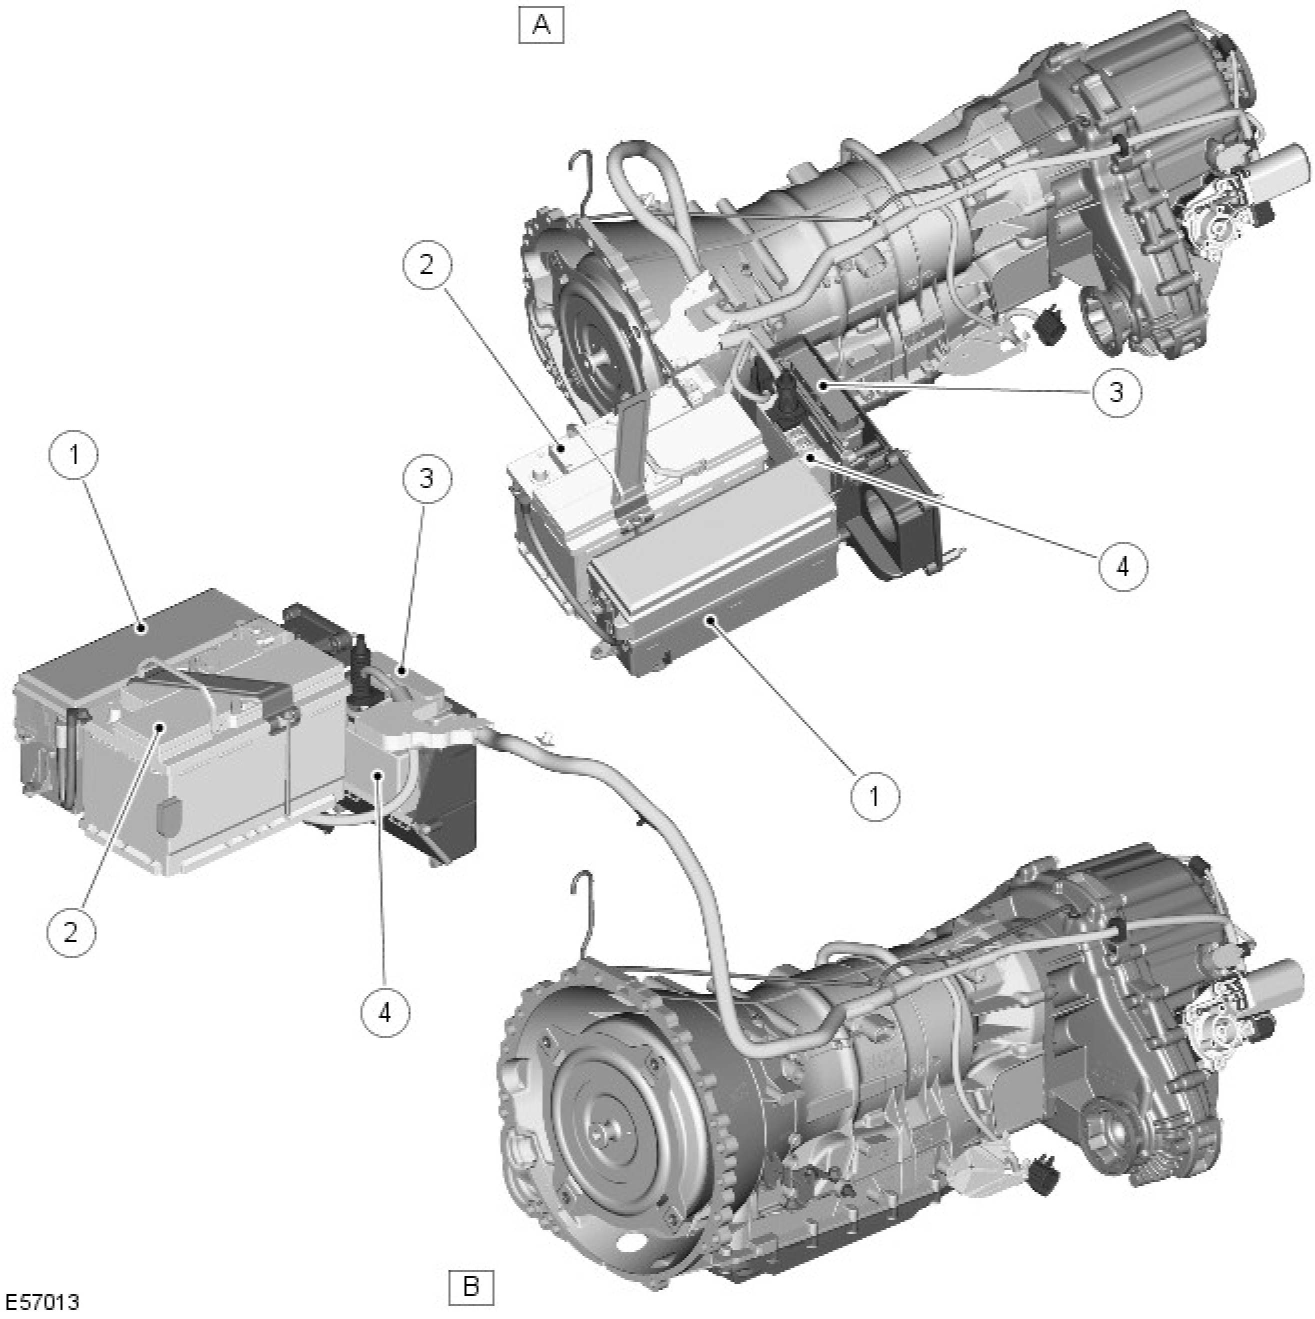
E49201

Item	Part Number	Description
1	-	Clutch piston
2	-	Motor shaft
3	-	Clutch control disc
4	-	Motor levers
5	-	Ramp mechanism balls

By turning the clutch control disc (3), via the motor shaft (2), the motor levers (4) are rotated relative to each other. This relative movement acts on 5 balls (5) in a ramp mechanism between the two levers and give a defined axial movement. The movement forces the clutch piston (1) to induce friction between the plates supported by the clutch hub and the plates supported by the clutch basket on the differential carrier. This frictional force inhibits the differential rotation; the differential carrier and front differential side gear are locked together.

TRANSFER BOX CONTROL MODULE

The transfer box control module controls the high/low 'shift-on-the-move' actuation and the multi-plate clutch actuation. The control module is located in the E-box, next to the Engine Control Module (ECM), behind the battery in the engine compartment. The position of the control module changes with LH and RH drive vehicles.



Item	Part Number	Description
A	-	RH drive
B	-	LH drive
1	-	Battery Junction Box (BJB)
2	-	Battery
3	-	Engine Control Module (ECM)
4	-	Transfer box control module

The control module is connected to the Controller Area Network (CAN) bus and controls transfer box operation using CAN messages from other control modules on the network.

The control module memorises the position of the transfer box motor when the ignition is switched off.

The transfer box control module uses the same actuator to control both range change function and application of centre differential locking torque. The module uses position feed back from the actuator to provide smooth range changing capability and graduated application of locking torque appropriate for the current driving conditions. Range change can be carried out while moving providing the transmission is in neutral and the vehicle is below the speed necessary for the requested range change.

The control module uses three connectors for all inputs and outputs. It receives a permanent power supply via a 30A fusible link located in the Battery Junction Box (BJB), and an ignition supply via fuse 24 in the Central Junction Box (CJB).

The control module uses a series of programmed shift maps to control the synchronisation speed and ensure that a maximum shift time of approximately one second is achieved.

If the control module is replaced, T4 must be connected to the vehicle and the transfer box control module self-calibration procedure must be performed. This procedure must also be performed if the transfer box motor assembly is replaced.

Default/Limp-home Strategy

If a fault occurs with the transfer box, the transfer box control module or one of the required input signals i.e. road speed signal, the control module records an error code and will respond appropriately to provide the highest level of system capability under the specific fault conditions. The following fault states are possible:

Fault state	System response	Driver warning
No reduction in capability	Diagnostic Trouble Code (DTC) will be recorded but no effect on performance	None
Clutch control not possible. Temporary over temperature condition	The tractive capability of the vehicle, off road, is reduced	Driveline over temperature warning lamp or "TRANSMISSION OVERHEAT SLOW DOWN" on message centre
Clutch control not possible. Permanent fault	The tractive capability of the vehicle, off road, is reduced	Driveline fault warning lamp or "TRANSMISSION FAULT TRACTION REDUCED" on message centre
Range change not possible	The system inhibits the driver from making a range change	Driveline fault warning lamp or "TRANSMISSION RANGE CHANGE INOPERATIVE" on message centre
Stuck in Transfer box neutral	The transfer box is stuck between high and low range resulting in no drive to wheels	Flash low range indicator plus "PARK LOCK FAILURE APPLY HAND/PARKBRAKE" message on message centre

If a driveline over temperature condition has occurred, after the driveline has been allowed to cool, clutch control will be re-enabled and the warnings will disappear. There is no need to seek service assistance following an over temperature event.

If clutch control or range change is not possible due to a permanent fault the driver must seek service assistance at the earliest opportunity.

If the system suffers a fault, which causes the transfer box to fail in neutral, the control module is designed to continue attempting to engage the requested range or return to its original range for a fixed number of attempts. If this has not been successful and the low range lamp is still flashing the driver should bring the vehicle to a halt and attempt the range change again while stationary. If this does not work after a number of attempts, key off for 30 seconds, restart engine and request range change again while stationary. The driver must seek service assistance at the earliest opportunity.

Transfer Box Control Module Pin Out Details

Connector C1319

Pin No.	Description	Input/output
1	Not used	-
2	Not used	-
3	CAN bus low	Data (input and output)
4	Range change selection switch - High	Input
5	Range change selection switch - Low	Input
6	CAN bus high	Data (input and output)

TRANSFER BOX CONTROL MODULE INPUTS

The transfer box control module receives the following inputs:

- Range change selection switch
- High/low position sensor
- Transfer box actuator motor temperature
- Transfer box actuator motor position sensor
- CAN bus messages.

CAN Bus Messages

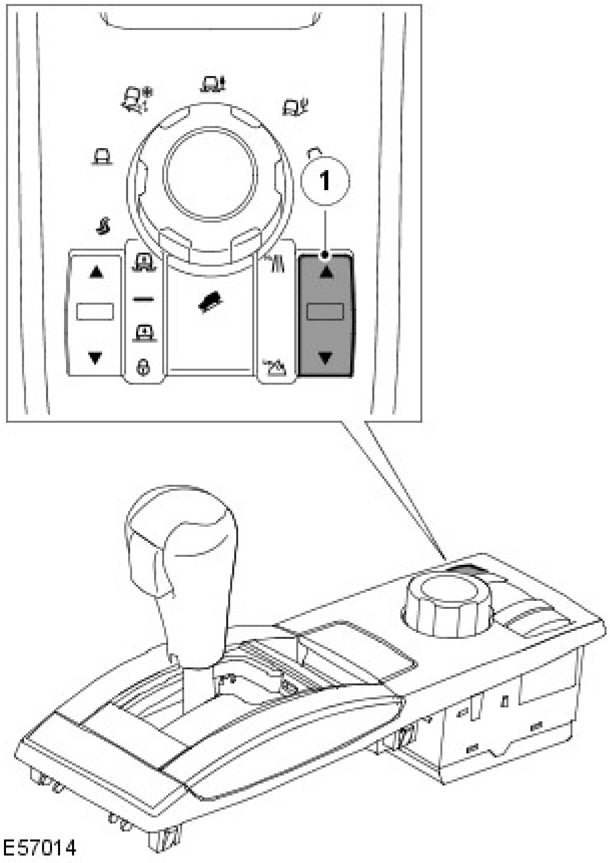
The CAN bus is a high speed broadcast network connected between various vehicle control modules. The CAN network carries an extensive list of messages between the different control modules enabling more sophisticated control with reduced complexity. Data on the network is packaged for efficient communication and prioritised according the urgency and importance of the messages. The bus comprises two wires, which are twisted together to minimise electromagnetic interference (noise) produced by the CAN messages.
For additional information, refer to: Communications Network (418-00 Module Communications Network, Description and Operation).

The transfer box control module is connected on the CAN bus and controls transfer box operation using CAN messages from other control units on the network. Wheel speed, vehicle acceleration, engine torque and speed, gear information, from the transmission, temperature information, car configuration, axle ratios and Terrain Response mode inputs, are some of the main signals received by the control module.

In the event of a CAN bus failure the following symptoms may be observed:

- Shift from high to low or low to high inoperative
- Instrument cluster low range warning lamp inoperative
- Warning messages or lamps displayed in instrument cluster.

Range Change Selection Switch



Item	Part Number	Description
1	-	Range change selection switch

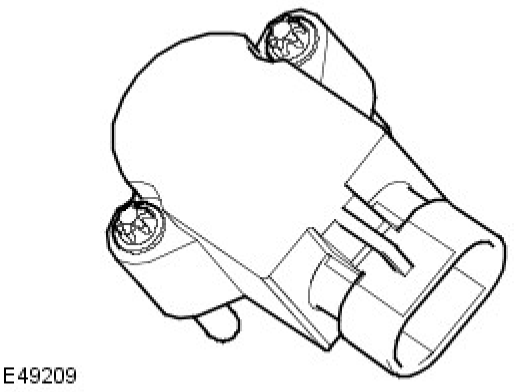
The range change selection switch is located behind the main transmission selection lever, in the centre console. The switch is a 3-position momentary action centre sprung device. The driver pushes the lever forward to select high range and back to select low range.

The switch comprises a housing, which provides the location for a sliding contact. When the switch is moved to the high or low position, it completes a momentary connection to 12V with one of two micro-switches located at each end of the range change selection switch. These micro-switches correspond to the high or low range positions.

The transfer box control module receives this momentary signal and selects the requested range.

In this position, a spring will move the selector lever to the centre position when released.

High/Low Position Sensor



The high/low position sensor converts the pivotal movement of the high/low fork into a PWM signal on the input. The PWM signal of the position sensor differs between high range and low range. The control module checks this signal and informs the driver, via the instrument cluster and the range change selection switch LED's, if a range change is in progress or has been completed.

The high/low position sensor is connected to the transfer box control module via a three-pin connector.

TRANSFER BOX CONTROL MODULE OUTPUTS

The transfer box control module sends the following outputs:

- CAN bus messages
- Key interlock solenoid
- High/low range change LED
- Transfer box motor
- Solenoid.

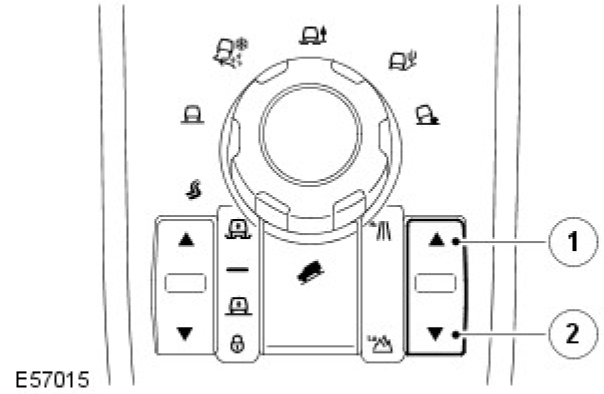
CAN Bus Messages

The control module also sends messages via the CAN bus to tell other control modules on the network, the status of the transfer box. The high/low status, clutch torque and default mode status are some of the main signals sent out by the transfer box control module.

Key Interlock Solenoid

The transfer box control module is able to send a signal to the key interlock solenoid. This signal locks the key in the ignition barrel to prevent it from being removed if the transmission is not in the 'Park' position.

High/Low Range Change LED



Item	Part Number	Description
1	-	High range LED
2	-	Low range LED

The control module is responsible for illuminating the 2 'high/low' range change LED's adjacent to the range change lever. One LED indicates high range and the other indicates low range.

One LED will be on continuously when in the corresponding range.

When changing range, the current range LED will remain on until the new range status has been achieved.

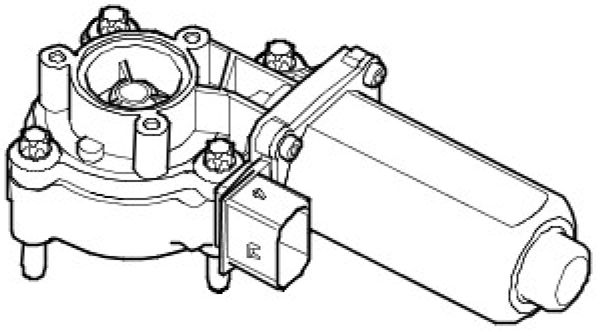
The new range LED will start flashing only when the range change has commenced (i.e. speed and neutral conditions have been met). The new range LED will be illuminated continuously at the same instant that the current range (now the old range) LED turns off.

The flash rate is 2 Hz with a 50% duty cycle.

The LED's have 2 levels of intensity, high when the vehicle lights are switch off and low when they are switched on.

If both lights are flashing at 0.5 Hz, this would indicate a transfer box fault or that the transfer box is in undefined range and may require calibration.

Transfer Box Motor



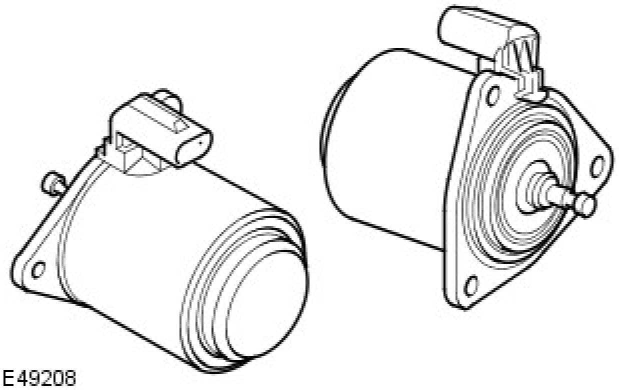
E49207

The transfer box motor provides the necessary movement to perform the high/low range change and the multi-plate clutch actuation. The motor is located on the rear casing assembly and secured with four bolts.

The motor is a PWM controlled, DC motor with an integrated worm gear reduction drive. It is connected to the transfer box control module with an eight-pin connector; the power supply of the motor is maintained through two large diameter cables on the motor connector. An internal position sensor checks the rotational movement of the motor.

There is a temperature sensor located within the motor housing.

Solenoid



E49208

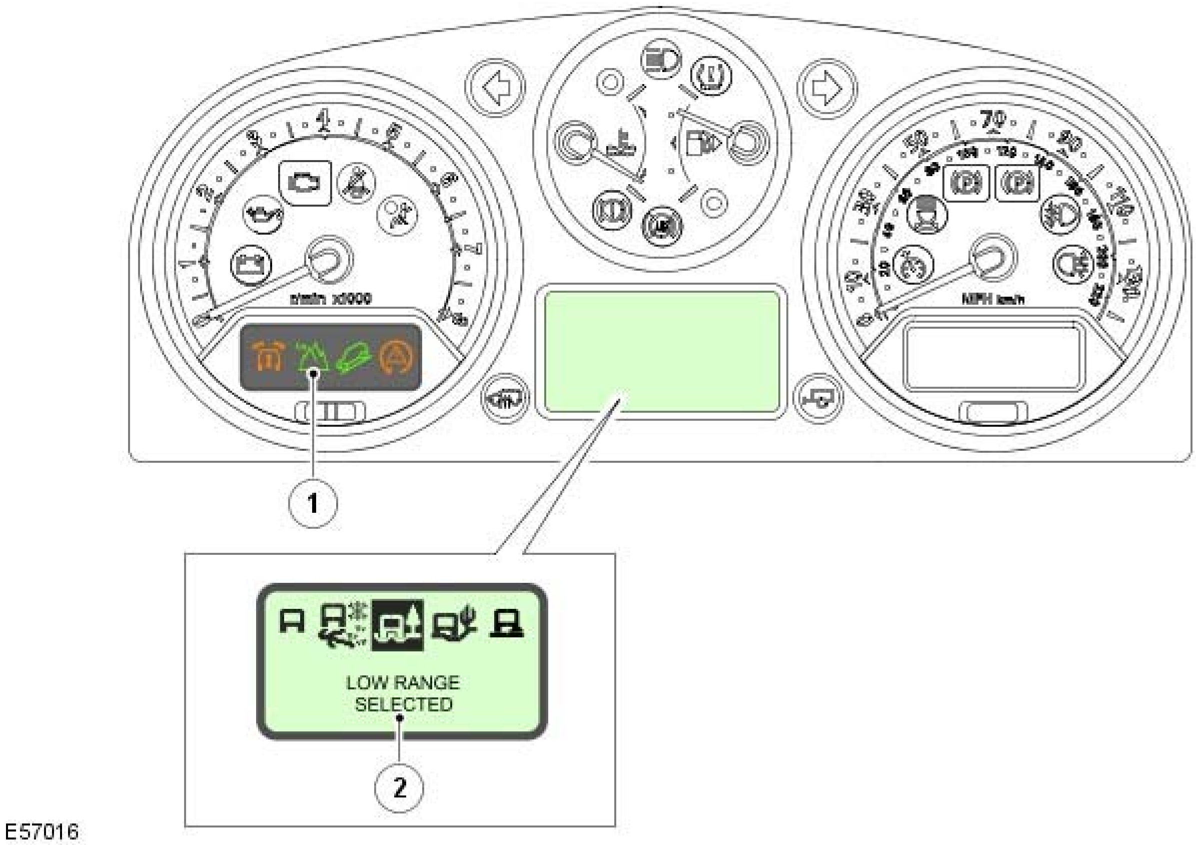
The solenoid switches the power flow on the actuation system between high/low range change mode and clutch control mode. When the solenoid is energized, the solenoid pin deploys and activates the clutch control mode. When the solenoid is de-energized, the internal spring rejects the solenoid pin and activates the high/low range change mode.

- NOTE: In order to replace the solenoid in service, the solenoid must be energized using T4.

The solenoid is connected to the transfer box control module with a two-pin connector.

Status Indication

Instrument Cluster



Item	Part Number	Description
1	-	Low-range status indicator
2	-	Message centre text

The low range status indicator will take the form of a mountain symbol and has the following logic:

- Lamp on = low range
- Lamp off = high range
- Lamp flashing = range change in progress/range undefined/range fault.

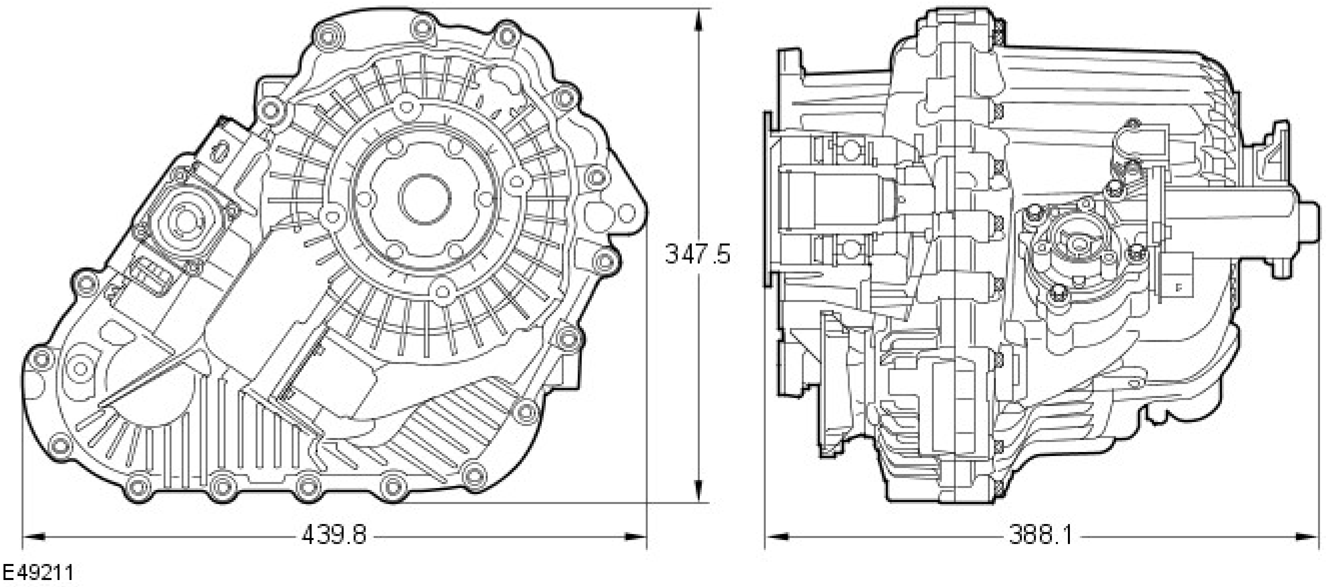
There will also be a message displayed in the message centre, which will inform the driver of any faults with the transfer box.

The following table shows the messages that can be displayed in the message centre relating to the transfer box:

Message	Description	Chime
'LOW RANGE ENGAGED'	Transfer case has engaged low range after a range change request	Single
'HIGH RANGE ENGAGED'	Transfer case has engaged high range after a range change request	Single
'SPEED TOO HIGH FOR RANGE CHANGE'	Range change request when vehicle speed too high	Single
'SELECT NEUTRAL FOR RANGE CHANGE'	Range change request when lever not in neutral	Single
'PARK LOCK FAILURE APPLY HANDBRAKE' (PARKBRAKE US/CAN)	This alerts the driver that the transmission park lock function is inoperative due to transfer box out of high or low range. Transfer box control module has stopped transmitting on the CAN bus during a range change or while in neutral mode and as a result the transmission park lock function is inoperative	One per second for three seconds
'TRANSMISSION RANGE CHANGE INOPERATIVE'	Transfer box has detected a fault inhibiting a new range change. Control unit has shut down due to thermal overload	Single
'TRANSMISSION OVER HEAT SLOW DOWN'	Centre differential temperature is approaching the over heated threshold	Single
'TRANSMISSION FAULT – TRACTION REDUCED'	Centre differential has failed - operating as an open differential	Single
'TRANSMISSION FAULT – TRACTION REDUCED'	Transfer box control module has stopped transmitting on the CAN bus and defaults to open centre differential	Single

SERVICE

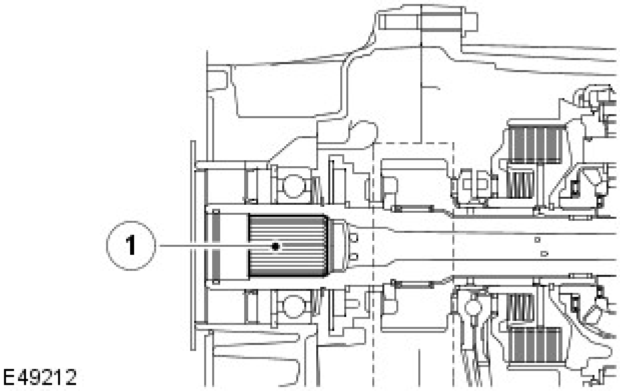
Basic Dimensions (Millimetres)



The transfer box weighs 40.30 kg without oil and 41.55 kg with oil. The unit requires 1500 ml ± 2% of oil from empty (dry).

The oil used in the transfer box is Shell TF 0753, which has been specially developed by Magna Steyr and Shell. The oil contains unique additives, which enhance the transfer box operation. No other oil must be used in the transfer box.

There is a unique type of grease, Weicon anti-seize montagepaste grau TL 7391, that needs to be applied to the units input shaft spline when installing or reinstalling the transfer box.



Item	Part Number	Description
1	-	Input shaft spline

DIAGNOSTICS

The transfer box control module can store fault codes, which can be retrieved using T4 or a diagnostic tool using KW2000* protocol.

The information is communicated via a diagnostic socket.

The diagnostic socket allows the exchange of information between the various control modules on the bus systems and T4 or another suitable diagnostic tool. The information is communicated to the socket via the CAN bus. This allows the retrieval of diagnostic information and programming of certain functions using T4 or another suitable diagnostic tool.

The transfer box control module uses Diagnostic Trouble Codes (DTC), which relate to transfer box electrical faults.

Clutch and Range Change Mechanism Calibration

In order for the range change mechanism to function correctly, the transfer box control module must be calibrated to the mechanical dimensions of the transfer box that it is connected to.

This procedure will need to be followed if one of the following occurs:

- The vehicle is first assembled
- The switch is changed
- The transfer box control module is changed
- The transfer box or range position sensor is changed
- Vehicle or transfer box control module fault has caused the transfer box to revert to an undefined range.

Calibration can be carried out using the service tool or by following this procedure:

- Switch ignition to position II without the engine running
- Select neutral
- Depress the throttle pedal fully
- Press and hold the range change switch for 5 or more seconds to allow calibration to start
- When the calibration is heard to start, the switch and throttle pedal can be released
- Upon adopting high range, start the engine and wait 30 seconds while the first calibration of the clutch in high range is done. While this calibration process is in progress, no shifting is accepted
- Switch ignition off and wait 15 seconds
- Start engine
- Perform a range change to low range. Wait 30 seconds while the first calibration of the clutch in low range is done. While this calibration process is in progress, no shifting is accepted
- Switch ignition off and wait 15 seconds
- Range and clutch calibration is now complete.

SYSTEM OPERATION

The selection of high/low range is achieved by using a switch located behind the main transmission selection lever in the centre console. A range change can only be performed when the transmission selector lever is in neutral (position 'N'). The accelerator pedal must not be depressed when a range change is in progress.

If high or low range is requested and the transmission selector lever is in a position other than 'N' or 'P', the instrument cluster message center will display 'SELECT NEUTRAL'.

• NOTE: If the transmission selector lever is in the 'P' position, the range change will not take place and the 'SELECT NEUTRAL' message will not be displayed in the message centre.

When low range is selected, the low range 'mountain' symbol will flash when the range change is taking place and then remain illuminated when the range change is complete. The instrument cluster message centre will display 'LOW RANGE' for approximately 3 seconds followed by a chime from the instrument cluster to confirm that the range change has been completed. Only 'D' and 'Manual mode' are available, the 'Sport mode' selection is not available.

When high range is selected, the low range 'mountain' symbol will flash when the range change is taking place and then extinguish when the range change is complete. The instrument cluster message centre will display 'HIGH RANGE' for approximately 3 seconds followed by a chime from the instrument cluster to confirm that the range change has been completed.

The design of the transfer box allows range changes when the vehicle is moving, within set limitations as follows:

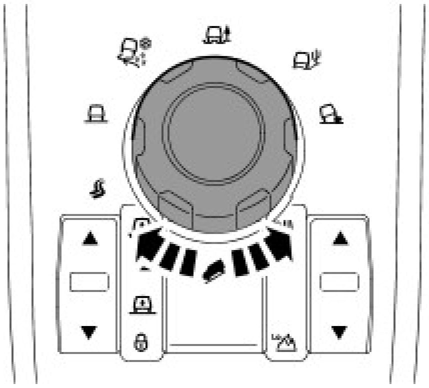
- High to Low – at speeds not exceeding 25 mph (40 km/h)
- Low to High – at speeds not exceeding 37 mph (60 km/h).

If the vehicle speed is higher than the parameters given, the instrument cluster message centre will display 'SLOW DOWN'. When the correct speed range is reached, the message will be deleted and the range change will commence.

The transfer box control module interprets a road speed of less than 2 mph (3 km/h) as a static shift (vehicle not moving). In this instance, the driver must use the shift lock procedure of operating the brake pedal to allow the selector lever to be moved from 'N' to 'D' after the range change has been performed.

High range should be used for all normal road driving and also for off-road driving across dry, level terrain. Low range should only be required where low speed manoeuvring is necessary, such as reversing a trailer, negotiating steep slippery surfaces or boulder-strewn terrain. Low range should also be used for extreme off-road conditions where progress in high range cannot be maintained. Low range should never be used for normal road driving.

Terrain Response



E57017

The Terrain Response system allows the driver to select a program, which will provide the optimum settings for traction and performance for the prevailing terrain conditions.

The system is controlled by a rotary control located on the centre console. The rotary control allows the selection of one of the following five programs:

- Special programs off (general driving conditions)
- Grass/Gravel/Snow
- Mud/Ruts
- Sand
- Rock crawl.

The Terrain Response system uses a combination of vehicle subsystems to achieve the required vehicle characteristics for the terrain selected. The following subsystems form the Terrain Response system:

- Engine management system
- Transmission
- Transfer box
- Rear locking differential (if fitted)
- Brake system
- Air suspension.

Each subsystem control module provides a feedback for the selected program so that the Terrain Response control module can check that all systems are controlling the system correctly.
For additional information, refer to: Ride and Handling Optimization (204-06 Ride and Handling Optimization, Description and Operation).

HIGH RANGE OPERATION

In high range, the torque input from the transmission is passed to the transfer box input shaft. The position of the synchronizer sleeve couples the shaft directly to the differential housing. The differential splits the torque between the two side gears. One side gear is connected by splines and passes the torque to the rear output flange. The second side gear is connected to the chain drive sprocket and passes the torque, via the chain, to the front output flange.

LOW RANGE OPERATION

In low range, the torque input from the transmission is passed to the transfer box input shaft. The synchroniser sleeve is moved and connects the planetary carrier to the differential housing. The torque from the transmission is now directed through the sun gear of the epicyclic gearset and, via the pinion gears and pinion gear shafts, into the planetary carrier. The annulus gear of the epicyclic gearset is secured inside the casing and generates the low range ratio of 2.93:1. The torque is then passed, via the synchroniser sleeve, to the differential housing where it is split between the two side gears. One side gear is connected by splines and passes the torque to the rear output flange. The second side gear is connected to the chain drive sprocket and passes the torque, via the chain, to the front output flange.

HIGH/LOW RANGE GEARS WITH SHIFT-ON-THE-MOVE

The driver is able to change between high and low range gears while the vehicle is moving, or if the vehicle is stationary.

Pushing the range change lever makes a range change requests. This lever is located on the centre console behind and to one side of the main transmission lever.

The driver requests a high to low range change by pushing the range change lever towards the rear of the vehicle and, conversely, a low to high request by pushing the lever towards the front of the vehicle. The range change lever is centre sprung and therefore does not latch in the forward or rear positions.

The driver is informed of the range status via a green lamp (mountain symbol) in the instrument cluster and LED's next to the range change lever. The lamp will not be illuminated in high range, illuminated in low range and flashes during a range change. There are two LED's on the range change lever one for high and one for low. During a range change the new range LED will flash.

The vehicle will remain in the selected range unless the driver requests a change, i.e. it will not automatically revert to high range following a key off/key on sequence.

RANGE CHANGE PROCEDURE

Neutral must be selected on the main transmission before requesting a range change and then select the appropriate gear following completion of the range change. During the range change the main transmission will be locked in neutral.

If neutral is not selected when a range change is requested then the request is denied and the driver will be advised to select neutral via the instrument cluster message centre.

The range change process can take up to one second to complete following a request being accepted.

There is a limit set on the maximum speed at which a range change can be achieved. The maximum speed for a high to low range change is 25 mph (40 km/h). The maximum speed for a low to high range change is 37 mph (60 km/h). If the vehicle speed is over the limit when a range change is selected then the request is denied and the instrument cluster message centre will display a 'SLOW DOWN' message.

Four-Wheel Drive Systems - Four-Wheel Drive Systems

Diagnosis and Testing

Overview

The DD295 transfer box is a permanent four-wheel-drive unit, with 50/50 torque distribution to the front and rear driveshafts and is identical for all engine derivatives. For additional information, refer to section 308-07 - Four-Wheel Drive Systems in the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Confirm which, if any, warning lights and/or messages were displayed on the instrument cluster. For a list of messages, refer to the relevant section of the workshop manual.
3. **3.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Transfer box ● Oil leaks ● Driveshafts ● Halfshafts ● Constant velocity (CV) joints	● Fuse(s) ● Wiring harness/electrical connectors ● Controller area network (CAN) circuits ● Instrument cluster ● Range change selection switch ● Transfer box control module

4. **4.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
5. **5.** Use the approved diagnostic system or a scan tool to retrieve any DTCs before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Message	Possible causes	Action
Loss of drive due to transfer box stuck in neutral and transmission park lock function is inoperative	'PARK LOCK FAILURE APPLY HANDBRAKE'	● Transfer box control module CAN bus - off bus during range change ● Transfer box changeover solenoid fault ● Transfer box motor fault ● Transfer box internal obstruction	Refer to the Network Communications section of the workshop manual.
Loss of drive	-	● Half shaft failure ● Driveshaft failure ● Front or rear axle: differential failure ● Transfer box center differential failure	Check the condition of the driveshafts, half shafts and CV joints.
Range change inhibited	'TRANSMISSION RANGE CHANGE INOPERATIVE'	● Transfer box control module has shut down due to thermal overload ● Transfer box internal obstruction ● Transfer box changeover solenoid fault ● Transfer box motor fault ● Transfer box control module failure	Check for transfer box control module DTCs.
Off road traction reduced	'TRANSMISSION OVER HEAT SLOW DOWN'	● Center differential temperature is approaching the over heated threshold	Check for over-temperature DTCs.

Symptom	Message	Possible causes	Action
	'TRANSMISSION FAULT – TRACTION REDUCED'	• Center differential has failed - operating as an open differential • Transfer box control module has stopped transmitting on the CAN bus and defaults to open center differential	Check for lost communication and bus off DTCs.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

Power latch

There are references to "power latch" within the DTC index. This is where the module must be reset by means of a complete power down and power up.

DTC	Description	Possible Causes	Action
P0560-00	System Voltage - No sub type information	• Power or ground supply circuit fault • Battery or charging system fault	• NOTE: This DTC may be logged due to battery voltage, suspect battery or charging system fault • Check the battery condition and state of charge. Check the battery connections, power and ground cables. Refer to the relevant workshop manual section • Using the manufacturer approved diagnostic system, check other modules, for related diagnostic trouble codes and refer to the relevant diagnostic trouble code index • Clear the DTC and retest • Using the manufacturer approved diagnostic system monitor supply voltage - Datalogger / section 308 manual transmission / transaxle and clutch /control module supply voltage = Pid D111 • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0561-00	System Voltage Unstable - No sub type information	• Battery disconnected and reconnected • Battery connections loose/corroded • Battery ground cable intermittent high resistance • Battery positive cable intermittent: high resistance	• Check the battery condition and state of charge. Check the battery connections, power and ground cables. Refer to the relevant section of the workshop manual • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0562-00	System Voltage Low - No sub type information	• Battery voltage low • Battery ground cable high resistance • Battery connections loose/corroded • Battery current drain	• Check the battery condition and state of charge. Check the battery connections, power and ground cables. Check the ignition power supply circuit connections and wiring. Refer to the relevant workshop manual section • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0563-00	System Voltage High - No sub type information	• Vehicle battery boosted from high voltage starting aid • Battery voltage high • Generator over charge condition	• Check if the vehicle has been jump-started. Check the battery condition and state of charge. Check the battery connections, power and ground cables. Refer to the relevant workshop manual section • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0607-00	Control Module Performance - No sub type information	• Transfer box control module - event information - CPU watch	• Check the transfer box control module circuits and connectors. Refer to the electrical circuit diagrams. Clear the DTC. Cycle the ignition, allow power latch and retest. If the DTC resets, suspect the transfer

DTC	Description	Possible Causes	Action
		dog	box control module. Refer to the warranty policy and procedures manual if a module is suspect
P0634-00	PCM / ECM / TCM Internal Temperature A Too High - No sub type information	● Transfer box motor, driver stage over-temperature deactivation ● Transfer box internal sensor error	● Consider atmospheric and customer driving conditions before carrying out any other action. Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor wiring. Refer to the warranty policy and procedures manual if a module is suspect
P0641-00	Sensor Reference Voltage A Circuit - No sub type information	● Transfer box motor hall effect sensor supply circuit high resistance ● Transfer box motor hall effect sensor ground circuit high resistance ● Transfer box motor hall effect sensor failure ● Transfer box control module failure	● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor wiring. Refer to the warranty policy and procedures manual if a module is suspect ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0642-00	Sensor Reference Voltage A Circuit Low - No sub type information	● Transfer box motor hall effect sensor supply circuit short circuit to ground ● Transfer box motor hall effect sensor supply circuit high resistance ● Transfer box motor hall effect sensor failure ● Transfer box control module failure	● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor wiring. Refer to the warranty policy and procedures manual if a module is suspect ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0643-00	Sensor Reference Voltage A Circuit High - No sub type information	● Transfer box motor hall effect sensor supply circuit short circuit to power ● Transfer box motor hall effect sensor failure ● Transfer box control module failure	● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box actuator hall effect sensor wiring. Refer to the warranty policy and procedures manual if a module is suspect ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0652-00	Sensor Reference Voltage B Circuit Low - No sub type information	● Gear shift position sensor supply circuit short circuit to ground ● Gear shift position sensor supply circuit high resistance ● Gear shift position sensor failure	● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box position sensor wiring (manual transmission x-sensor and manual transmission y-sensor). Renew the sensor ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0653-00	Sensor Reference Voltage B Circuit High - No sub type information	● Gear shift position sensor supply circuit short circuit to power ● Gear shift position sensor failure	● Refer to the electrical circuit diagrams and check the transfer box control module circuits, especially the transfer box position sensor wiring (manual transmission x-sensor and manual transmission y-sensor). Renew the sensor ● Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0666-00	PCM/ECM/TCM Internal Temperature Sensor 'A' Circuit - No sub type information	● Changeover solenoid, driver stage over-temperature deactivation	● Consider atmospheric and customer driving conditions before carrying out any other action. Refer to the electrical circuit diagrams and check the transfer box mode change solenoid wiring. Check for over-temperature DTCs in other modules
P0698-00	Sensor Reference Voltage C Circuit Low - No sub type information	● Manual transmission output shaft speed sensor circuit short circuit to ground	● Refer to the electrical circuit diagrams and check the transmission circuits, especially the transmission output speed sensor wiring. Renew the sensor

DTC	Description	Possible Causes	Action
		• Manual transmission output shaft speed sensor circuit high resistance • Manual transmission output shaft speed sensor failure	
P0699-00	Sensor Reference Voltage C Circuit High - No sub type information	• Manual transmission output shaft speed sensor circuit short circuit to power • Manual transmission output shaft speed sensor failure	• Refer to the electrical circuit diagrams and check the transmission circuits, especially the transmission output speed sensor wiring. Renew the sensor
P0702-00	Transmission Control System Electrical - No sub type information	• Unexpected reset • Battery short circuit to ground • Generator circuit short circuit to ground • Transfer box control module supply short to ground	• Refer to the electrical circuit diagrams and check for intermittent loss of power or ground of the main power supply circuits to the module. Check the battery connections, power and ground cables. Check the ignition power supply circuit connections and wiring
P0712-00	Transmission Fluid Temperature Sensor 'A' Circuit Low - No sub type information	• Transfer box motor temperature sensor circuit short circuit to ground • Transfer box motor temperature sensor failure	• Refer to the electrical circuit diagrams and check the transfer box motor temperature sensor and circuits • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0713-00	Transfer box Motor Temperature Sensor A Circuit - No sub type information	• Transfer box motor temperature sensor circuit short circuit to power • Transfer box motor temperature sensor circuit high resistance • Transfer box motor temperature sensor failure	• Refer to the electrical circuit diagrams and check the transfer box motor temperature sensor and circuits • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0715-00	Turbine/Input Shaft Speed Sensor A Circuit - no sub type information	• Clutch slip - transmission input and output speeds incorrect for selected gear ratio	• NOTE: This DTC may be induced by the driver • Confirm that the DTC has not been induced by the driving style of the driver (riding the clutch). Refer to the electrical circuit diagrams and check the circuit between gearbox secondary speed sensor and the transfer box control module. Check the gear selector mechanism for correct operation
P0716-00	Turbine/Input Shaft Speed Sensor A Circuit Range/Performance - no sub type information	• Clutch slip - transmission input and output speeds incorrect for selected gear ratio	• NOTE: This DTC may be induced by the driver • Confirm that the DTC has not been induced by the driving style of the driver (riding the clutch). Refer to the electrical circuit diagrams and check the circuit between gearbox secondary speed sensor and the transfer box control module. Check the gear selector mechanism for correct operation
P0717-00	Turbine/Input Shaft Speed Sensor A Circuit No Signal - no sub type information	• Clutch slip - transmission input and output speeds incorrect for selected gear ratio	• NOTE: This DTC may be induced by the driver • Confirm that the DTC has not been induced by the driving style of the driver (riding the clutch). Refer to the electrical circuit diagrams and check the circuit between gearbox secondary speed sensor and the transfer box control module. Check the gear selector mechanism for correct operation

DTC	Description	Possible Causes	Action
P0780-00	Shift Malfunction - No sub type information	- Gear shifting blocked (the transfer box motor movement and position does not correspond to the expected values)	- Refer to the electrical circuit diagrams and check transfer box motor wiring and transfer box motor hall effect sensor wiring. Check transfer box motor
P0806-00	Clutch Position Sensor Circuit Range/Performance - No sub type information	- Clutch and range change mechanism calibration failure	- Calibrate the clutch and range change mechanism using the manufacturer approved diagnostic system. If fault is still present check the transfer box wiring, especially the transfer box motor wiring, transfer box motor hall effect sensor wiring and transfer box range position sensor wiring. In box of manual transmission variant also check x-sensor, y-sensor and manual transmission output speed sensor wiring
P0807-00	Clutch Position Sensor Circuit Low - No sub type information	- Transfer box motor hall effect sensor signal circuit short circuit to ground - Transfer box motor hall effect sensor failure	- Refer to the electrical circuit diagrams and check the transfer box circuits, especially the transmission output speed sensor wiring. Repair/renew as necessary
P0808-00	Clutch Position Sensor Circuit High - No sub type information	- Transfer box motor hall effect sensor signal circuit short circuit to power - Transfer box motor hall effect sensor signal circuit high resistance - Transfer box motor hall effect sensor failure	- Refer to the electrical circuit diagrams and check the transfer box circuits, especially the transmission output speed sensor wiring. Repair/renew as necessary - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0820-00	Gear Lever X-Y Position Sensor Circuit - no sub type information	- High force at gear select lever puts sensor outside of boundary parameters - gear ratio not specified - Clutch slip - transmission input and output speeds incorrect for selected gear ratio - Gear position sensor circuit fault - Gear position sensor fault (gear not specified)	• NOTE: This DTC may be induced by the driver - Confirm that the DTC has not been induced by the driving style of the driver (riding the clutch or holding the gear select lever while driving) - Refer to the electrical circuit diagrams and check the circuit between gearbox secondary speed sensor and the transfer box control module - Check the gear selector mechanism for correct operation
P0826-00	Up and Down Switch Circuit - No sub type information	- Transmission High/Low switch activation too long or high and low switches activated at the same time - Transmission High/Low switch pressed for more than 255 seconds - Switch pack harness circuit short circuit to ground, short circuit to power, high resistance - Transmission High/Low switch failure	• NOTE: This DTC may be induced by the driver - Clear the DTC - Check the center console switch pack operation - Clear the DTC and retest - If the DTC returns - Using the manufacturer approved diagnostic system monitor supply voltage - Datalogger / section 308 manual transmission / transaxle and clutch / transfer box control module input status = Pid 1983 - Refer to the electrical circuit diagrams and check the center console switch pack circuit. Repair/renew as necessary - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0900-00	Clutch Actuator Circuit/Open - No sub type information	- Transfer box motor circuit fault - Transfer box motor failure	- Clear the DTC and retest - If the DTC returns - Refer to the electrical circuit diagrams and check the transfer box motor circuit. Repair/renew as necessary - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine

DTC	Description	Possible Causes	Action
P0902-00	Clutch Actuator Circuit - No sub type information	- Transfer box motor circuit short circuit to ground - Transfer box motor circuit high resistance - Transfer box motor failure	- Refer to the electrical circuit diagrams and check the transfer box motor circuit. Repair/renew as necessary - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0903-00	Clutch Actuator Circuit - No sub type information	- Transfer box motor circuit short circuit to power - Transfer box motor failure	- Refer to the electrical circuit diagrams and check the transfer box motor circuit. Repair/renew as necessary - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0915-00	Gear Shift Position Circuit Range/Performance - No sub type information	- Gear shift position sensor circuit fault - Gear shift position sensor failure	- Refer to the electrical circuit diagrams and check the selector position sensor circuit - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0916-00	Gear Shift Position Circuit Low - No sub type information	- Gear shift position sensor circuit short circuit to ground - Gear shift position sensor failure	- Refer to the electrical circuit diagrams and check the selector position sensor circuit - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P0917-00	Gear Shift Position Circuit High - No sub type information	- Gear shift position sensor circuit short circuit to power - Gear shift position sensor failure	- Refer to the electrical circuit diagrams and check the selector position sensor circuit - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P173A-00	Clutch Actuator Position Sensor Circuit Range/Performance - No sub type information	- Clutch Actuator position sensor - A - circuit fault - Clutch Actuator position sensor - B - circuit fault - Clutch Actuator position sensor failure - Transfer box internal failure	- Refer to the electrical circuit diagrams and check the transfer box motor hall effect sensor - **A** - and - **B** - circuits for short circuit to ground, short circuit to power, open circuit, high resistance, short circuit to another circuit - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P173B-00	Clutch Actuator Position Sensor Circuit Low - No sub type information	- Transfer box motor hall effect sensor signal circuit short circuit to ground - Transfer box motor hall effect sensor signal circuit high resistance - Transfer box motor hall effect sensor failure	- Refer to the electrical circuit diagrams and check the transfer box motor hall effect sensor circuit - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P173C-00	Clutch Actuator Position Sensor Circuit High - No sub type information	- Transfer box motor hall effect sensor signal circuit short circuit to power - Transfer box motor hall effect sensor signal circuit high resistance - Transfer box motor hall effect sensor failure	- Refer to the electrical circuit diagrams and check the transfer box motor hall effect sensor circuit - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P173E-00	Ignition Key Lock Solenoid Circuit Low - No sub type information	- Key-lock solenoid circuit short circuit to ground - Key-lock solenoid circuit high resistance - Key-lock solenoid failure	- Using the manufacturer approved diagnostic system carry out the guided diagnostic routine - Refer to the electrical guides and check the Key-lock solenoid circuit
P173F-00	Ignition Key Lock Solenoid Circuit High - No sub type information	- Key-lock solenoid circuit short circuit to power - Key-lock solenoid failure	- Using the manufacturer approved diagnostic system carry out the guided diagnostic routine - Refer to the electrical guides and check the key-lock solenoid circuit

DTC	Description	Possible Causes	Action
P174A-00	Gear Lever X Position Sensor Circuit Low - no sub type information	• Gearbox X position sensor circuit fault • Gearbox position sensor internal failure	• Refer to the electrical circuit diagrams and check the gearbox position sensor circuit for fault
P174B-00	Gear Lever X Position Sensor Circuit High - no sub type information	• Gearbox X position sensor circuit fault • Gearbox position sensor internal failure	• Refer to the electrical circuit diagrams and check the gearbox position sensor circuit for fault
P174C-00	Gear Lever Y Position Sensor Circuit Low - no sub type information	• Gearbox Y position sensor circuit fault • Gearbox position sensor internal failure	• Refer to the electrical circuit diagrams and check the gearbox position sensor circuit for fault
P174D-00	Gear Lever Y Position Sensor Circuit High - no sub type information	• Gearbox X position sensor circuit fault • Gearbox position sensor internal failure	• Refer to the electrical circuit diagrams and check the gearbox position sensor circuit for fault
P1806-00	4-Wheel Drive High Indicator Short Circuit To Battery - No sub type information	• LED circuit short circuit to power • Switch pack LED failure	• Refer to the electrical circuit diagrams and check the LED circuit • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P1807-00	4-Wheel Drive High Indicator Short Circuit To Ground - No sub type information	• LED circuit short circuit to ground • LED circuit high resistance • Switch pack LED failure • Transfer box control module failure	• Refer to the electrical guides and check the LED circuit • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P1808-00	4-Wheel Drive Low Indicator Circuit failure- No sub type information	• LED circuit short circuit to power • Switch pack LED failure	• Refer to the electrical circuit diagrams and check the LED circuit • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P1810-00	4-Wheel Drive Low Indicator Short Circuit To Power - No sub type information	• LED circuit short circuit to power • Switch pack LED failure	• Refer to the electrical circuit diagrams and check the LED circuit
P181B-00	Clutch Actuator Changeover Solenoid Low - no sub type information	• Clutch actuator changeover solenoid circuit short circuit to ground • Clutch actuator changeover solenoid circuit high resistance • Clutch actuator changeover solenoid failure	• Refer to the electrical circuit diagrams and check the transfer box mode selector solenoid circuit • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P181C-00	Clutch Actuator Changeover Solenoid High - No sub type information	• Clutch actuator changeover solenoid circuit short circuit to power • Clutch actuator changeover solenoid failure	• Refer to the electrical circuit diagrams and check the transfer box mode selector solenoid circuit • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
P181D-00	Clutch Actuator Changeover Solenoid Range/Performance - No sub type information	• Mode selector solenoid circuit short circuit to ground or power • Mode selector solenoid hall effect sensor circuit short circuit to ground or power • Mode selector solenoid	• NOTE: Check for DTC P0916-00 if logged investigate first • Refer to the electrical circuit diagrams and check the mode selector solenoid circuit. Repair/renew as necessary • Using the manufacturer approved diagnostic system carry out the guided diagnostic routine

DTC	Description	Possible Causes	Action
		failure	
P181E-00	Clutch Actuator Range/Performance - No sub type information	- Transfer box motor current plausibility error - Transfer box motor wiring circuit short to ground or power - Transfer box motor hall effect sensor wiring circuit short to ground or power - Transfer box motor or solenoid failure	- Refer to the electrical circuit diagrams and check the transfer box motor wiring and transfer box motor hall effect sensor wiring. Check the transfer box motor and transfer box mode selector solenoid
P181F-00	Clutch Control System Performance - No sub type information	- Transfer box motor wiring circuit fault - Transfer box motor hall effect sensor circuit fault - Transfer box motor or solenoid failure	• NOTE: Check for DTC P0900, P0902, P0903 if logged investigate first - Refer to the electrical circuit diagrams and check the transfer box motor wiring and transfer box motor hall effect sensor wiring. Check the transfer box motor and transfer box mode selector solenoid
P183A-00	Range Change Mechanism failure- No sub type information	- Transfer box input and output speed do not change as necessary for a range change - Synchronizer lock defect	- Refer to the electrical circuit diagrams and check the transfer box motor wiring and transfer box motor hall effect sensor wiring. Check the transfer box motor
P186D-00	Clutch Actuator Stuck - No sub type information	- Power or ground supply circuit fault - Transfer box motor fault - Transfer box internal fault	- Clear the DTC and retest - Refer to the electrical circuit diagrams and check the transfer box motor wiring and transfer box motor hall effect sensor circuit - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine - Using the manufacturer approved diagnostic system check and install latest relevant level of software to the transfer box control module
P2711-00	Unexpected Mechanical Gear Disengagement - no sub type information	- Transfer box motor control circuit fault - Transfer box motor internal fault	- Refer to the electrical circuit diagrams and check the control circuit between the transfer box control module and the transfer box motor for fault. Check the operation of the transfer box motor
P2785-00	Clutch Actuator Temperature Too High - No sub type information	- Actuator internal temperature sensor value above 150°C - Extensive prolonged off-road use - Insufficient oil quantity - Incorrect oil specification - Internal Differential problem	- Confirm the customer complaint and vehicle usage at the time of DTC event. Check the operation of the rear differential. Check the rear differential oil quantity, specification and for signs of over-heating. Refer to the relevant section of the workshop manual. If necessary, allow the differential to cool, renew the oil, clear the DTC and retest. If the problem persists, renew the rear differential assembly. Refer to the warranty policy and procedures manual if a differential is suspect
P2787-00	Clutch Temperature Too High - No sub type information	- Event information - Clutch plate high temperature reached	- This DTC is for information only, consider the customer usage conditions that may have logged this DTC (i.e. prolonged off-road use). Clear/ignore this DTC
P2789-00	Clutch Adaptive Learning at Limit - No sub type information	- Clutch not calibrated - Error occurred during clutch calibration	- Check the clutch condition. Calibrate as necessary using the manufacturer approved diagnostic system. If fault is still present check transfer box wiring. Especially check transfer box motor wiring and transfer box motor hall effect sensor wiring
P2806-00	Transmission Range Sensor Alignment - no sub type information	- Gear position select X Y sensor (gearbox position sensor) not calibrated	- Using the manufacturer approved diagnostic system carry out the routine (Setup and calibration / transfer box / X Y sensor replacement) then carry

DTC	Description	Possible Causes	Action
		- Clutch position not calibrated	out the routine (Setup and calibration / parking brake / clutch sensor calibration routine). Clear the DTC and retest if the DTC returns suspect the transfer box control module. Refer to the warranty policy and procedures manual if a module/component is suspect
U0073-88	Control Module Communication - Bus "A" Off	- Bus off: Traction control module (TCCM) - Bus off: Body control module (BCM) - Bus off: Park aid module (PAM). - Bus off: Electric parking brake module (EPB) - Bus off: Dynamic suspension module	- Using the manufacturer approved diagnostic system carry out the guided diagnostic routine - Check the control module installation/configuration. Refer to the lost communication statement at the start of the Network Communications section in the workshop manual
U0100-87	Lost Communication With ECM/PCM "A" - Missing message	- CAN Link transfer box control module/ECM missing message	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the engine control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0101-87	Lost Communication with TCM - No sub type information	- Power or ground circuit fault - CAN Bus circuit fault	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the transmission control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0104-86	Lost Communication With Cruise Control Module - signal invalid	- Invalid signal from the TCCM - ACC timed out, signal out of range or signal invalid	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the cruise control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0122-87	Lost communication with vehicle dynamics control module - Missing message	- CAN Link transfer box control module/ABS module missing message	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the vehicle dynamics module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0126-87	Lost communication with steering angle sensor module (SASM) - Missing message	- CAN bus fault - SASM disconnected - SASM not configured/calibrated - SASM failure	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the steering angle module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine

DTC	Description	Possible Causes	Action
U0128-87	Lost communication with park brake control module - Missing message	- CAN bus fault - Park brake module disconnected - Park brake module not configured - Park brake module failure	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the park brake control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0132-86	Lost Communication With Suspension Control Module "A" - Signal invalid	- Air suspension timed out, signal out of range or signal invalid	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the all suspension control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0136-87	Lost Communication With Differential Control Module - Rear - Missing message	- CAN Link transfer box control module/electronic rear differential control module missing message - CAN bus fault - ATCM disconnected - ATCM not configured - ATCM failure - Harness/connector issue	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the differential control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0138-86	Lost Communication with All Terrain Control Module - Signal invalid	- CAN Link transfer box control module/terrain response control module signal invalid - CAN bus fault - ATCM disconnected - ATCM not configured - ATCM failure - Harness/connector issue	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the all terrain control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U0155-87	Lost Communication With Instrument Panel Cluster (IPC) Control Module - Missing message	- CAN Link transfer box control module/instrument cluster missing message - CAN bus fault - IPC disconnected - IPC not configured - IPC failure - Harness/connector issue	- Refer to the electrical circuit diagrams and check the power and ground connections to the module. Using the manufacturer approved diagnostic system, complete a CAN network integrity test. Refer to the electrical circuit diagrams and check the CAN network between the instrument panel cluster (IPC) control module and transfer box control module - Using the manufacturer approved diagnostic system carry out the guided diagnostic routine
U1A03-87	Car Config Parameter - Missing message	- Lost communication with the BCM/RCM - Missing message - Car configuration not received	- Configure the module using the approved diagnostic system. Refer to the lost communication statement in the Network Communications section in the workshop manual
U1A35-4A	Lost Communication With Differential Control Module - Front - Incorrect component installed - VIN data	- VIN Data mismatch - Lost communication with differential control module - front - incorrect component installed	- Replace the original control module or configure the module using the approved diagnostic system. Refer to the Network Communications section in the workshop manual
U3003-62	Battery Voltage - Signal compare failure	- Signal compare failure	- Check the battery condition and state of charge. Check the battery connections, power and ground cables. Refer to the relevant section of the workshop manual

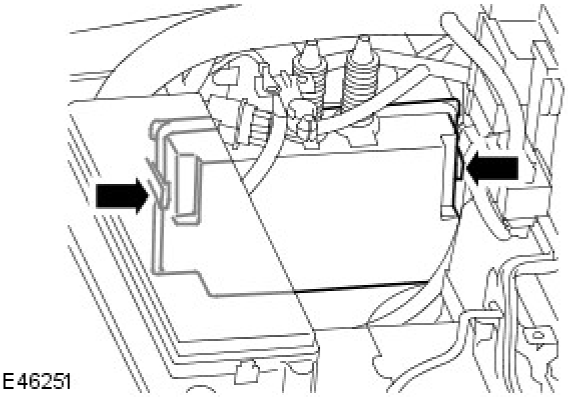
Four-Wheel Drive Systems - Four-Wheel Drive (4WD) Control Module

Removal and Installation

Removal

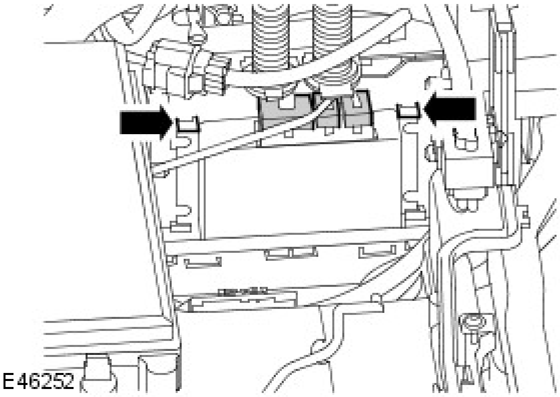
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. Remove the battery.
For additional information, refer to: Battery (414-01 Battery, Mounting and Cables, Removal and Installation).



3. Remove the four wheel drive control module cover.

- Depress the 2 clips.
- Release the cover.



4. Release and remove the four wheel drive control module.

- Depress the 2 clips.
- Disconnect the 3 electrical connectors.

Installation

1. To install, reverse the removal procedure.

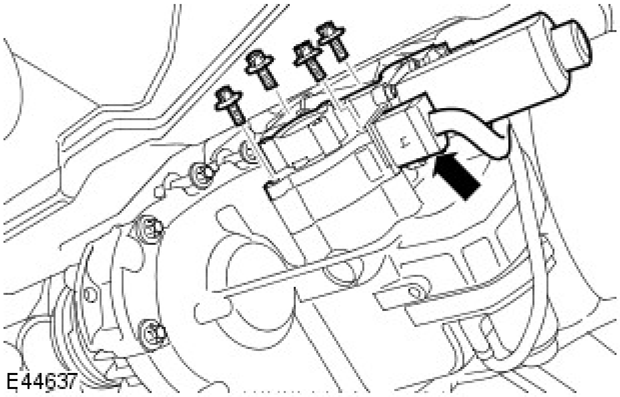
2. Program a new control module using T4.

Published: 11-May-2011

Four-Wheel Drive Systems - Transfer Case Shift Motor

Removal and Installation

Removal



1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the transmission crossmember.
   For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

3. ⚠ CAUTION: To avoid damage to the joints or gaiters, do not allow the transmission to hang on the driveshafts.

   Remove the shift motor.

   - Lower the rear of the transmission for access.
   - Disconnect the electrical connector.
   - Remove the 4 Torx bolts.

Installation

1. Install the shift motor.
   - Clean the components.
   - Tighten the Torx bolts to 25 Nm (18 lb.ft).
   - Connect the electrical connector.

2. Install the transmission crossmember.
   For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

3. Use T4 to re-calibrate a new transfer case shift motor.

Published: 11-May-2011

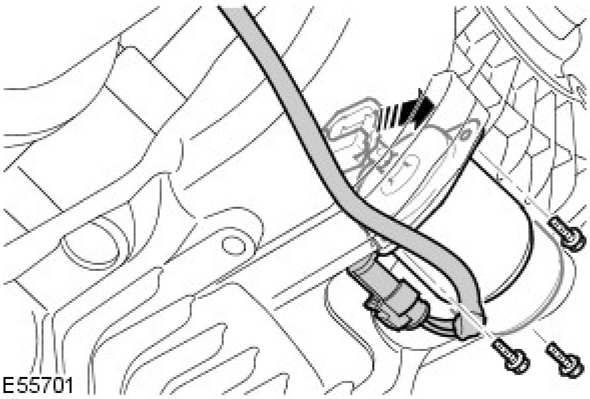
Four-Wheel Drive Systems - Transfer Case Clutch Solenoid

Removal and Installation

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



2. ⚠ CAUTION: Connect T4, prior to removal of the solenoid.

• NOTE: Some fluid spillage is inevitable during this operation.

Remove the transfer case clutch control solenoid.

- Position a container to collect the fluid spillage.
- Remove the 3 Torx screws.
- Use T4 to energise the solenoid.
- Detach from the selector lever.
- Disconnect the electrical connector.

Installation

1. ⚠ CAUTION: Make sure the seal is installed correctly.

Install the transfer case clutch control solenoid.

- Clean the components.
- Connect the electrical connector.
- Use T4 to energise the solenoid.
- Install to the selector lever.
- Tighten the Torx screws to 10 Nm (7 lb.ft).

2. Check and top-up the transfer case fluid level.

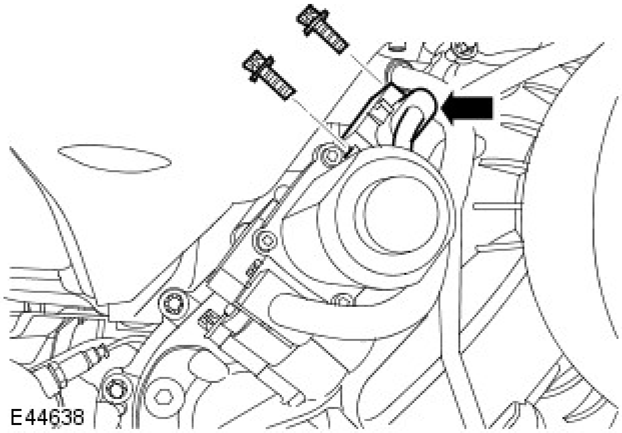
3. Using T4, calibrate a new transfer case control solenoid.

Published: 11-May-2011

Four-Wheel Drive Systems - High/Low Range Sensor

Removal and Installation

Removal



1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

3. ⚠ CAUTION: To avoid damage to the joints or gaiters, do not allow the transmission to hang on the driveshafts.

Remove the mode sensor.

- Lower the rear of the transmission for access.
- Disconnect the electrical connector.
- Remove the 2 Torx bolts.

Installation

1. To install, reverse the removal procedure.

- Clean the components.
- Tighten the Torx bolts to 10 Nm (7 lb.ft).

2. Install the crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

3. Use T4 to re-calibrate a new mode sensor.

Transfer Case -

Sealers and Lubricants

Item	Specification
* Recommended oil	Shell TF 0753
Capacity - Wet and dry fill	1.5 litres, (2.6 pints) (1.5 US quarts)
Input shaft splines grease	Weicon TL7391
Sealant	STC 50550 or Loctite 5900

*** CAUTION:** Do not use any lubricant other than that specified

General Specification

Item	Specification
Make	Magna Steyr
Model	DD295
Type	Two speed, permanent four wheel drive transfer case having synchronised shift on the move facility with an actively controlled wet clutch and 50/50 torque split across the centre differential
Clutch type	Wet, multi-plate
Maximum torque capacity	2500 Nm (1842.5 lb-ft)
Ratios:	
High	1:1
Low	2.93:1
Maximum shift speeds:	
High to low ratio	40 km/h (24.8 mph)
Low to high ratio	60 km/h (37.2 mph)

Torque Specifications

Description	Nm	lb-ft
Transfer case fluid drain plug	22	16
Transfer case fluid level/filler plug	22	16
Fuel tank heat shield nuts/bolts	10	7
Drive shaft Torx screws	55	40
Drive shaft centre bearing bolts	30	22
Transmission support insulator	60	44
Wiring harness securing bolts	10	7
Fuel line support bracket bolts	10	7
Transfer case retaining bolts	45	33

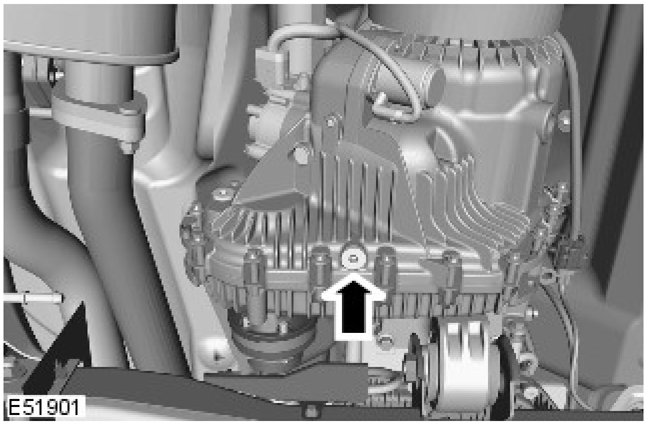
Transfer Case - Transfer Case Draining and Filling

General Procedures

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Position a container to collect the fluid.



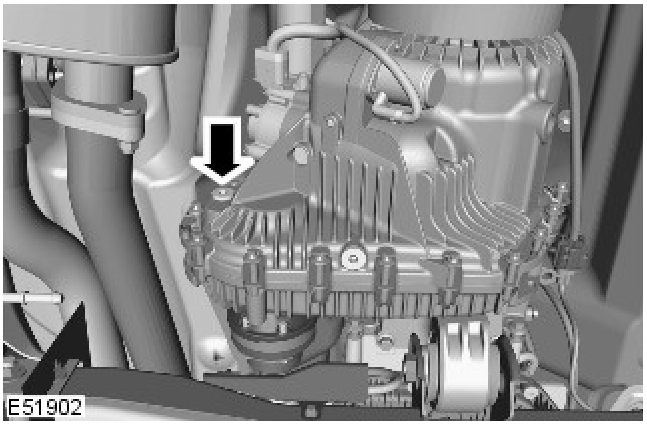
3. Remove the fluid drain plug.

- Clean the immediate area.
- Remove and discard the sealing washer.

4. Allow the fluid to drain.

5. Install the drain plug and tighten it to 22 Nm (16 lb.ft).

- Clean the component mating faces.
- Install a new sealing washer.



6. Remove the fluid filler/level plug.

- Clean the immediate area.
- Remove and discard the sealing washer.

7. Refill transfer case with the recommended fluid, until the fluid is level with bottom of filler/level plug hole.
For additional information, refer to: Specifications (308-07B Transfer Case, Specifications).

8. Install the fluid filler/level plug and tighten to 22 Nm (16 lb.ft).

- Clean the component mating faces.
- Install a new sealing washer.

Transfer Case - Transfer Case Input Shaft SealV8 S/C 4.2L Petrol

In-vehicle Repair

Special Tool(s)	
	Oil seal installer 308-598
	Oil seal remover 303-903 (LRT-12-092)

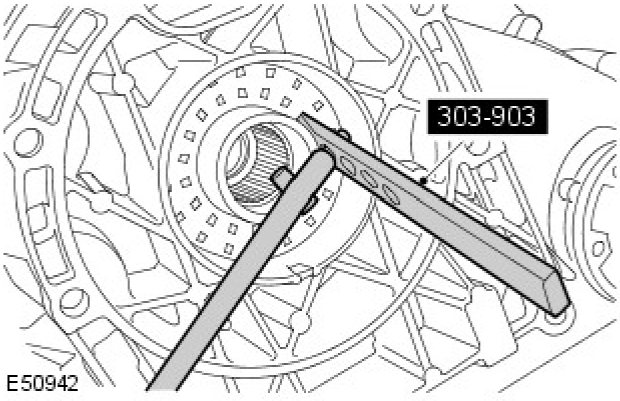
Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transfer case.
For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Removal).

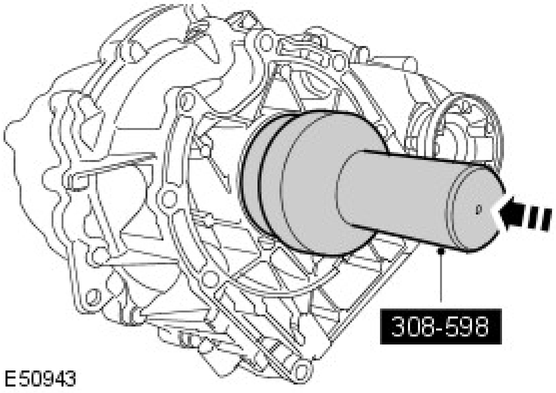


4. CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Carefully remove and discard the oil seal.

- Use the special tool.

Installation



1. ⚠ CAUTION: Oil seals must be fitted dry.

   Install a new seal.

   - Clean the seal register.
   - Use the special tool.

2. Install the transfer case.
   For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Removal).

3. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

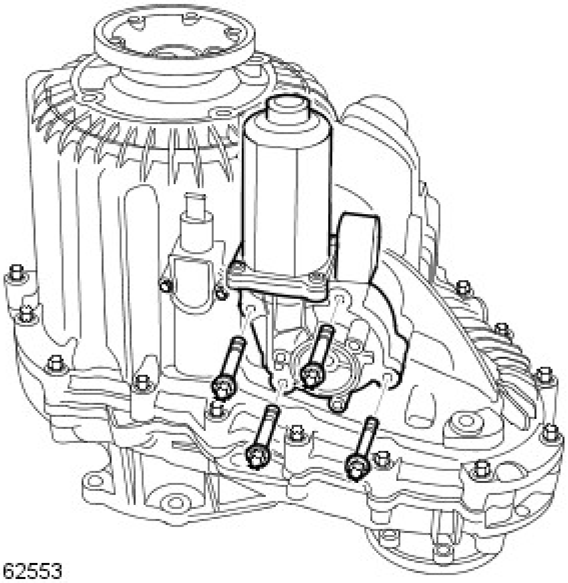
4. Remove the transfer case.
For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Removal).

5. With assistance, secure the transfer case with its transmission mating face down on a flat surface.

- Secure with 2 bolts.

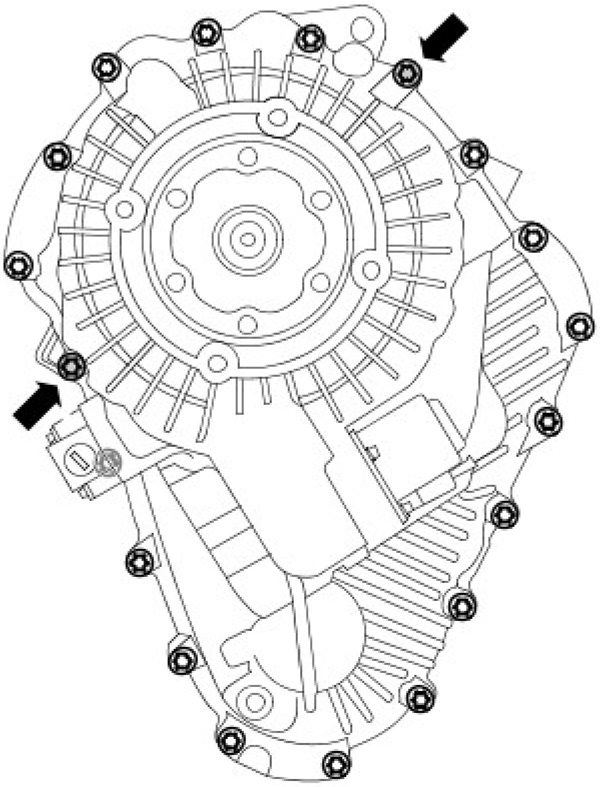


E62553

6. ⚠ WARNING: Eye protection must be worn.

Remove the shift motor.

- Remove the 4 bolts.
- Remove any debris from the bolt holes.



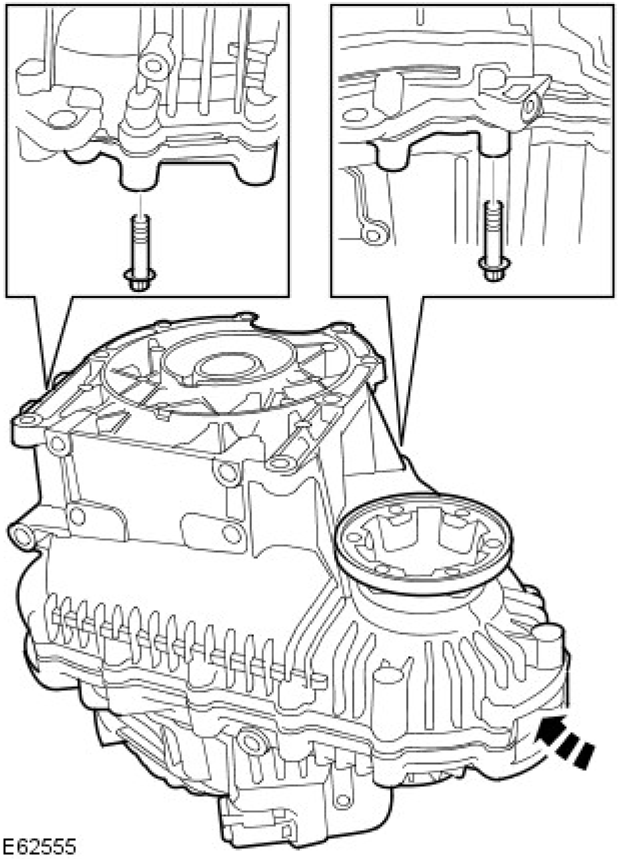
E62554

7. ⚠ WARNING: Eye protection must be worn.

Remove 17 Torx bolts securing the transfer casings.

- The two bolts indicated remain fully tightened.
- Remove any debris from the bolt holes.

8. With assistance, release the transfer case and secure with the rear face of the transfer case facing down on a flat surface.



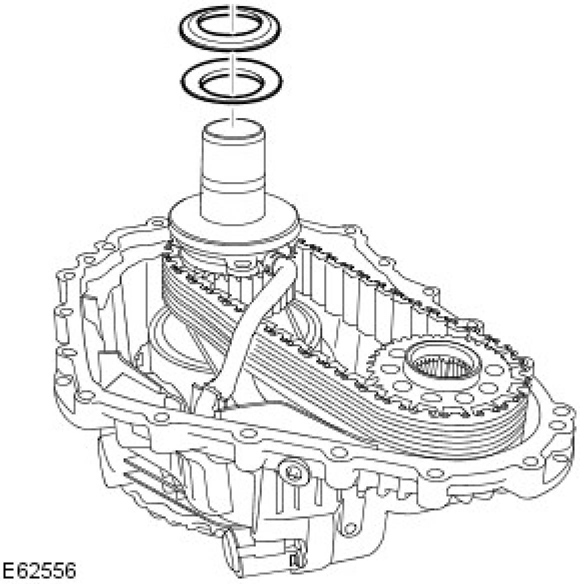
E62555

9. WARNING: Eye protection must be worn.

CAUTION: Care must be taken to avoid damage to the mating surfaces.

Remove the front half of the transfer case.

- Remove the remaining 2 Torx bolts.
- Remove any debris from the bolt holes.
- Use a soft faced mallet.



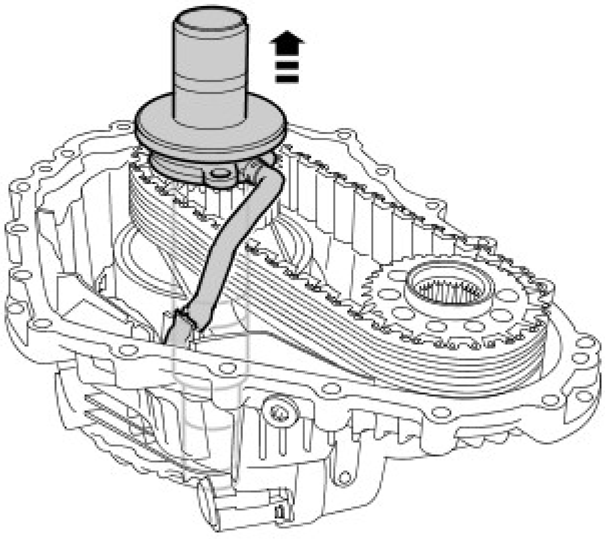
E62556

10. CAUTION: Note the fitted position of the special washers.

Remove the 2 special washers.

11. Remove the input shaft and oil pump assembly.

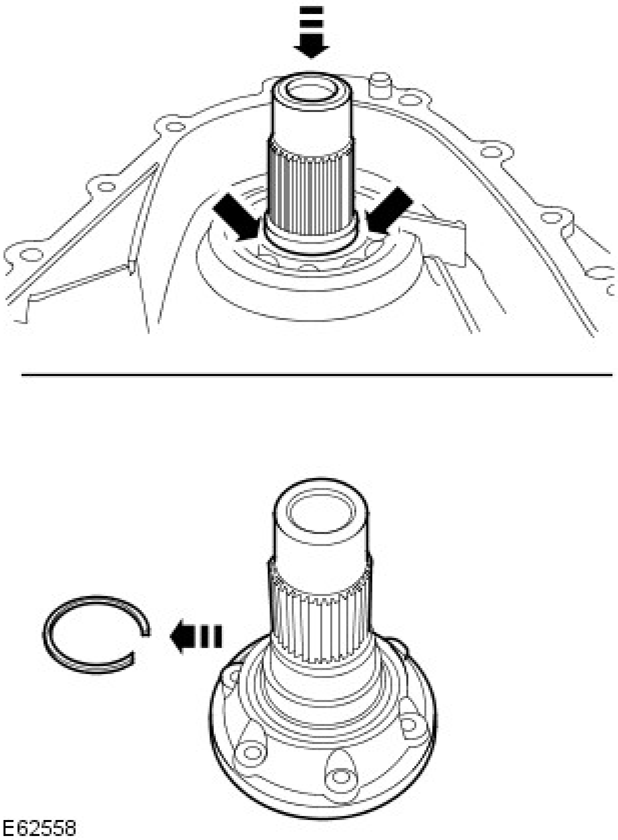
- Release the fluid pump pickup line.



E62557

12. Remove the front output flange.

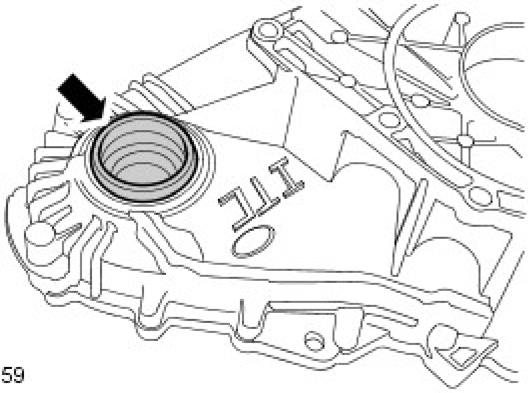
- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.



E62558

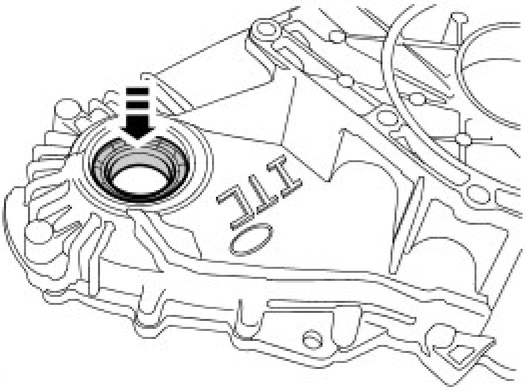
13. CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Remove the output flange seal.



E62559

14. Remove the output flange bearing.



E62560

Installation

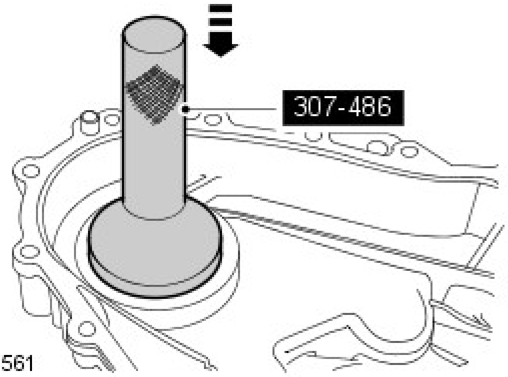
1. Remove the sealant from the transfer case mating faces.

2. Clean the magnetic filter.

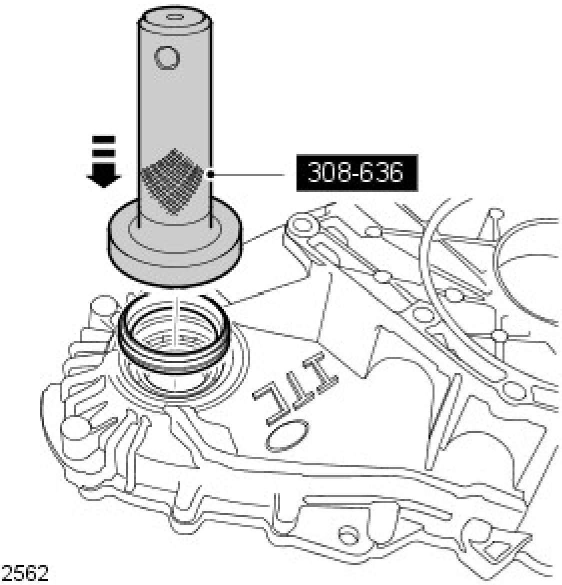
3. CAUTION: The chamfer on the bearing inner track must face the seal.

Using the special tool, install the output flange bearing.

- Clean the components mating faces.

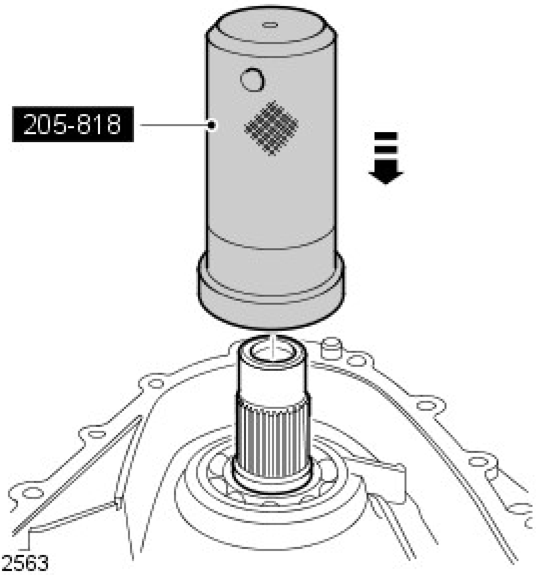


E62561



4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.



5. CAUTIONS:

⚠ Centralise the snap ring in the snap ring groove before installing the output flange.

⚠ Extreme care is necessary to make sure the snap ring enters the bearing squarely.

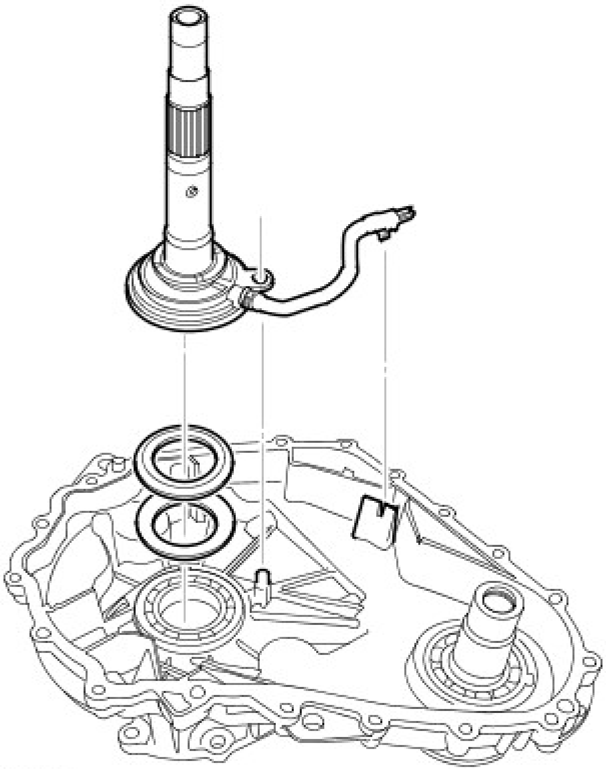
Using the special tool and with assistance, install the drive flange.

- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.

6. ⚠ CAUTION: Make sure the washers are installed correctly.

Install the 2 special washers.

- Clean the components.

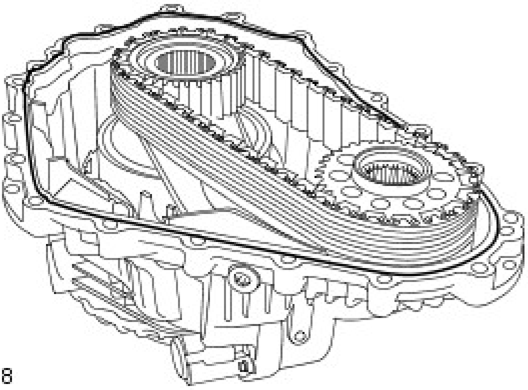


E62564

7. CAUTION: Make sure the oil pump is installed over its location peg.

Install the input shaft and oil pump assembly.

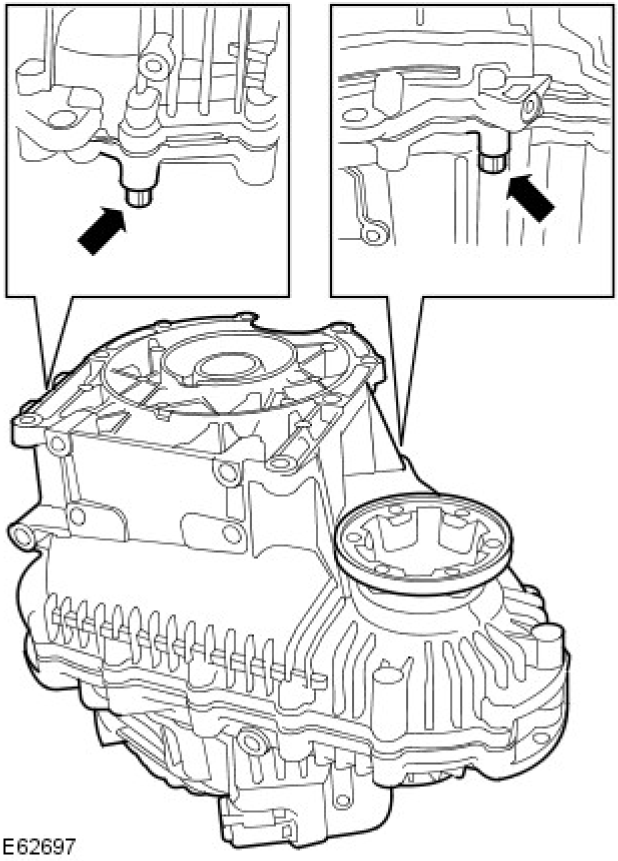
- Clean the components.
- Secure the fluid pickup line.



E62568

8. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.



9. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).

10. With assistance, release the transfer case and secure with its transmission mating face down on a flat surface.

11. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

12. Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

13. With assistance, release the transfer case.

- Remove the 2 bolts.

14. Install the transfer case.
For additional information, refer to: Transfer Case - V8 S/C 4.2L Petrol (308-07B Transfer Case, Removal).

15. Refill the transfer case with the recommended fluid.
For additional information, refer to: Transfer Case Draining and Filling (308-07B Transfer Case, General Procedures).

16. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

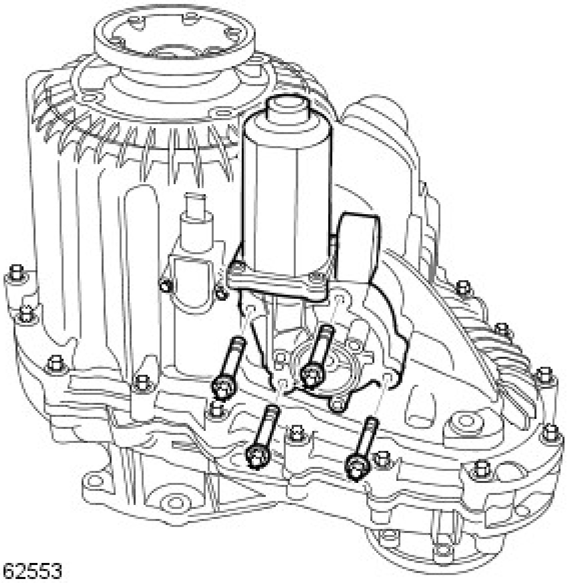
- Secure with 2 bolts.



E62553

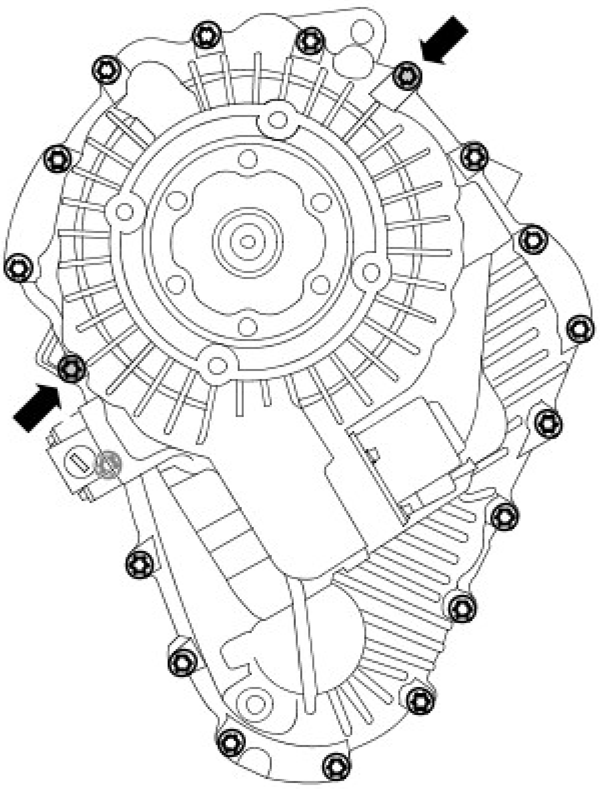
6. WARNING: Eye protection must be worn.

Remove the shift motor.

- Remove the 4 bolts.
- Remove any debris from the bolt holes.

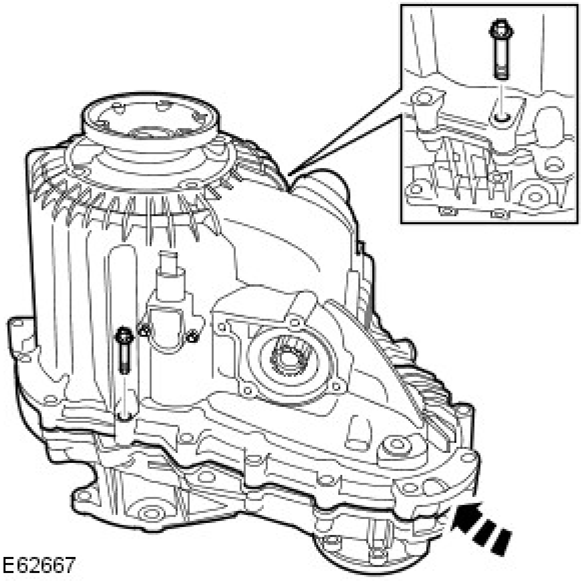


E62554

7. WARNING: Eye protection must be worn.

Remove 17 Torx bolts securing the transfer casings.

- The two bolts indicated remain fully tightened.
- Remove any debris from the bolt holes.



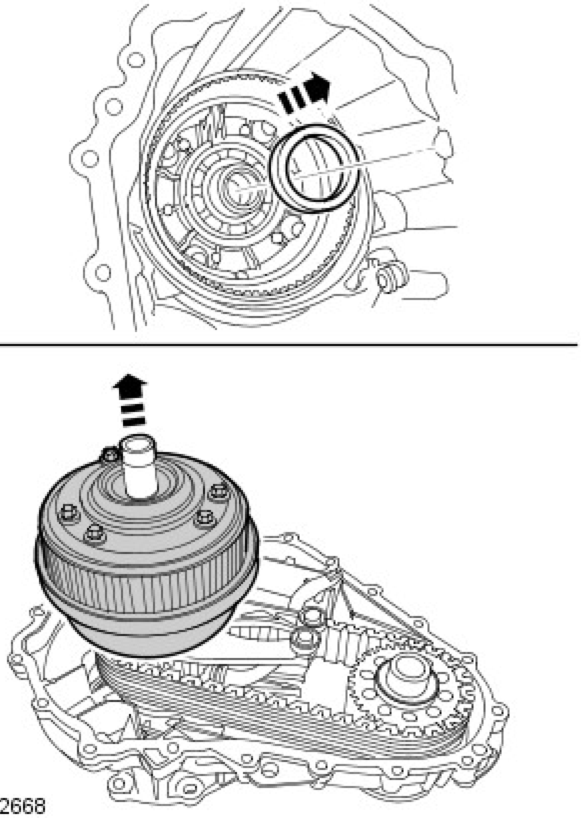
E62667

8. WARNING: Eye protection must be worn.

CAUTION: Care must be taken to avoid damage to the mating surfaces.

Remove the rear half of the transfer case.

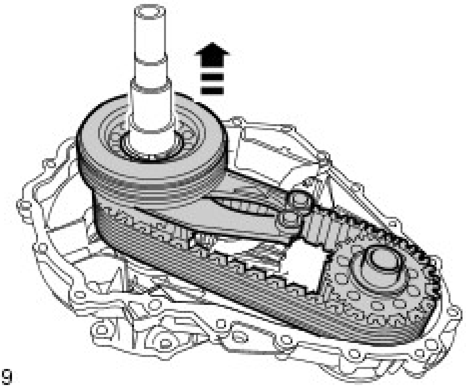
- Remove the remaining 2 Torx bolts.
- Remove any debris from the bolt holes.
- Use a soft faced mallet.



E62668

9. Remove the differential module.

- Remove the spacer.



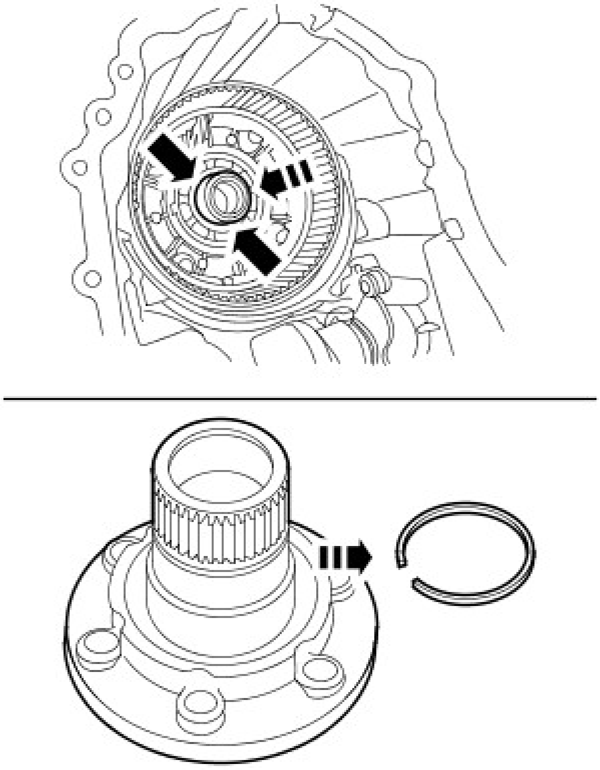
E62669

10. NOTE: Remove as an assembly.

Remove the clutch, chain and sprocket.

11. Remove the rear output flange.

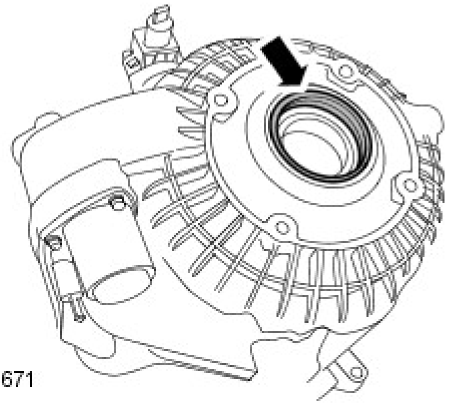
- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.



E62670

12. ⚠ CAUTION: Care must be taken to avoid damage to the seal register and running surface.

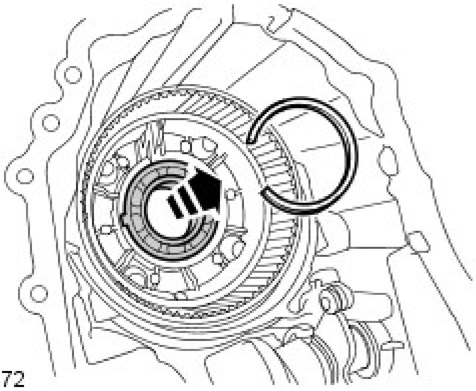
Remove the output flange seal.



E62671

13. Remove the output flange bearing.

- Remove the circlip.



E62672

14. Release the front half of the transfer case from the flat surface.

- Remove the 2 bolts.

Installation

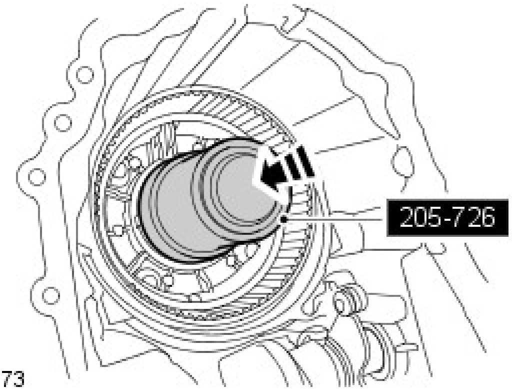
1. Remove the sealant from the transfer case mating faces.

2. Clean the magnetic filter.

3. ⚠ CAUTION: The chamfer on the bearing inner track must face the seal.

Using the special tool, install the output flange bearing.

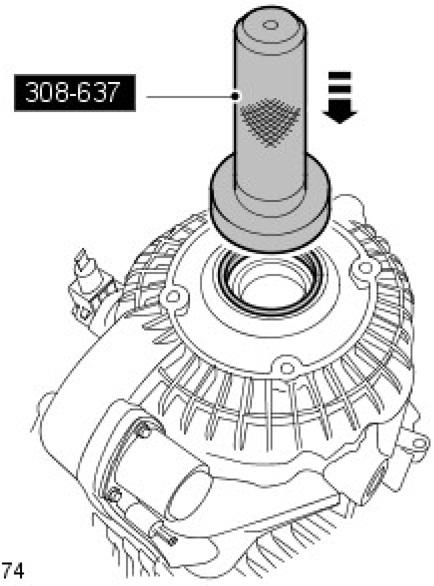
- Clean the components mating faces.
- Install the circlip.



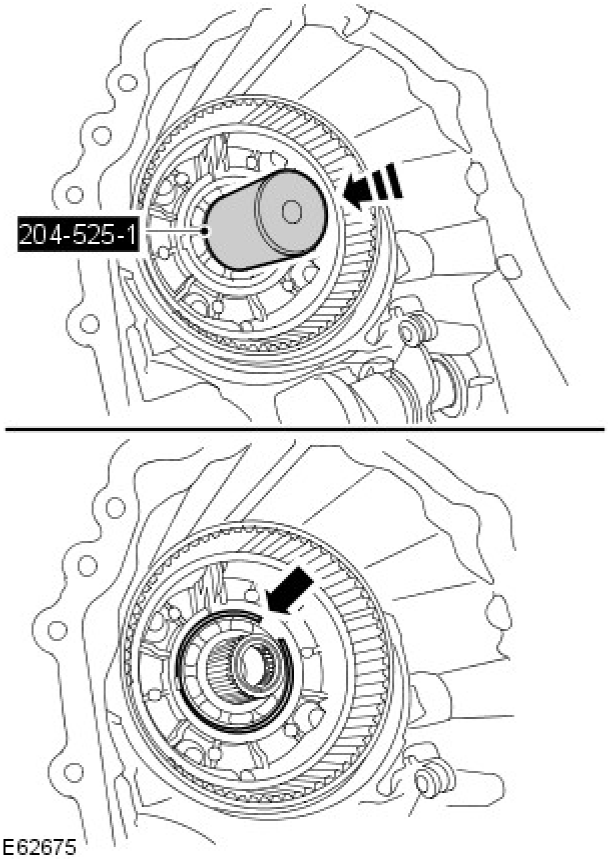
E62673

4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.



E62674



E62675

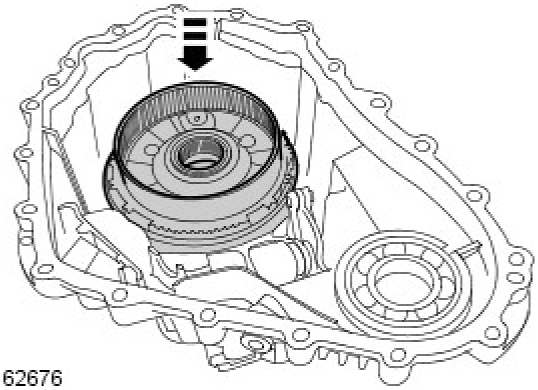
5. CAUTIONS:

⚠ Centralize the snap ring in the snap ring groove before installing the output flange.

⚠ Extreme care is necessary to make sure the snap ring enters the bearing squarely.

Using the special tool and with assistance, install the drive flange.

- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.



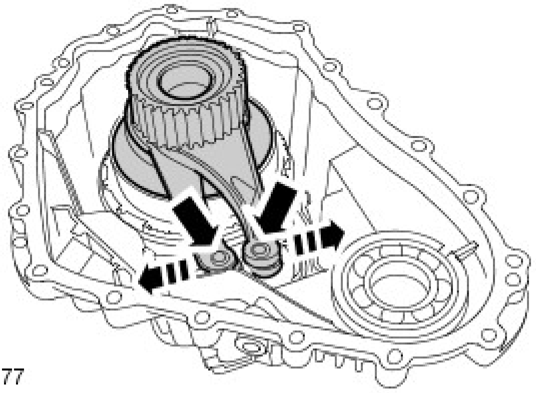
E62676

6. Secure the rear half of the transfer case with its rear face down on a flat surface.

7. NOTE: Rotate the differential to engage the splines.

Install the differential module.

- Clean the components.
- Install the spacer.



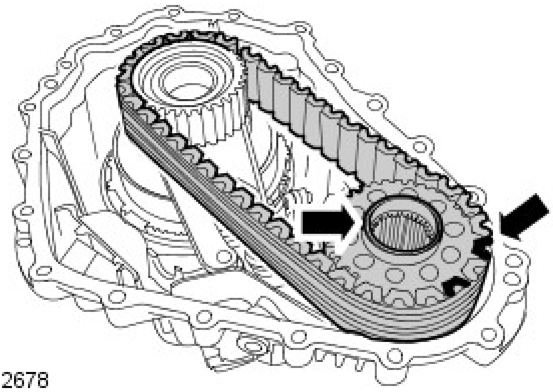
E62677

8. NOTE: Rotate the assembly to engage the clutch plates.

• NOTE: Use circlip pliers to open the actuator levers.

Install the clutch.

- Clean the components.
- Engage the actuator levers.



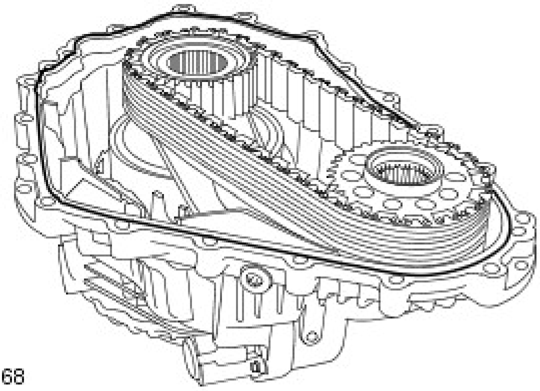
E62678

9. ⚠ CAUTION: The dark links in the chain face up as shown.

• NOTE: The relieved splined inner diameter of the sprocket must face up as shown.

Install the chain and sprocket.

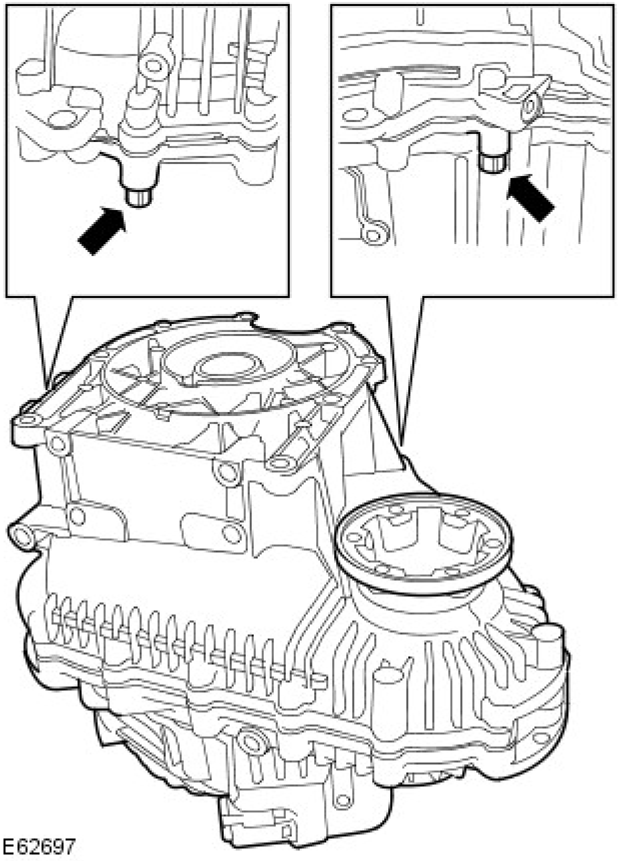
- Clean the components.



E62568

10. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.
- Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.



11. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).

12. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

13. Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

14. With assistance, release the transfer case from the flat surface.

- Remove the 2 bolts.

15. Install the transfer case.
For additional information, refer to: Transfer Case - TDV8 3.6L Diesel (308-07B Transfer Case, Removal).

16. Refill the transfer case with the recommended fluid.
For additional information, refer to: Transfer Case Draining and Filling (308-07B Transfer Case, General Procedures).

17. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Removal

Special Tool(s)	
	Wrench adaptor 303-1069

Removal

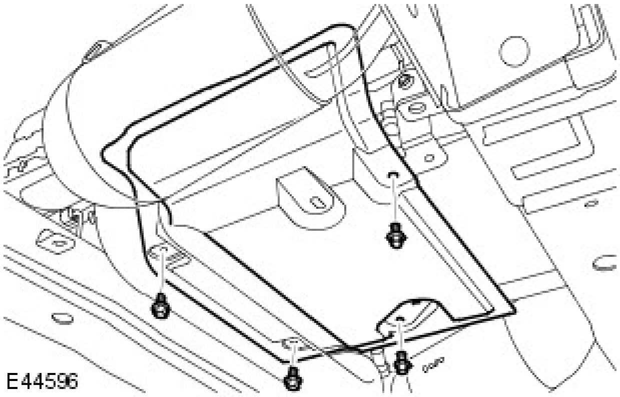
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the transmission heat shield.

- Remove the 4 bolts.



4. Remove the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

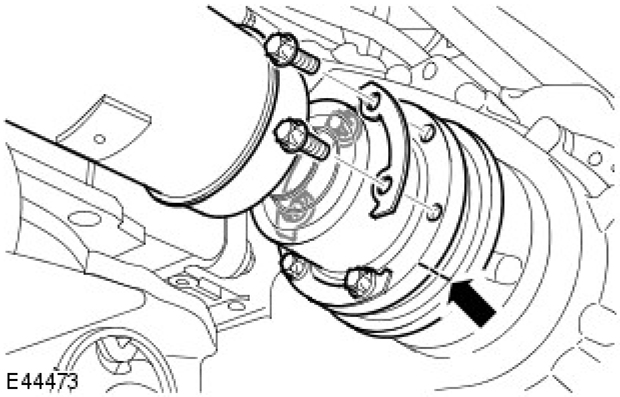
5. CAUTIONS:

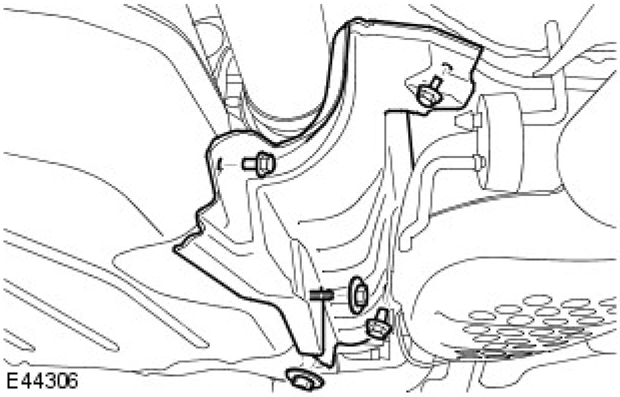
Mark the position of the driveshaft flange in relation to the drive pinion flange.

To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the front driveshaft from the transfer case drive flange.

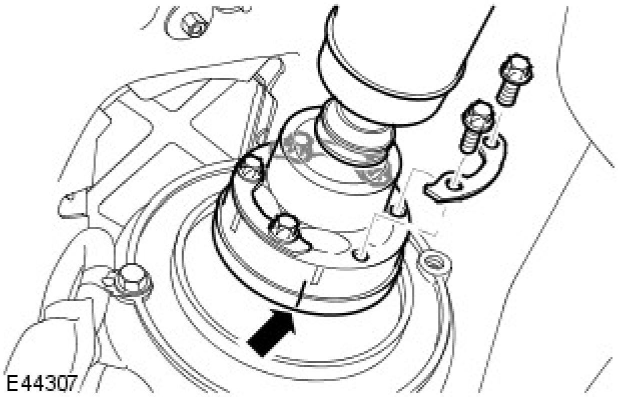
- Remove the 6 Torx bolts and washers, discard the bolts.
- Using a suitable tie strap, reposition and secure the driveshaft to the exhaust system.





6. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.



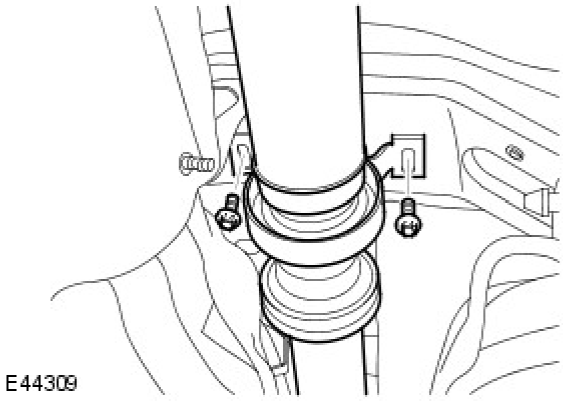
7. CAUTIONS:

⚠ Mark the position of the driveshaft flange in relation to the drive pinion flange.

⚠ To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the rear driveshaft from the transfer case drive flange.

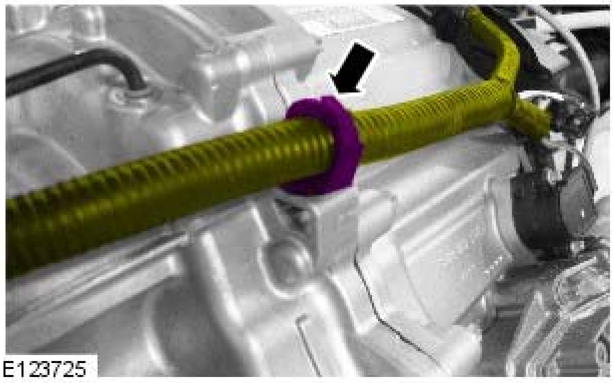
- Remove the 6 Torx bolts and washers.



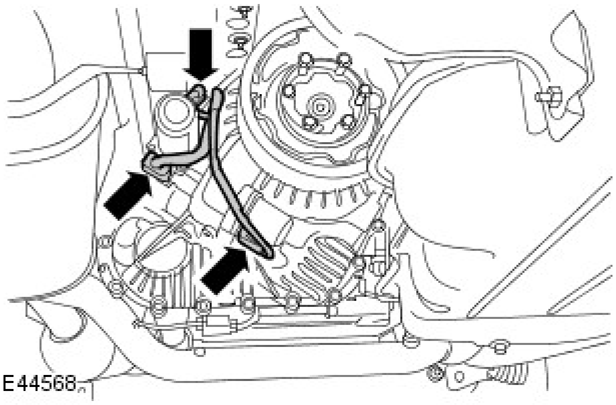
8. ⚠ CAUTION: To avoid damage to the joint or gaiter, do not allow the driveshaft to hang.

Release the driveshaft center bearing mount.

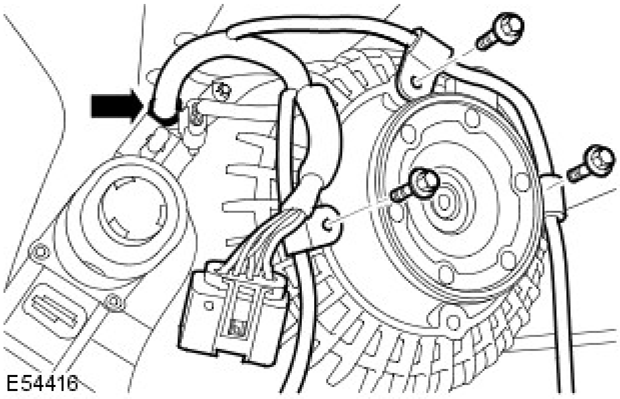
- Remove the 2 driveshaft center bearing mount bolts.
- Using suitable securing strap, reposition and support the driveshaft.



9. Release the transmission wiring harness retaining clip.

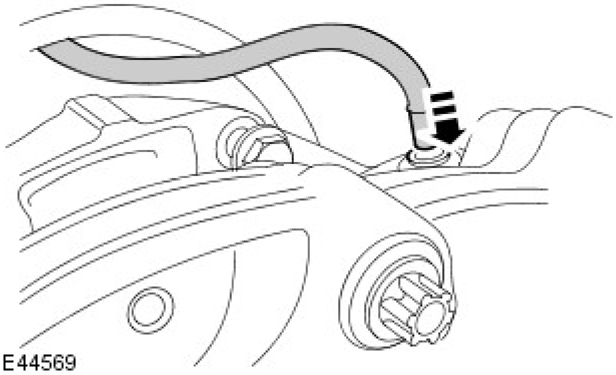


10. Disconnect the transfer case 3 electrical connectors.



11. Release the wiring harness from the transfer case.

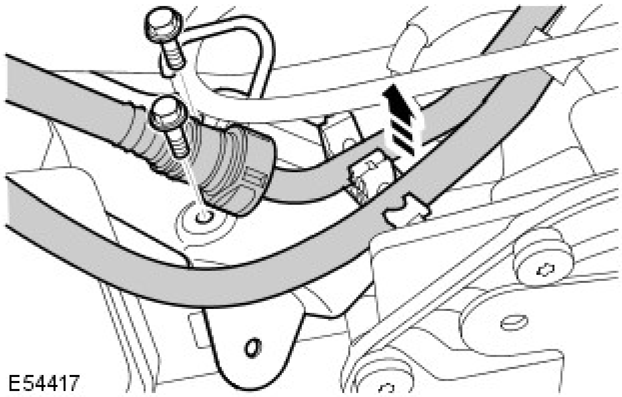
- Remove the 3 bolts.
- Release the clip.



12. ⚠ CAUTION: Always plug any open connections to prevent contamination.

Disconnect the breather line.

- Depress the locking ring.



13. Release the fuel line support bracket.

- Release the fuel lines.
- Remove the 2 bolts.

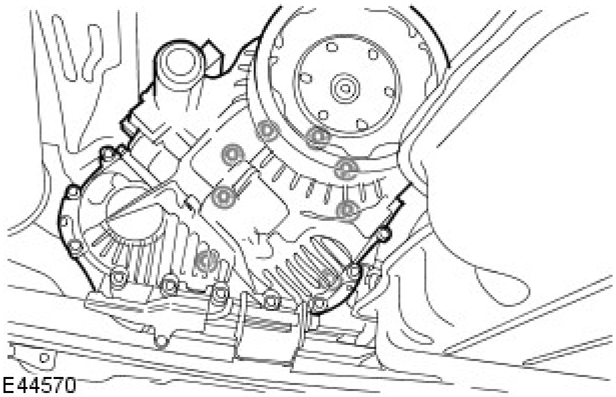
14. Support the transmission on a jack.

15. ⚠ WARNING: Secure the component to the transmission jack.

Using a transmission jack, support the transfer case.

16. With assistance, remove the transfer case.

- Remove the 8 bolts.
- Move the fuel hose support bracket aside.



17. Remove and discard the O-ring seal.

Installation

Special Tool(s)	
 303-1069 E53727	Wrench adaptor 303-1069

Installation

1. With assistance, install the transfer case.

- Clean the component mating faces.
- Lubricate input shaft splines with 'Weicon TL7391' grease.
- Install the O-ring seal.
- Using the special tool, tighten the bolts to 45 Nm (33 lb.ft).

2. Connect the breather line.

3. Position the fuel line support bracket.

- Tighten the bolts to 10 Nm (7 lb.ft).
- Secure the fuel lines.

4. Connect the electrical connectors.

5. Secure the wiring harness to the transfer case.

- Secure with the clip.
- Tighten the bolts to 25 Nm (18 lb.ft).

6. Secure the front driveshaft to the transfer case drive flange.

- Stage 1: Tighten the bolts to 45 Nm (33 lb.ft).
- Stage 2: Tighten the bolts a further 90 degrees.

7. Secure the rear driveshaft to the transfer case drive flange.

- Clean the component mating faces.
- Tighten the Torx bolts to 55 Nm (40 lb.ft).

8. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

9. CAUTIONS:

⚠ Align the driveshaft center bearing mount by moving the floating front section of the shaft backward or forwards until the bolt holes in the mount align with the holes in the chassis.

⚠ Make sure the center bearing mount is not under tension.

Install the driveshaft center bearing mount bolts.

- Align the center bearing mount.
- Tighten the driveshaft center bearing retaining bolts to 30 Nm (22 lb.ft).

10. Install the transmission heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

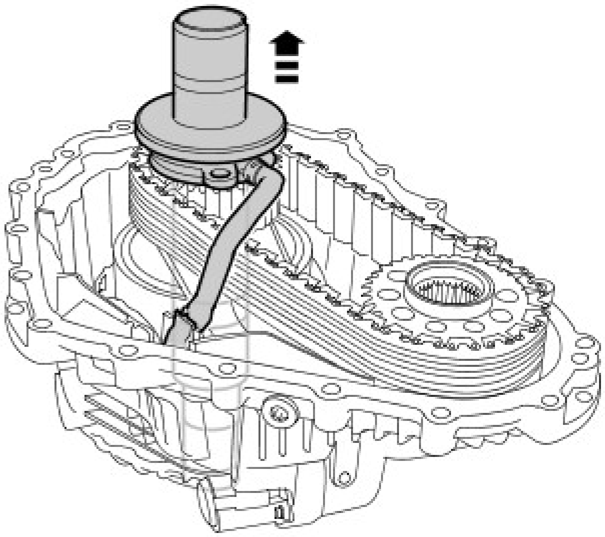
10. ⚠ CAUTION: Note the fitted position of the special washers.

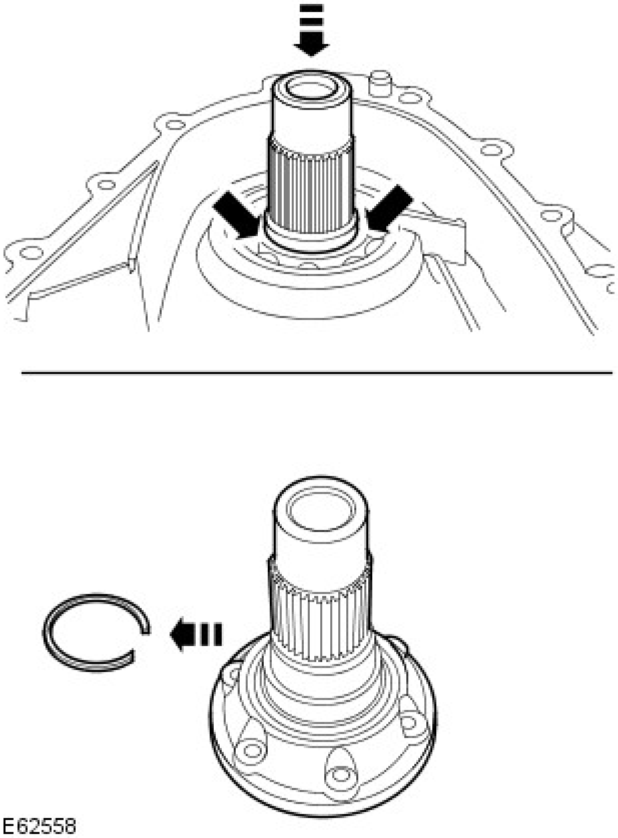
Remove the 2 special washers.



E62557

11. Remove the input shaft and oil pump assembly.

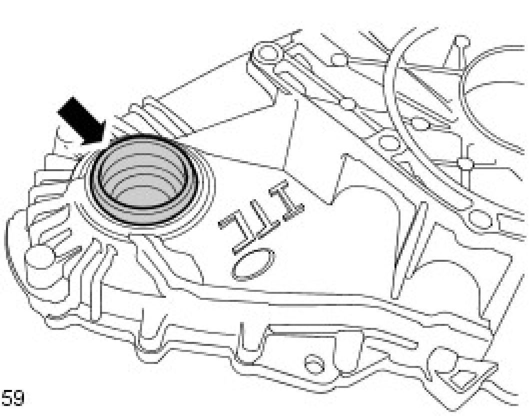
- Release the fluid pump pickup line.



E62558

12. Remove the front output flange.

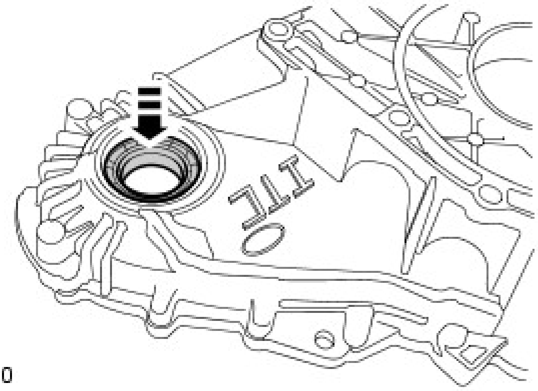
- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.



E62559

13. ⚠CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Remove the output flange seal.



E62560

14. Remove the output flange bearing.

Installation

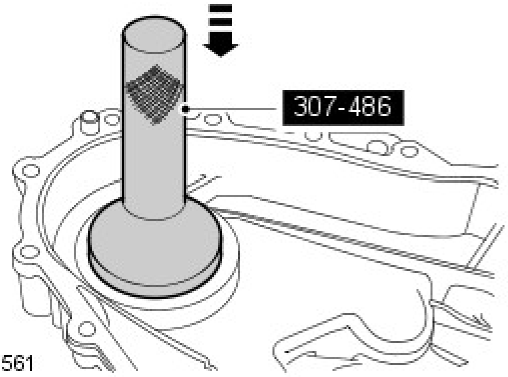
1. Remove the sealant from the transfer case mating faces.

2. Clean the magnetic filter.

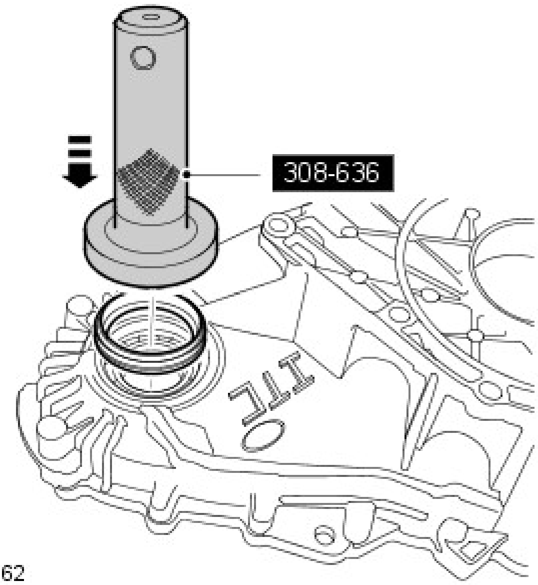
3. ⚠CAUTION: The chamfer on the bearing inner track must face the seal.

Using the special tool, install the output flange bearing.

- Clean the components mating faces.



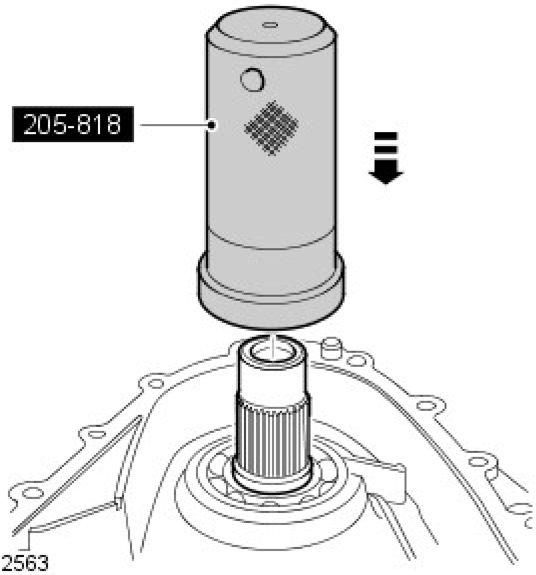
E62561



E62562

4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.



E62563

5. CAUTIONS:

⚠ Centralise the snap ring in the snap ring groove before installing the output flange.

⚠ Extreme care is necessary to make sure the snap ring enters the bearing squarely.

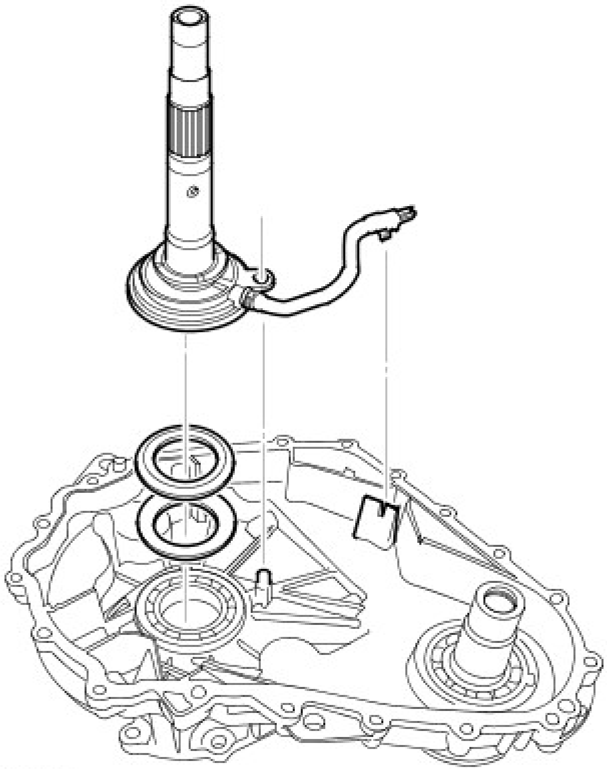
Using the special tool and with assistance, install the drive flange.

- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.

6. ⚠ CAUTION: Make sure the washers are installed correctly.

Install the 2 special washers.

- Clean the components.

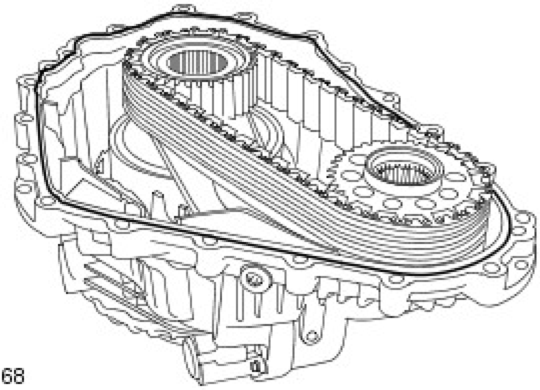


E62564

7. ⚠ CAUTION: Make sure the oil pump is installed over its location peg.

Install the input shaft and oil pump assembly.

- Clean the components.
- Secure the fluid pickup line.



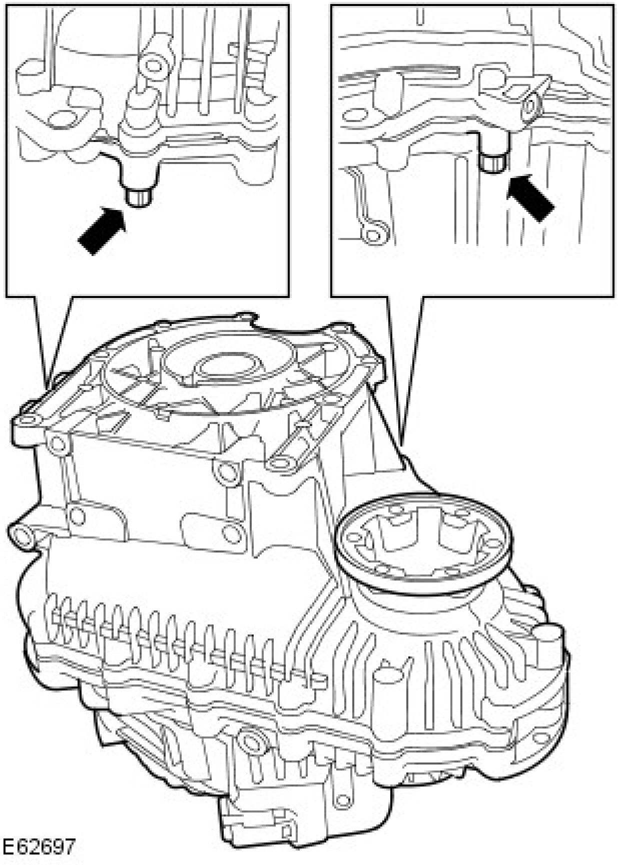
E62568

8. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.

9. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).



10. With assistance, release the transfer case and secure with its transmission mating face down on a flat surface.

11. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

12. Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

13. With assistance, release the transfer case.

- Remove the 2 bolts.

14. Install the transfer case.
For additional information, refer to: Transfer Case - TDV6 2.7L Diesel (308-07B Transfer Case, Removal).

15. Refill the transfer case with the recommended fluid.
For additional information, refer to: Transfer Case Draining and Filling (308-07B Transfer Case, General Procedures).

16. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Transfer Case - Transfer Case Rear Output Shaft SealTDV6 2.7L Diesel

In-vehicle Repair

Special Tool(s)	
	Remover/installer (LRT-54-015) 205-726
	Seal installer 308-637
	Installer 204-525/1

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

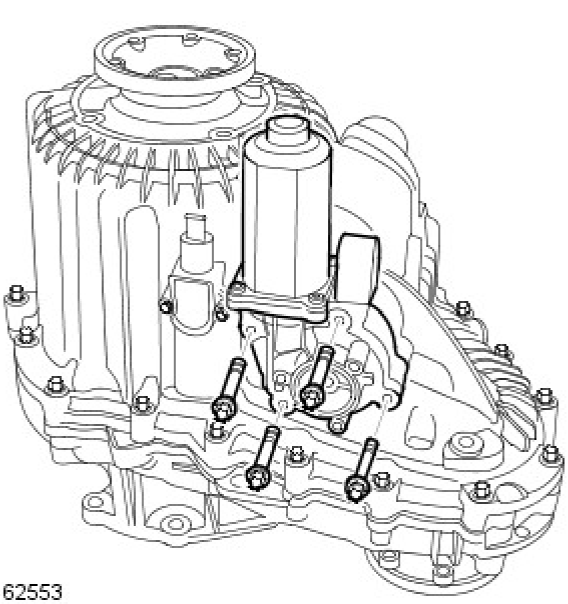
Raise and support the vehicle.

3. Drain the transfer case fluid.
For additional information, refer to: Transfer Case Draining and Filling (308-07B Transfer Case, General Procedures).

4. Remove the transfer case.
For additional information, refer to: Transfer Case - TDV6 2.7L Diesel (308-07B Transfer Case, Removal).

5. With assistance, secure the transfer case with its transmission mating face down on a flat surface.

- Secure with 2 bolts.

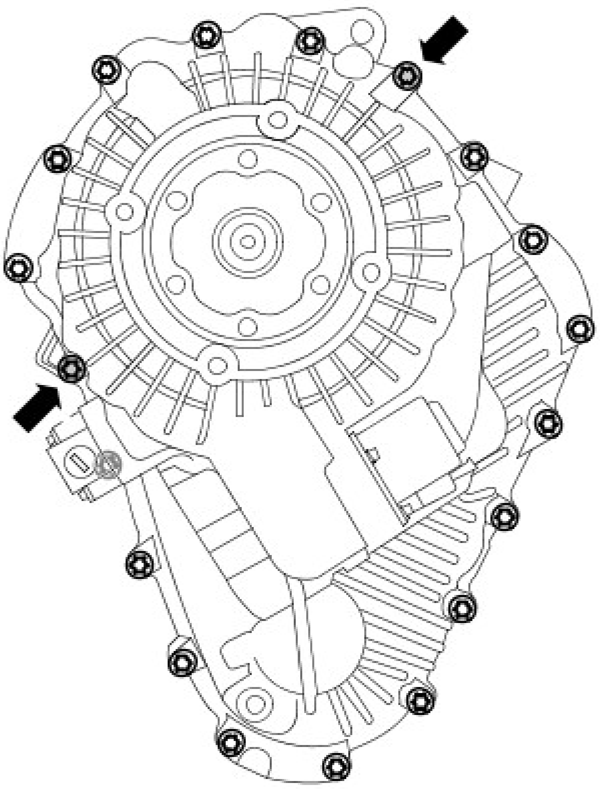


E62553

6. ⚠ WARNING: Eye protection must be worn.

Remove the shift motor.

- Remove the 4 bolts.
- Remove any debris from the bolt holes.

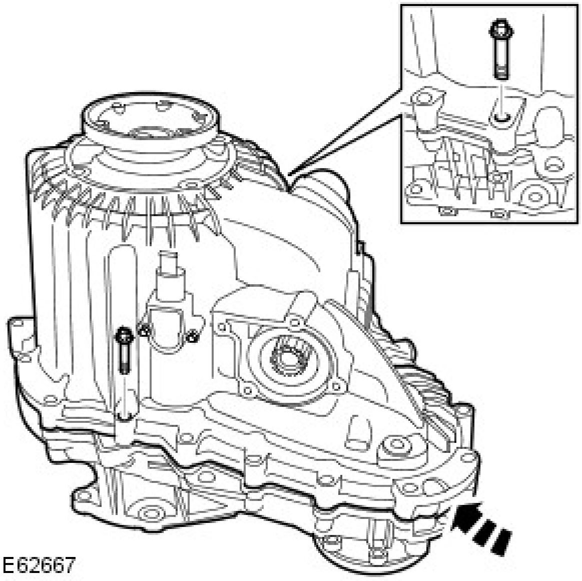


E62554

7. ⚠ WARNING: Eye protection must be worn.

Remove 17 Torx bolts securing the transfer casings.

- The two bolts indicated remain fully tightened.
- Remove any debris from the bolt holes.



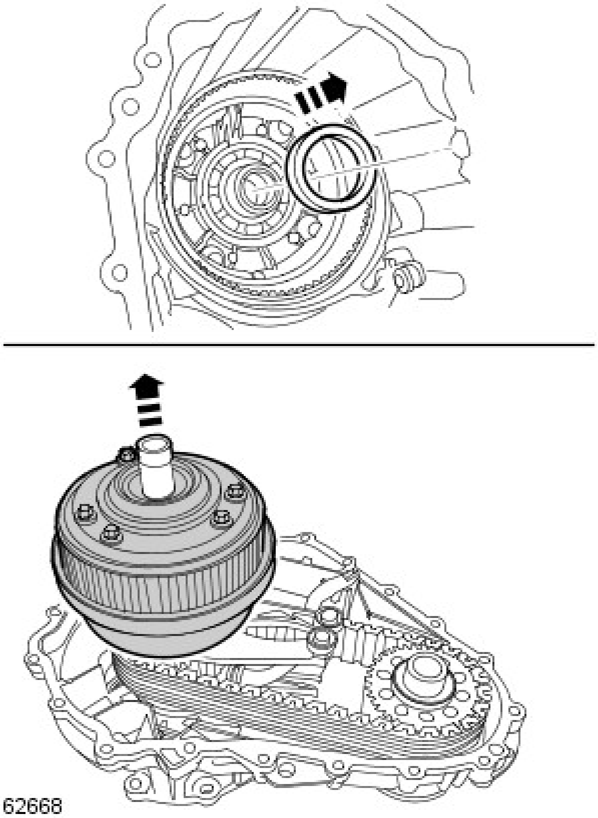
E62667

8. WARNING: Eye protection must be worn.

CAUTION: Care must be taken to avoid damage to the mating surfaces.

Remove the rear half of the transfer case.

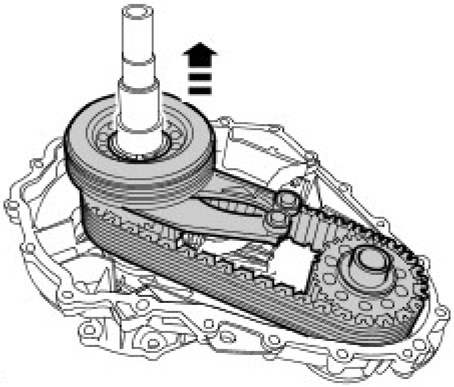
- Remove the remaining 2 Torx bolts.
- Remove any debris from the bolt holes.
- Use a soft faced mallet.



E62668

9. Remove the differential module.

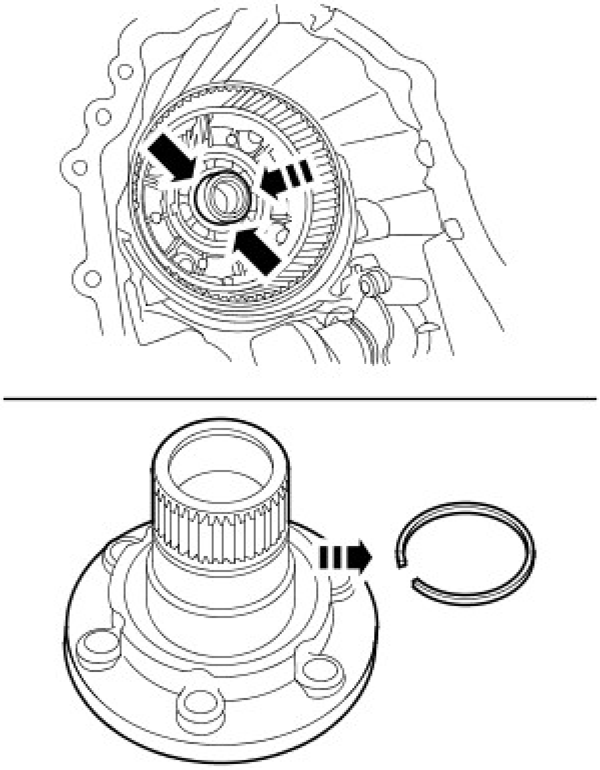
- Remove the spacer.



E62669

10. NOTE: Remove as an assembly.

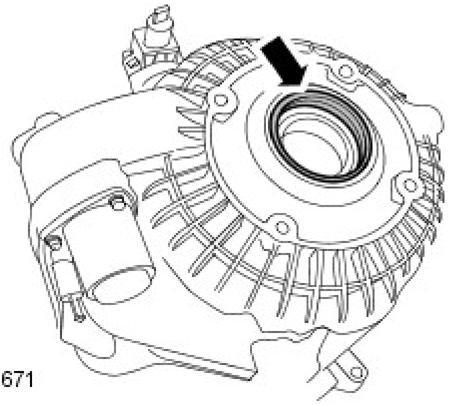
Remove the clutch, chain and sprocket.



E62670

11. Remove the rear output flange.

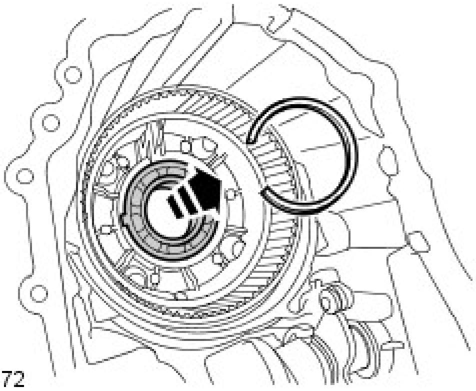
- Compress the snap ring.
- Press the flange through the bearing.
- Remove and discard the snap ring.



E62671

12. ⚠CAUTION: Care must be taken to avoid damage to the seal register and running surface.

Remove the output flange seal.



13. Remove the output flange bearing.

- Remove the circlip.

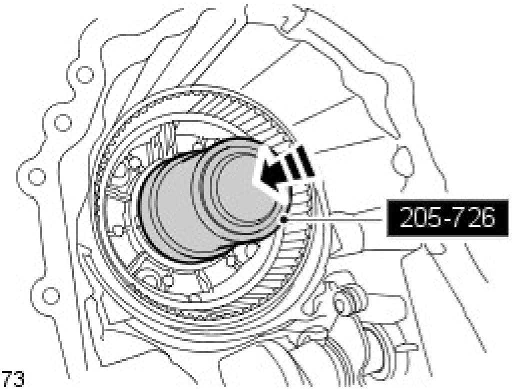
14. Release the front half of the transfer case from the flat surface.

- Remove the 2 bolts.

Installation

1. Remove the sealant from the transfer case mating faces.

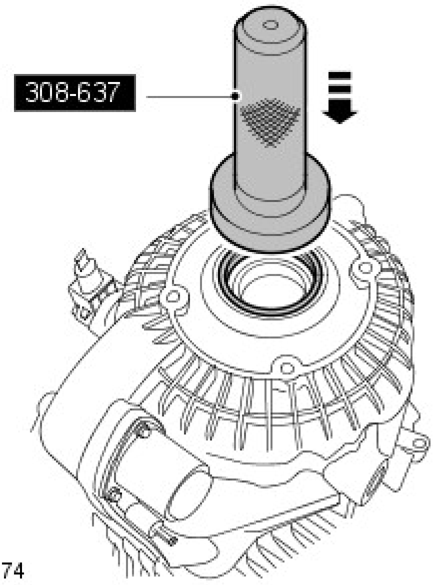
2. Clean the magnetic filter.



3. ⚠CAUTION: The chamfer on the bearing inner track must face the seal.

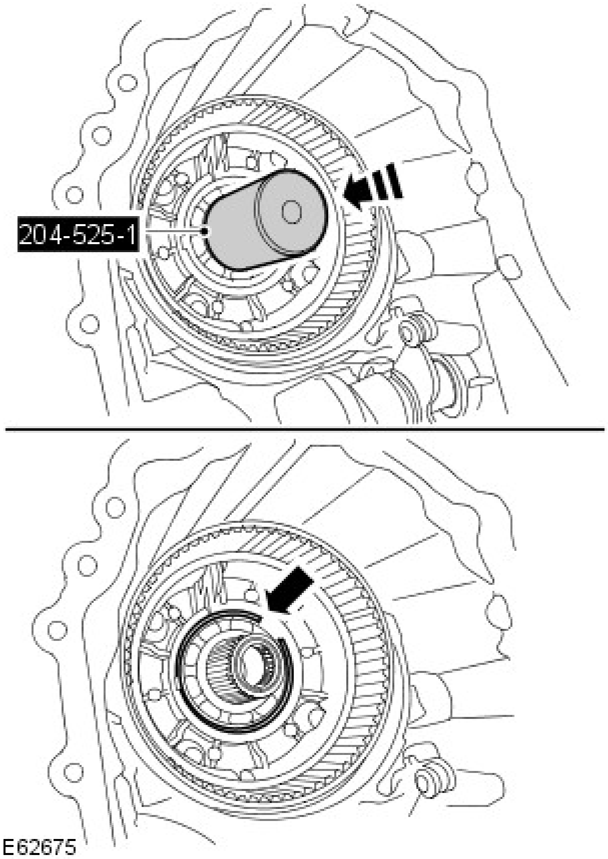
Using the special tool, install the output flange bearing.

- Clean the components mating faces.
- Install the circlip.



4. Using the special tool, install a new oil seal.

- Clean the component mating faces.
- Grease the new seal.



E62675

5. CAUTIONS:

⚠ Centralise the snap ring in the snap ring groove before installing the output flange.

⚠ Extreme care is necessary to make sure the snap ring enters the bearing squarely.

Using the special tool and with assistance, install the drive flange.

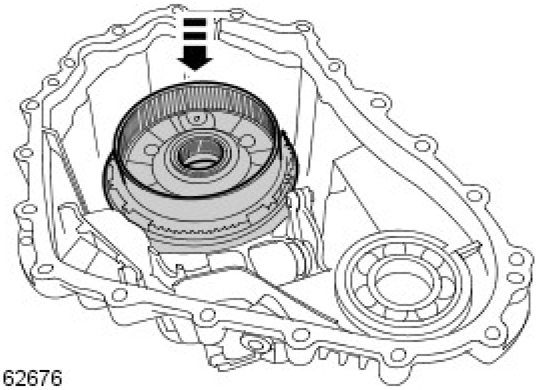
- Clean the component mating faces.
- Install a new snap ring.
- Make sure the snap ring is fully engaged and retains the drive flange.

6. Secure the rear half of the transfer case with its rear face down on a flat surface.

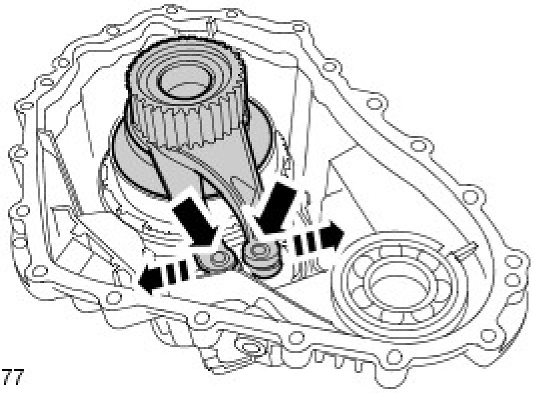
7. NOTE: Rotate the differential to engage the splines.

Install the differential module.

- Clean the components.
- Install the spacer.



E62676



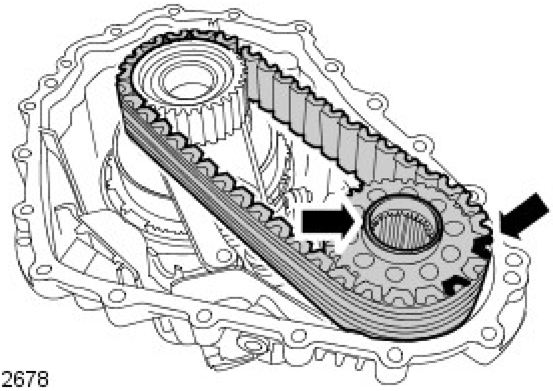
E62677

8. NOTE: Rotate the assembly to engage the clutch plates.

• NOTE: Use circlip pliers to open the actuator levers.

Install the clutch.

- Clean the components.
- Engage the actuator levers.



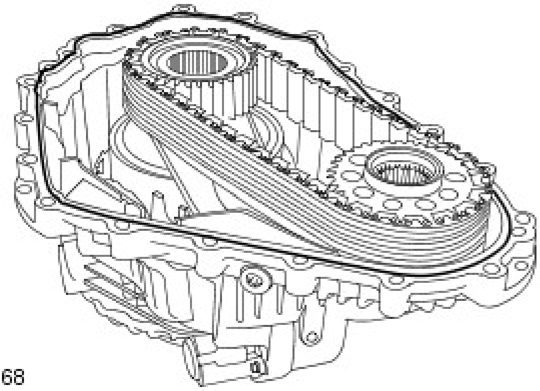
E62678

9. ⚠ CAUTION: The dark links in the chain face up as shown.

• NOTE: The relieved splined inner diameter of the sprocket must face up as shown.

Install the chain and sprocket.

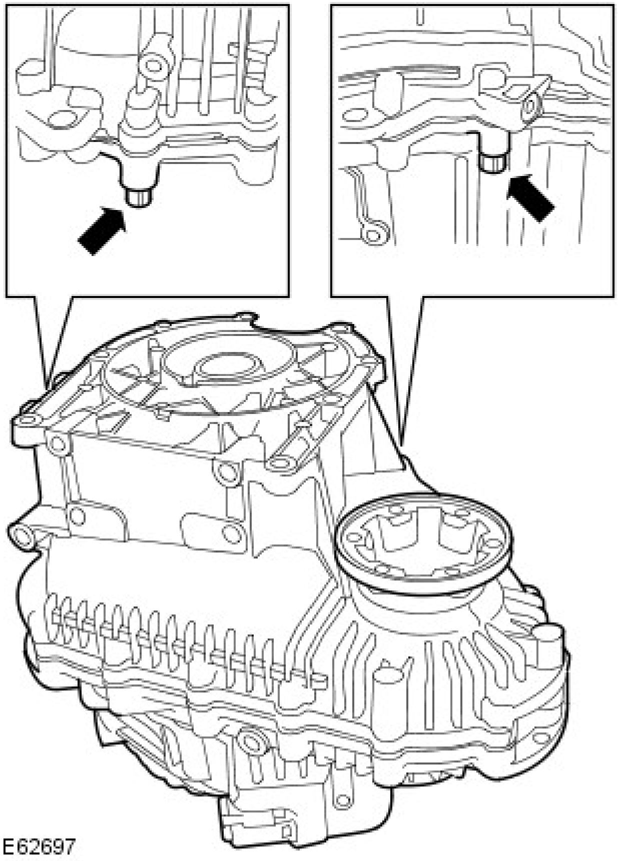
- Clean the components.



E62568

10. Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.

- Clean the component mating faces.
- Clean the dowels and dowel holes.
- Apply a 2 mm bead of sealant to one surface of the transfer case mating face, as shown.



11. Install the front half of the transfer case.

- Evenly tighten the 2 Torx bolts shown to 35 Nm (26 lb.ft).

12. Tighten the remaining Torx bolts to 35 Nm (26 lb.ft).

13. Install the shift motor.

- Clean the components.
- Tighten the Torx bolts to 25 Nm (18 lb.ft).

14. With assistance, release the transfer case from the flat surface.

- Remove the 2 bolts.

15. Install the transfer case.
For additional information, refer to: Transfer Case - TDV6 2.7L Diesel (308-07B Transfer Case, Removal).

16. Refill the transfer case with the recommended fluid.
For additional information, refer to: Transfer Case Draining and Filling (308-07B Transfer Case, General Procedures).

17. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Exhaust System - V8 S/C 4.2L Petrol -

Recommended Lubricant

Item	Specification
HO2S threads	Use a high temperature resistant anti-seize compound

General Specifications

Item	Specification
Exhaust manifolds	Fabricated, air gapped with exhaust gas recirculation (EGR) tapping on left hand manifold
Exhaust system	Twin, stainless steel pipes throughout with stainless steel mufflers
Catalytic converters - type/location	Close coupled cascade - located in each down pipe with pre and post catalyst sensors in both pipes

Torque Specifications

Description	Nm	lb-ft
** HO2S	45	33
Catalytic converter retaining clamp	55	40
Catalytic converter to muffler nuts and retaining clamp	48	35
Tailpipe clamps	55	40
* Catalytic converter to exhaust manifold bolts	22	16

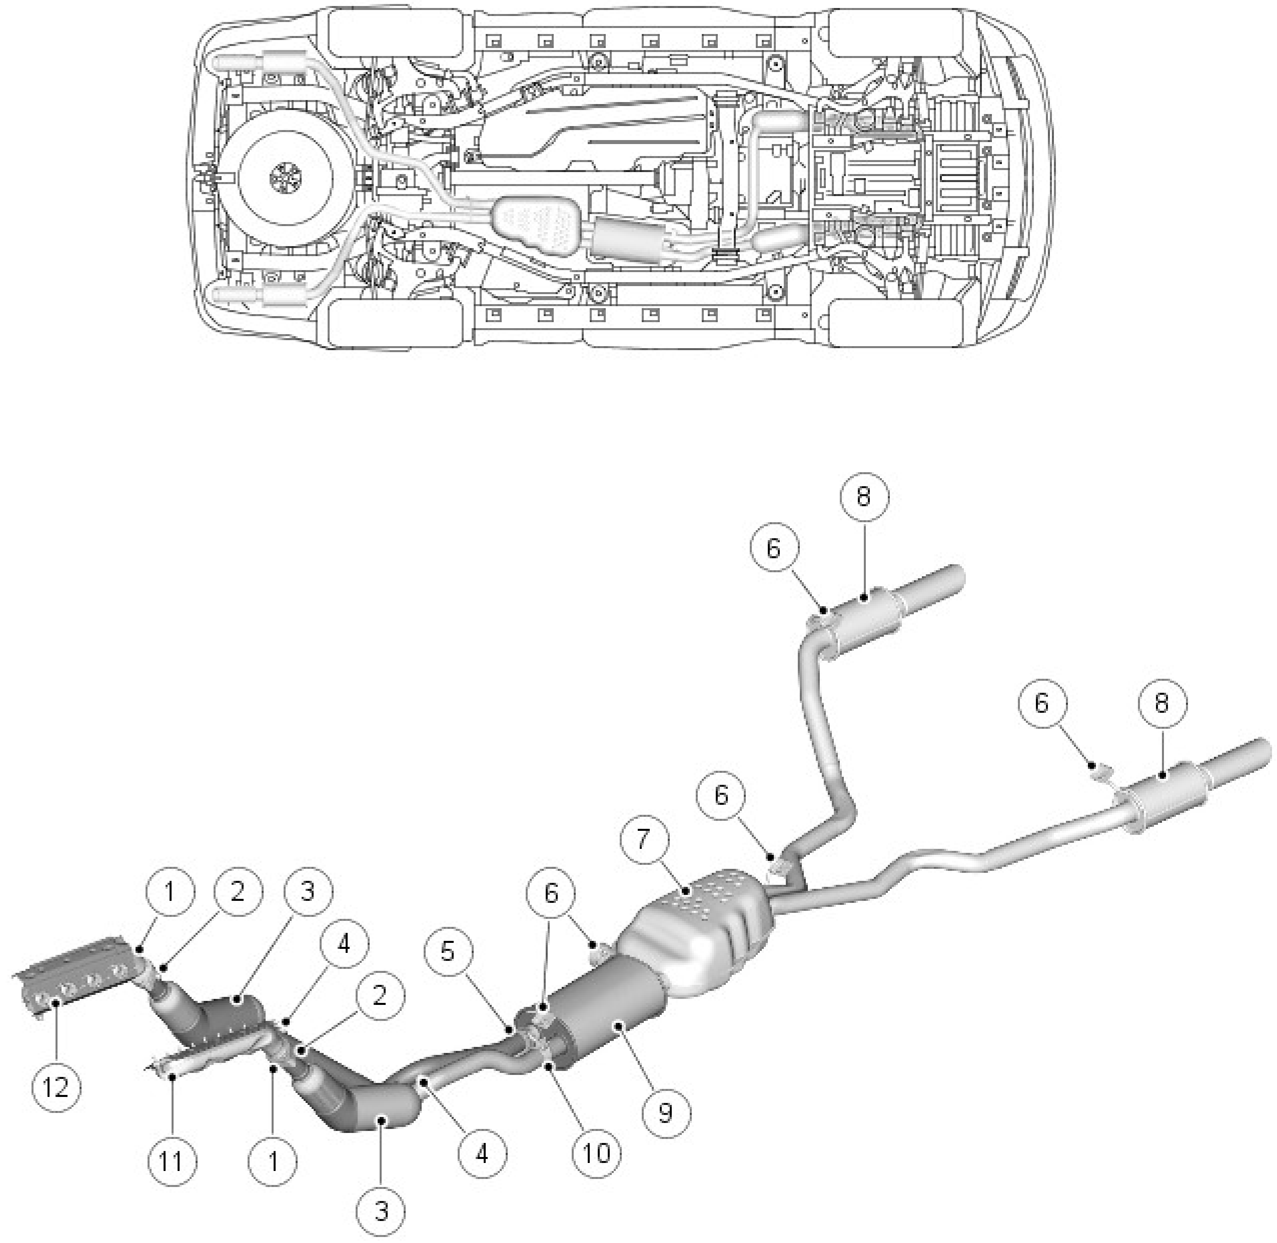
*** New bolts must be installed**

**** Apply suitable high temperature resistant anti-seize compound**

Exhaust System - V8 S/C 4.2L Petrol - Exhaust System

Description and Operation

4.2L V8 SC COMPONENT LOCATION



E57339

Item	Part Number	Description
1	-	Flange - manifold to front section
2	-	Pre catalyst heated oxygen sensor location
3	-	Catalyst
4	-	Post catalyst heated oxygen sensor location
5	-	Flange - RH front section to rear section
6	-	Mounting rubber (5 off)
7	-	Silencer - Centre
8	-	Silencer - Rear
9	-	Silencer - Front
10	-	Clamp - LH front section to rear section

11	-	LH exhaust manifold
12	-	RH exhaust manifold

OVERVIEW

The 4.2L V8 Supercharged exhaust system is fabricated from stainless steel and is supplied as three separate assemblies; a LH front section incorporating a catalytic converter, a RH front section incorporating a catalytic converter and a rear section incorporating a front silencer, a centre silencer and two rear silencers.

The system is attached to the underside of the body with five mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body. The system is routed mainly on the inside of the LH chassis longitudinal before splitting near the rear differential to exit at each side of the rear of the vehicle.

The system has service repair items available. Indentations in the rear section, between the center and the rear silencers, show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

FRONT SECTION

Both front sections have a welded flange with two holes which provide for the attachment with two bolts onto the LH and RH exhaust manifolds. The flange is sealed by a tapered seat in the flange and a machined cone on the manifold.

The flange is welded to a short, straight pipe, which in turn is welded to the body of the catalytic converter. The pipe has a threaded boss which is welded over a hole in the pipe to provide location for the pre catalyst heated oxygen sensor (HO2S).

- NOTE: On NAS vehicles from 2007MY, the HO2S is located in a boss on the catalytic converter.

On the LH front section, the converter outlet pipe is a 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the outlet pipe is inserted into the flared end of the rear section. A clamp is used to compress and secure the joint.

On the RH front section, the converter outlet pipe is a 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the pipe curves left, under the transmission and then curves again to run parallel to the LH pipe. The end of the pipe has a welded flange with two holes which locate on two studs on the rear section and is secured with nuts. A metal gasket is used to seal the joint between the front and rear section flanges.

Both the LH and RH converter outlet pipes have a threaded boss which is welded over a hole in the pipe to provide location for the post catalyst HO2S.

REAR SECTION

The rear section has a short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is flared to an inside diameter of 55 mm (2.16 in) to locate the LH front section. The tube is welded to the front silencer assembly. A second short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, has a welded flange with captive studs to provide attachment for the flange on the RH front section. This tube is also welded to the front silencer assembly.

The front silencer comprises a single skin and two end plates which are welded together to give a capacity of 11.0 liters (671.2 in^3). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. A hanger bar is welded to the front of the silencer and provides for the location of a mounting rubber.

The silencer has two short 55 mm (2.16 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which connect to the center silencer.

The center silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 liters (1538 in^3). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gasses pass through the silencer. A hanger bar is welded to the front right hand side of the silencer and provides location for a mounting rubber.

The silencer has two 55 mm (2.16 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components. The outlet pipe diameter increases to 60 mm (2.36 in) diameter mid-way between the center silencer and the tail silencers.

Each outlet pipe terminates in a welded joint with the tail silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber.

A hanger bar is welded to the front face of each tail silencer and provides for the location of a mounting rubber. The silencer is a circular fabrication with a baffle tube which is surrounded with glass fibre to provide further noise suppression. Each silencer has a capacity of 2.7 liters (165 in^3).

The silencers each have an outlet pipe which is 65 mm (2.5 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is straight with an integral, oval, polished acoustic finisher.

CATALYTIC CONVERTER

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions.

To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter is integrated into the front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing metals, which are the active constituent for converting harmful emissions into inert by-products. The metals add oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water respectively.

Exhaust System - V8 S/C 4.2L Petrol - Exhaust System

Diagnosis and Testing

Overview

For additional information, refer to the relevant section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
● Leaks ● Metal fatigue ● Pipes ● Catalytic converter ● Muffler(s) ● Joints ● Mountings ● Clearance around components	● Fuses ● Wiring harness ● Electrical connector(s) ● Sensor(s) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Noisy or leaking exhaust	● Exhaust system/components	Install new components as necessary. Refer to the relevant section of the workshop manual.
Lack of power	● Air intake system fault ● Supercharger fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust gas recirculation (EGR) valve(s) fault	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. For EGR and turbocharger tests, refer to the relevant section of the workshop manual.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to section 303-14 - Electronic Engine Controls section of the workshop manual.

DTC	Description	Possible causes	Action
P003100	HO2S Heater Control Circuit Low (Bank 1, Sensor 1)	● Heated 0^2 sensor heater power supply circuit high resistance ● Heated 0^2 sensor heater control circuit high resistance ● Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P003200	HO2S Heater Control Circuit High (Bank 1, Sensor 1)	● Heated 0^2 sensor heater power supply circuit high resistance ● Heated 0^2 sensor heater control circuit high resistance ● Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P003600	HO2S Heater Control Circuit (Bank 1, Sensor 2)	• Catalyst monitor sensor heater control circuit short circuit to ground • Catalyst monitor sensor heater control circuit high resistance • Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005100	HO2S Heater Control Circuit Low (Bank 2, Sensor 1)	• Heated 0^2 sensor heater power supply circuit high resistance • Heated 0^2 sensor heater control circuit high resistance • Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005200	HO2S Heater Control Circuit High (Bank 2, Sensor 1)	• Heated 0^2 sensor heater power supply circuit high resistance • Heated 0^2 sensor heater control circuit high resistance • Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005600	HO2S Heater Control Circuit (Bank 2, Sensor 2)	• Catalyst monitor sensor (left-hand bank) heater control circuit short circuit to ground • Catalyst monitor sensor heater control circuit high resistance • Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01301A	O2 Circuit (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) element impedance low • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01301B	O2 Circuit (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) element impedance high • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013100	O2 Circuit Low Voltage (Bank 1, Sensor 1)	• Heated 0^2 sensor signal circuit high resistance • Heated 0^2 sensor signal circuit short circuit to ground • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013200	O2 Circuit High Voltage (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) signal circuit short circuit to power • Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013300	O2 Circuit Slow Response (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) to ECM wiring high resistance • Exhaust leak • HO2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013400	O2 Circuit No Activity Detected (Bank 1, Sensor 1)	• Heated 0^2 sensor (right-hand bank) slow activation	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013700	O2 Circuit Low Voltage (Bank 1, Sensor 2)	• Catalyst monitor sensor (right-hand bank) to ECM wiring high resistance • Catalyst monitor sensor short circuit to ground • Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013800	O2 Circuit High Voltage (Bank 1, Sensor 2)	• Catalyst monitor sensor (right-hand bank) sensing circuit short circuit to power • Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013900	O2 Circuit Slow Response (Bank 1, Sensor 2)	• Catalyst monitor sensor (right-hand bank) slow response	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P014000	O2 Circuit No Activity Detected (Bank 1, Sensor 2)	- Catalyst monitor (right-hand bank) to ECM wiring high resistance - Catalyst monitor sensing circuit short circuit to power - Catalyst monitor short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P014100	O2 Heater Circuit (Bank 1, Sensor 2)	- Catalyst monitor sensor (right-hand bank) heater control circuit high resistance - Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01501A	O2 Circuit (Bank 2, Sensor 1)	- Circuit (left-hand bank) resistance below threshold - Element impedance low - Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01501B	O2 Circuit (Bank 2, Sensor 1)	- Circuit (left-hand bank) resistance above threshold - Element impedance high - Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015100	O2 Circuit Low Voltage (Bank 2, Sensor 1)	- Heated 0² sensor (left-hand bank) signal circuit high resistance - Heated 0² sensor signal circuit short circuit to ground - Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015200	O2 Circuit High Voltage (Bank 2, Sensor 1)	- Heated 0² sensor (left-hand bank) signal circuit short circuit to power - Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015300	O2 Circuit Slow Response (Bank 2, Sensor 1)	- Heated 0² sensor (left-hand bank) to ECM wiring high resistance - Exhaust leak - Heated 0² sensor failure	Check the exhaust system for leaks. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015400	O2 Circuit No Activity Detected (Bank 2, Sensor 1)	- Heated 0² sensor (left-hand bank) slow activation	Check the HO2S and circuits. Refer to the electrical guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015700	O2 Circuit Low Voltage (Bank 2, Sensor 2)	- Catalyst monitor sensor (left-hand bank) to ECM wiring high resistance - Catalyst monitor sensor short circuit to ground - Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015800	O2 Circuit High Voltage (Bank 2, Sensor 2)	- Catalyst monitor sensor (left-hand bank) sensing circuit short circuit to power - Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015900	O2 Circuit Slow Response (Bank 2, Sensor 2)	- Catalyst monitor sensor (left-hand bank) slow response	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P016000	O2 Circuit No Activity Detected (Bank 2, Sensor 2)	- Catalyst monitor (left-hand bank) to ECM wiring high resistance - Catalyst monitor sensing (left-hand bank) circuit short circuit to power - Catalyst monitor short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P016100	O2 Heater Circuit (Bank 2, Sensor 2)	- Catalyst monitor sensor (left-hand bank) heater control circuit malfunction	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P042000	Catalyst System Efficiency Below Threshold (Bank 1)	● Catalyst failure due to overheating damage caused by misfire and/or lean combustion ● Catalyst failure due to poisoning caused by excessive oil consumption and/or contaminated fuel	Check the catalyst condition.
P043000	Catalyst System Efficiency Below Threshold (Bank 2)	● Catalyst failure due to overheating damage caused by misfire and/or lean combustion ● Catalyst failure due to poisoning caused by excessive oil consumption and/or contaminated fuel	Check the catalyst condition.

Exhaust System - V8 S/C 4.2L Petrol - Tailpipe

Removal and Installation

Special Tool(s)	
	Pipe cutter-exhaust 100-051 (LRT-99-027)

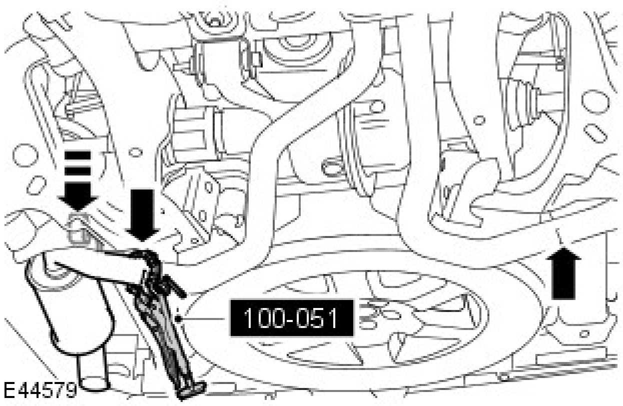
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.
- Disconnect from the exhaust hanger.



Installation

1. NOTE: Do not tighten the retaining clamp at this stage.

Install the tail pipe.

- Clean the components.
- Install the retaining clamp.

2. Align the tail pipe and tighten the retaining clamp to 55 Nm (40 lb.ft).

Published: 11-May-2011

Exhaust System - V8 S/C 4.2L Petrol - Catalytic Converter LH

Removal and Installation

Special Tool(s)	
 310-121 E53465	Wrench, HO2S 310-121(LRT-19-014)

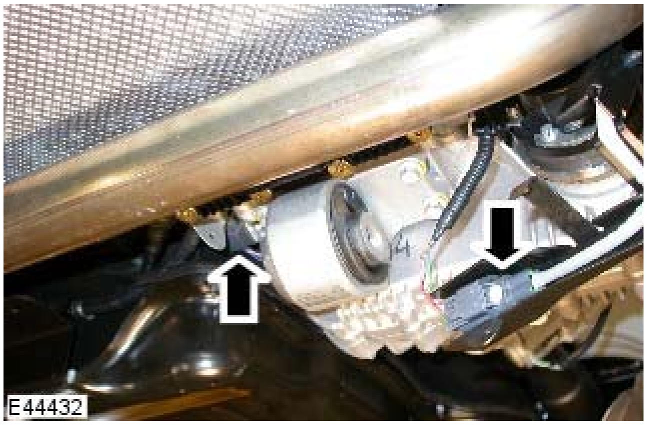
Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

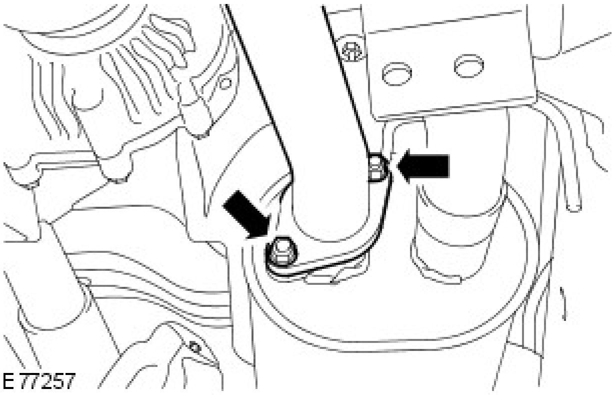
   Raise and support the vehicle.

2. Remove the transmission crossmember.
   For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

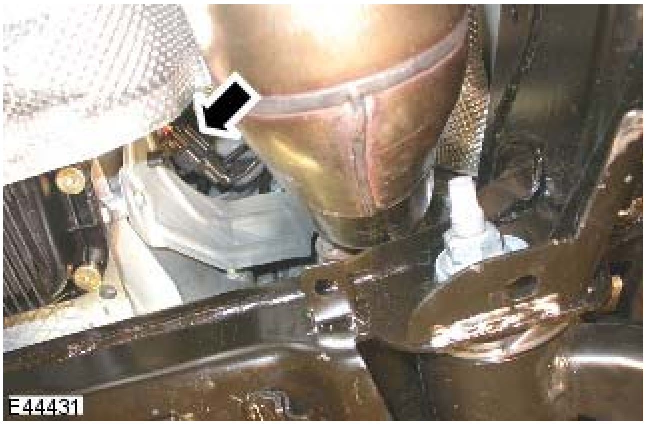
3. Release the LH rear HO2S wiring harness.
   - Disconnect the electrical connector.



4. Release the RH rear HO2S wiring harness.
   - Disconnect the electrical connector.

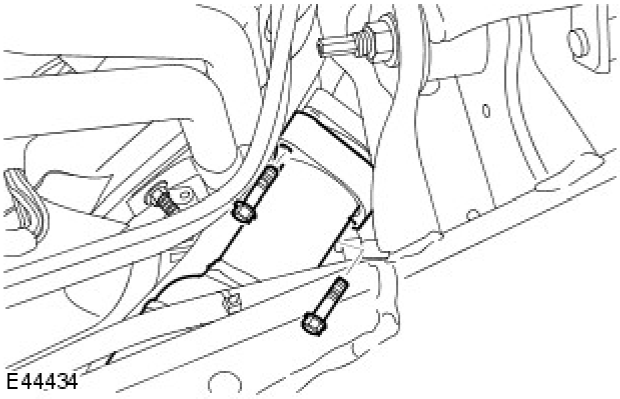


5. Disconnect the RH catalytic converter from the muffler assembly.
   - Remove the 2 nuts.
   - Discard the gasket.



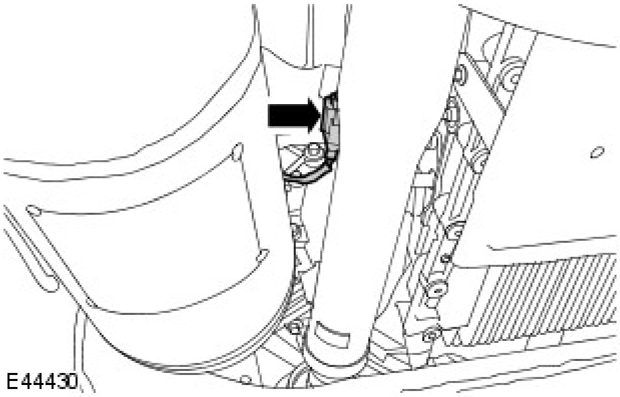
6. Release the RH front HO2S wiring harness.

- Disconnect the electrical connector.



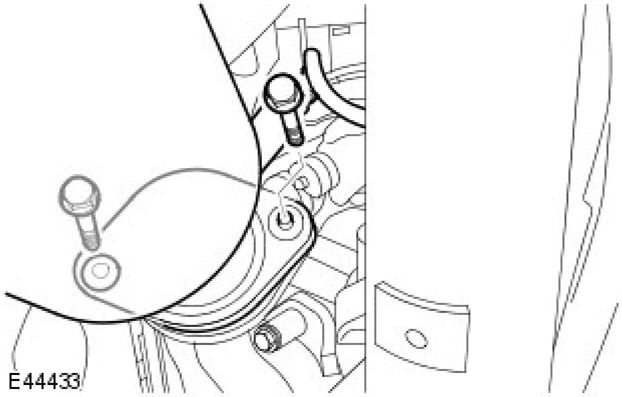
7. Remove the RH catalytic converter.

- Remove and discard the 2 bolts.



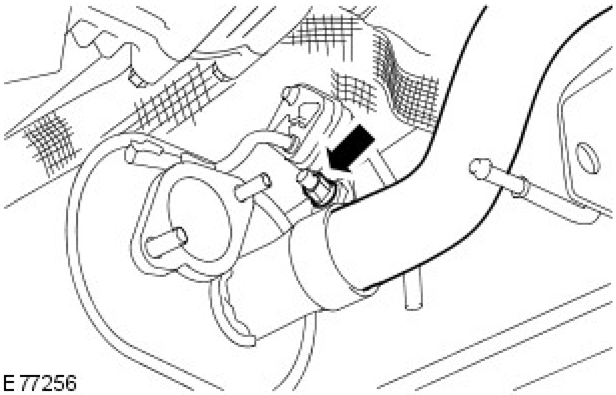
8. Release the LH front HO2S wiring harness.

- Disconnect the electrical connector.



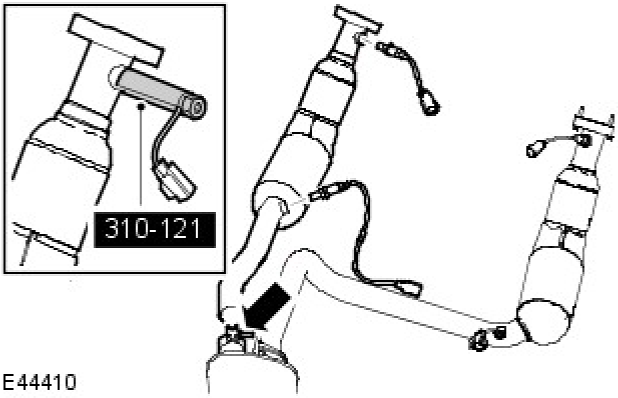
9. Disconnect the LH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.



10. Remove the LH catalytic converter.

- Loosen the nut and release the retaining clamp.



11. NOTE: Do not disassemble further if the component is removed for access only.

Using the special tool, remove both HO2S from the catalytic converter.

Installation

1. ⚠CAUTION: Make sure the anti-seize compound does not contact the HO2S tip.

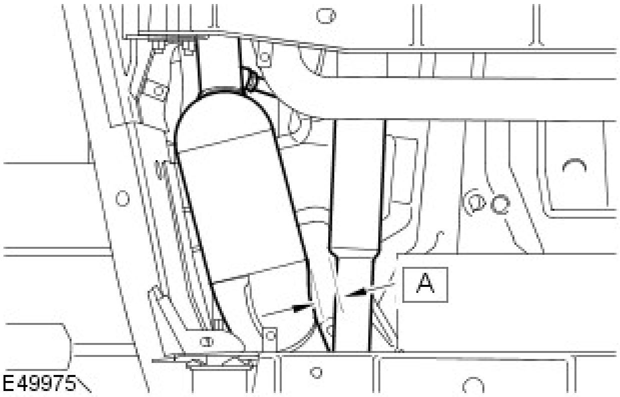
Using the special tool, install the HO2S to the catalytic converter and tighten to 45 Nm (33 lb.ft).

- Clean the components.
- Apply an anti-seize compound to the thread of the sensor.

2. NOTE: Do not tighten the retaining clamp at this stage.

Position the LH catalytic converter to the front muffler.

- Clean the components.



3. ⚠CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

4. ⚠ CAUTION: Make sure the H02S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Connect the LH front HO2S electrical connector.

- Attach the HO2S wiring harness.

5. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

6. ⚠ CAUTION: Make sure the H02S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Connect the RH front HO2S electrical connector.

- Attach the HO2S wiring harness.

7. Position the RH catalytic converter to the front muffler.

- Clean the components.
- Install a new gasket.
- Tighten the nuts to 55 Nm (40 lb.ft).

8. Tighten the LH catalytic converter retaining clamp to 55 Nm (40 lb.ft).

9. ⚠ CAUTION: Make sure the H02S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Connect the rear HO2S electrical connectors.

- Attach the HO2S wiring harnesses.

10. Install the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

11. NOTE: For NAS vehicles only.

If required, carry out a long drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, General Procedures).

- Disconnect the electrical connector.

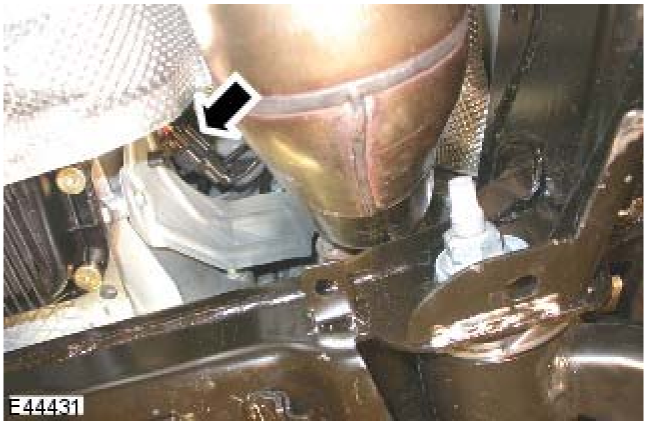
E44430

6. Release the RH front HO2S wiring harness.

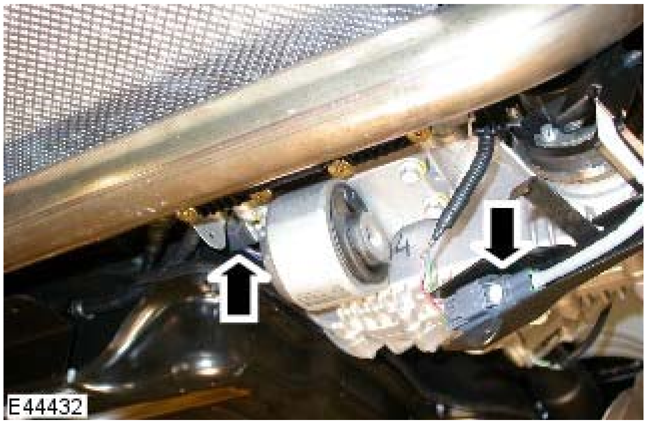
- Disconnect the electrical connector.



E44431

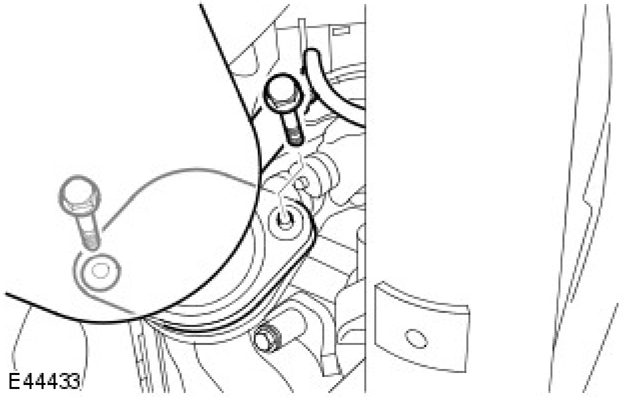
7. Release the LH rear HO2S wiring harness.

- Disconnect the electrical connector.



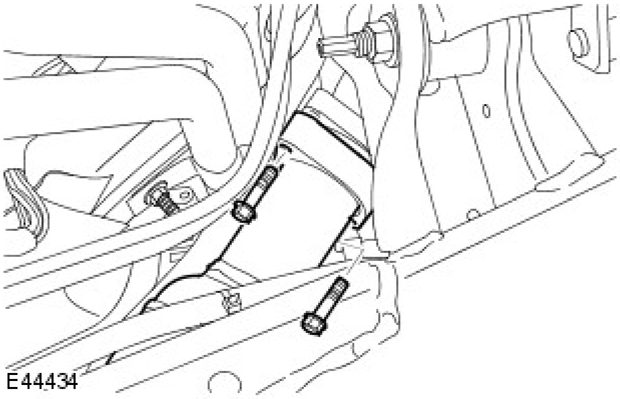
8. Release the RH rear HO2S wiring harness.

- Disconnect the electrical connector.



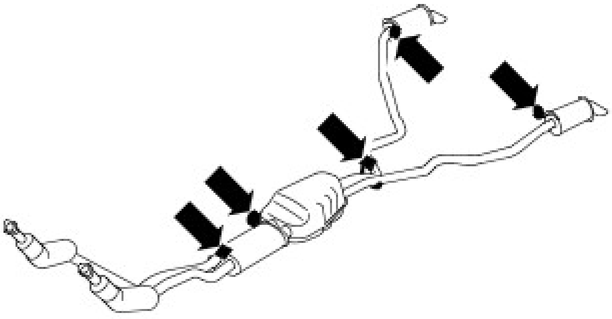
9. Disconnect the LH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.



10. Disconnect the RH catalytic converter from the exhaust manifold.

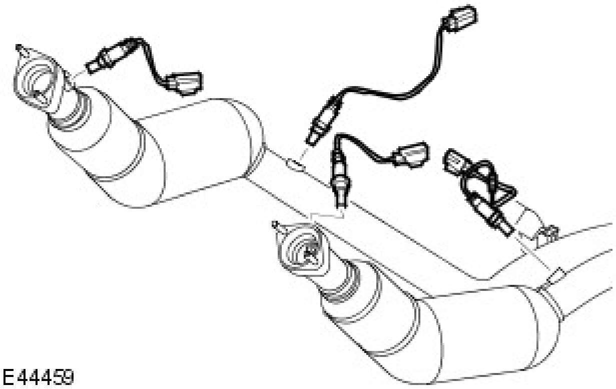
- Remove and discard the 2 bolts.



E44435

11. With assistance, remove the exhaust system.

- Disconnect the 5 exhaust hangers.



E44459

12. NOTE: Do not disassemble further if the component is removed for access only.

Using the special tool, remove the 4 HO2S from the catalytic converters.

Installation

1. ⚠ CAUTION: Make sure the anti-seize compound does not contact the HO2S tip.

Using the special tool, install the HO2S to the catalytic converters and tighten to 45 Nm (33 lb.ft).

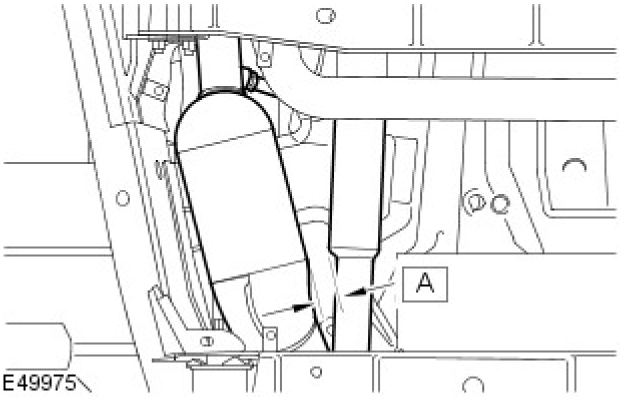
- Clean the components.
- Apply an anti-seize compound to the thread of the HO2S.

2. With assistance, install the exhaust system.

- Attach the exhaust hangers.

3. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).



4. ⚠ CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

5. ⚠ CAUTION: Make sure the H02S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Connect the HO2S electrical connectors.

- Attach the HO2S wiring harnesses.

6. Install the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

7. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

8. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Exhaust System - V8 S/C 4.2L Petrol - Muffler

Removal and Installation

Special Tool(s)	
	Pipe cutter-exhaust 100-051 (LRT-99-027)

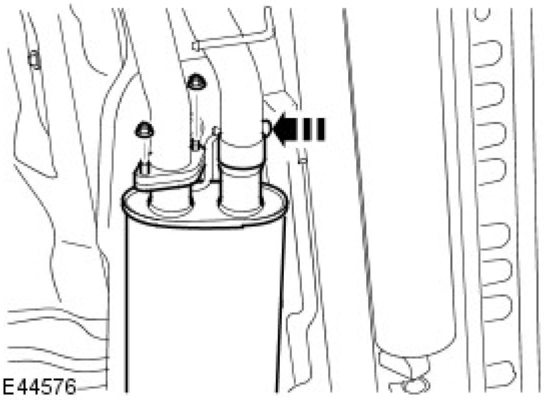
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

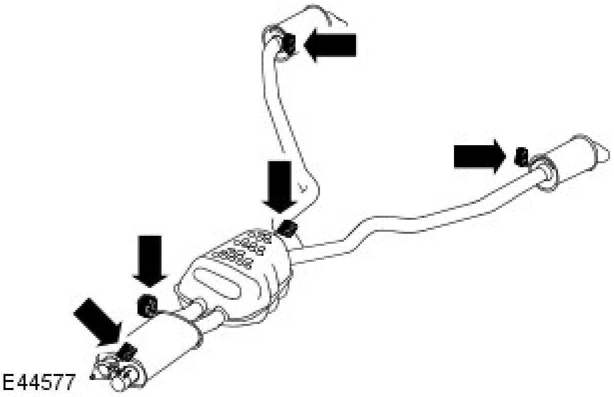
2. Disconnect the RH catalytic converter from the muffler assembly.

- Remove the 2 nuts.



3. Disconnect the LH catalytic converter from the muffler assembly.

- Remove the nut and release the retaining clamp.



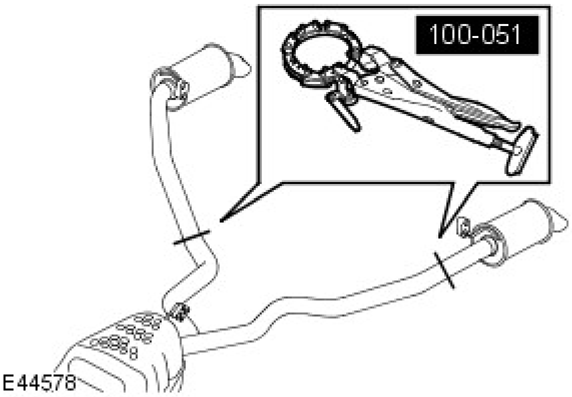
4. With assistance, remove the muffler assembly.

- Disconnect the 5 exhaust hangers.

5. NOTE: Do not disassemble further if the component is removed for access only.

Remove the LH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.



6. Remove the RH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.

Installation

1. NOTE: Do not tighten the retaining clamp at this stage.

Position the RH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

2. NOTE: Do not tighten the retaining clamp at this stage.

Position the LH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

3. With assistance, install the muffler assembly.

- Attach the exhaust hangers.
- Tighten the catalytic converter nuts and clamp to 48 Nm (35 lb.ft).

4. Align both tail pipes and tighten the retaining clamps to 55 Nm (40 lb.ft).

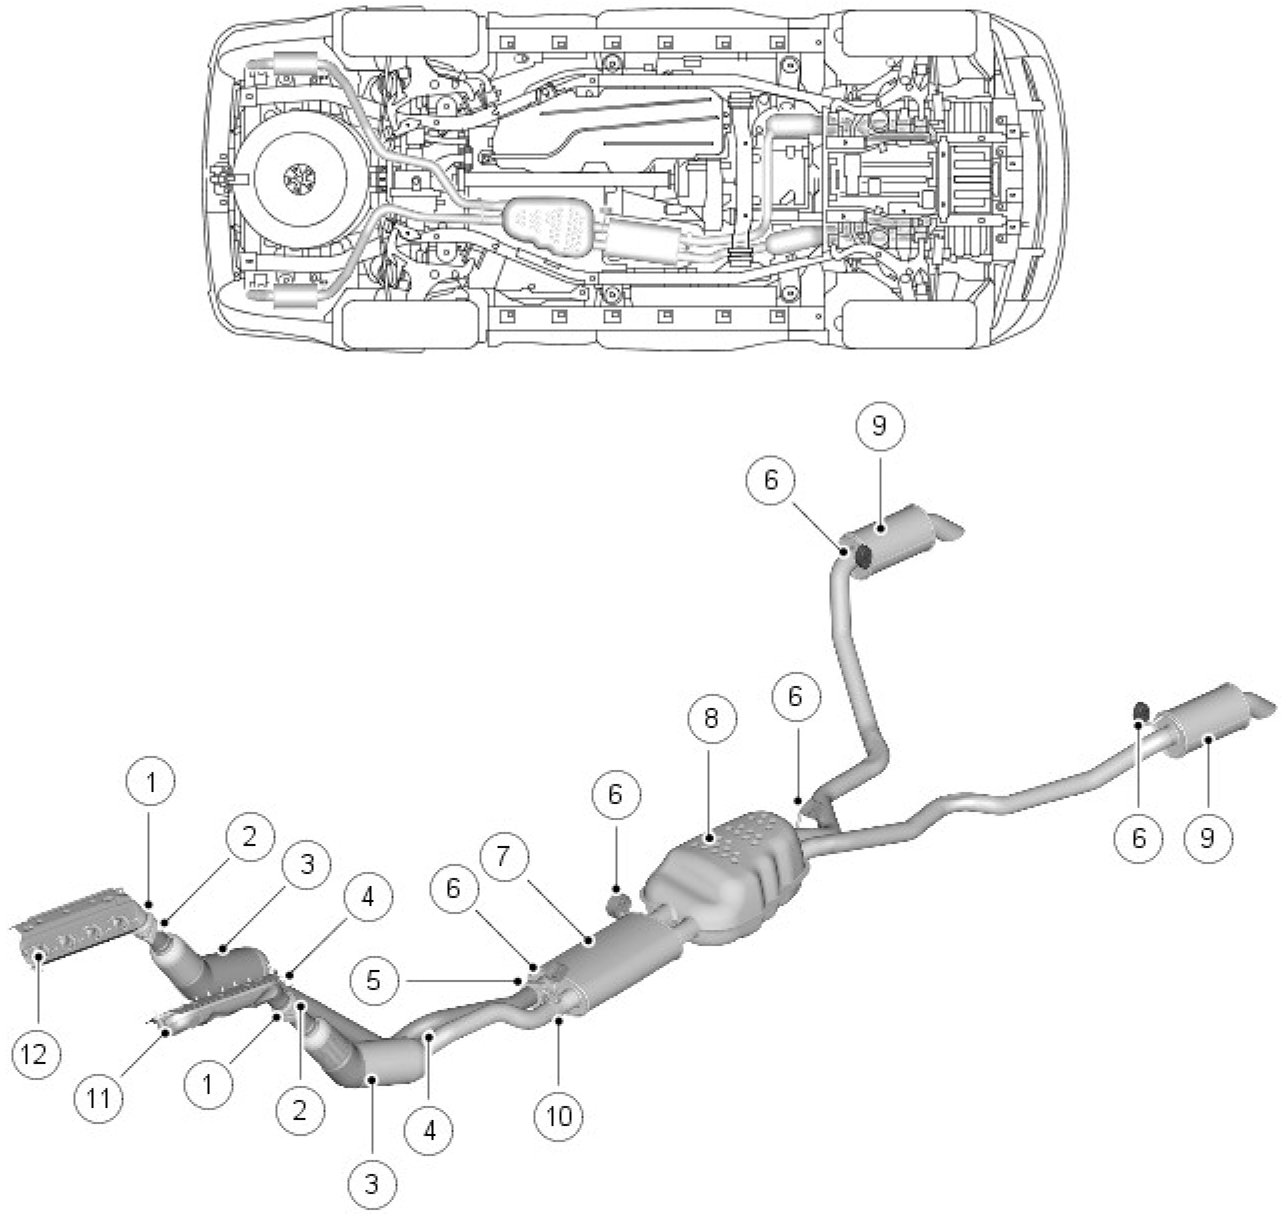
Exhaust System - V8 4.4L Petrol - Exhaust System

Description and Operation

4.4L V8 COMPONENT LOCATION



E57338

Item	Part Number	Description
1	-	Flange - manifold to front section
2	-	Pre catalyst heated oxygen sensor location
3	-	Catalyst
4	-	Post catalyst heated oxygen sensor location
5	-	Flange - RH front section to rear section
6	-	Mounting rubber (5 off)
7	-	Silencer - Front
8	-	Silencer - Centre
9	-	Silencer - Rear
10	-	Clamp - LH front section to rear section

11	-	LH exhaust manifold
12	-	RH exhaust manifold

OVERVIEW

The 4.4L V8 exhaust system is fabricated from stainless steel and is supplied as three separate assemblies; a LH front section incorporating a catalytic converter, a RH front section incorporating a catalytic converter and a rear section incorporating a front silencer, a centre silencer and two rear silencers.

The system is attached to the underside of the body with five mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body. The system is routed mainly on the inside of the LH chassis longitudinal before splitting near the rear differential to exit at each side of the rear of the vehicle.

The system has service repair items available. Indentations in the rear section, between the center and the rear silencers, show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

FRONT SECTION

Both front sections have a welded flange with two holes which provide for the attachment with two bolts onto the LH and RH exhaust manifolds. The flange is sealed by a tapered seat in the flange and a machined cone on the manifold.

The flange is welded to a short, straight pipe, which in turn is welded to the body of the catalytic converter. The pipe has a threaded boss which is welded over a hole in the pipe to provide location for the pre catalyst heated oxygen sensor (HO2S).

- NOTE: On NAS vehicles from 2007MY, the HO2S is located in a boss on the catalytic converter.

On the LH front section, the converter outlet pipe is a 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the outlet pipe is inserted into the flared end of the rear section. A clamp is used to compress and secure the joint.

On the RH front section, the converter outlet pipe is a 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is welded to the converter body. The rear of the pipe curves left, under the transmission and then curves again to run parallel to the LH pipe. The end of the pipe has a welded flange with two holes which locate on two studs on the rear section and is secured with nuts. A metal gasket is used to seal the joint between the front and rear section flanges.

Both the LH and RH converter outlet pipes have a threaded boss which is welded over a hole in the pipe to provide location for the post catalyst HO2S.

REAR SECTION

The rear section has a short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which is flared to an inside diameter of 55 mm (2.16 in) to locate the LH front section. The tube is welded to the front silencer assembly. A second short 55 mm (2.16 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, has a welded flange with captive studs to provide attachment for the flange on the RH front section. This tube is also welded to the front silencer assembly.

The front silencer comprises a single skin and two end plates which are welded together to give a capacity of 6.4 liters (390.5 in^3). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. A hanger bar is welded to the front of the silencer and provides for the location of a mounting rubber.

The silencer has two short 55 mm (2.16 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which connect to the center silencer.

The center silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 liters (1538 in^3). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gasses pass through the silencer. A hanger bar is welded to the front right hand side of the silencer and provides location for a mounting rubber.

The silencer has two 55 mm (2.17 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components.

Each outlet pipe terminates in a welded joint with the tail silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber.

A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber. The silencer is a circular fabrication with a baffle tube which is surrounded with glass fibre to provide further noise suppression. Each silencer has a capacity of 2.7 liters (165 in^3).

The silencers each have an outlet pipe which is 60 mm (2.4 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

CATALYTIC CONVERTER

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions.

To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter is integrated into the front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing metals, which are the active constituent for converting harmful emissions into inert by-products. The metals add oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water respectively.

Exhaust System - V8 4.4L Petrol - Exhaust System

Diagnosis and Testing

Overview

For additional information, refer to the relevant section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious signs of mechanical damage.

Visual inspection

Mechanical
● Leaks ● Metal fatigue ● Pipes ● Catalytic converter ● Muffler(s) ● Joints ● Mountings ● Clearance around components

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

Symptom Chart

Symptom	Possible causes	Action
Noisy or leaking exhaust	● Exhaust system/components	Install new components as necessary. Refer to the relevant section of the workshop manual.
Lack of power	● Air intake system fault ● Restricted exhaust system ● Low fuel pressure ● Exhaust gas recirculation (EGR) valve(s) fault ● Turbocharger fault	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. For EGR and turbocharger tests, refer to the relevant section of the workshop manual.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to section 303-14 - Electronic Engine Controls section of the workshop manual.

DTC	Description	Possible causes	Action
P003100	HO2S Heater Control Circuit Low (Bank 1, Sensor 1)	● Heated 0^2 sensor heater power supply circuit high resistance ● Heated 0^2 sensor heater control circuit high resistance ● Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P003200	HO2S Heater Control Circuit High (Bank 1, Sensor 1)	● Heated 0^2 sensor heater power supply circuit high resistance ● Heated 0^2 sensor heater control circuit high resistance ● Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P003600	HO2S Heater Control Circuit (Bank 1, Sensor 2)	● Catalyst monitor sensor heater control circuit short circuit to ground ● Catalyst monitor sensor heater control circuit high resistance	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
		● Catalyst monitor sensor heater failure	
P005100	HO2S Heater Control Circuit Low (Bank 2, Sensor 1)	● Heated 0^2 sensor heater power supply circuit high resistance ● Heated 0^2 sensor heater control circuit high resistance ● Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005200	HO2S Heater Control Circuit High (Bank 2, Sensor 1)	● Heated 0^2 sensor heater power supply circuit high resistance ● Heated 0^2 sensor heater control circuit high resistance ● Heated 0^2 sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P005600	HO2S Heater Control Circuit (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) heater control circuit short circuit to ground ● Catalyst monitor sensor heater control circuit high resistance ● Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01301A	O2 Circuit (Bank 1, Sensor 1)	● Heated 0^2 sensor (right-hand bank) element impedance low ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01301B	O2 Circuit (Bank 1, Sensor 1)	● Heated 0^2 sensor (right-hand bank) element impedance high ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013100	O2 Circuit Low Voltage (Bank 1, Sensor 1)	● Heated 0^2 sensor signal circuit high resistance ● Heated 0^2 sensor signal circuit short circuit to ground ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013200	O2 Circuit High Voltage (Bank 1, Sensor 1)	● Heated 0^2 sensor (right-hand bank) signal circuit short circuit to power ● Heated 0^2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013300	O2 Circuit Slow Response (Bank 1, Sensor 1)	● Heated 0^2 sensor (right-hand bank) to ECM wiring high resistance ● Exhaust leak ● HO2 sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013400	O2 Circuit No Activity Detected (Bank 1, Sensor 1)	● Heated 0^2 sensor (right-hand bank) slow activation	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013700	O2 Circuit Low Voltage (Bank 1, Sensor 2)	● Catalyst monitor sensor (right-hand bank) to ECM wiring high resistance ● Catalyst monitor sensor short circuit to ground ● Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013800	O2 Circuit High Voltage (Bank 1, Sensor 2)	● Catalyst monitor sensor (right-hand bank) sensing circuit short circuit to power ● Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P013900	O2 Circuit Slow Response (Bank 1, Sensor 2)	● Catalyst monitor sensor (right-hand bank) slow response	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P014000	O2 Circuit No Activity Detected (Bank 1, Sensor 2)	● Catalyst monitor (right-hand bank) to ECM wiring high resistance ● Catalyst monitor sensing circuit short circuit to power ● Catalyst monitor short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.

DTC	Description	Possible causes	Action
P014100	O2 Heater Circuit (Bank 1, Sensor 2)	● Catalyst monitor sensor (right-hand bank) heater control circuit high resistance ● Catalyst monitor sensor heater failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01501A	O2 Circuit (Bank 2, Sensor 1)	● Circuit (left-hand bank) resistance below threshold ● Element impedance low ● Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P01501B	O2 Circuit (Bank 2, Sensor 1)	● Circuit (left-hand bank) resistance above threshold ● Element impedance high ● Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015100	O2 Circuit Low Voltage (Bank 2, Sensor 1)	● Heated 0² sensor (left-hand bank) signal circuit high resistance ● Heated 0² sensor signal circuit short circuit to ground ● Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015200	O2 Circuit High Voltage (Bank 2, Sensor 1)	● Heated 0² sensor (left-hand bank) signal circuit short circuit to power ● Heated 0² sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015300	O2 Circuit Slow Response (Bank 2, Sensor 1)	● Heated 0² sensor (left-hand bank) to ECM wiring high resistance ● Exhaust leak ● Heated 0² sensor failure	Check the exhaust system for leaks. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015400	O2 Circuit No Activity Detected (Bank 2, Sensor 1)	● Heated 0² sensor (left-hand bank) slow activation	Check the HO2S and circuits. Refer to the electrical guides. Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015700	O2 Circuit Low Voltage (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) to ECM wiring high resistance ● Catalyst monitor sensor short circuit to ground ● Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015800	O2 Circuit High Voltage (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) sensing circuit short circuit to power ● Catalyst monitor sensor failure	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P015900	O2 Circuit Slow Response (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) slow response	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P016000	O2 Circuit No Activity Detected (Bank 2, Sensor 2)	● Catalyst monitor (left-hand bank) to ECM wiring high resistance ● Catalyst monitor sensing (left-hand bank) circuit short circuit to power ● Catalyst monitor short circuit to ground	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P016100	O2 Heater Circuit (Bank 2, Sensor 2)	● Catalyst monitor sensor (left-hand bank) heater control circuit malfunction	Refer to the guided diagnostic routine for this code on the approved diagnostic system.
P042000	Catalyst System Efficiency Below Threshold (Bank 1)	● Catalyst failure due to overheating damage caused by misfire and/or lean combustion ● Catalyst failure due to poisoning caused by excessive oil consumption and/or contaminated fuel	Check the catalyst condition.

DTC	Description	Possible causes	Action
P043000	Catalyst System Efficiency Below Threshold (Bank 2)	- Catalyst failure due to overheating damage caused by misfire and/or lean combustion - Catalyst failure due to poisoning caused by excessive oil consumption and/or contaminated fuel	Check the catalyst condition.

Exhaust System - V8 4.4L Petrol - Tailpipe

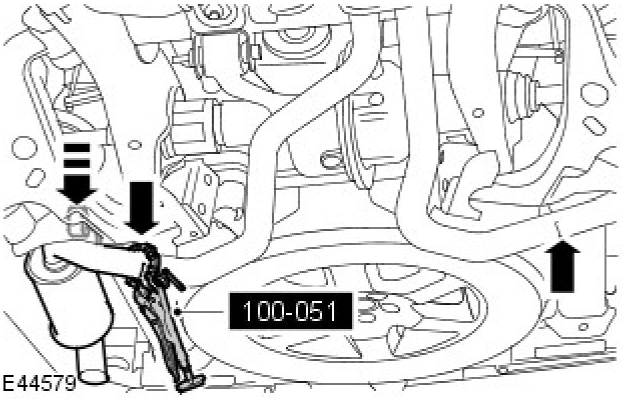
Removal and Installation

Special Tool(s)	
	Pipe cutter-exhaust 100-051 (LRT-99-027)

Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.



2. Remove the tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.
- Disconnect from the exhaust hanger.

Installation

1. NOTE: Do not tighten the retaining clamp at this stage.

Install the tail pipe.

- Clean the components.
- Install the retaining clamp.

2. Align the tail pipe and tighten the retaining clamp to 55 Nm (40 lb.ft).

Published: 11-May-2011

Exhaust System - V8 4.4L Petrol - Catalytic Converter LH

Removal and Installation

Special Tool(s)	
	Wrench, HO2S 310-121 (LRT-19-014)

Removal

1. Disconnect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

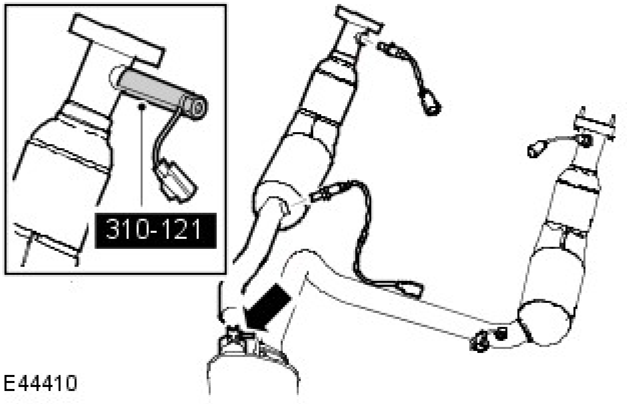
3. Remove the exhaust system.
   For additional information, refer to: Exhaust System (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

4. Remove the catalytic converter.

   - Remove the nut and release the retaining clamp.

5. NOTE: Do not disassemble further if the component is removed for access only.

   Using the special tool, remove both HO2S from the catalytic converter.



Installation

1. ⚠ CAUTION: Make sure the anti-seize compound does not contact the HO2S tip.

   Using the special tool, install the HO2S to the catalytic converter and tighten to 45 Nm (33 lb.ft).

   - Clean the components.
   - Apply an anti-seize compound to the thread of the HO2S.

2. NOTE: Do not tighten the retaining clamp at this stage.

   Position the catalytic converter to the front muffler.

   - Clean the components.

- Install the nut.

3. Install the exhaust system.
For additional information, refer to: Exhaust System (309-00B Exhaust System - V8 4.4L Petrol, Removal and Installation).

4. Tighten the catalytic converter retaining clamp to 55 Nm (40 lb.ft).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

6. NOTE: For NAS vehicles only.

If required, carry out a long drive cycle.
For additional information, refer to: Powertrain Control Module (PCM) Long Drive Cycle Self-Test (303-14A, General Procedures).

Removal and Installation

Special Tool(s)	
	Wrench, HO2S 310-121 (LRT-19-014)

Removal

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

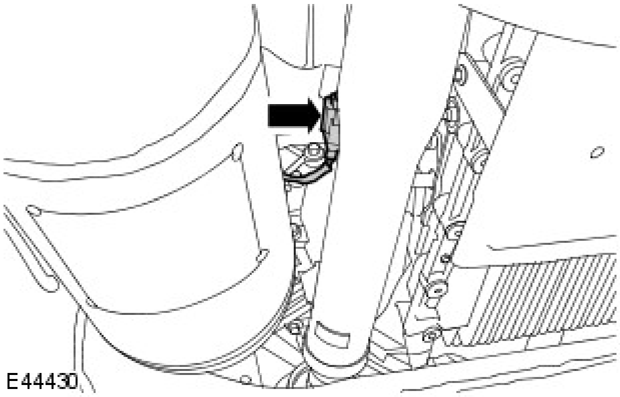
Raise and support the vehicle.

3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

4. Remove the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

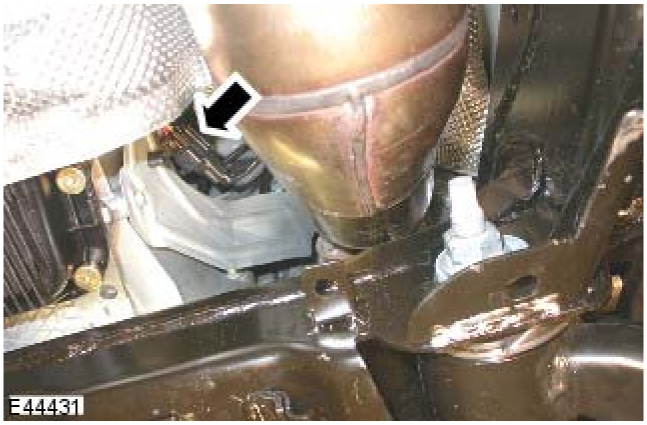
5. Release the LH front HO2S wiring harness.

- Disconnect the electrical connector.



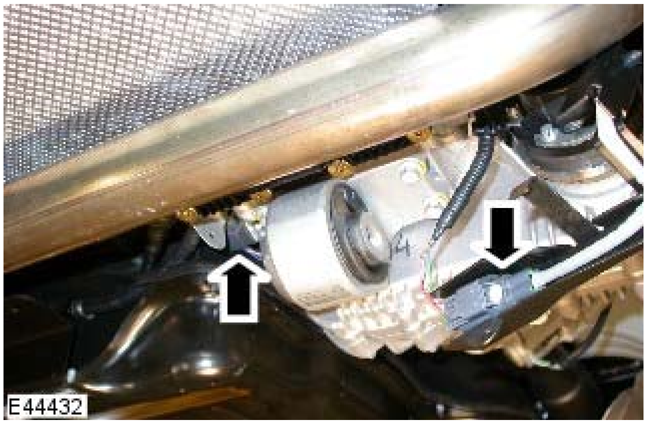
6. Release the RH front HO2S wiring harness.

- Disconnect the electrical connector.



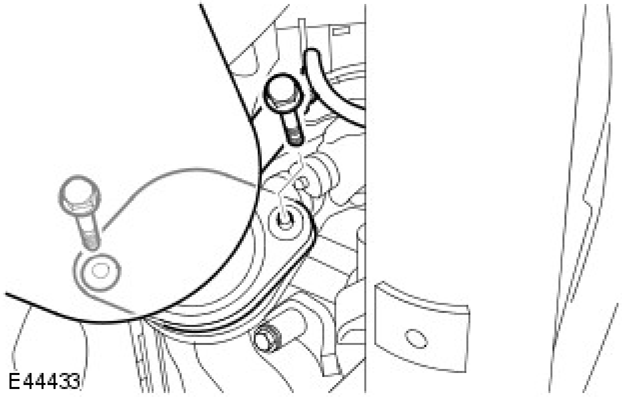
7. Release the LH rear HO2S wiring harness.

- Disconnect the electrical connector.



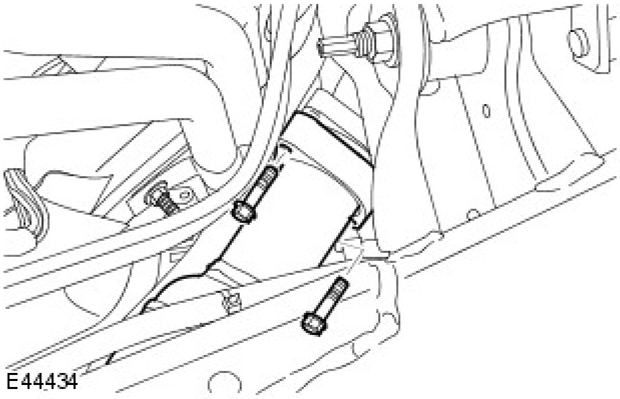
8. Release the RH rear HO2S wiring harness.

- Disconnect the electrical connector.



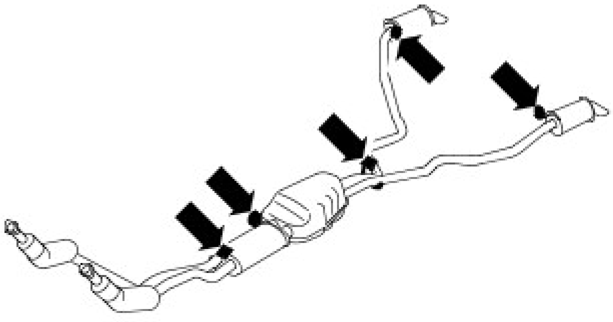
9. Disconnect the LH catalytic converter from the exhaust manifold.

- Remove and discard the 2 bolts.



10. Disconnect the RH catalytic converter from the exhaust manifold.

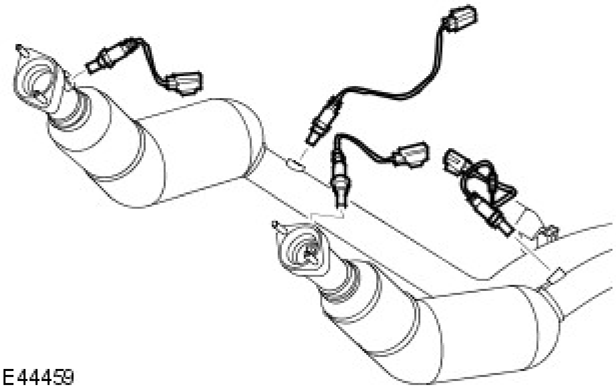
- Remove and discard the 2 bolts.



E44435

11. With assistance, remove the exhaust system.

- Disconnect the 5 exhaust hangers.



E44459

12. NOTE: Do not disassemble further if the component is removed for access only.

Using the special tool, remove the 4 HO2S from the catalytic converters.

Installation

1. ⚠CAUTION: Make sure the anti-seize compound does not contact the HO2S tip.

Using the special tool, install the HO2S to the catalytic converters and tighten to 45 Nm (33 lb.ft).

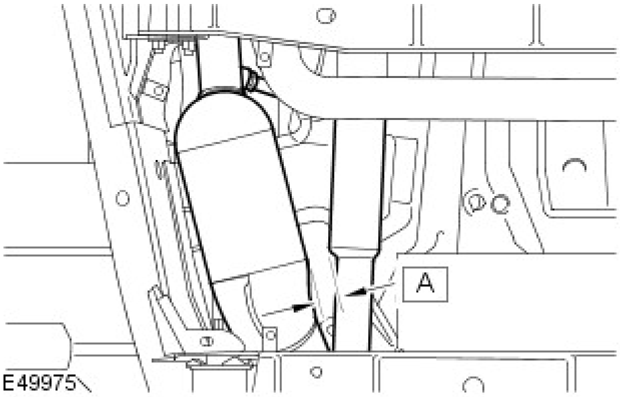
- Clean the components.
- Apply an anti-seize compound to the thread of the HO2S.

2. With assistance, install the exhaust system.

- Attach the exhaust hangers.

3. Position the RH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).



4. ⚠ CAUTION: Make sure there is a clearance (A) of 25 mm to 30 mm between the closest points of the LH catalytic converter and the front driveshaft.

Position the LH catalytic converter to the exhaust manifold.

- Clean the components.
- Tighten the new bolts to 22 Nm (16 lb.ft).

5. ⚠ CAUTION: Make sure the H02S wiring harness is not twisted more than 180 degrees and is not in contact with either the exhaust or driveshaft.

Connect the HO2S electrical connectors.

- Attach the HO2S wiring harnesses.

6. Install the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

7. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

8. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Removal and Installation

Special Tool(s)	
	Pipe cutter-exhaust 100-051 (LRT-99-027)

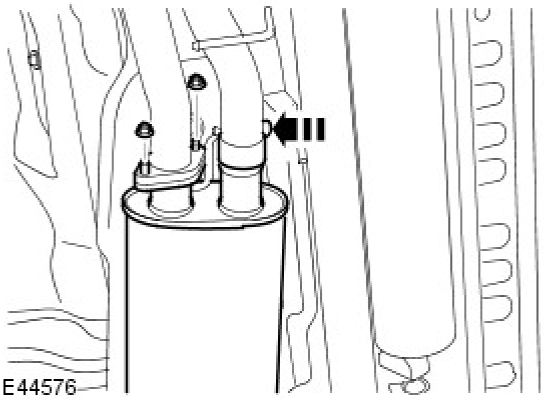
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

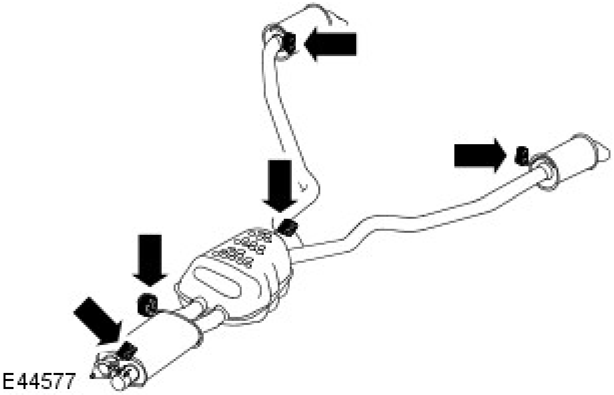
2. Disconnect the RH catalytic converter from the muffler assembly.

- Remove the 2 nuts.



3. Disconnect the LH catalytic converter from the muffler assembly.

- Remove the nut and release the retaining clamp.



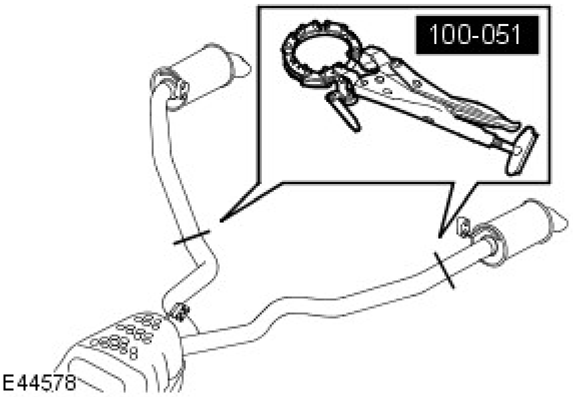
4. With assistance, remove the muffler assembly.

- Disconnect the 5 exhaust hangers.

5. NOTE: Do not disassemble further if the component is removed for access only.

Remove the LH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.



6. Remove the RH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.

Installation

1. NOTE: Do not tighten the retaining clamp at this stage.

Position the RH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

2. NOTE: Do not tighten the retaining clamp at this stage.

Position the LH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

3. With assistance, install the muffler assembly.

- Attach the exhaust hangers.
- Tighten the catalytic converter nuts and clamp to 48 Nm (35 lb.ft).

4. Align both tail pipes and tighten the retaining clamps to 55 Nm (40 lb.ft).

Exhaust System - TDV6 2.7L Diesel -

General Specifications

Item	Specification
Exhaust manifolds	Cast with cross over pipe from right to left hand manifold exiting into single turbocharger
Exhaust system	Single, stainless steel downpipe with twin stainless steel intermediate and tail pipes and stainless steel mufflers
Catalytic converter - type/location	Near coupled cascade - located in the down pipe

Torque Specifications

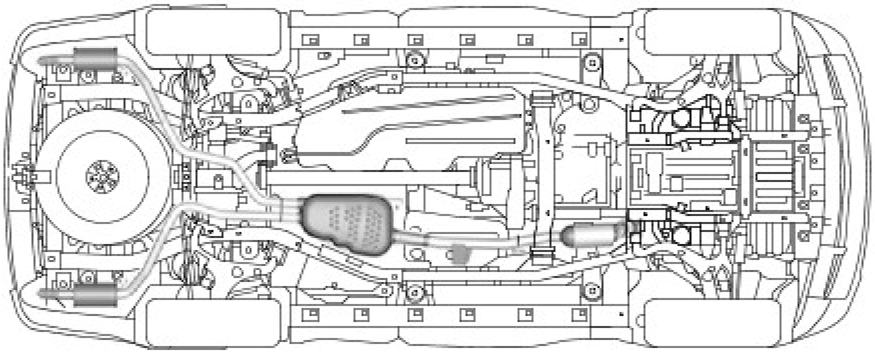
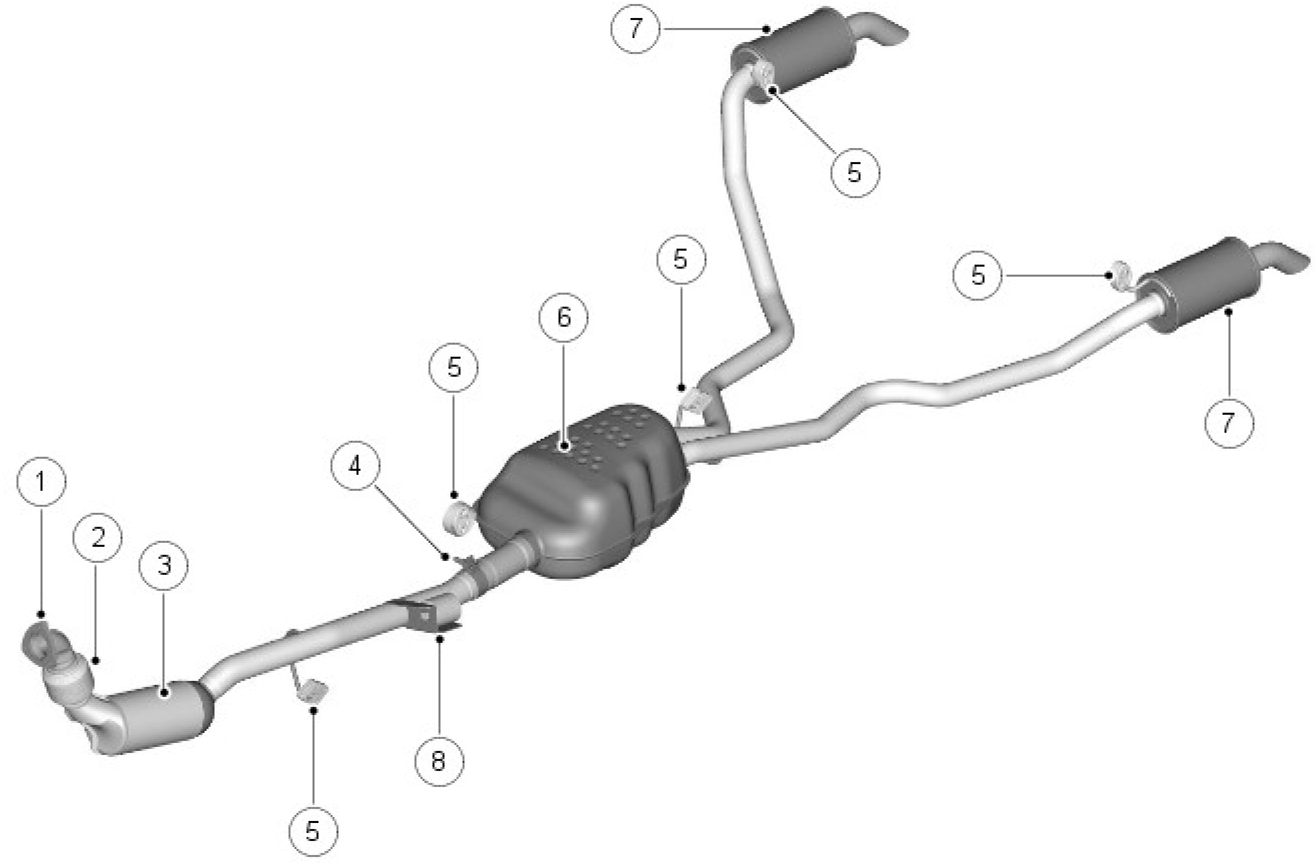
Exhaust System - TDV6 2.7L Diesel - Exhaust System

Description and Operation

TdV6 EXHAUST SYSTEM COMPONENT LOCATION - WITHOUT DIESEL PARTICULATE FILTER

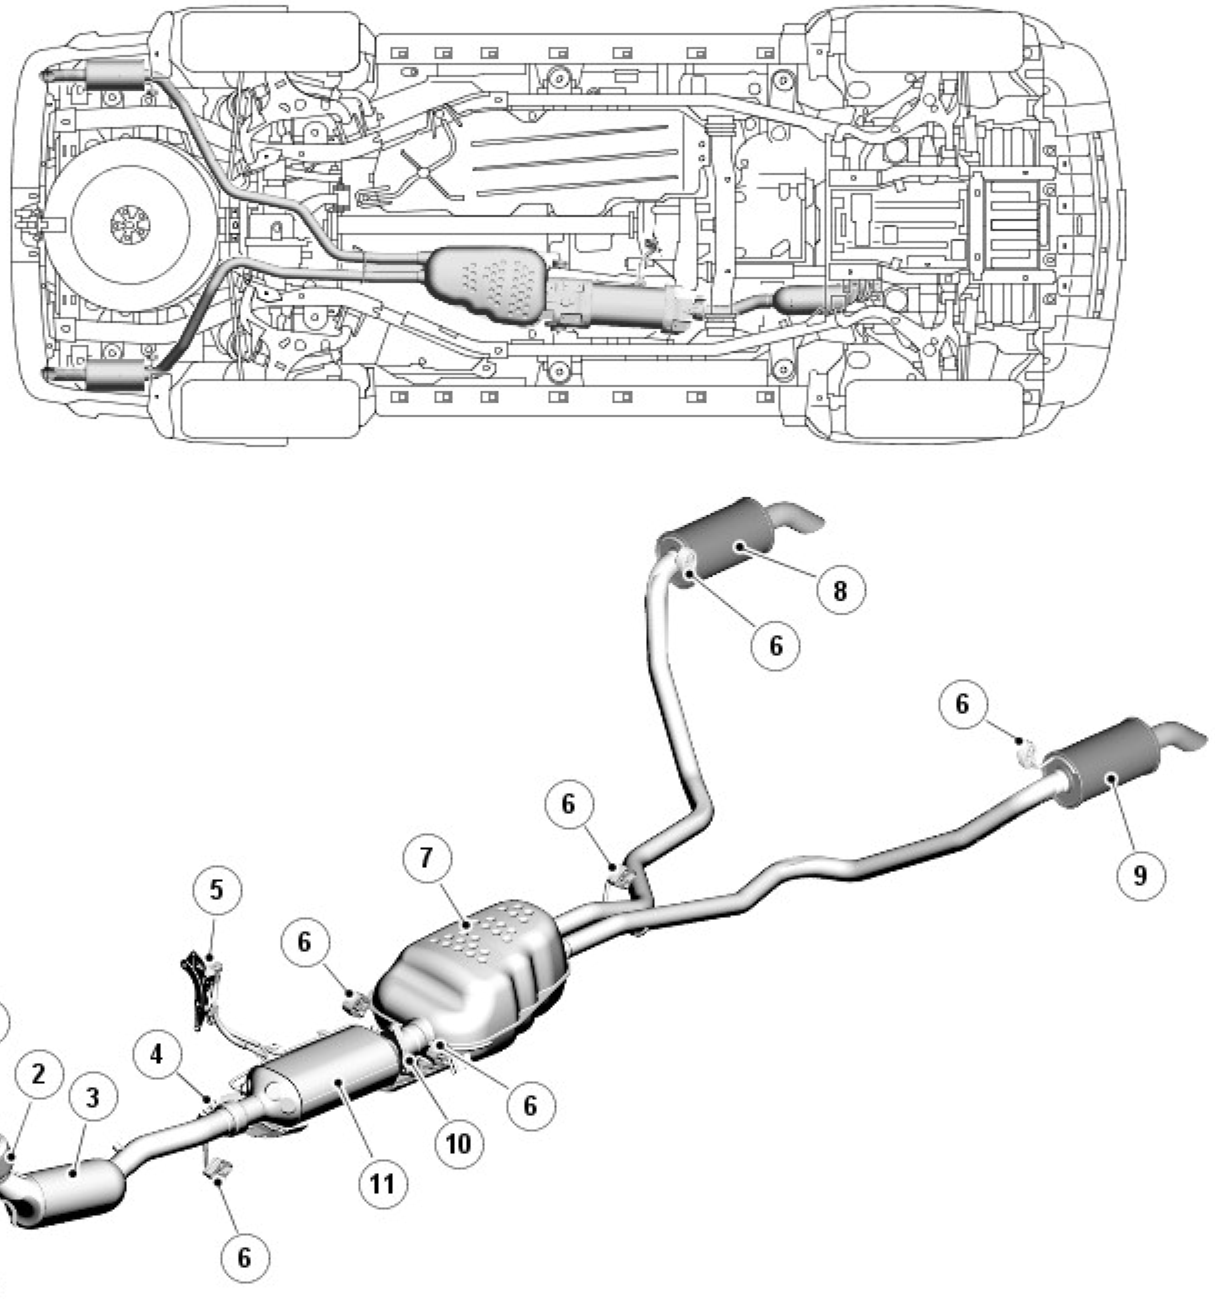




Item	Part Number	Description
1	-	Inlet flange
2	-	Flexible de-coupler
3	-	Catalytic converter
4	-	Clamp
5	-	Mounting rubber (5 off)
6	-	Silencer - Centre
7	-	Silencer - Rear
8	-	Mass damper (Not fitted to vehicles from 2007MY)

TdV6 EXHAUST SYSTEM COMPONENT LOCATION - WITH OPTIONAL DIESEL PARTICULATE

FILTER - FROM 2008 MY (WHERE FITTED)



Item	Part Number	Description
1	-	Inlet flange
2	-	Flexible de-coupler
3	-	Catalytic converter
4	-	Clamp
5	-	Differential pressure sensor
6	-	Mounting rubber (6 off)
7	-	Silencer - Centre
8	-	Silencer - Rear Left Hand (LH)
9	-	Silencer - Rear Right Hand (RH)
10	-	Flange joint and gasket
11	-	DPF

OVERVIEW

The TdV6 exhaust system is fabricated from stainless steel and is supplied as two separate assemblies; a front section incorporating a catalytic converter and a rear section incorporating a centre silencer and two rear silencers.

The system is attached to the underside of the body with five mounting rubbers which are located on mild steel hanger bars that are welded to the system. The mounting rubbers locate on corresponding hangers which are welded to the underside of the vehicle body.

The system has service repair items available. Indentations in the rear section between the center and the rear silencers show the cut points for the service replacement rear silencers or front section. When a service repair section is used, the joint is connected using a sleeve and two clamps to connect the pipes at the cut points.

On vehicles from 2008MY, an optional Diesel Particulate Filter (DPF) is available. The non-DPF exhaust system is also available on vehicles from 2008MY as the DPF is not required to comply with EU4 emission regulations.

- CAUTIONS:

⚠ The use of bio-fuels can seriously contaminate and destroy the coatings used on the catalytic converter. The DPF and the catalytic converter can become irreversibly contaminated if non-specified oils or fuels are used. This will result in the vehicle being unable to regenerate the DPF, becoming non-compliant with tailpipe emission regulations and replacement of the catalytic converter and DPF will be required.

⚠ If the vehicle is waded in deep water and the engine is stopped with the tailpipes submerged, the water, which can enter the system, can also contaminate both the DPF and the catalytic converter. This again can result in catalytic converter damage and damaging the ability for the DPF to regenerate therefore requiring both components to be replaced.

FRONT SECTION

The front section has a welded flange with three holes which provide for the attachment to three studs on the turbocharger. The flange is sealed with a metal gasket. This is secured to the turbocharger studs with three nuts.

The flange is welded to a fabricated elbow which in turn is welded to the de-coupler. Fabricated pressings are welded between the de-coupler and the body of the catalytic converter. The converter outlet pipe is a 60 mm (2.2 in) diameter tube, with a 2.0 mm (0.079 in) wall thickness, which is welded to the converter body. The outlet pipe has hanger bar which provides for the location of a mounting rubber.

Vehicles without DPF

The rear of the outlet pipe from the catalytic converter locates into the rear section. When the front section is inserted into the flared end, a clamp is used to compress and secure the joint.

Vehicles with Optional DPF - From 2008MY

The rear outlet pipe from the catalytic converter has a flared end which slides onto the DPF inlet pipe and is secured with a clamp. The outlet pipe of the DPF has a triangular shaped flange which mates with a similar flange on the rear section of the exhaust. The 2 flanges are sealed with a metal gasket and are secured using 3 locknuts screwed onto captive studs located in the DPF flange.

REAR SECTION

Vehicles without DPF

On vehicles without DPF, the rear section has a short 70 mm (2.75 in) diameter tube, with a 1.5 mm (0.06 in) wall thickness, which provides location for the front section as previously mentioned. The tube is welded to the centre silencer assembly.

Vehicles with Optional DPF - From 2008MY

On vehicles from 2008MY fitted with the optional DPF, the rear section has a short 70 mm (2.75 in) with a triangular flange which mates with a similar flange on the front section as previously mentioned.

All Vehicles

The centre silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 liters (1537 in^3). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. Hanger bars are welded to the front right hand side and left hand side of the silencer and provide for the location of mounting rubbers.

The silencer has two 50 mm (2.0 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components.

Each outlet pipe terminates in a welded joint with the rear silencers. The outlet pipes have a hanger bar which provides for the location of a mounting rubber.

A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber. The silencer is a circular fabrication with a baffle tube which is surrounded with glass fiber to provide further noise suppression. Each silencer has a capacity of 2.7 liters (165 in^3).

The silencers each have an outlet pipe which is 55 mm (2.16 in) diameter, with a wall thickness of 1.2 mm (0.05 in). Each outlet pipe is curved downwards to direct exhaust gasses away from the rear of the vehicle.

CATALYTIC CONVERTER

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions.

To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter (Diesel Oxidation Catalyst) is integrated into the front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing platinum on vehicles without a DPF or platinum and palladium on vehicles with a DPF, which are the active constituents for converting harmful emissions into inert by-products. The platinum and palladium adds oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water.

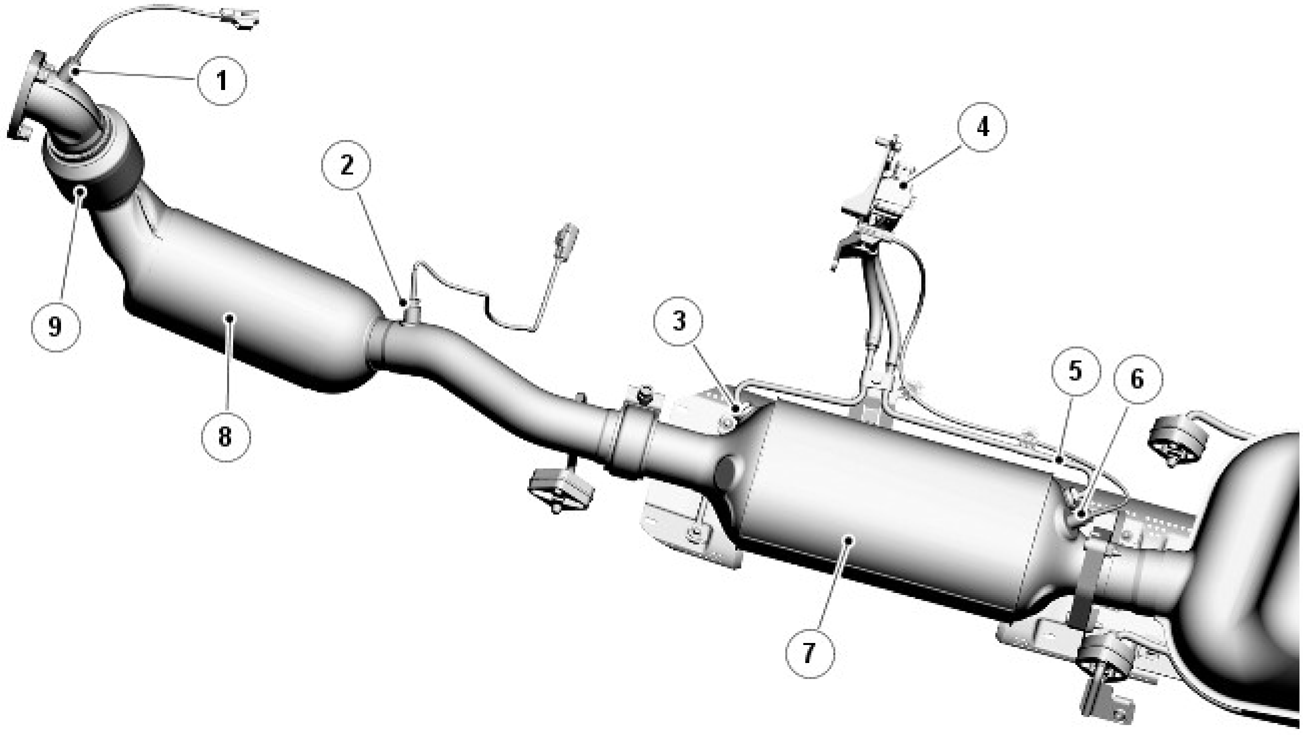
DIESEL PARTICULATE FILTER (DPF) - VEHICLES FROM 2008MY (WHERE FITTED)

On vehicles from 2008MY, an optional Diesel Particulate Filter (DPF) is available.

- NOTE: The non-DPF exhaust system is also available on vehicles from 2008MY.

The DPF system reduces diesel particulate emissions to negligible levels.

DPF System Components



E91610

Item	Part Number	Description
1	-	Exhaust gas temperature sensor (pre catalyst)
2	-	Exhaust gas temperature sensor (post catalyst)
3	-	High pressure sensor pipe
4	-	Differential pressure sensor
5	-	Low pressure sensor pipe

6	-	Exhaust gas temperature sensor (Post DPF)
7	-	Diesel particulate filter
8	-	Catalytic converter

The particulate emissions are the black fumes emitted from the diesel engine under certain load conditions. The emissions are a complex mixture of solid and liquid components with the majority of the particulates being carbon microspheres on which hydrocarbons from the engine's fuel and lubricant condense.

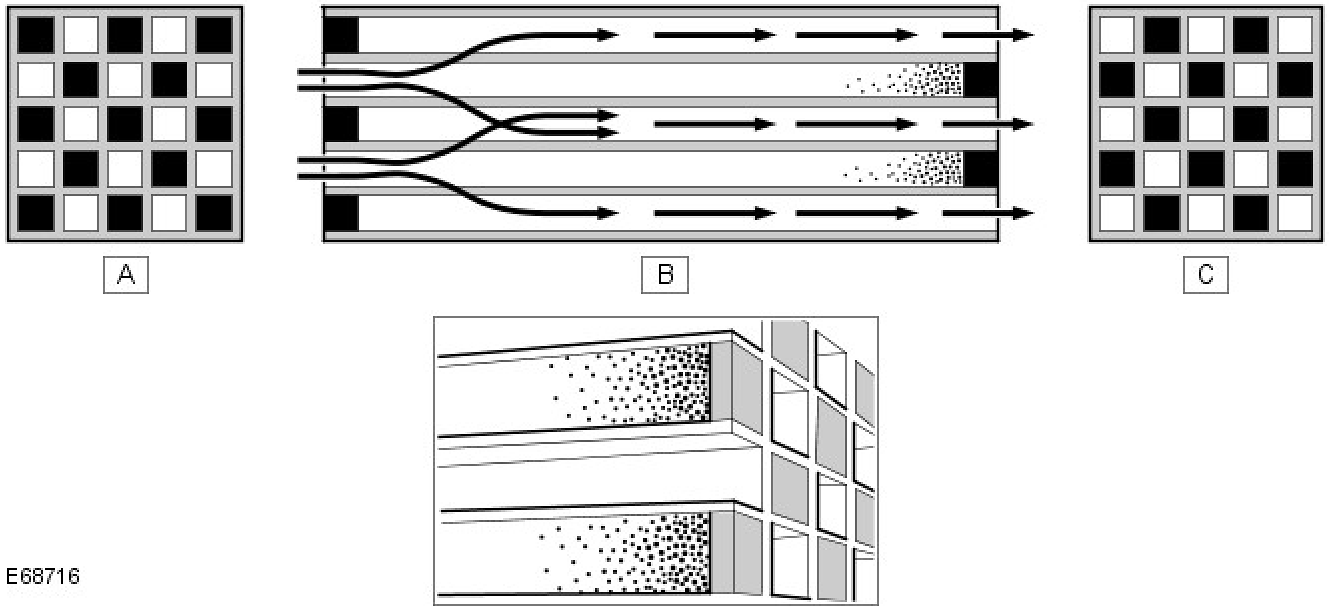
The DPF system comprises the following components:

- Diesel particulate filter
- DPF control software incorporated into the Engine Control Module (ECM)
- Differential pressure sensor.

Diesel Particulate Filter

The DPF is located in the exhaust system, downstream of the catalytic converter. A major feature of the DPF is its ability for regeneration. Regeneration is the burning of particulates trapped by the filter to prevent obstruction to the free flow of exhaust gasses. The regeneration process takes place at calculated intervals and is not noticeable by the driver of the vehicle.

Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged or destroyed. The material trapped in the filter is in the most part carbon particles with some absorbed hydrocarbons.



Item	Part Number	Description
A	-	Front face showing alternate closed cells
B	-	Side view showing exhaust gas flow through the filter and particulate build up
C	-	Rear face showing alternate closed cells

The DPF uses a filter technology based on a filter with a catalytic coating. The DPF is made from silicon carbide housed in a steel container and has excellent thermal shock resistance and thermal conductivity properties. The DPF is designed for the engine's operating requirements to maintain the optimum back pressure requirements.

The porous surface of the filter consists of a number of small parallel channels positioned in the longitudinal direction of the exhaust system. Adjacent channels in the filter are alternately plugged at the end. This design forces the exhaust gasses to flow through the porous filter walls, which act as the filter medium. Particulate matter which are too big to pass through the porous surface are collected and stored in the channels.

The collected particulate matter, if not removed, can create an obstruction to exhaust gas flow. The particles are removed by a regeneration process which oxidizes the particles.

DPF regeneration is controlled by the temperature of the exhaust gasses and the DPF. The DPF includes a wash coat to the filter surface which comprises platinum and other active components and is similar to the catalytic converter. At certain exhaust gas and DPF temperatures the wash coat promotes combustion of the particles in addition to oxidizing carbon monoxide and hydrocarbon emissions.

The exhaust gas and DPF temperatures are controlled by the DPF software located in the ECM. The DPF software monitors the load status of the DPF based on driving style, distance travelled and signals from the differential pressure sensor and temperature sensors. When the particulate loading of the DPF reaches predetermined levels, the DPF is actively regenerated by adjusting, in conjunction with the ECM, various engine control functions such as:

- fuel injection
- intake air throttle
- exhaust gas recirculation
- turbocharger boost pressure control.

The regeneration process is possible because of the flexibility of the common-rail fuel injection engine which provides precise control of fuel flow, fuel pressure and injection timing which are essential requirements to promote the efficient regeneration process.

Two processes are used to regenerate the DPF; passive and active.

Passive Regeneration

Passive regeneration requires no special engine management intervention and occurs during normal engine operation. The passive regeneration involves a slow conversion of the particulate matter deposited in the DPF into carbon dioxide. This process is active when the DPF temperature reaches 250°C (482°F) and is a continuous process when the vehicle is being driven at higher engine loads and speeds.

During passive regeneration, only a portion of the particulate matter is converted into carbon dioxide. This is due to the chemical reaction process which is only effective within the normal operating temperature range of 250°C to 500°C (482°F to 932°F).

Above this temperature range the conversion efficiency of the particulates into carbon dioxide increases as the DPF temperature is raised. These temperatures can only be achieved using the active regeneration process.

Active Regeneration

Active regeneration starts when the particulate loading of the DPF reaches a threshold as monitored or determined by the DPF control software. The threshold calculation is based on driving style, distance travelled and back pressure signals from the differential pressure sensor.

Active regeneration generally occurs every 450 miles (725 km) although this is highly dependant on how the vehicle is driven. For example, if the vehicle is driven at low loads in urban traffic regularly, active regeneration will occur more often. This is due to the rapid build-up of particulates in the DPF than if the vehicle is driven at high speeds when passive regeneration will have occurred.

The DPF software incorporates a mileage trigger which is used as back-up for active regeneration. If active regeneration has not been initiated by a back pressure signal from the differential pressure sensor, regeneration is requested based on distance travelled.

Active regeneration of the DPF is commenced when the temperature of the DPF is increased to the combustion temperature of the particles. The DPF temperature is raised by increasing the exhaust gas temperature. This is achieved by introducing post-injection of fuel after the pilot and main fuel injections have occurred.

This is determined by the DPF software monitoring the signals from the two DPF temperature sensors to establish the temperature of the DPF. Depending on the DPF temperature, the DPF software requests the ECM to perform either one or two post-injections of fuel:

- The first post-injection of fuel retards combustion inside the cylinder which increases the temperature of the exhaust gas.
- The second post-injection of fuel is injected late in the power stroke cycle. The fuel partly combusts in the cylinder, but some unburnt fuel also passes into the exhaust where it creates an exothermic event within the catalytic converter, further increasing the temperature of the DPF.

The active regeneration process takes approximately 20 minutes to complete. The first phase increases the DPF temperature to 500°C (932°F). The second phase further increases the DPF temperature to 600°C (1112°F) which is the optimum temperature for particle combustion. This temperature is then maintained for 15-20 minutes to ensure complete incineration of the particles within the DPF. The incineration process converts the carbon particles to carbon dioxide and water.

The active regeneration temperature of the DPF is closely monitored by the DPF software to maintain a target temperature of 600°C (1112°F) at the DPF inlet. The temperature control ensures that the temperatures do not exceed the operational limits of the turbocharger and the catalytic converter. The turbocharger inlet temperature must not exceed 830°C (1526°F) and the catalytic converter brick temperature must not exceed 800°C (1472°F) and the exit temperature must remain below 750°C (1382°F).

During the active regeneration process the following ECM controlled events occur:

- The turbocharger is maintained in the fully open position. This minimizes heat transmission from the exhaust gas to the turbocharger and reduces the rate of exhaust gas flow allowing optimum heating of the DPF. If the driver demands an increase in engine torque, the turbocharger will respond by closing the vanes as necessary.
- The throttle is closed as this assists in increasing the exhaust gas temperature and reduces the rate of exhaust gas flow which has the effect of reducing the time for the DPF to reach the optimum temperature.
- The Exhaust Gas Recirculation (EGR) valve is closed. The use of EGR decreases the exhaust gas temperature and therefore

prevents the optimum DPF temperature being achieved.

If, due to vehicle usage and/or driving style, the active regeneration process cannot take place or is unable to regenerate the DPF, the dealer can force regenerate the DPF. This is achieved by either driving the vehicle until the engine is at its normal operating temperature and then driving for a further 20 minutes at speeds of not less than 30 mph (48 km/h) or by connecting a Land Rover approved diagnostic system to the vehicle which will guide the technician through an automated regeneration procedure to clean the DPF.

Diesel Particulate Filter Control

The DPF requires constant monitoring to ensure that it is operating at its optimum efficiency and does not become blocked. The ECM contains DPF software which controls the monitoring and operation of the DPF system and also monitors other vehicle data to determine regeneration periods and service intervals.

The DPF software can be divided into three separate control software modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested. The DPF supervisor module is a sub-system of the DPF co-ordinator module.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- Timing and quantity of the four split injections per stroke (pilot, main and two post injections).
- Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- EGR control
- Turbocharger boost pressure control
- Intake air temperature and pressure control.

During active regeneration, the EGR operation is disabled and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

The module controls the intake air temperature by actuating the EGR throttle and by adjustment of the turbocharger boost pressure control.

DPF Co-ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and co-ordinating the following DPF regeneration requests:

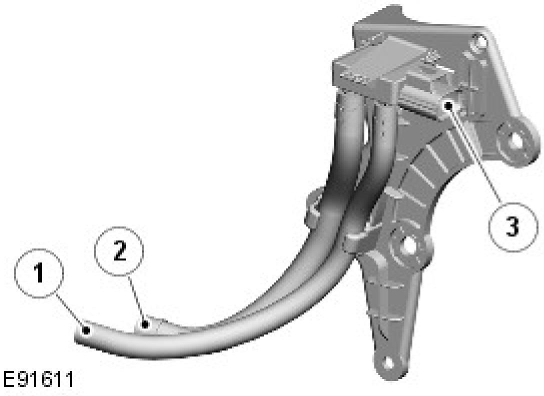
- EGR cut-off
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests EGR cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the EGR system confirming that the EGR valve is closed.

When the EGR valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

Differential Pressure Sensor



Item	Part Number	Description
1	-	Low pressure connection
2	-	High pressure connection
3	-	Electrical connector

The differential pressure sensor is located on a bracket which is attached to the transfer case.

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet and outlet pressures of the DPF

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conjunction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

Differential Particulate Filter Temperature Sensors

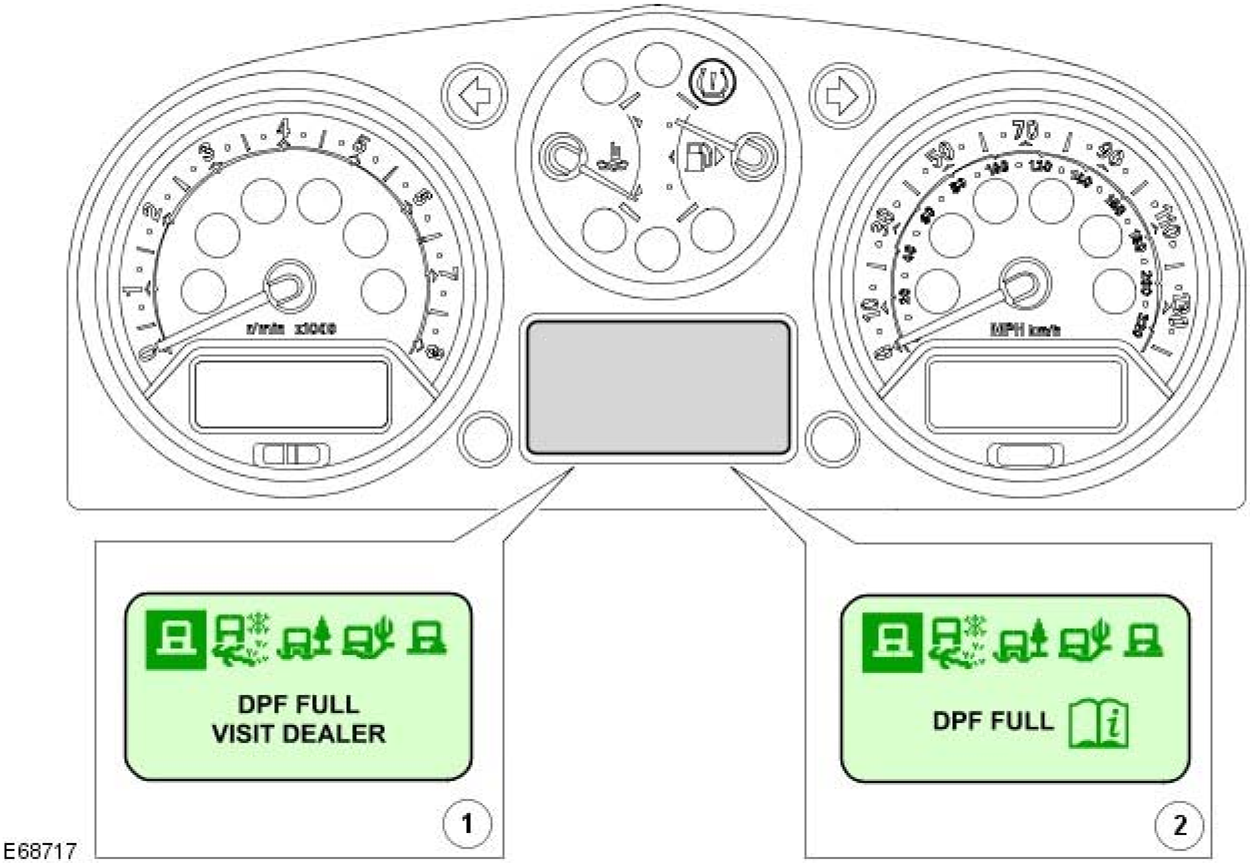
Three temperature sensors are used in the DPF system. The first is located just after the turbocharger in the catalytic converter inlet pipe, the second located in the catalytic converter outlet pipe and the third in the DPF outlet cone pipe work.

The sensors measure the temperature of exhaust gas exiting the turbocharger, after the catalyst and after it passes through the DPF to provide the information needed to calculate the DPF temperature.

The information is used, in conjunction with other data, to estimate the amount of accumulated particulates and to control the DPF temperature.

Instrument Cluster Indications

For drivers who make regular short journeys at low speeds, it may not be possible to efficiently regenerate the DPF. In this case, the DPF software will detect a blockage of the DPF from signals from the differential pressure sensor and will alert the driver as follows.



Item	Part Number	Description
1	-	'DPF FULL VISIT DEALER' message
2	-	'DPF FULL' message

Vehicles with DPF use a high-line instrument cluster to alert the driver to the condition of the DPF via messages in the message centre.

When the DPF becomes full the driver will be alerted to this condition by a message 'DPF FULL' accompanied by a handbook symbol. As detailed in the Owners Handbook, the driver should drive the vehicle until the engine is at its normal operating temperature and then drive for a further 20 minutes at speeds of not less than 30 mph (48 km/h). Successful regeneration of the DPF is indicated to the driver by the 'DPF FULL' message no longer being displayed.

If the DPF software detects that the DPF is still blocked, the message will change to 'DPF FULL VISIT DEALER', the driver should take the vehicle to an authorized dealer to have the DPF force regenerated.

Diesel Particulate Filter Side Effects

The following section details some side effects caused by the active regeneration process.

Engine Oil Dilution

Engine oil dilution can occur due to small amounts of fuel entering the engine crankcase during the post-injection phases. This has made it necessary to introduce a calculation based on driving style to reduce oil service intervals if necessary. The driver is alerted to the oil service by a message in the instrument cluster.

The DPF software monitors the driving style, the frequency of the active regeneration and duration. Using this information a calculation can be made on the engine oil dilution. When the DPF software calculates the engine oil dilution has reached a predetermined threshold (fuel being 7% of engine oil volume) a service message is displayed in the instrument cluster.

Depending on driving style, some vehicles may require an oil service before the designated interval. If an service message is displayed, the vehicle will be required have a full service and the service interval counter will be reset.

Fuel Consumption

During the active regeneration process of the DPF, there will be an increase in fuel consumption. However, because active regeneration occurs infrequently and for limited periods of time, the overall effect on fuel consumption is approximately 2%. The additional fuel used during the active regeneration process is accounted for in the instantaneous and average fuel consumption displays in the instrument cluster.

Diagnosis and Testing

Overview

For additional information, refer to the relevant section of the workshop manual.

Inspection and Verification

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual inspection

Mechanical	Electrical
- Leaks - Metal fatigue - Pipes - Catalytic converter - Muffler(s) - Joints - Mountings - Clearance around components	- Fuses - Wiring harness - Electrical connector(s) - Sensor(s) - Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Noisy or leaking exhaust	- Exhaust system/components	Install new components as necessary. Refer to the relevant section of the workshop manual.
Lack of power	- Air intake system fault - Restricted exhaust system - Low fuel pressure	Check the air intake system. Check for a blocked catalytic converter or muffler, install new components as necessary. Check the fuel pressure. Refer to the relevant section of the workshop manual.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to section 303-14 - Electronic Engine Controls section of the workshop manual.

Exhaust System - TDV6 2.7L Diesel - Tailpipe

Removal and Installation

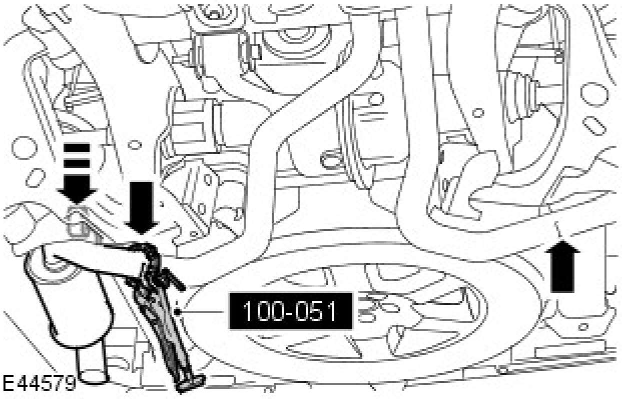
Special Tool(s)	
	Pipe cutter-exhaust 100-051 (LRT-99-027)

Removal

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

   Raise and support the vehicle.

2. Remove the tail pipe.
   - Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.
   - Disconnect from the exhaust hanger.



Installation

1. NOTE: Do not tighten the retaining clamp at this stage.

   Install the tail pipe.
   - Clean the components.
   - Install the retaining clamp.

2. Align the tail pipe and tighten the retaining clamp to 55 Nm (40 lb.ft).

Removal and Installation

Removal

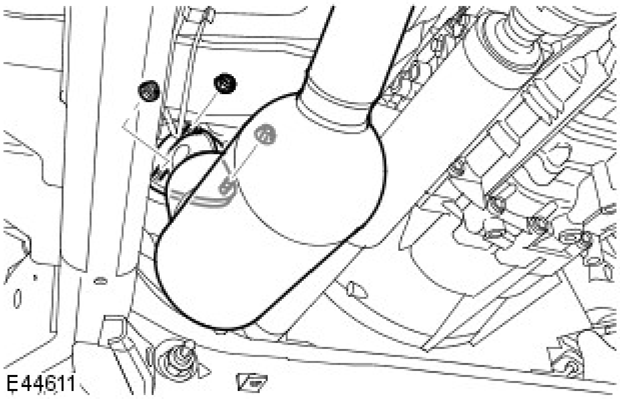
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

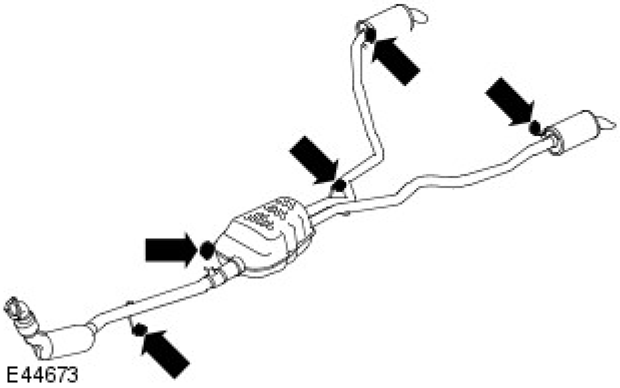
3. Remove the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

4. Remove the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).



5. Disconnect the catalytic converter from the exhaust manifold.

- Remove the 3 nuts.
- Discard the gasket.



6. With assistance, remove the exhaust system.

- Disconnect the 5 exhaust hangers.

Installation

1. With assistance, install the exhaust system.

- Attach the exhaust hangers.

2. Position the catalytic converter to the exhaust manifold.

- Clean the components.

- Install a new gasket.
- Tighten the nuts to 48 Nm (35 lb.ft).

3. Install the transmission crossmember.
For additional information, refer to: Transmission Support Crossmember (502-02 Full Frame and Body Mounting, Removal and Installation).

4. Install the engine undershield.
For additional information, refer to: Engine Undershield (501-02 Front End Body Panels, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Exhaust System - TDV6 2.7L Diesel - MufflerVehicles Without: Diesel Particulate Filter (DPF)

Removal and Installation

Special Tool(s)	
	Pipe cutter-exhaust 100-051 (LRT-99-027)

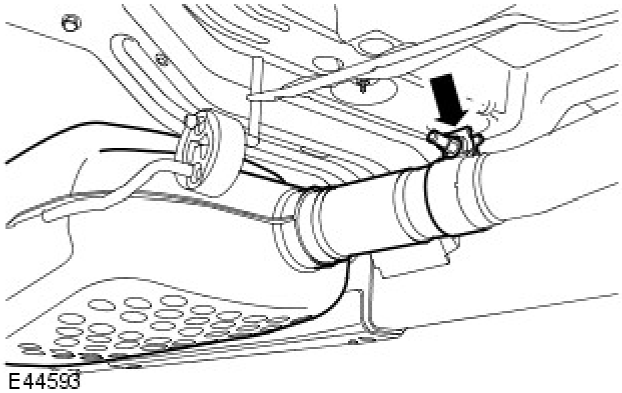
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

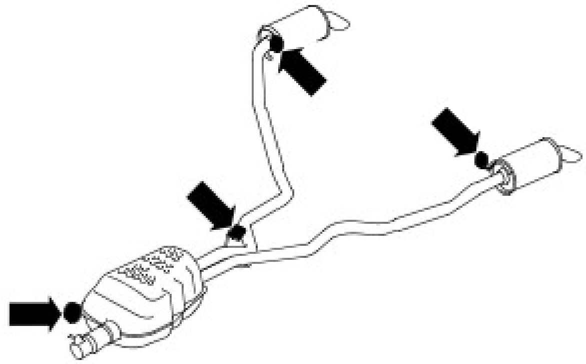
2. Disconnect the catalytic converter from the muffler assembly.

- Remove the nut and release the retaining clamp.



3. With assistance, remove the muffler assembly.

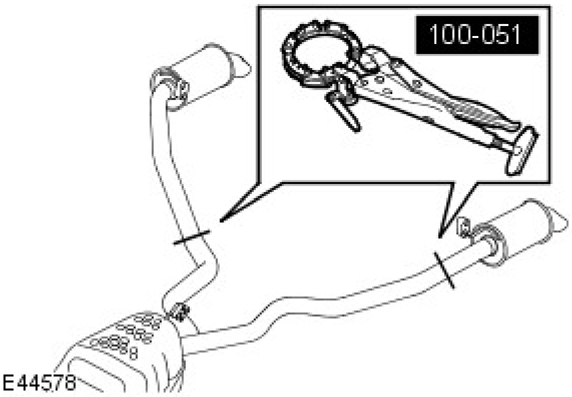
- Disconnect the 4 exhaust hangers.



4. NOTE: Do not disassemble further if the component is removed for access only.

Remove the LH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.



5. Remove the RH tail pipe.

- Using 100-051, cut the tail pipe at the point indicated by a depression in the pipe.

Installation

1. NOTE: Do not tighten the retaining clamp at this stage.

Position the RH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

2. NOTE: Do not tighten the retaining clamp at this stage.

Position the LH tail pipe to the muffler assembly.

- Clean the components.
- Install the retaining clamp.

3. With assistance, install the muffler assembly.

- Attach the exhaust hangers.
- Tighten the catalytic converter nuts and clamp to 48 Nm (35 lb.ft).

4. Align both tail pipes and tighten the retaining clamps to 55 Nm (40 lb.ft).

OVERVIEW

The TDV8 exhaust system is fabricated from stainless steel and is supplied as three separate assemblies; a LH front section incorporating a catalytic converter, a RH front section incorporating a catalytic converter and a rear section incorporating a centre silencer and two rear silencers. In service sections of the system can be replaced individually. Service joints are identified by indentations on the pipes which show where the exhaust pipes can be cut to accommodate replacement sections.

After the replacement sections are positioned, the system integrity is restored by sealing the service joints with one piece sleeves and two clamps to connect the pipes at the cut points.

The system is attached to the underside of the body with four rubber mountings which are located on mild steel hanger bars that are welded to the system. The rubber mountings locate on adjacent hanger brackets which are bolted to the underside of the vehicle body.

On vehicles from 2008MY, an optional Diesel Particulate Filter (DPF) is available. The non-DPF exhaust system is also available on vehicles from 2008MY as the DPF is not required to comply with EU4 emission regulations.

- CAUTIONS:

⚠ The use of bio-fuels can seriously contaminate and destroy the coatings used on the catalytic converter. The DPF and the catalytic converter can become irreversibly contaminated if non-specified oils or fuels are used. This will result in the vehicle being unable to regenerate the DPF, becoming non-compliant with tailpipe emission regulations and replacement of the catalytic converter and DPF will be required.

⚠ If the vehicle is waded in deep water and the engine is stopped with the tailpipes submerged, the water, which can enter the system, can also contaminate both the DPF and the catalytic converter. This again can result in catalytic converter damage and damaging the ability for the DPF to regenerate therefore requiring both components to be replaced.

FRONT SECTION

The front down pipes have a welded flange with three holes which provide for the attachment to the turbocharger using three bolts. The flange is sealed with a metal gasket.

The flange is welded to a fabricated elbow which feeds into a decoupler which in turn is connected to the 2.2 liter (134 in^3) catalytic converter.

Vehicles without DPF

On the LH front section, the converter outlet pipe is welded to the converter body. The rear of the outlet pipe is inserted into the flared end of the rear section. A clamp is used to compress and secure the joint.

On the RH front section, the converter outlet pipe is welded to the converter body. The rear of the pipe curves left, under the transmission and then curves again to run parallel to the LH pipe. The end of the pipe has a welded flange with two holes which locate on two studs on the rear section and is secured with nuts. A metal gasket is used to seal the joint between the front and rear section flanges.

Vehicles with DPF - From 2008MY

On the LH front section, the converter outlet pipe is welded to the converter body. The rear of the outlet pipe is inserted into the flared end of the DPF. A clamp is used to compress and secure the joint.

On the RH front section, the converter outlet pipe is welded to the converter body. The rear of the pipe curves left, under the transmission and then curves again to run parallel to the LH pipe. The end of the pipe has a welded flange with two holes which locate on two studs on the DPF and is secured with nuts. A metal gasket is used to seal the joint between the front and rear section flanges.

REAR SECTION

Vehicles without DPF

The rear section has a short tube welded to the front silencer assembly which is flared to locate the LH front section. A second short tube, also welded to the front silencer assembly, has a welded flange with captive studs to provide attachment for the flange on the RH front section.

Vehicles with Optional DPF - From 2008MY

The rear section has a short tube welded to the DPF which is flared to locate the LH front section. A second short tube, also welded to the DPF, has a welded flange with captive studs to provide attachment for the flange on the RH front section.

Vehicles without DPF

The front silencer comprises rolled stainless steel casing which is clenched via a lockseam giving a capacity of 6.4 liters (391 in^3). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. A hanger bar is welded to the front right hand side of the silencer and provides for the location of a mounting rubber.

Vehicles with Optional DPF - From 2008MY

The front silencer is connected to the DPF with two welded tubes. The front silencer comprises two pressed stainless steel shells which are welded together to give a capacity of 25.2 liters (1537 in^3). The silencer contains baffles and perforated tubes which reduce noise as the exhaust gases pass through the silencer. A hanger bar is welded to the front right hand side of the silencer and provides for the location of a mounting rubber. The change in silencer design for 08MY with DPF was introduced to address sound quality is during regeneration under light load driving conditions.

All Models

The front silencer has two 50 mm (1.96 in) diameter outlet pipes, with a 1.5 mm (0.06 in) wall thickness, which are curved to pass around the rear suspension components. Each outlet pipe terminates in a welded joint with the rear silencers.

A hanger bar is welded to the front face of each rear silencer and provides for the location of a mounting rubber. The silencer is a circular fabrication with a baffle tube which is surrounded with glass fibre to provide further noise suppression. Each rear silencer has a capacity of 2.7 liters (164 in^3).

The rear silencers each have an outlet pipe which is curved downwards to distribute exhaust gasses away from the rear of the vehicle.

CATALYTIC CONVERTERS

The engine management system provides accurately metered quantities of fuel to the combustion chambers to ensure the most efficient use of fuel and to minimise the exhaust emissions. To further reduce the carbon monoxide and hydrocarbons content of the exhaust gasses, catalytic converters are integrated into the front sections of the exhaust system.

To further reduce the carbon monoxide and hydrocarbons content of the exhaust gases, a catalytic converter (Diesel Oxidation Catalyst) is integrated into the front pipe of the exhaust system. In the catalytic converter the exhaust gases are passed through honeycombed ceramic elements coated with a special surface treatment called 'washcoat'. The washcoat increases the surface area of the ceramic elements by a factor of approximately 7000. On top of the washcoat is a coating containing platinum on vehicles without a DPF or platinum and palladium on vehicles with a DPF, which are the active constituents for converting harmful emissions into inert by-products. The platinum and palladium adds oxygen to the carbon monoxide and the hydrocarbons in the exhaust gases, to convert them into carbon dioxide and water.

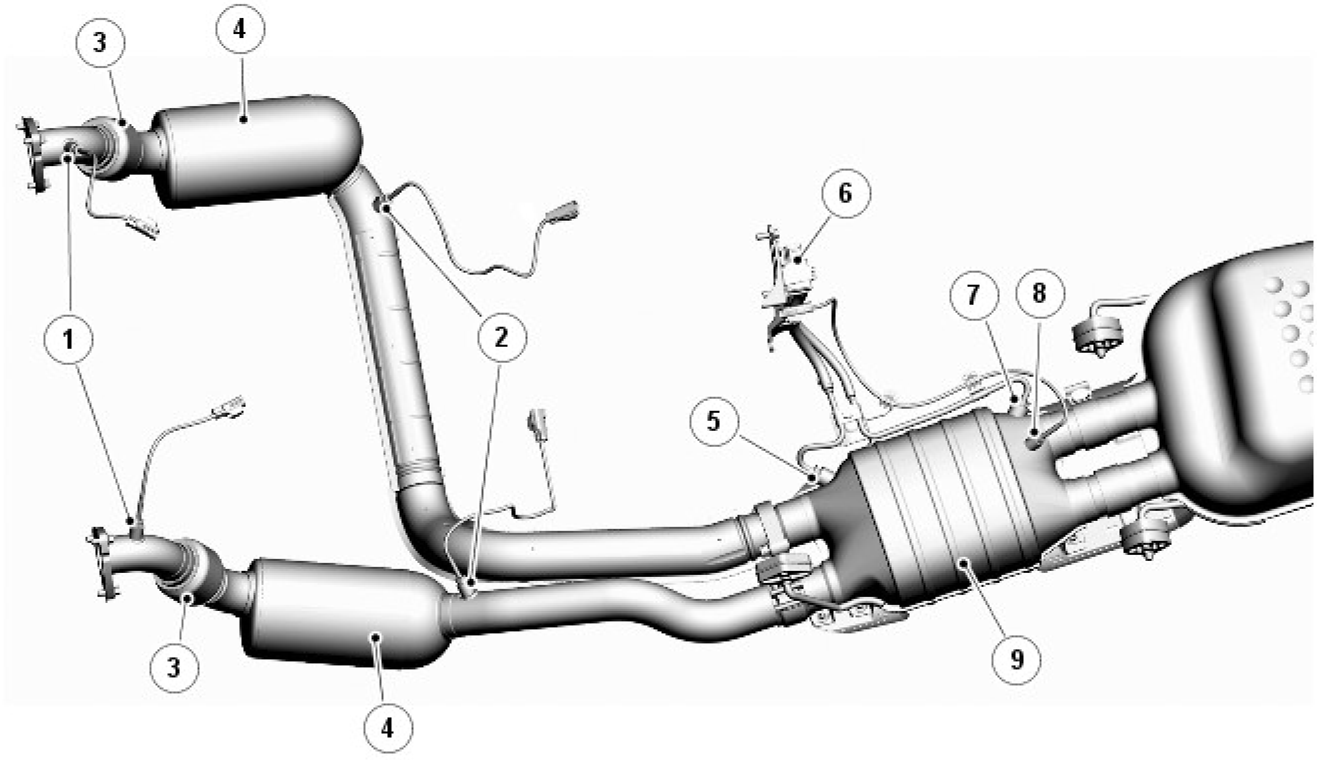
DIESEL PARTICULATE FILTER (DPF) - VEHICLES FROM 2008MY (WHERE FITTED)

On vehicles from 2008MY, an optional Diesel Particulate Filter (DPF) is available.

- NOTE: The non-DPF exhaust system is also available on vehicles from 2008MY.

The DPF system reduces diesel particulate emissions to negligible levels.

DPF System Components



E91639

Item	Part Number	Description
1	-	Exhaust gas temperature sensor (pre catalyst)
2	-	Exhaust gas temperature sensor (post catalyst)
3	-	Flexible decoupler
4	-	Catalytic converter
5	-	High pressure sensor pipe
6	-	Differential pressure sensor
7	-	Low pressure sensor pipe
8	-	Exhaust gas temperature sensor (Post DPF)
9	-	Diesel particulate filter

The particulate emissions are the black fumes emitted from the diesel engine under certain load conditions. The emissions are a complex mixture of solid and liquid components with the majority of the particulates being carbon microspheres on which hydrocarbons from the engine's fuel and lubricant condense.

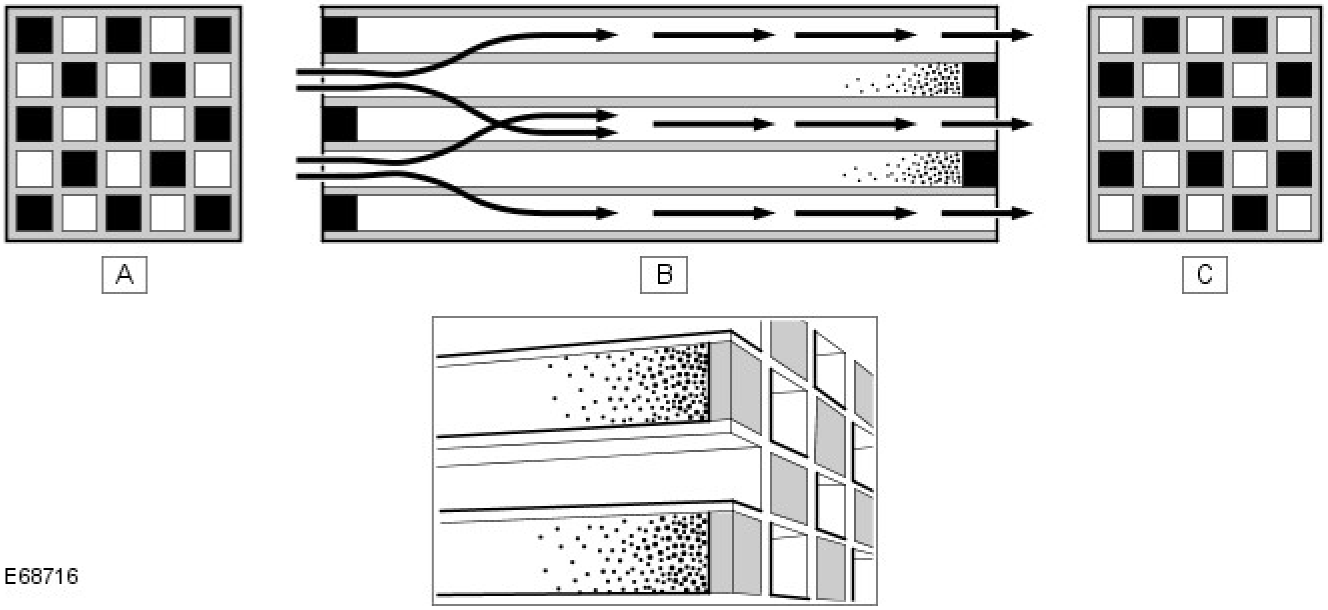
The DPF system comprises the following components:

- Diesel particulate filter
- DPF control software incorporated into the Engine Control Module (ECM)
- Differential pressure sensor.

Diesel Particulate Filter

The DPF is located in the exhaust system, downstream of the catalytic converter. A major feature of the DPF is its ability for regeneration. Regeneration is the burning of particulates trapped by the filter to prevent obstruction to the free flow of exhaust gasses. The regeneration process takes place at calculated intervals and is not noticeable by the driver of the vehicle.

Regeneration is most important, since an overfilled filter can damage the engine through excessive exhaust back pressure and can itself be damaged or destroyed. The material trapped in the filter is in the most part carbon particles with some absorbed hydrocarbons.



Item	Part Number	Description
A	-	Front face showing alternate closed cells
B	-	Side view showing exhaust gas flow through the filter and particulate build up
C	-	Rear face showing alternate closed cells

The DPF uses a filter technology based on a filter with a catalytic coating. The DPF is made from silicon carbide housed in a steel container and has excellent thermal shock resistance and thermal conductivity properties. The DPF is designed for the engine's operating requirements to maintain the optimum back pressure requirements.

The porous surface of the filter consists of a number of small parallel channels positioned in the longitudinal direction of the exhaust system. Adjacent channels in the filter are alternately plugged at the end. This design forces the exhaust gasses to flow through the porous filter walls, which act as the filter medium. Particulate matter which are too big to pass through the porous surface are collected and stored in the channels.

The collected particulate matter, if not removed, can create an obstruction to exhaust gas flow. The particles are removed by a regeneration process which oxidizes the particles.

DPF regeneration is controlled by the temperature of the exhaust gasses and the DPF. The DPF includes a wash coat to the filter surface which comprises platinum and other active components and is similar to the catalytic converter. At certain exhaust gas and DPF temperatures the wash coat promotes combustion of the particles in addition to oxidizing carbon monoxide and hydrocarbon emissions.

The exhaust gas and DPF temperatures are controlled by the DPF software located in the ECM. The DPF software monitors the load status of the DPF based on driving style, distance travelled and signals from the differential pressure sensor and temperature sensors. When the particulate loading of the DPF reaches predetermined levels, the DPF is actively regenerated by adjusting, in conjunction with the ECM, various engine control functions such as:

- fuel injection
- intake air throttle
- exhaust gas recirculation
- turbocharger boost pressure control.

The regeneration process is possible because of the flexibility of the common-rail fuel injection engine which provides precise control of fuel flow, fuel pressure and injection timing which are essential requirements to promote the efficient regeneration process.

Two processes are used to regenerate the DPF; passive and active.

Passive Regeneration

Passive regeneration requires no special engine management intervention and occurs during normal engine operation. The passive regeneration involves a slow conversion of the particulate matter deposited in the DPF into carbon dioxide. This process is active when the DPF temperature reaches 250°C (482°F) and is a continuous process when the vehicle is being driven at higher engine loads and speeds.

During passive regeneration, only a portion of the particulate matter is converted into carbon dioxide. This is due to the chemical reaction process which is only effective within the normal operating temperature range of 250°C to 500°C (482°F to 932°F).

Above this temperature range the conversion efficiency of the particulates into carbon dioxide increases as the DPF temperature is raised. These temperatures can only be achieved using the active regeneration process.

Active Regeneration

Active regeneration starts when the particulate loading of the DPF reaches a threshold as monitored or determined by the DPF control software. The threshold calculation is based on driving style, distance travelled and back pressure signals from the differential pressure sensor.

Active regeneration generally occurs every 450 miles (725 km) although this is highly dependant on how the vehicle is driven. For example, if the vehicle is driven at low loads in urban traffic regularly, active regeneration will occur more often. This is due to the rapid build-up of particulates in the DPF than if the vehicle is driven at high speeds when passive regeneration will have occurred.

The DPF software incorporates a mileage trigger which is used as back-up for active regeneration. If active regeneration has not been initiated by a back pressure signal from the differential pressure sensor, regeneration is requested based on distance travelled.

Active regeneration of the DPF is commenced when the temperature of the DPF is increased to the combustion temperature of the particles. The DPF temperature is raised by increasing the exhaust gas temperature. This is achieved by introducing post-injection of fuel after the pilot and main fuel injections have occurred.

This is determined by the DPF software monitoring the signals from the two DPF temperature sensors to establish the temperature of the DPF. Depending on the DPF temperature, the DPF software requests the ECM to perform either one or two post-injections of fuel:

- The first post-injection of fuel retards combustion inside the cylinder which increases the temperature of the exhaust gas.
- The second post-injection of fuel is injected late in the power stroke cycle. The fuel partly combusts in the cylinder, but some unburnt fuel also passes into the exhaust where it creates an exothermic event within the catalytic converter, further increasing the temperature of the DPF.

The active regeneration process takes approximately 20 minutes to complete. The first phase increases the DPF temperature to 500°C (932°F). The second phase further increases the DPF temperature to 600°C (1112°F) which is the optimum temperature for particle combustion. This temperature is then maintained for 15-20 minutes to ensure complete incineration of the particles within the DPF. The incineration process converts the carbon particles to carbon dioxide and water.

The active regeneration temperature of the DPF is closely monitored by the DPF software to maintain a target temperature of 600°C (1112°F) at the DPF inlet. The temperature control ensures that the temperatures do not exceed the operational limits of the turbocharger and the catalytic converter. The turbocharger inlet temperature must not exceed 830°C (1526°F) and the catalytic converter brick temperature must not exceed 800°C (1472°F) and the exit temperature must remain below 750°C (1382°F).

During the active regeneration process the following ECM controlled events occur:

- The turbocharger is maintained in the fully open position. This minimizes heat transmission from the exhaust gas to the turbocharger and reduces the rate of exhaust gas flow allowing optimum heating of the DPF. If the driver demands an increase in engine torque, the turbocharger will respond by closing the vanes as necessary.
- The throttle is closed as this assists in increasing the exhaust gas temperature and reduces the rate of exhaust gas flow which has the effect of reducing the time for the DPF to reach the optimum temperature.
- The Exhaust Gas Recirculation (EGR) valve is closed. The use of EGR decreases the exhaust gas temperature and therefore prevents the optimum DPF temperature being achieved.

If, due to vehicle usage and/or driving style, the active regeneration process cannot take place or is unable to regenerate the DPF, the dealer can force regenerate the DPF. This is achieved by either driving the vehicle until the engine is at its normal operating temperature and then driving for a further 20 minutes at speeds of not less than 30 mph (48 km/h) or by connecting a Land Rover approved diagnostic system to the vehicle which will guide the technician through an automated regeneration procedure to clean the DPF.

Diesel Particulate Filter Control

The DPF requires constant monitoring to ensure that it is operating at its optimum efficiency and does not become blocked. The ECM contains DPF software which controls the monitoring and operation of the DPF system and also monitors other vehicle data to determine regeneration periods and service intervals.

The DPF software can be divided into three separate control software modules; a DPF supervisor module, a DPF fuel management module and a DPF air management module.

These three modules are controlled by a fourth software module known as the DPF co-ordinator module. The co-ordinator module manages the operation of the other modules when an active regeneration is requested. The DPF supervisor module is a sub-system of the DPF co-ordinator module.

DPF Fuel Management Module

The DPF fuel management module controls the following functions:

- Timing and quantity of the four split injections per stroke (pilot, main and two post injections).
- Injection pressure and the transition between the three different calibration levels of injection.

The above functions are dependant on the condition of the catalytic converter and the DPF.

The controlled injection determines the required injection level in addition to measuring the activity of the catalytic converter and the DPF. The fuel management calculates the quantity and timing for the four split injections, for each of the three calibration levels for injection pressure, and also manages the transition between the levels.

The two post injections are required to separate the functionality of increasing in-cylinder gas temperatures and the production of hydrocarbons. The first post injection is used to generate the higher in-cylinder gas temperature while simultaneously retaining the same engine torque output produced during normal (non-regeneration) engine operation. The second post injection is used to generate hydrocarbons by allowing unburnt fuel into the catalytic converter without producing increased engine torque.

DPF Air Management Module

The DPF air management module controls the following functions:

- EGR control
- Turbocharger boost pressure control
- Intake air temperature and pressure control.

During active regeneration, the EGR operation is disabled and the closed-loop activation of the turbocharger boost controller is calculated. The air management module controls the air in the intake manifold to a predetermined level of pressure and temperature. This control is required to achieve the correct in-cylinder conditions for stable and robust combustion of the post injected fuel.

The module controls the intake air temperature by actuating the EGR throttle and by adjustment of the turbocharger boost pressure control.

DPF Co-ordinator Module

The DPF co-ordinator module reacts to a regeneration request from the supervisor module by initiating and co-ordinating the following DPF regeneration requests:

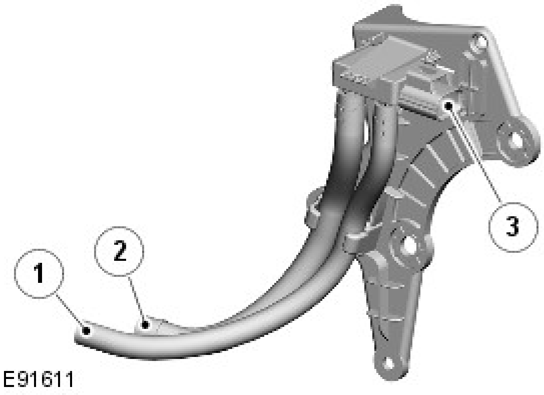
- EGR cut-off
- Turbocharger boost pressure control
- Engine load increase
- Control of air pressure and temperature in the intake manifold
- Fuel injection control.

When the supervisor module issues a regeneration request, the co-ordinator module requests EGR cut-off and a regeneration specific turbocharger boost pressure control. It then waits for a feedback signal from the EGR system confirming that the EGR valve is closed.

When the EGR valve is closed, the co-ordinator module initiates requests to increase engine load by controlling the intake air temperature and pressure.

Once confirmation is received that intake conditions are controlled or a calibration time has expired, the co-ordinator module then changes to a state awaiting an accelerator pedal release manoeuvre from the driver. If this occurs or a calibration time has expired, the co-ordinator module generates a request to control fuel injections to increase exhaust gas temperature.

Differential Pressure Sensor



Item	Part Number	Description
1	-	Low pressure connection
2	-	High pressure connection
3	-	Electrical connector

The differential pressure sensor is located on a bracket which is attached to the transfer case.

The differential pressure sensor is used by the DPF software to monitor the condition of the DPF. Two pipe connections on the sensor are connected by pipes to the inlet and outlet ends of the DPF. The pipes allow the sensor to measure the inlet and outlet pressures of the DPF

As the amount of particulates trapped by the DPF increases, the pressure at the inlet side of the DPF increases in comparison to the DPF outlet. The DPF software uses this comparison, in conjunction with other data, to calculate the accumulated amount of trapped particulates.

By measuring the pressure difference between the DPF inlet and outlet and the DPF temperature, the DPF software can determine if the DPF is becoming blocked and requires regeneration.

Differential Particulate Filter Temperature Sensors

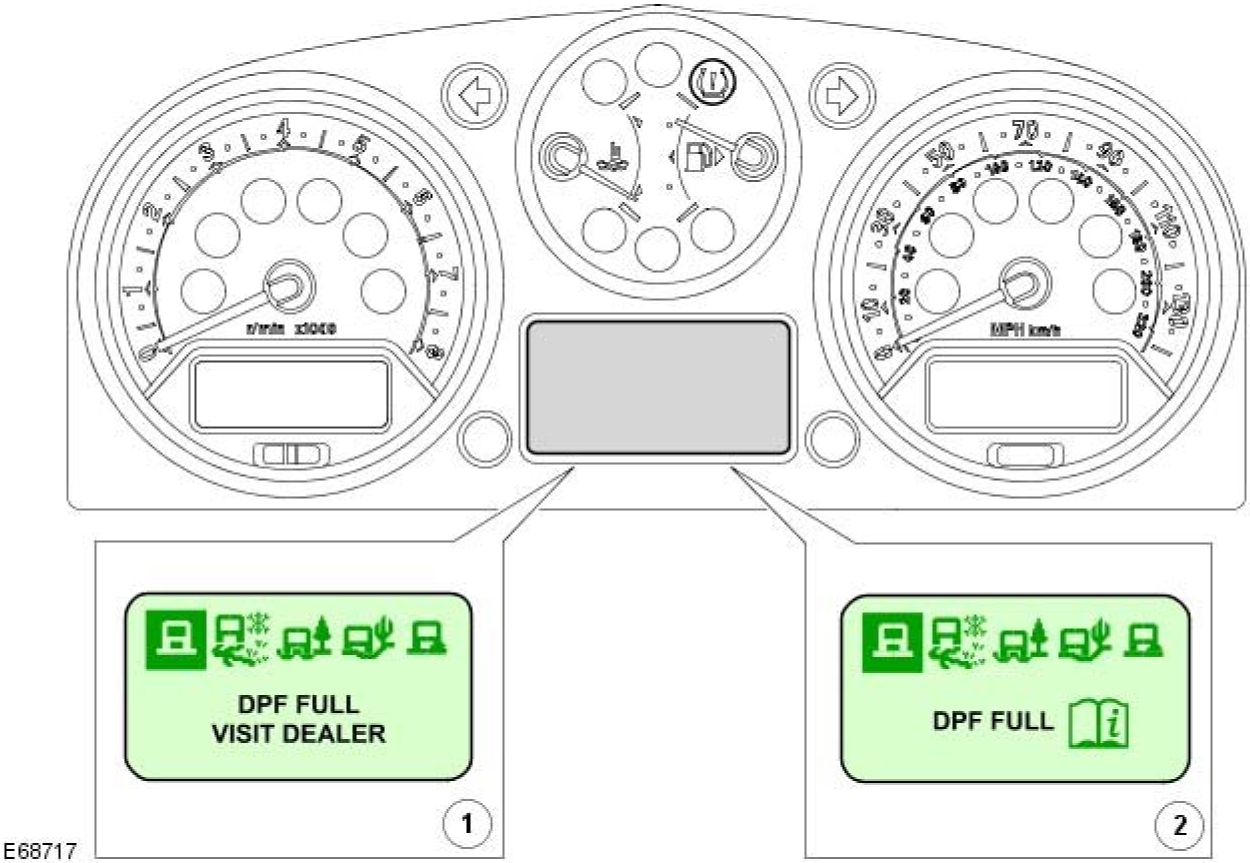
Three temperature sensors are used in the DPF system. The first is located just after the turbocharger in the catalytic converter inlet pipe, the second located in the catalytic converter outlet pipe and the third in the DPF outlet cone pipe work.

The sensors measure the temperature of exhaust gas exiting the turbocharger, after the catalyst and after it passes through the DPF to provide the information needed to calculate the DPF temperature.

The information is used, in conjunction with other data, to estimate the amount of accumulated particulates and to control the DPF temperature.

Instrument Cluster Indications

For drivers who make regular short journeys at low speeds, it may not be possible to efficiently regenerate the DPF. In this case, the DPF software will detect a blockage of the DPF from signals from the differential pressure sensor and will alert the driver as follows.



Item	Part Number	Description
1	-	'DPF FULL VISIT DEALER' message
2	-	'DPF FULL' message

Vehicles with DPF use a high-line instrument cluster to alert the driver to the condition of the DPF via messages in the message centre.

When the DPF becomes full the driver will be alerted to this condition by a message 'DPF FULL' accompanied by a handbook symbol. As detailed in the Owners Handbook, the driver should drive the vehicle until the engine is at its normal operating temperature and then drive for a further 20 minutes at speeds of not less than 30 mph (48 km/h). Successful regeneration of the DPF is indicated to the driver by the 'DPF FULL' message no longer being displayed.

If the DPF software detects that the DPF is still blocked, the message will change to 'DPF FULL VISIT DEALER', the driver should take the vehicle to an authorized dealer to have the DPF force regenerated.

Diesel Particulate Filter Side Effects

The following section details some side effects caused by the active regeneration process.

Engine Oil Dilution

Engine oil dilution can occur due to small amounts of fuel entering the engine crankcase during the post-injection phases. This has made it necessary to introduce a calculation based on driving style to reduce oil service intervals if necessary. The driver is alerted to the oil service by a message in the instrument cluster.

The DPF software monitors the driving style, the frequency of the active regeneration and duration. Using this information a calculation can be made on the engine oil dilution. When the DPF software calculates the engine oil dilution has reached a predetermined threshold (fuel being 7% of engine oil volume) a service message is displayed in the instrument cluster.

Depending on driving style, some vehicles may require an oil service before the designated interval. If an service message is displayed, the vehicle will be required have a full service and the service interval counter will be reset.

Fuel Consumption

During the active regeneration process of the DPF, there will be an increase in fuel consumption. However, because active regeneration occurs infrequently and for limited periods of time, the overall effect on fuel consumption is approximately 2%. The additional fuel used during the active regeneration process is accounted for in the instantaneous and average fuel consumption displays in the instrument cluster.

3. Release the DPF differential pressure sensor.

- Release the clip.

4. ⚠ CAUTION: Make a note of the connection orientation of the high and low pressure hoses to the sensor ports. Make sure the hoses are located to the correct sensor port when installed. Failure to follow these instructions may result in damage to the vehicle.

Disconnect the high and low pressure hoses from the DPF differential pressure sensor.

- Release the 2 clips.

Installation

1. Connect the high and low pressure hoses to the DPF differential pressure sensor.

- Secure the clips.

2. Secure the DPF differential pressure sensor.

- Secure with the clip.

3. Connect the DPF differential pressure sensor electrical connector.

Exhaust System - TDV8 3.6L Diesel - MufflerVehicles With: Diesel Particulate Filter (DPF)

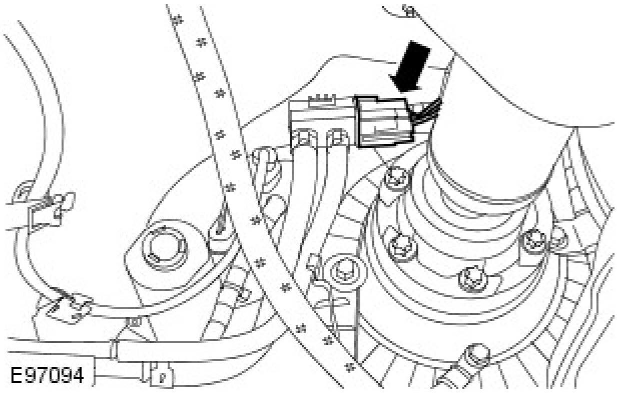
Removal and Installation

Special Tool(s)	
	Pipe cutter-exhaust 100-051(LRT-99-027)

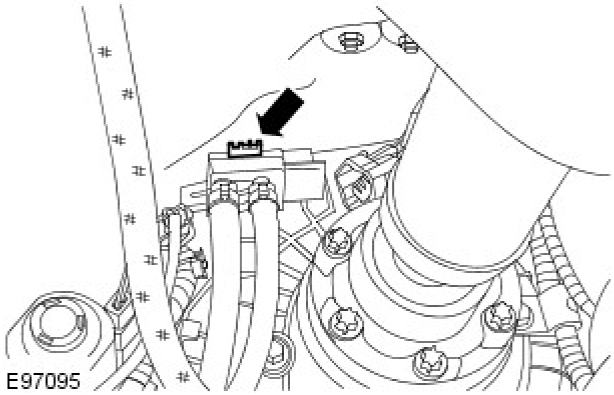
Removal

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

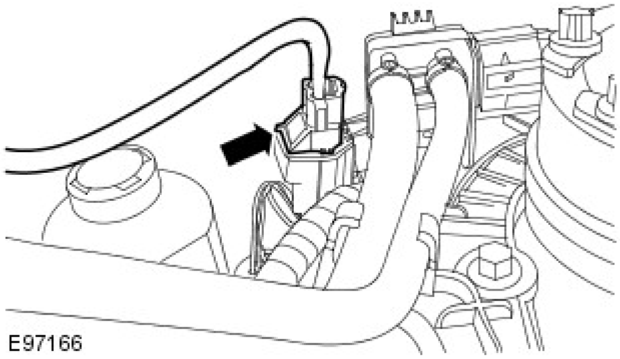


2. Disconnect the diesel particulate filter (DPF) differential pressure sensor electrical connector.

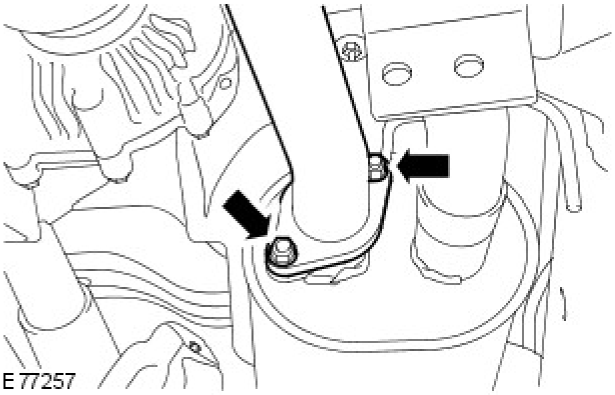


3. Release the DPF differential pressure sensor.

- Release the clip.



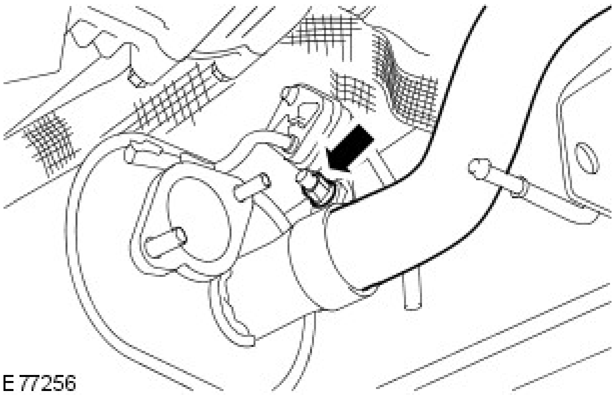
4. Disconnect the DPF exhaust gas temperature sensor electrical connector.



5. NOTE: Discard the gasket.

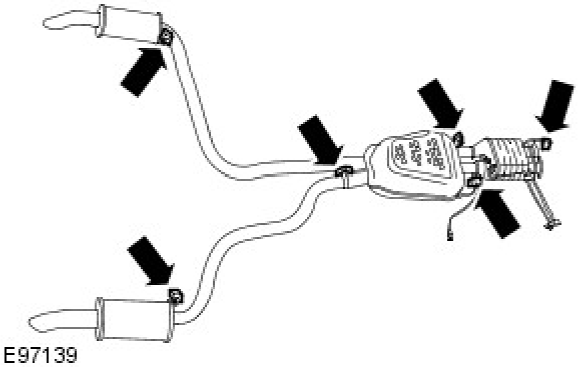
Release the RH catalytic converter from the exhaust system.

- Remove the 2 nuts.



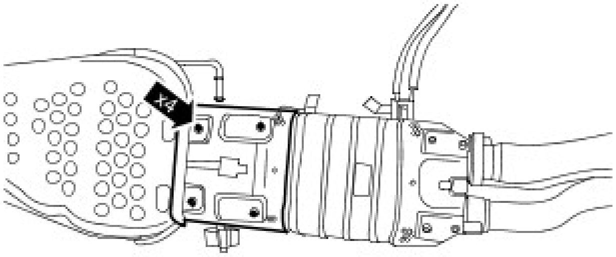
6. Release the LH catalytic converter from the exhaust system.

- Release the exhaust clamp.
- Remove and discard the clamp.



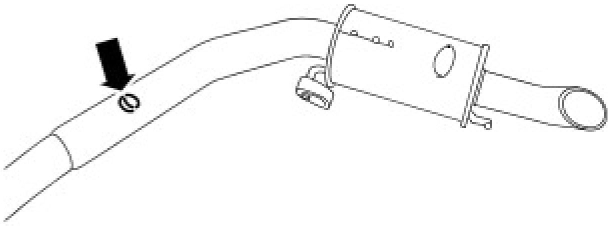
7. With assistance, remove the DPF and tailpipe assembly.

- Using a suitable stand, support the exhaust.
- Disconnect the 6 exhaust hangers.



E97387

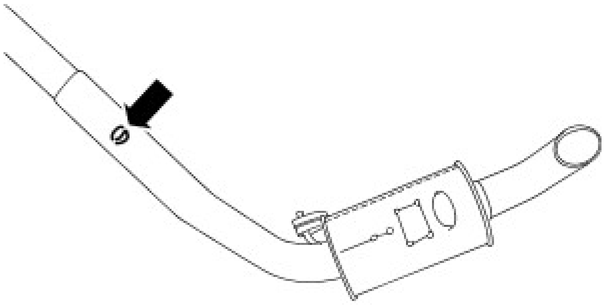
8. Remove the DPF rear heat shield.



E87326

9. Remove the LH tail pipe.

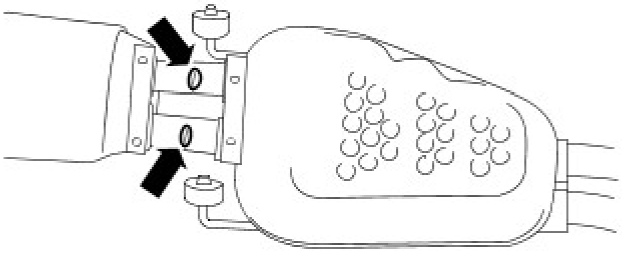
- Using the special tool, cut the exhaust pipe at the marked position.



E87327

10. Remove the RH tail pipe.

- Using the special tool, cut the exhaust pipe at the marked position.



E97386

11. Remove the muffler.

- Using the special tool, cut the exhaust pipes at the marked positions.

Installation

1. NOTE: Do not fully tighten the clamps at this stage.

• NOTE: Clean the component mating faces.

Install the muffler to the DPF.

- Install the 2 clamps.

2. NOTE: Do not fully tighten the clamp at this stage.

• NOTE: Clean the component mating faces.

Install the RH tail pipe to the muffler assembly.

- Install the clamp.

3. NOTE: Do not fully tighten the clamp at this stage.

• NOTE: Clean the component mating faces.

Install the LH tail pipe to the muffler assembly.

- Install the clamp.

4. NOTE: Install a new LH catalytic converter clamp.

With assistance, install the DPF and tailpipe assembly.

- Connect the exhaust hangers.

5. NOTE: Clean the component mating faces.

• NOTE: Install a new gasket.

Secure the RH catalytic converter to the exhaust system.

- Tighten the nuts to 48 Nm (35 lb.ft).

6. Secure the LH catalytic converter to the exhaust system.

- Tighten the nut to 48 Nm (35 lb.ft).

7. Secure the muffler to the DPF.

- Tighten the clamps to 48 Nm (35 lb.ft).

8. Install the DPF rear heat shield.

- Tighten the bolts to 10 Nm (7 lb.ft).

9. Align both of the tail pipes and tighten the clamps to 48 Nm (35 lb.ft).

10. Secure the DPF differential pressure sensor.

11. Connect the DPF differential pressure sensor electrical connector.

12. Connect the DPF exhaust gas temperature sensor electrical connector.

General Procedures

Special Tool(s)	
	Adapter - fuel pressure check 310-116(LRT-19-006A)

- WARNINGS:

⚠ Do not carry out any repairs to the fuel system with the engine running. The fuel pressure within the system can be as high as 1650 bar (23,931 lb-sq-in). Failure to follow this instruction may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

⚠ Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

⚠ Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

⚠ Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

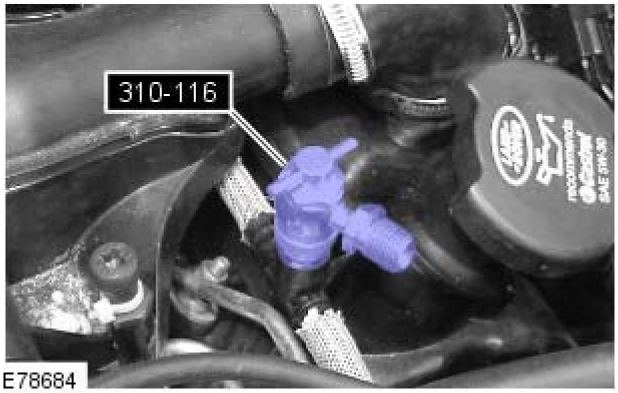
⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

- CAUTIONS:

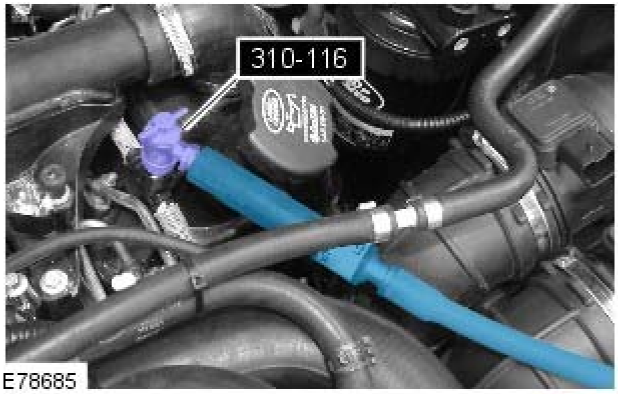
⚠ Make sure that any protective clothing worn is clean and made from lint-free non-flocking material.

⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

1. Remove the engine cover.
2. Remove the Schraeder valve cap.



3. Install the special tool union to the Schraeder valve.



4. Connect a suitable clean piece of clear tube to the special tool.

- Position the piece of clear tube in a suitable fluid container.
- Open the valve on the special tool.

5. Turn the ignition key to position II to operate the fuel pump.

6. NOTE: The fuel pump will only operate for a set time and will switch off if it does not see a crank signal.

Repeat the above procedure until air-free fuel flows from the piece of clear tube.

7. Disconnect the piece of clear tube from the special tool.

- Remove the container.
- Close the valve on the special tool.

8. Remove the special tool.

9. Install the Schraeder valve cap.

10. Install the engine cover.

Fuel System - General Information - Low-Pressure Fuel System BleedingTDV6 2.7L Diesel

General Procedures

Special Tool(s)	
	Adaptor fuel rail pressure check 310-116 (LRT-19-006A)

- WARNINGS:

Wait at least 30 seconds after the engine stops before commencing any repair to the high-pressure fuel injection system. Failure to follow this instruction may result in personal injury.

Before any work is carried out on the fuel system, ground the vehicle to earth and maintain the ground connection until the work is complete.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

After carrying out repairs, the fuel system must be checked visually for leaks. Failure to follow this instruction may result in personal injury.

If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

- CAUTIONS:

Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

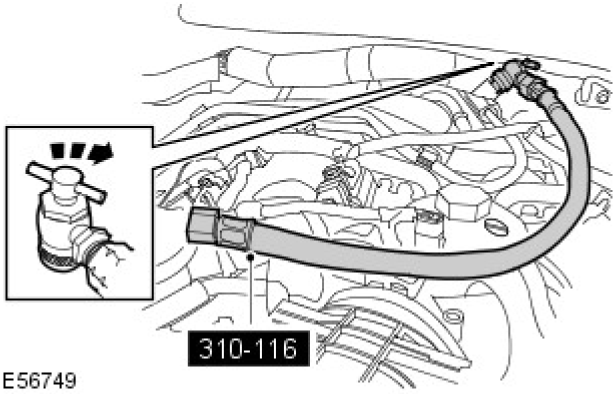
This procedure must be carried out before the engine is attempted to be started, following removal or replacement of any fuel system component involving fuel line intrusion. Failure to follow this instruction will result in damage to the fuel injection pump.

1. This procedure is necessary if any of the following fuel system components are removed, disconnected or replaced: Fuel tank, fuel lines, fuel filter element, fuel coolers, fuel injection pump or fuel rail pressure sensor.
2. Remove the engine cover. For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).
3. Install the special tool to the fuel rail Schraeder valve.

- Remove the fuel rail Schraeder valve cap.

4. Position a container to collect spillage.

- Open the valve on the special tool.



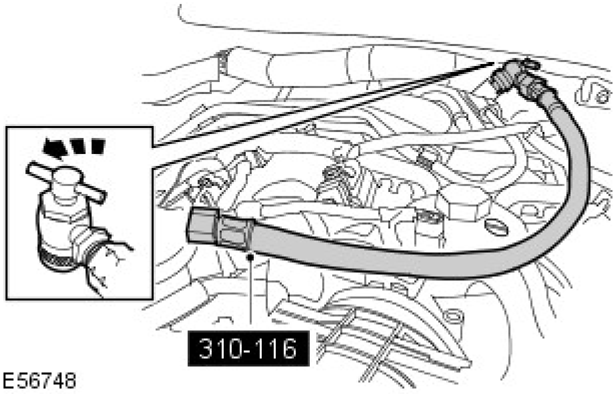
5. Turn the ignition switch to the ON position for 25 seconds. The fuel pump in the fuel tank will be audible.

6. Repeat the above procedure until clean, air free fuel is seen escaping from the special tool.

- While the pump is still running, close the valve on the special tool to prevent air entering the fuel system.

7. Remove the special tool from the Schraeder valve.

- Install the Schraeder valve protective cap.



8. Remove the container.

9. ⚠CAUTION: If a new fuel injection pump is fitted, the following step must be carried out to make sure the fuel injection pump is fully primed. Failure to follow this instruction may result in damage to the vehicle.

Repeat Step 5 four times.

10. NOTE: The engine must be allowed to idle for two minutes to allow air in the fuel injection supply manifolds and fuel injectors to purge.

Start the engine and allow to idle.

11. Install the engine cover. For additional information, refer to: Engine Cover - TDV6 2.7L Diesel (501-05 Interior Trim and Ornamentation, Removal and Installation).

GENERAL

The major components of the 4.2L V8 supercharged fuel system comprise a fuel tank, a fuel pump, a fuel filler assembly and two fuel level sensors.

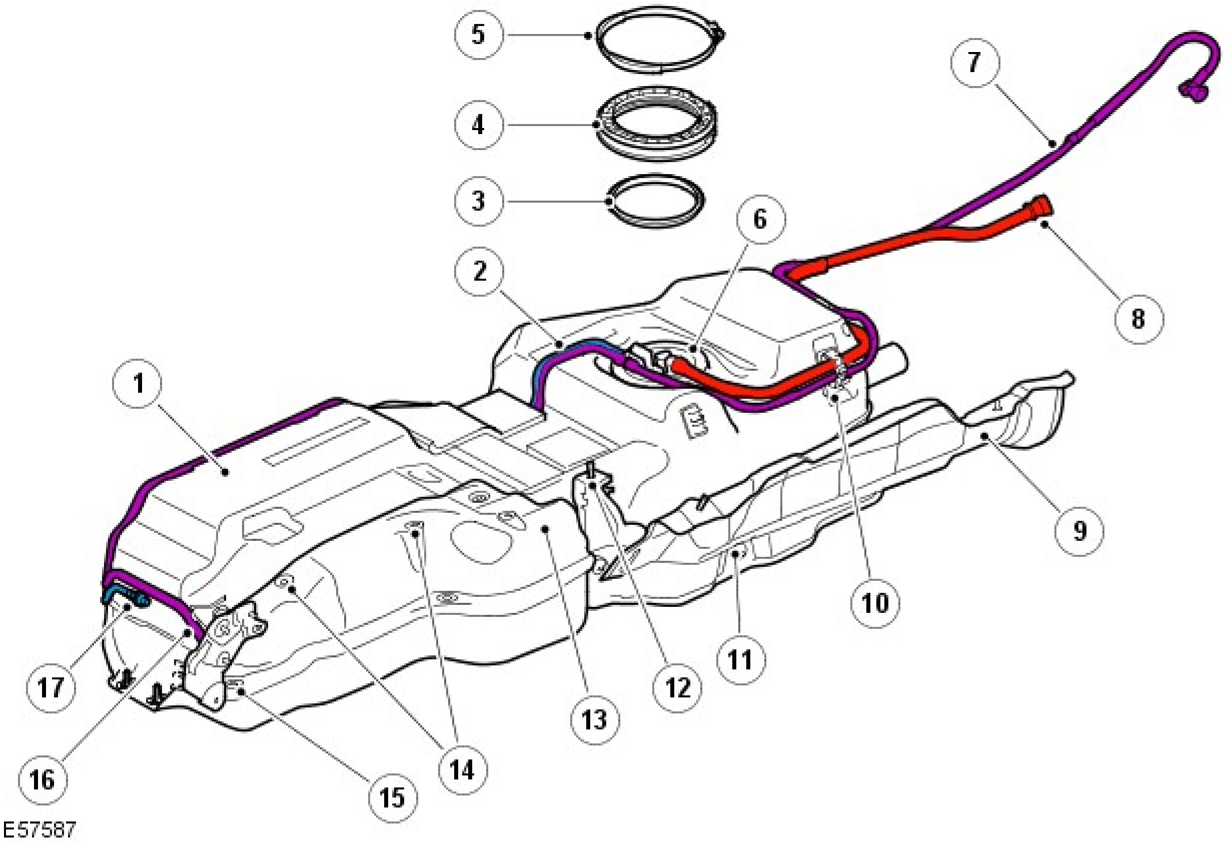
The 4.2L V8 supercharged fuel system uses an electronic returnless fuel system which comprises a pump module mounted in the fuel tank to deliver fuel at variable flow and pressure to the fuel rails which supply fuel to all fuel injectors. The fuel pump operation is regulated by a fuel pump control module which is controlled by the engine management system. The control module regulates the flow and pressure supplied by controlling the operation of the fuel pump using a Pulse Width Modulation (PWM) output.

The fuel rails and the injectors are described in Fuel Charging and Controls – 4.4L V8.
For additional information, refer to: Fuel Charging and Controls (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Description and Operation).

Fuel system emission control is described in Engine Emission Control - 4.2L V8
For additional information, refer to: Evaporative Emissions (303-13A Evaporative Emissions - V8 S/C 4.2L Petrol, Description and Operation).

The fuel pump control module is described in the Electronic Engine Controls 4.2L V8
For additional information, refer to: Electronic Engine Controls (303-14A Electronic Engine Controls - V8 S/C 4.2L Petrol, Description and Operation).

FUEL TANK ASSEMBLY



Item	Part Number	Description
1	-	Fuel tank
2	-	Pipe - fuel feed
3	-	Pump module seal
4	-	Pump module collar
5	-	Pump module clamp
6	-	Fuel pump module flange
7	-	Pipe - purge valve to charcoal canister
8	-	Tank breather pipe
9	-	Heat shield
10	-	Clip (2 off)
11	-	Cradle
12	-	Mounting screws (6 off) and washers (7 off)
13	-	Cover
14	-	Scrivet (2 off)
15	-	Screw M6 (2 off)
16	-	Pipe connection - purge valve
17	-	Pipe connection - fuel feed

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank has a useable capacity of 88.1 liters (23.2 US gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front right hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

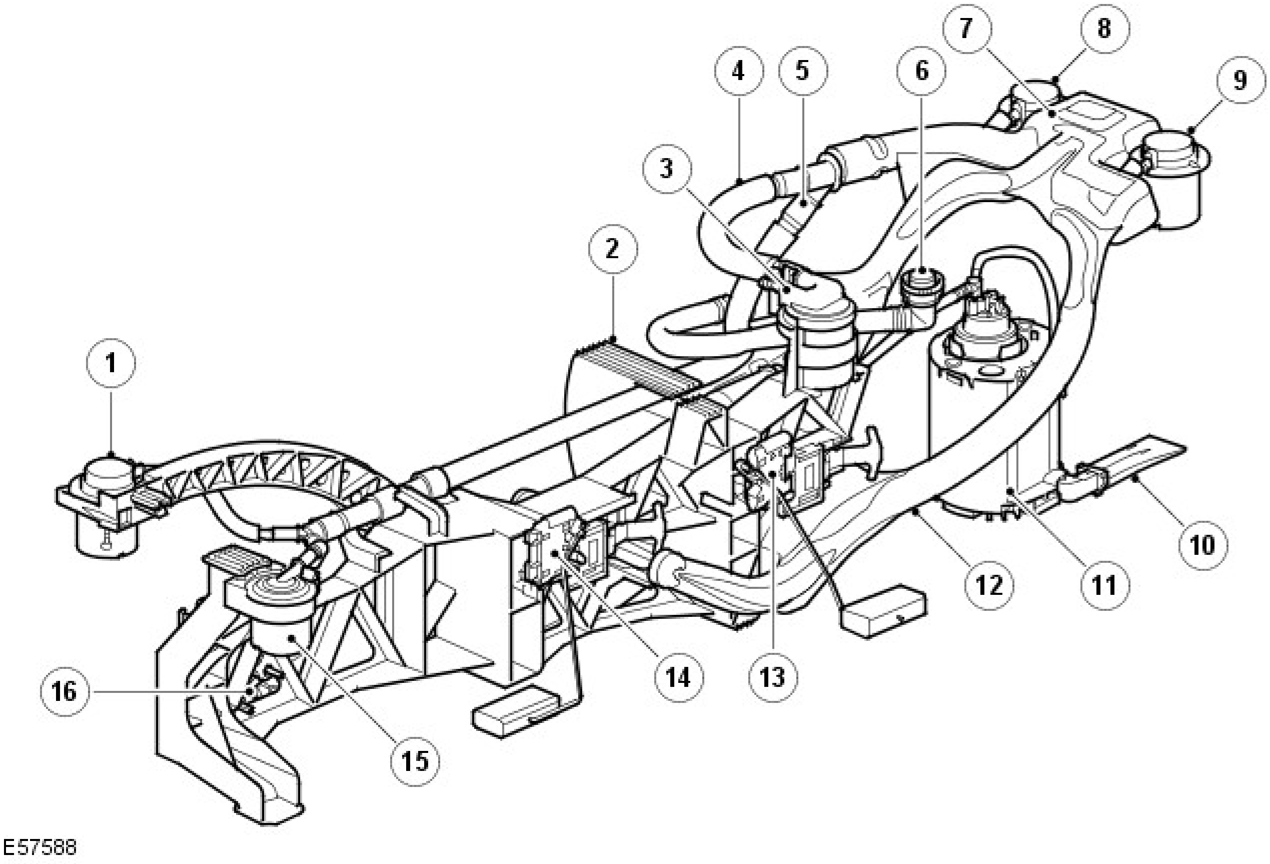
The flange assembly comprises a pump module flange which contains all external pipe and electrical connections for the tank internal components, a collar and a clamp. The flange is fitted with a seal which locates in the tank aperture. An arrow on the flange must be aligned between two moulded lines on the tank, adjacent to the pump module flange aperture, to obtain the correct orientation. The collar is located over the flange and is secured with the clamp. The flange, seal, collar and clamp arrangement meets the sealing requirements of LEV2 emissions.

The flange has a five pin external connector which provides for electrical connections for the level sensors, a common ground for the sensors and the fuel pump. This connector is wired to three push fit connectors on the underside of the flange. A quick release connector provides for the connection of the fuel feed pipe and breather.

A tank carrier assembly is attached inside the tank and is used to locate the internal tank components. The carrier provides location for the front and rear level sensors, the Roll Over Valves (ROVs) and the front jet pump.

The fuel pump module is mounted on a bayonet fitting at the base of the fuel tank. The module locks into position by rotating the module clockwise into the bayonet. The module comprises the fuel pump, the rear jet pump, the pump inlet filter, a second fine mesh filter which mounts into the carrier and an over pressure valve (PRV). The pump module, fuel filter and level sensors are available as serviceable components, the individual assembly components are not available separately.

Fuel Tank Internal Components



Item	Part Number	Description
1	-	Front right hand Roll Over Valve (ROV)
2	-	Carrier assembly
3	-	Fuel Level Vent Valve (FLVV)
4	-	Fuel Level Vent Valve (FLVV) breather corrugated tube to LVS
5	-	Front ROV corrugated tube to LVS
6	-	Connector to underside of fuel pump module flange
7	-	Liquid Vapor Separator (LVS)
8	-	Rear right hand ROV
9	-	Rear left hand ROV
10	-	Filter
11	-	Fuel pump module
12	-	LVS carrier
13	-	Rear fuel level sensor
14	-	Front fuel level sensor
15	-	Front left hand ROV
16	-	Front jet pump (hidden)

The 4.2L V8 supercharged vent system comprises:

- Four Roll Over Valves (ROV)
- One Fuel Level Vent Valve (FLVV)

- One Liquid Vapor Separator (LVS)

The vent system is mounted on the fuel tank internal carrier which is assembled outside of the tank and inserted into the tank during the blow moulding process. None of the internal tank venting components are serviceable.

The two rear ROVs are mounted directly onto the LVS with rubber grommets and secured with clips.

The two front ROVs are located in the front of the tank and are attached to the main beam of the carrier by a moulded clip. Both ROVs are connected to the LVS with a plastic corrugated tube.

The four ROVs vent directly into the LVS. Any liquid fuel is separated from the vapor in the LVS and drains back into the tank via the FLVV. The LVS is connected by a corrugated tube to the fuel pump module flange. This allows fuel vapor to exit the tank.

The main purpose of the FLVV is to control the fill volume of the tank. During filling, vapor is passed via the FLVV to the LVS. The vapor then passes from the LVS to the fuel pump module flange vent connection via a corrugated tube. The flange vent connection is connected to the charcoal canister which stores the fuel vapor. During filling, when the tank reaches its full level, the FLVV closes and prevents fuel vapor passing through to the LVS. This causes the pressure in the tank to rise which in turn causes the pump filling nozzle to turn off.

Fuel Pump Module

The fuel pump module is attached to the base of the fuel tank by the bayonet fitting. The pump module flange has three electrical connectors; one for the fuel pump motor and one for each of the fuel level sensors. All are connected to the external electrical connector via the connectors on the underside of the fuel pump module flange.

The pump module has a maximum rated flow of 180 liters/hour (47.55 US gallons/hour) and an output pressure of 5.0 bar (72.5 lbf/in^2).

The fuel pump is energised by the fuel pump relay which is located in the Battery Junction Box (BJB) and the fuel pump control module which is located in the left hand side of the luggage compartment. The relay and control module are controlled by the engine control module The relay is energized at all times when the ignition switch is in ignition position II.

A 60 micron fine mesh, pump inlet filter is attached to the pump inlet port at the bottom of the pump. The filter is located vertically at the side of the pump to ensure that a portion of the filter is off the base of the swirl pot to prevent premature blocking of the filter.

A second, serviceable fine mesh filter is located in-line. This provides additional filtration to the fuel before it is passed to the fuel rail. The filter has an electrical connection which is attached to ground to prevent electrostatic build-up.

The PRV, which is located in-line before the fuel filter, incorporates a non-return valve which prevents fuel returning to the pump when the engine is not running. This ensures that system pressure is maintained in the fuel feed line to the fuel rail when the engine is not running. It also incorporates an over pressure valve which relieves pressure at between 5.6 and 6.4 bar (81.2 to 92.8 lbf/in^2) during 'hot-soak' conditions when the vehicle is switched off.

Fuel Level Sensors

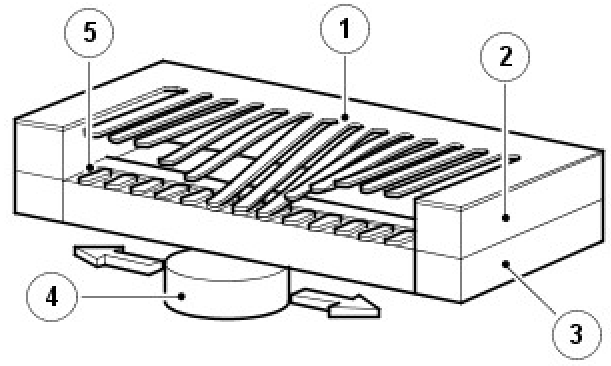
The sensor is a MAgnetic Passive Position Sensor (MAPPS) which provides a variable resistance to ground for the output from the fuel gage. The sensor is sealed from the fuel preventing contamination of the contacts, increasing reliability. The front and rear fuel level sensors are connected to the external electrical connector on the flange via the connectors on the underside of the fuel pump module flange.

The front and rear sensors are attached to the carrier and are accessible via the fuel pump flange aperture.

• NOTE: When a service replacement tank is ordered the tank is supplied with the front and rear level sensors fitted

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves, the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

Sensor Operating Principle



E44504

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal is output proportional to the amount of fuel in the tank and the position of the float arm. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gage pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning lamp is incorporated in the instrument cluster and illuminates when the fuel level is at or below 10 liters (2.64 US gallons).

The fuel level sender signal is converted into a CAN message by the instrument cluster as a direct interpretation of the fuel tank contents in liters. The ECM uses the CAN message to store additional OBD P Codes for misfire detection when the fuel level is below a predetermined capacity.

Front Fuel Level Sensor Resistance / Fuel Gage Read out Table

- NOTE: These figures are with the vehicle on level ground. Sensor readings will differ with varying vehicle inclinations.

Sender Unit Resistance, Ohms	Nominal Gage Reading
51	Empty
84	Low fuel level illumination (12.5L)
375	Half full
911	Full

Rear Fuel Level Sensor Resistance / Fuel Gage Read out Table

- NOTE: These figures are with the vehicle on level ground. Sensor readings will differ with varying vehicle inclinations.

Sender Unit Resistance, Ohms	Nominal Gage Reading
86	Empty
160	Low fuel level illumination (12.5L)
441	Half full
944	Full

Swirl Pot

The swirl pot is located at the rear of the fuel tank and provides for the attachment or location of most of the fuel pump assembly components.

The swirl pot acts as a fuel reserve, providing a constant supply of fuel to the fuel pump irrespective of fuel quantity or vehicle attitude. When the vehicle is level the swirl pot contains approximately 400 cm^3 (24.4 in^3) of fuel when the engine is running. The two jet pumps ensure that fuel is constantly supplied to the swirl pot to provide a sufficient fuel supply for the pump.

A one way valve is located in the base of the swirl pot. The valve allows fuel from the tank to enter the swirl pot, but prevents it from escaping.

Jet Pumps

The fuel system incorporates two jet pumps. The front jet pump is located on the carrier near the front of the fuel tank. The rear jet pump is located in the swirl pot below the fuel pump. Both jet pumps operate on a venturi effect created by the fuel at pump output pressure passing through the jet pump. This draws additional fuel from the tank through ports in the jet pump body, delivering additional fuel to the swirl pot.

The front jet pump is mainly used when the vehicle is driving downhill. The jet pump is connected via a pipe from a three-way connection in the fuel pump. The front jet pump collects fuel from the front of the tank and transfers it into the swirl pot, ensuring a constant supply of fuel to the pump. The jet pump has a jet nozzle of 0.5 mm diameter.

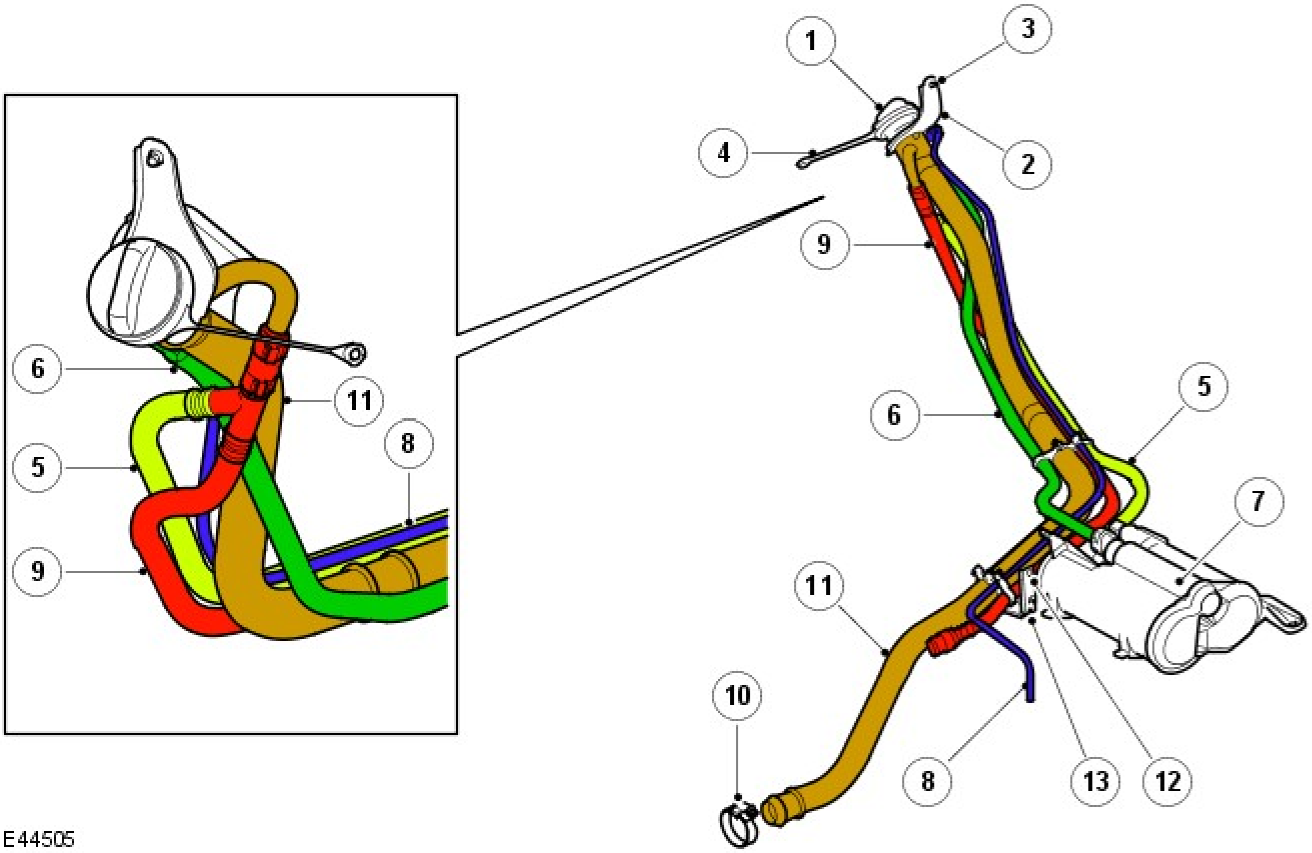
The rear jet pump operates at pump output pressure and delivers some of the fuel at pump pressure from the rear of the tank. The jet pump has a jet nozzle of 0.5 mm diameter.

Roll Over Valves (ROVs)

Four ROVs are located on the carrier and are connected via pipes to a liquid vapour separator. The separator, which is also attached to the carrier, is connected via a pipe to the tank breather outlet in the pump module flange. The ROVs contain non-return valves which close in the event of the vehicle overturning, preventing liquid fuel escaping from the tank via the breather pipe.

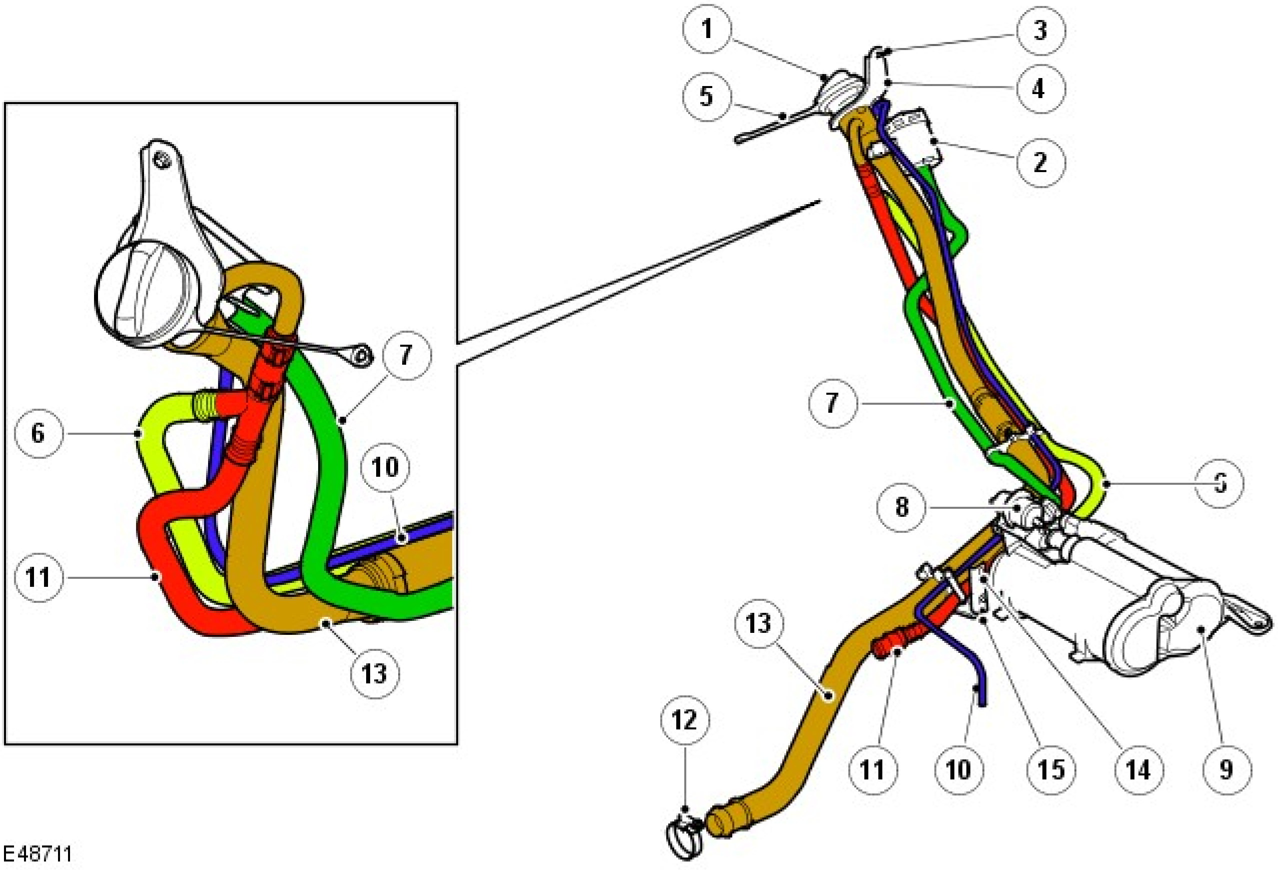
FUEL FILLER PIPE ASSEMBLY

Fuel Filler - ROW



Item	Part Number	Description
1	-	Filler cap
2	-	Bracket
3	-	Screw M6
4	-	Filler cap lanyard
5	-	Charcoal canister breather hose
6	-	Charcoal canister vent hose to atmosphere
7	-	Charcoal canister (ROW)
8	-	Rear differential breather pipe
9	-	Tank breather pipe
10	-	Clamp - filler hose
11	-	Fuel filler pipe
12	-	Screw M8
13	-	Lower mounting bracket to EPB bracket

Fuel Filler - NAS



Item	Part Number	Description
1	-	Filler cap
2	-	DMTL pump filter
3	-	Screw M6
4	-	Bracket
5	-	Filler cap lanyard
6	-	Charcoal canister breather hose
7	-	DMTL pump vent hose to filter
8	-	DMTL pump
9	-	Charcoal canister (NAS)
10	-	Rear differential breather pipe
11	-	Tank breather pipe
12	-	Clamp - filler hose
13	-	Fuel filler pipe
14	-	Screw M8
15	-	Lower mounting bracket to EPB bracket

The fuel filler head is positioned at the rear of the vehicle, above the right hand rear wheel. The filler head is covered by a moulded plastic cover which is electrically locked when the vehicle is locked. The filler cap is a conventional screw in type which is secured to the vehicle with a lanyard.

- NOTE: The fuel filler head plastic cover does not lock on NAS vehicles.

The filler head is a stainless steel fabrication. Two brackets provide for the attachment of the filler head to the vehicle body and the chassis electronic park brake bracket.

Connections on the rear of the filler head allow for the connection of the fuel tank breather pipe from the fuel tank flange, the fuel filler pipe to the tank and the charcoal canister breather pipe.

The fuel tank breather pipe has a quick release fitting and connects to the breather pipe from the fuel tank flange.

The fuel filler pipe locates in a short flexible hose attached to the tank and is secured with worm drive clamps. The canister breather pipe is routed alongside the fuel filler pipe and attaches to the canister with a quick release coupling.

A fourth pipe is also routed alongside the fuel filler pipe and provides air ventilation for the charcoal canister. On all petrol vehicles, except NAS vehicles, the pipe is connected to the air pump port on the charcoal canister with a quick release coupling and connects to an insect trap at the fuel filler head. On NAS vehicles fitted with a DMTL pump, the pipe connects to the pump vent port and is also connected to a filter which is attached to the filler head.

A smaller pipe, which is not associated with the fuel system, is attached to the side of the fuel filler pipe. This pipe connects to the rear differential and provides breathing for the differential case. The pipe terminates near the fuel filler head.

Fuel Tank and Lines - V8 S/C 4.2L Petrol - Fuel Tank and Lines

Diagnosis and Testing

Overview

For information on the system operation, refer to section 310-01 - Fuel Tank and Lines in the workshop manual.

Inspection and Verification

- WARNINGS:

⚠ Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠ If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

⚠ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

- CAUTIONS:

⚠ Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠ It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Fuel level ● Fuel contamination/grade/quality ● Fuel filter ● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel filler cap ● Fuel tank filler pipe ● Roll over valves (ROVs)	● Battery charge and condition ● Fuse(s) ● Inertia fuel shutoff (IFS) switch ● Loose or corroded electrical connectors ● Harnesses ● Fuel pump relay ● Fuel pump module ● Fuel pump driver module (FPDM) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - ○ Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action

Symptom	Possible causes	Action
Engine cranks, but does not fire	● Inertia fuel shutoff (IFS) switch ● Low/Contaminated fuel ● Engine breather system disconnected/restricted ● Ignition system ● Fuel leak ● Blocked fuel filter ● Fuel pump module fault ● Crankshaft position (CKP) sensor ● ECM fault	Check that the inertia switch has not tripped. Check the fuel level/condition. Check the engine breather system. Check for ignition system DTCs. Check the fuel system for leaks/damage. Check the fuel filter for a blockage/restriction. Check the fuel pump module operation. Check the CKP sensor. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Engine cranks and fires, but will not start	● Evaporative emissions purge valve ● Low fuel pressure ● Fuel leak ● Blocked fuel filter ● Fuel pump module fault ● Spark plugs ● HT short to ground (tracking) check rubber boots for cracks/damage ● Ignition coil failure(s) ● Harness	Check the evaporative emissions purge valve. Check the fuel pressure. Check the fuel system for leaks/damage. Check the fuel filter for a blockage/restriction. Check the fuel pump module operation. Check the spark plugs and ignition coils. Refer to the relevant section of the workshop manual.
Difficult to start after hot soak (vehicle standing after engine has reached operating temperature)	● Injector leak ● Fuel temperature sensor ● Intake air temperature (IAT) sensor ● Mass air flow (MAF) sensor ● Evaporative emissions purge valve ● Fuel pump module fault ● Ignition system	Check the fuel injectors. Check the fuel temperature sensor, check the IAT and MAF sensor circuits. Check the evaporative emissions purge valve. Check the operation of the fuel pump module. Check the spark plugs and ignition coil circuits. Refer to the relevant section of the workshop manual.
Engine stalls soon after start	● Breather system disconnected/restricted ● ECM relay ● Harness ● MAF sensor ● Ignition system ● Air cleaner restricted ● Air leakage ● Fuel lines ● Fuel rail pressure (FRP) sensor	Check the engine breather system. Check the ECM relay and circuits. Check the MAF sensor circuits. Check the spark plugs and ignition coil circuits. Check for a restricted air cleaner. Check the intake air system for leaks. Check the fuel lines for leaks/damage. Check the FRP sensor circuits. Refer to the relevant section of the workshop manual.
Engine hesitates/poor acceleration	● Restricted pedal travel (carpet, etc) ● Ignition system ● Air leakage ● Heated oxygen (HO2) sensors ● Fuel pressure ● Blocked fuel filter ● Fuel lines ● Fuel pump module fault ● Injector leak ● Throttle position (TP) sensors ● Throttle motor ● Transmission malfunction ● Accelerator pedal position (APP) sensor	Check the accelerator pedal travel. Check the spark plugs and ignition coil circuits. Check the intake air system for leaks. Check the HO2 sensor circuits. Check the fuel pressure. Check the fuel filter for a blockage/restriction. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the fuel injectors. Check the TP sensor, throttle motor and APP sensor circuits. Refer to the relevant section of the workshop manual.

Symptom	Possible causes	Action
Engine backfires	• Ignition system • Air leakage • Fuel lines • Fuel pump module fault • MAF sensor • HO2 sensors • APP sensor	Check the spark plugs and ignition coil circuits. Check the intake air system for leaks. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the MAF, HO2 and APP sensor circuits. Refer to the relevant section of the workshop manual.
Engine surges	• Fuel lines • Fuel pump module fault • MAF sensor • Harness • TP sensors • Throttle motor • Ignition system • ECM fault	Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the MAF sensor, TP sensor and throttle motor circuits. Check the ignition coil circuits. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Engine detonates/knocks	• Fuel quality • Fuel lines • Fuel pump module fault • Air leakage • FRP sensor • Knock sensor (KS)/circuit malfunction • MAF sensor • HO2 sensors • BARO sensor malfunction (internal ECM fault)	Check the fuel for contamination/grade/quality. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the intake air system for leaks. Check the FRP, KS, MAF and HO2 sensor circuits. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to section 303-14 - Electronic Engine Controls in the workshop manual.

DTC	Description	Possible causes	Action
P008700	Fuel Rail/System Pressure - Too Low	• Fuel rail pressure (FRP) sensor disconnected • FRP sensor to ECM sensing circuit short circuit to ground • FRP sensor supply circuit high resistance • FRP sensor failure • Fuel line leak • Restricted fuel line • Fuel pump module circuit high resistance • Fuel pump module circuit short circuit to ground • Fuel pump module failure	Check the FRP sensor circuits Check the fuel lines, check the fuel pressure. Refer to the relevant section of the workshop manual. Check the fuel pump module circuits. Refer to the electrical guides.
P008800	Fuel Rail/System Pressure - Too High	• Fuel rail pressure (FRP) sensor to ECM wiring (supply/sense) short circuit to each other • FRP sensor to ECM sense circuit short circuit to power • FRP sensor failure • Fuel pressure control valve (FPCV) fault • Fuel pump module circuit short circuit to power • Fuel pump module failure	Check the FRP sensor circuits, check the FPCV. Refer to the relevant section of the workshop manual. Check the fuel pump module circuits. Refer to the electrical guides.

DTC	Description	Possible causes	Action
P017100	System Too Lean (Bank 1)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Low fuel pressure ● Fuel filter/system restriction ● Fuel pump module fault ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks. Check the MAF sensor condition and circuits. Check the fuel pressure. Check the fuel filter for a blockage/restriction. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the fuel injectors. Check the exhaust system for leaks, etc. Refer to the relevant section of the workshop manual. Check for evaporative emission DTCs.
P017200	System Too Rich (Bank 1)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions. Check the fuel system for leaks and check the fuel pressure. Check the fuel injectors. Check for fuel system DTCs. Check the oil for contamination/grade/quality. Refer to the relevant section of the workshop manual. Check for MAF sensor and evaporative emission DTCs.
P017400	System Too Lean (Bank 2)	● Air intake leak between MAF sensor and cylinder head ● MAF sensor fault (low intake air flow) ● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	Check the intake air system for leaks, etc. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Refer to the relevant section of the workshop manual. Check for evaporative emission DTCS.
P017500	System Too Rich (Bank 2)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions, etc. Check the fuel system for leaks, DTCs, etc. Check the oil condition. Refer to the relevant section of the workshop manual. Check for MAF sensor and evaporative emission DTCs.
P030000	Random Misfire Detected	● ECM to ignition coil primary circuit faults (cylinder misfire detected DTCs also logged) ● Ignition coil failure ● Spark plug failure/fouled /incorrect gap ● Fuel delivery pressure (low/high) ● Fuel injector circuit fault(s) (injector DTCs also logged) ● Fuel injectors restricted/leaking ● Fuel injectors continuously open ● Fuel contamination ● Cylinder compression low ● Valve clearance adjustment	Check for ignition coil DTCs. Check the condition of the spark plugs and the gaps. Check the fuel pressure. Check for fuel injector DTCs. Check the fuel for contamination/grade /quality. Check the cylinder compressions, check the valve clearances, check the condition of the camshaft and valve springs. Refer to the relevant section of the workshop manual.

DTC	Description	Possible causes	Action
		- Worn camshaft/broken valve springs	
P046129	Fuel Level Sensor A Circuit Range/Performance	- Fuel level sensor circuits intermittent short circuit or high resistance - Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P04612F	Fuel Level Sensor A Circuit Range/Performance	- Fuel level sensor circuits intermittent short circuit or high resistance - Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P046200	Fuel Level Sensor A Circuit Low	- Fuel level sensor circuits intermittent short circuit to ground or high resistance - Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P046300	Fuel Level Sensor A Circuit High	- Fuel level sensor circuits intermittent short circuit to power - Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P062800	Fuel Pump A Control Circuit Low	- Fuel pump control circuit short circuit to ground - Fuel pump control circuit high resistance - Fuel pump relay fault	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062900	Fuel Pump A Control Circuit High	- Fuel pump control circuit short circuit to power - Fuel pump relay fault	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P131500	Persistent Misfire	- ECM to ignition coil primary circuit fault (cylinder misfire detected DTC also flagged) - Ignition coil failure - Spark plug failure/fouled /incorrect gap - Fuel delivery pressure low - Fuel injector circuit fault(s) (injector DTCs also flagged) - Fuel contamination - Cylinder compression low	Check for ignition coil DTCs. Check the condition of the spark plugs and the gaps. Check the fuel pressure. Check for fuel injector DTCs. Check the fuel for contamination/grade /quality. Check the cylinder compressions. Refer to the relevant section of the workshop manual.

Fuel Tank and Lines - V8 S/C 4.2L Petrol - Fuel Pump Module

Removal and Installation

Removal

- WARNINGS:

⚠ Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

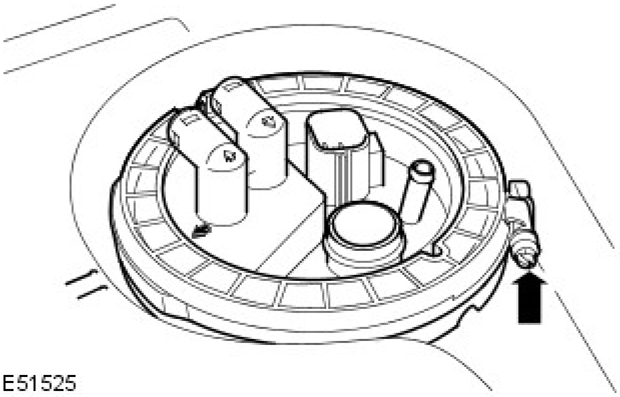
- NOTE: The fuel pump module comprises of a rear fuel level sender, filter and a fuel pressure regulator. These components cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the fuel tank.
For additional information, refer to: Fuel Tank (310-01B Fuel Tank and Lines - V8 4.4L Petrol, Removal and Installation).

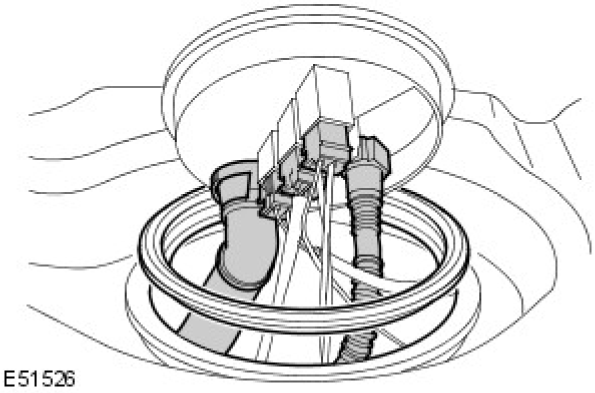


4. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

- NOTE: Note the fitted position.

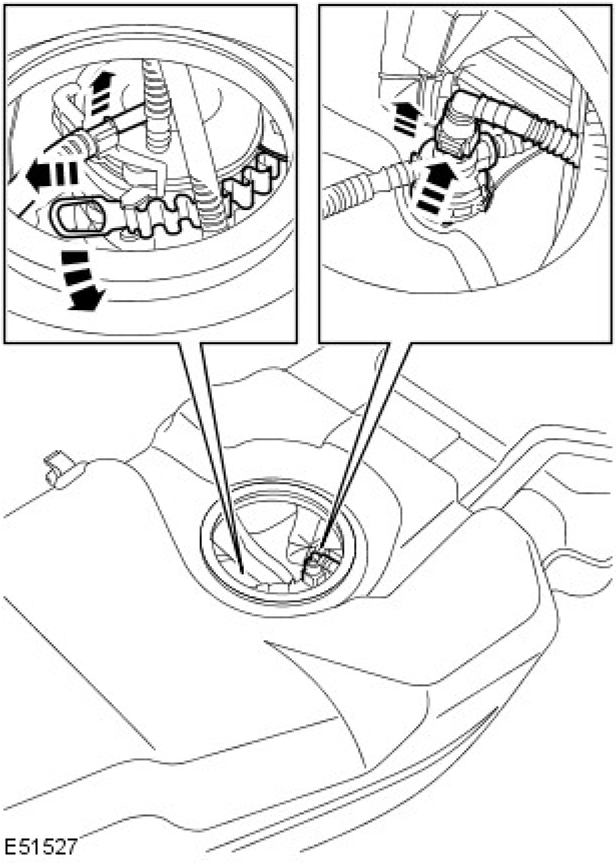
Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.



5. Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.



6. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.

Installation

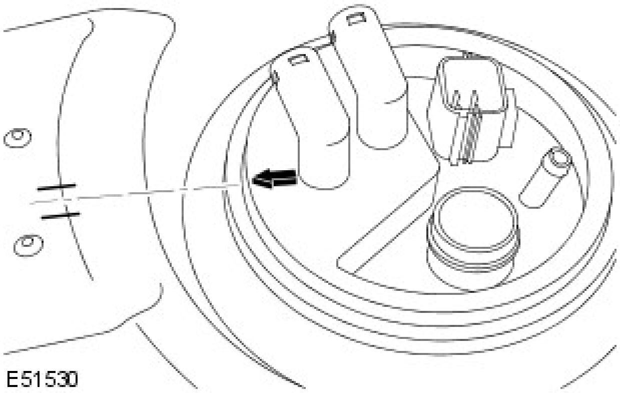
1. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

2. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.

- Connect the fuel supply line.
- Connect the vent line.



3. ⚠ CAUTION: Make sure the seal is correctly fitted.

• NOTE: Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

4. Install the fuel tank.
For additional information, refer to: Fuel Tank (310-01B Fuel Tank and Lines - V8 4.4L Petrol, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Removal and Installation

Removal

• WARNINGS:

Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

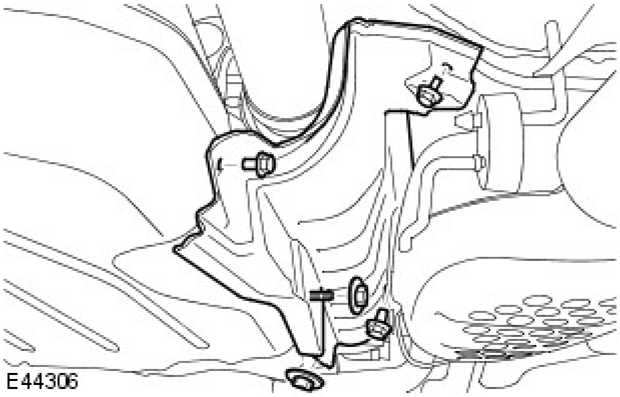
2. Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

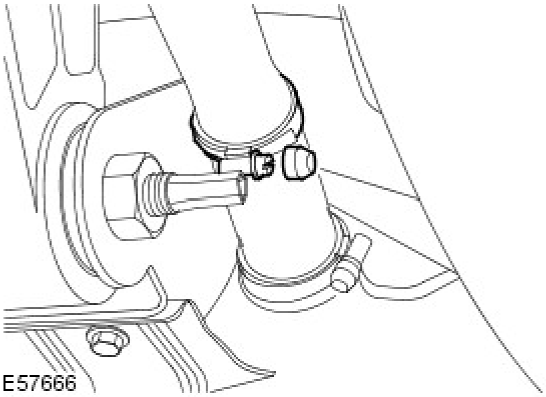
3. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

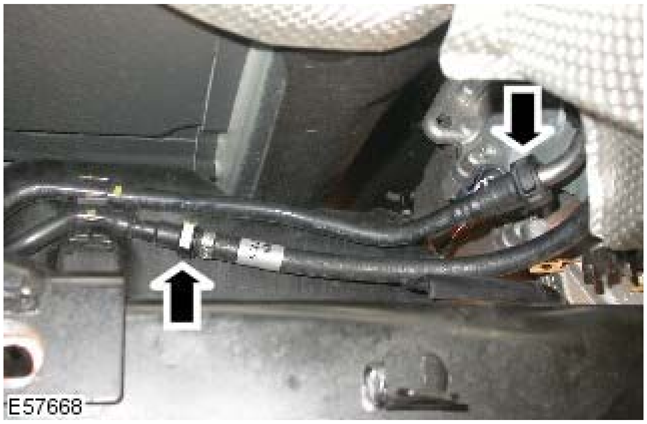




5. ⚠CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

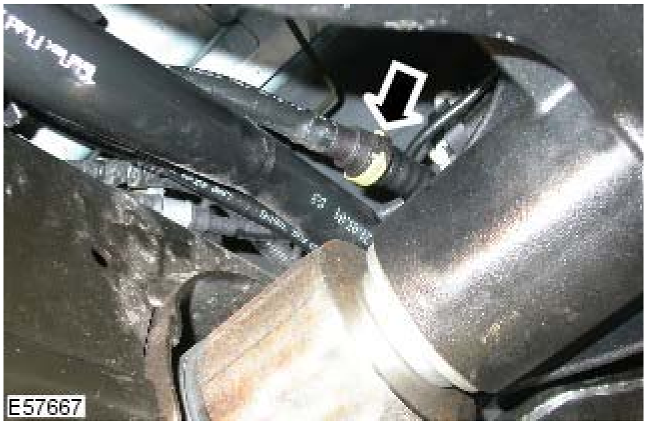
Disconnect the fuel filler neck from the filler neck hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



6. ⚠CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel supply and purge lines quick release connections at the front of the fuel tank.



7. ⚠CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

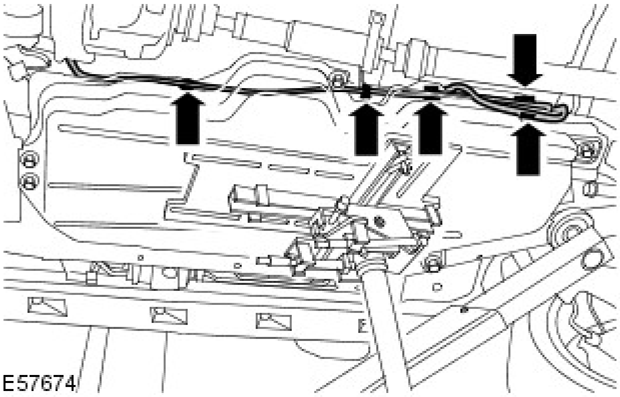
Disconnect the fuel tank vent line.

8. Release the fuel tank harness.

9. Release the parking brake emergency release cable.

- Release from the 4 clips.

10. Remove the 2 emergency release cable clips.



E57674

11. ⚠ WARNING: Secure the component to the transmission jack.

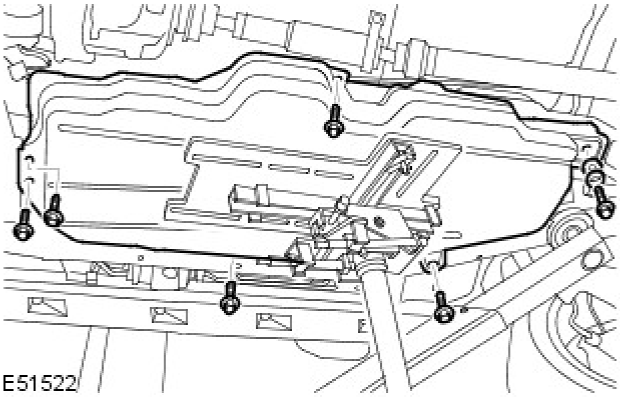
• CAUTIONS:

⚠ Do not lower the fuel tank more than 250 mm (9.75 in)

⚠ Note the rear bolt is fitted with 2 washers.

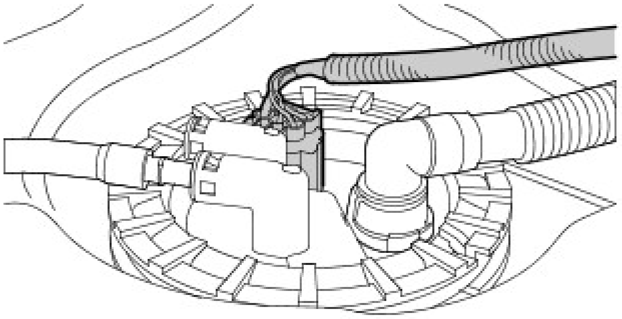
Using a transmission jack, lower the fuel tank sufficiently only to access the top of the fuel tank.

- Remove the 6 bolts.

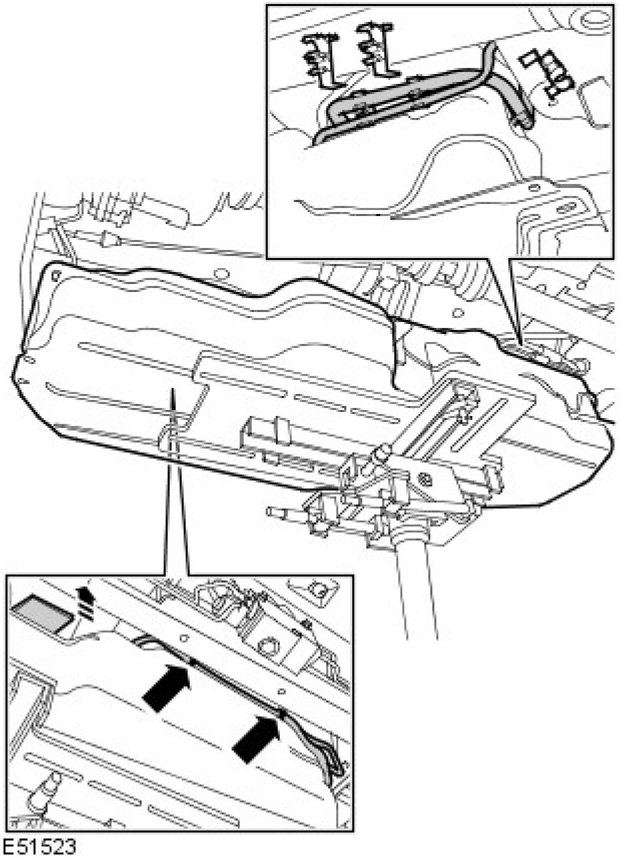


E51522

12. Disconnect the fuel pump module electrical connector.



E57673



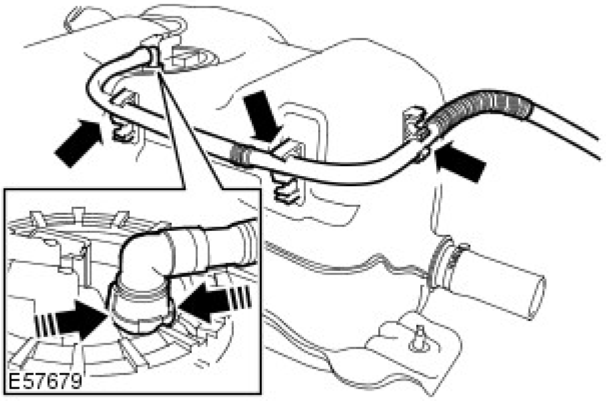
13. Release the purge line from the top of the fuel tank.

- Remove the adhesive pad.
- Release from the 5 clips.

14. Remove the fuel tank.

15. NOTE: Do not disassemble further if the component is removed for access only.

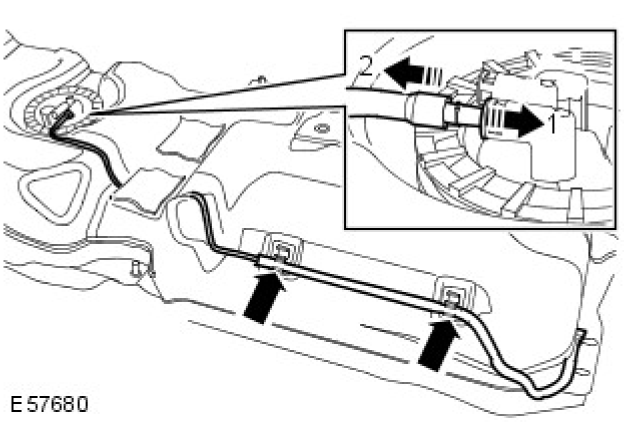
With assistance, remove the fuel tank from the transmission jack.



16. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the fuel tank vent line.

- Disconnect the quick release connector.
- Remove from the 3 clips.

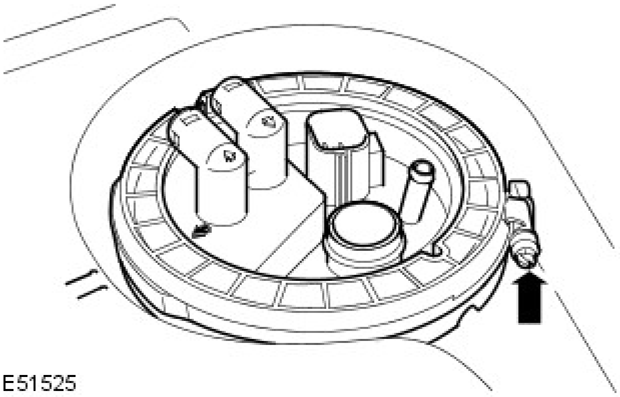


E57680

17. ⚠CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the fuel supply line.

- Disconnect the quick release connector.
- Release from the 2 clips.



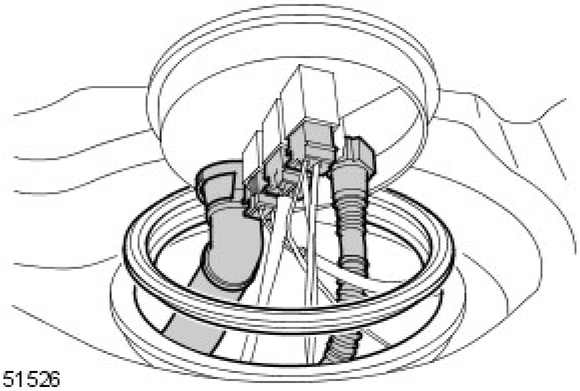
E51525

18. ⚠CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Note the fitted position.

Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.

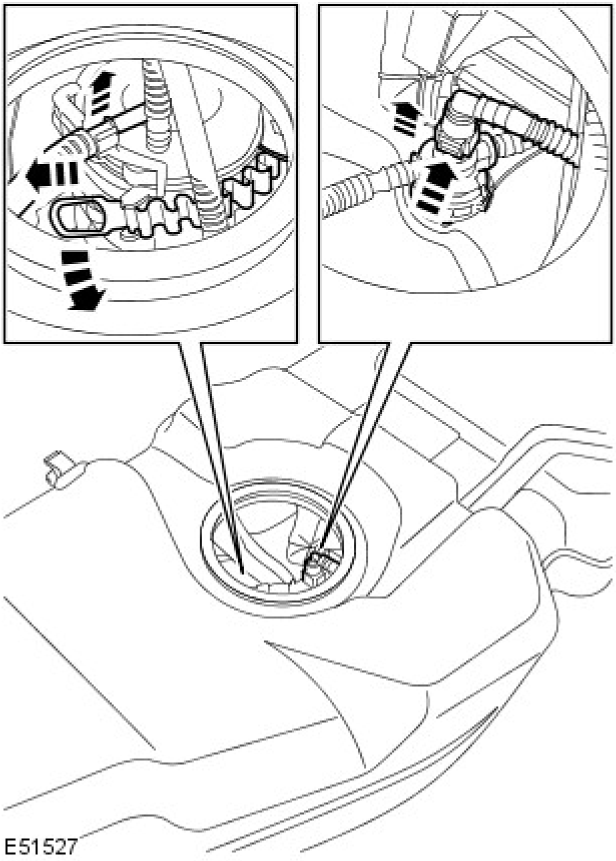


E51526

19. ⚠CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

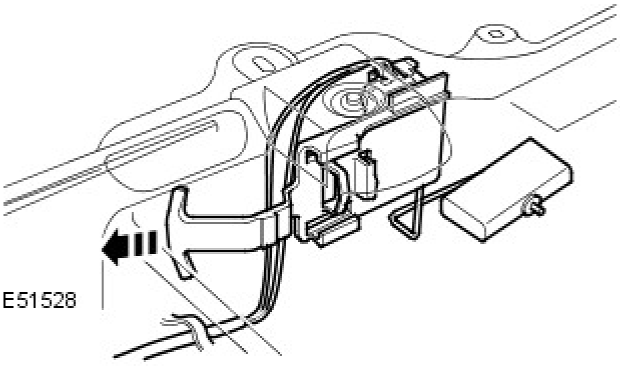
Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.



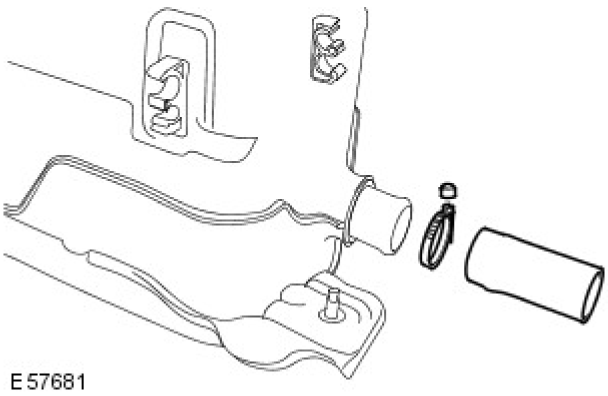
20. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.



21. Remove the fuel tank front fuel level sender unit.

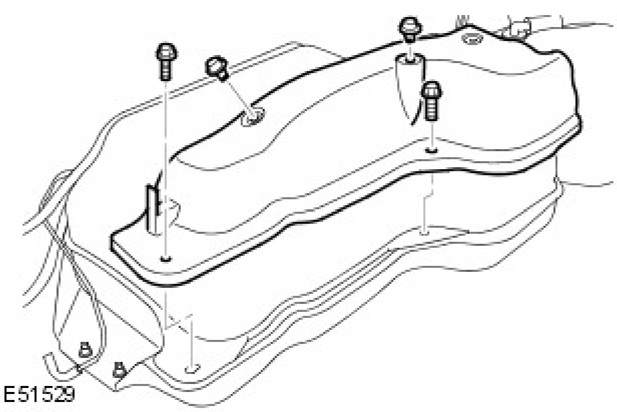
- Release the lead.
- Release the clip.



22. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the fuel filler hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



23. Remove the fuel tank bracket.

- Remove the 2 clips.
- Remove the 2 bolts.
- Remove the retaining plate.

Installation

1. Install the fuel tank bracket.

- Install the retaining plate.
- Install the clips.
- Tighten the bolts to 3.5 Nm (2.5 lb.ft).

2. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Install the fuel filler hose.

- Install a new retaining clip.

3. Install the fuel tank front fuel level sender unit.

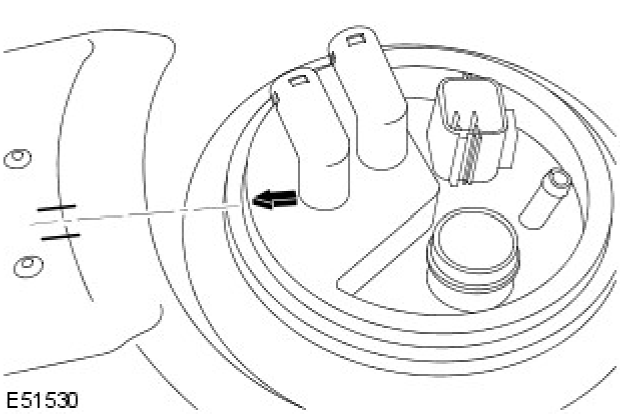
- Secure the clip.
- Secure the lead.

4. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

5. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.
- Connect the fuel supply line.
- Connect the vent line.



6. ⚠CAUTION: Make sure the seal is installed correctly.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

7. Install the fuel supply line.

- Connect the quick release connector.
- Secure in the 2 clips.

8. Install the vent line.

- Connect the quick release connector.
- Secure in the 3 clips.

9. With assistance, install the fuel tank to the transmission jack.

10. Position the fuel tank to the vehicle.

11. Secure the purge line to the fuel tank.

- Secure with the clips.
- Install the adhesive pad.

12. Connect the electrical connector.

13. ⚠CAUTION: Note the rear bolt is fitted with 2 washers.

Install the fuel tank.

- Tighten the bolts to 45 Nm (33 lb.ft).

14. Install the 2 emergency release cable clips.

15. Secure the parking brake emergency release cable.

- Secure in the 4 clips.

16. Secure the fuel tank harness.

17. Connect the vent line.

18. Connect the fuel supply and purge lines.

19. ⚠CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

20. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

21. Refill the fuel tank.

For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

Removal and Installation

Removal

- WARNINGS:

Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

1. WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Position the vehicle on a lift.

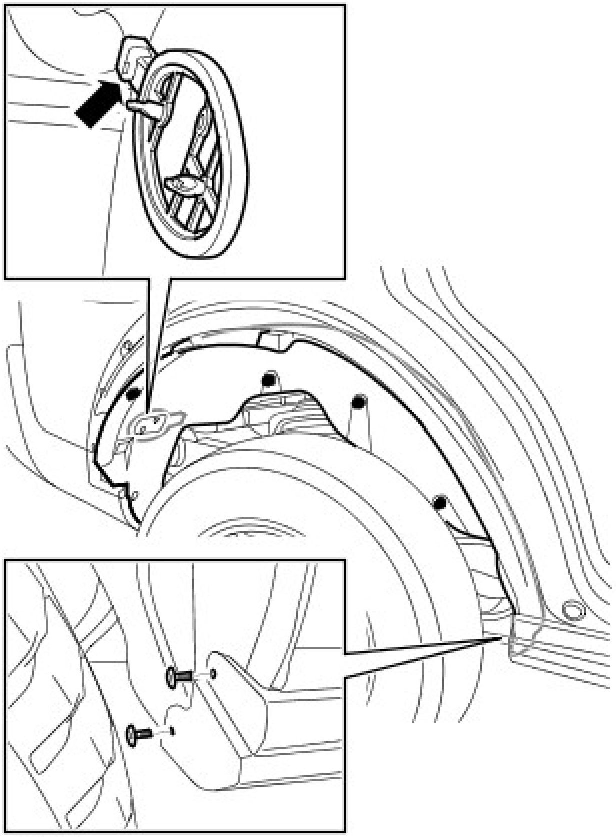
2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

4. Remove the RH rear wheel and tire.

5. Remove the fender splash shield.

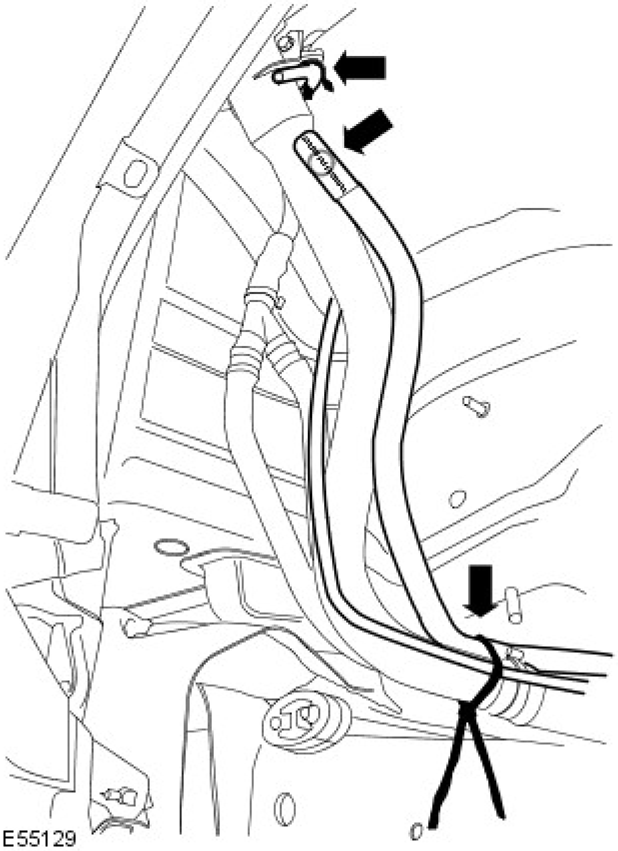
- Remove the 2 screws.
- Remove the 6 retainers.
- Disconnect the electrical connector.



E48478

6. Remove the fuel filler door.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

7. Remove the spare wheel and tire.



8. Disconnect the breather pipes.

- Remove the clip.
- Release the 2 clips.
- Remove and discard the cable tie.

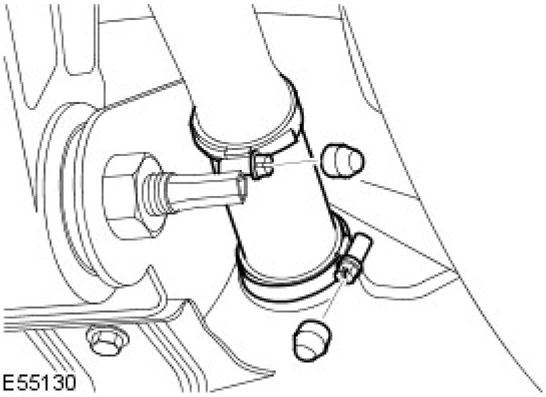
9. ⚠CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

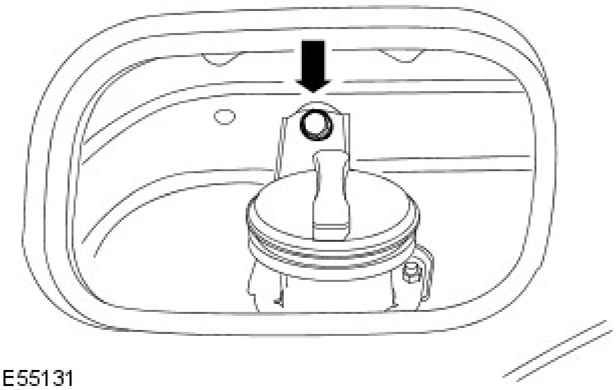
Disconnect the fuel filler neck from the fuel tank.

- Remove the tamper proof cover.
- Remove and discard the hose clip.

10. Remove the fuel tank filler pipe connector hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.





11. NOTE: Note the fitted position.

Remove the fuel tank filler pipe.

- Remove the bolt.

Installation

1. Install the filler pipe connector hose.

- Install the new tamper proof clip.

2. NOTE: Align to the position noted on removal.

Install the fuel tank filler pipe.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

3. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

4. Connect the breather pipes.

- Secure the clips.

5. Install the filler door.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

6. Install the fender splash shield.

7. Install the wheel and tire.

8. Install the spare wheel and tire.

9. Refill the fuel tank.

10. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Fuel Tank and Lines - V8 4.4L Petrol -

Capacity

Fuel tank	86.3 litres (18.9 gallons) (22.7 US gallons)

General Specification

Item	Specification
System type	Mechanical - returnless
Fuel delivery module	Located in the fuel tank
Fuel pump:	
Type/location	Electric - submersible - located in the fuel tank
Operating pressure	450 kPa (4.5 bar) (65.25 lb/in²)
Maximum output @12.3 volts	122 litres/hour (26.8 gallons/hour) (32.2 US gallons/hour)
Fuel pressure regulator:	
Type/location	In-line, within fuel tank
Operating pressure	450 kPa (4.5 bar) (65.25 lbf/in²)
Fuel filter	Located in the fuel delivery module - fitted with a renewable element
Fuel tank sender units	Two - Front and rear - Front unit is located remotely within the fuel tank, rear is mounted on the body of the fuel pump

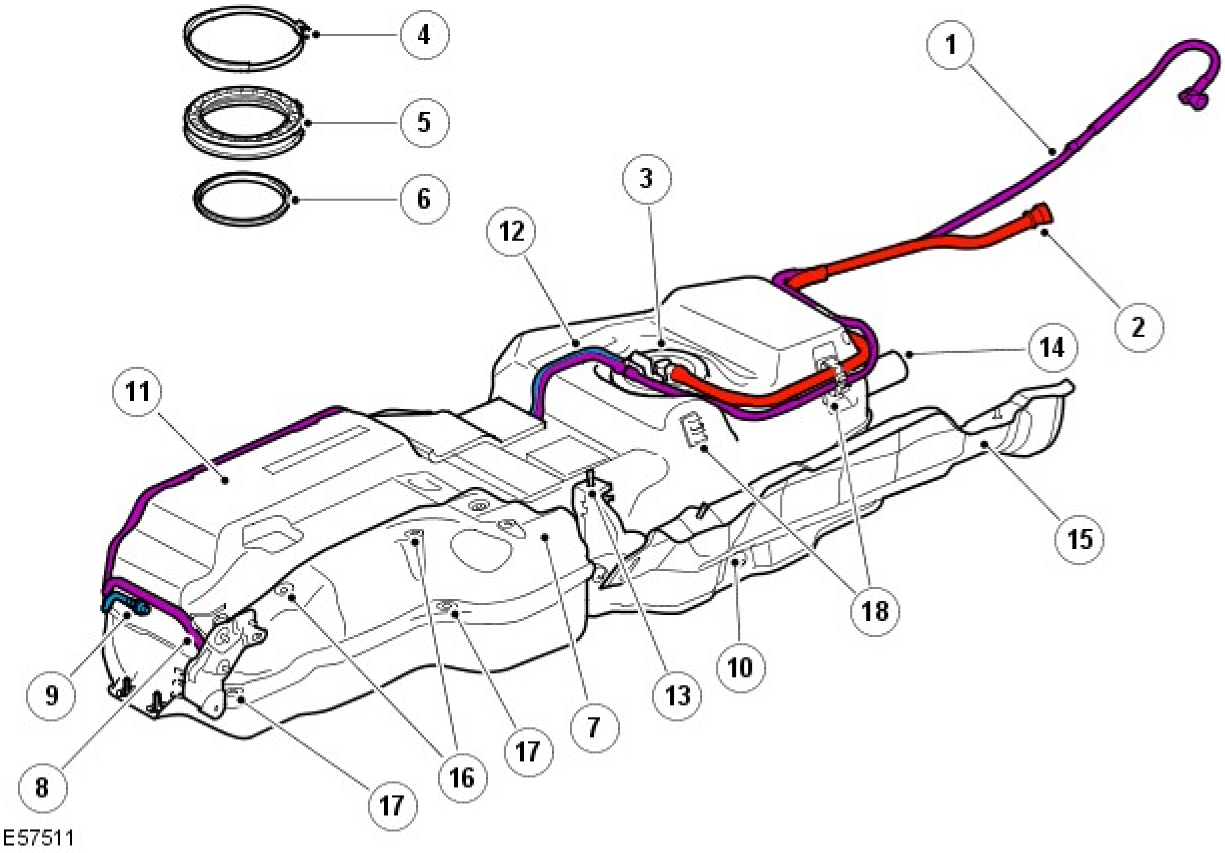
GENERAL

The major components of the 4.4L V8 fuel system comprise a fuel tank, a fuel pump, a fuel filler assembly and two fuel level sensors.

The 4.4L V8 fuel system uses a fuel pump mounted in the fuel tank to deliver a uniform level of pressure to the fuel rails which supply fuel to all fuel injectors. The fuel rails and the injectors are described in Fuel Charging and Controls – 4.4L V8.
For additional information, refer to: Fuel Charging and Controls (303-04B Fuel Charging and Controls - V8 4.4L Petrol, Description and Operation).

Fuel system emission control is described in Engine Emission Control - 4.4L V8
For additional information, refer to: Engine Cooling (303-03B Engine Cooling - V8 4.4L Petrol, Description and Operation).

FUEL TANK ASSEMBLY



Item	Part Number	Description
1	-	Pipe - purge valve to charcoal canister
2	-	Tank breather pipe
3	-	Fuel pump module flange
4	-	Pump module clamp
5	-	Pump module collar
6	-	Pump module seal
7	-	Cover
8	-	Pipe connection - purge valve
9	-	Pipe connection - fuel feed
10	-	Cradle
11	-	Fuel tank
12	-	Pipe - fuel feed
13	-	Mounting screws (6 off) and washers (7 off)
14	-	Fuel filler hose
15	-	Heat shield
16	-	Scrivet (2 off)
17	-	Screw M6 (2 off)
18	-	Clip cover (2 off)

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank has a useable capacity of 88.1 liters (23.2 US gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front right hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

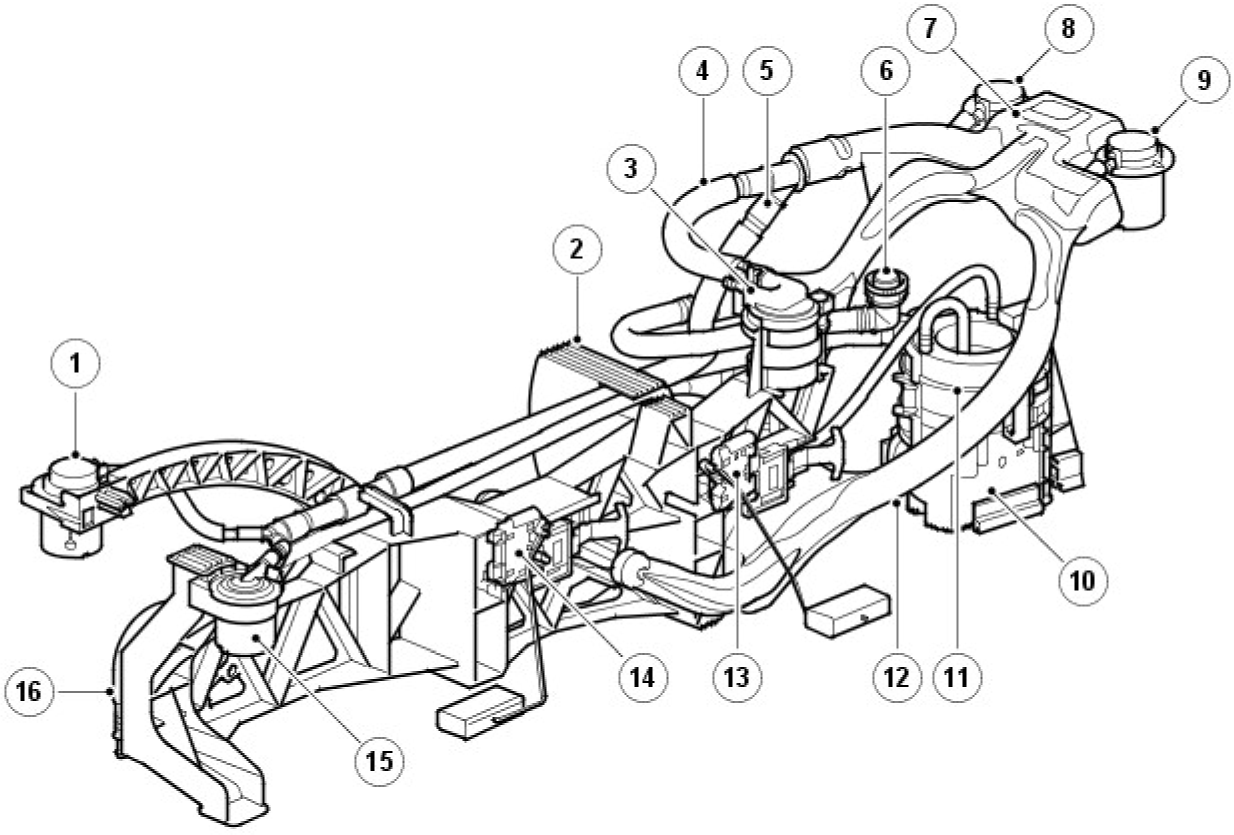
The flange assembly comprises a pump module flange which contains all external pipe and electrical connections for the tank internal components, a collar and a clamp. The flange is fitted with a seal which locates in the tank aperture. An arrow on the flange must be aligned between two moulded lines on the tank, adjacent to the pump module flange aperture, to obtain the correct orientation. The collar is located over the flange and is secured with the clamp. The flange, seal, collar and clamp arrangement meets the sealing requirements of LEV2 emissions.

The flange has a five pin external connector which provides for electrical connections for the level sensors, level sensors common ground and the fuel pump. This connector is wired to three push fit connectors on the underside of the flange. A quick release connector provides for the connection of the fuel feed pipe and breather.

A tank carrier assembly is attached inside the tank and is used to locate the internal tank components. The carrier provides location for the fuel pump module, the front and rear level sensors, the Roll Over Valves (ROVs), the Fuel Level Vent Valve (FLVV) and the front jet pump.

The fuel pump module comprises the fuel pump, the rear jet pump, the pump inlet filter, a second fine mesh filter and the fuel pressure regulator. The fuel pressure regulator is housed in a manifold attached to the carrier assembly. Only the pump module assembly and level sensors are available as serviceable components, the individual assembly components are not available separately.

Fuel Tank Internal Components



E58238

Item	Part Number	Description
1	-	Front right hand Roll Over Valve (ROV)
2	-	Carrier assembly
3	-	Fuel Level Vent Valve (FLVV)
4	-	Fuel Level Vent Valve (FLVV) breather corrugated tube to LVS
5	-	Front ROV corrugated tube to LVS
6	-	Tank breather connector to underside of fuel pump module flange
7	-	Liquid Vapor Separator (LVS)
8	-	Rear right hand ROV
9	-	Rear left hand ROV
10	-	Swirl pot
11	-	Fuel pump module
12	-	LVS carrier
13	-	Rear fuel level sensor
14	-	Front fuel level sensor
15	-	Front left hand ROV
16	-	Front jet pump

The 4.4L V8 vent system comprises:

- Four Roll Over Valves (ROV)
- One Fuel Level Vent Valve (FLVV)
- One Liquid Vapor Separator (LVS)

The vent system is mounted on the fuel tank internal carrier which is assembled outside of the tank and inserted into the tank during the blow moulding process. None of the internal tank venting components are serviceable.

The two rear ROVs are mounted directly onto the LVS with rubber grommets and secured with clamps.

The two front ROVs are located in the front of the tank and are attached to the main beam of the carrier by a moulded clip. Both ROVs are connected to the LVS with a plastic corrugated tube.

The four ROVs vent directly into the LVS. Any liquid fuel is separated from the vapor in the LVS and drains back into the tank via the FLVV. The LVS is connected by a corrugated tube to the fuel pump module flange. This allows fuel vapor to exit the tank during refuelling.

The main purpose of the FLVV is to control the fill volume of the tank. During filling, excess vapor is passed via the FLVV to the LVS. The vapor then passes from the LVS to the fuel pump module flange vent connection via a corrugated tube. The flange vent connection is connected to the charcoal canister which stores the fuel vapor. During filling, when the tank reaches its full level, the FLVV closes and prevents fuel vapor passing through to the LVS. This causes the pressure in the tank to rise which in turn causes the pump filling nozzle to turn off.

Fuel Pump Module

The fuel pump module is attached to the carrier and is located at the bottom of the swirl pot. The pump module flange has three electrical connectors; one for the fuel pump motor and one for each of the fuel level sensors. All are connected to the external electrical connector via the connectors on the underside of the fuel pump module flange.

The pump module has a rated flow of 122 liters/hour (32.2 US gallons/hour) at a voltage of 12.3V and an output pressure of 4.5 bar (65.2 lbf/in^2).

The fuel pump is energised by the fuel pump relay which is located in the Battery Junction Box (BJB). The relay is controlled by the engine control module and energises the relay at all times when the ignition switch is in ignition position II.

A pump inlet filter is attached to the pump inlet port at the bottom of the pump. The filter has a 'winged' section which is located vertically at the side of the pump to ensure that a portion of the filter is off the base of the swirl pot, to prevent premature blocking of the filter. The filter has a 31 micron fine mesh filter with a surface area of 70 cm^2 (10.8 in^2).

A second fine mesh filter is located around the top of the fuel pump. This provides additional filtration to the fuel before it is passed into the manifold and onto the fuel rail. The filter has an electrical connection which is attached to ground to prevent electrostatic build-up.

The fuel filter outlet also incorporates a non-return valve which prevents fuel returning to the pump when the engine is not running. This ensures that system pressure is maintained in the fuel feed line to the fuel rail when the engine is not running.

Fuel Level Sensors

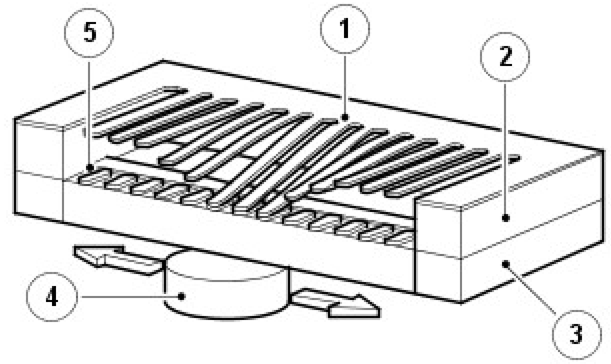
The sensor is a MAgnetic Passive Position Sensor (MAPPS) which provides a variable resistance to ground for the output from the fuel gage. The sensor is sealed from the fuel preventing contamination of the contacts, increasing reliability. The front and rear fuel level sensors are connected to the external electrical connector on the flange via the connectors on the underside of the fuel pump module flange.

The front and rear sensors are attached to the carrier and are accessible via the fuel pump flange aperture.

• NOTE: When a service replacement tank is ordered the tank is supplied with the front and rear level sensors fitted

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

Sensor Operating Principle



E44504

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal is output proportional to the amount of fuel in the tank and the position of the float arm. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gage pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning lamp is incorporated in the instrument cluster and illuminates when the fuel level is at or below 12.5 liters (3.30 US gallons).

The fuel level sender signal is converted into a CAN message by the instrument cluster as a direct interpretation of the fuel tank contents in liters. The ECM uses the CAN message to store additional OBD P Codes for misfire detection when the fuel level is below a predetermined capacity.

Front Fuel Level Sensor Resistance / Fuel Gage Read out Table

- NOTE: These figures are with the vehicle on level ground. Sensor readings will differ with varying vehicle inclinations.

Sender Unit Resistance, Ohms	Nominal Gage Reading
51	Empty
84	Low fuel level illumination (12.5L)
375	Half full
911	Full

Rear Fuel Level Sensor Resistance / Fuel Gage Read out Table

- NOTE: These figures are with the vehicle on level ground. Sensor readings will differ with varying vehicle inclinations.

Sender Unit Resistance, Ohms	Nominal Gage Reading
86	Empty
160	Low fuel level illumination (12.5L)
441	Half full
944	Full

Fuel Pressure Regulator

The fuel pressure regulator is located in the manifold inside the fuel tank. The regulator controls the fuel pressure in the feed pipe to the fuel rail by allowing some fuel to be diverted to the front jet pump.

The regulator is subject to pump output pressure. The regulator maintains the pressure of the fuel delivered to the fuel rail to 4.5 bar (65.2 lbf/in^2). The regulator is required to maintain the fuel pressure at the optimum pressure for correct fuel injection.

Swirl Pot

The swirl pot is located at the rear of the fuel tank and provides for the attachment or location of most of the fuel pump assembly components.

The swirl pot acts as a fuel reserve, providing a constant supply of fuel to the fuel pump irrespective of fuel quantity or vehicle attitude. When the vehicle is level the swirl pot contains approximately 400 cm^3 (24.4 in^3) of fuel when the engine is running. The two jet pumps ensure that fuel is constantly supplied to the swirl pot to provide a sufficient fuel supply for the pump.

A one way valve is located in the base of the swirl pot. The valve allows fuel from the tank to enter the swirl pot, but prevents it from escaping.

Jet Pumps

The fuel system incorporates two jet pumps. The front jet pump is located on the carrier near the front of the fuel tank. The front jet pump is mainly used when the vehicle is driving downhill. The jet pump is connected via a pipe from the fuel manifold and receives fuel diverted from the fuel feed pipe by the pressure regulator. The front jet pump collects fuel from the front of the tank and transfers it into the swirl pot, ensuring a constant supply of fuel to the pump. The front jet pump has a jet nozzle of 2.1 mm diameter.

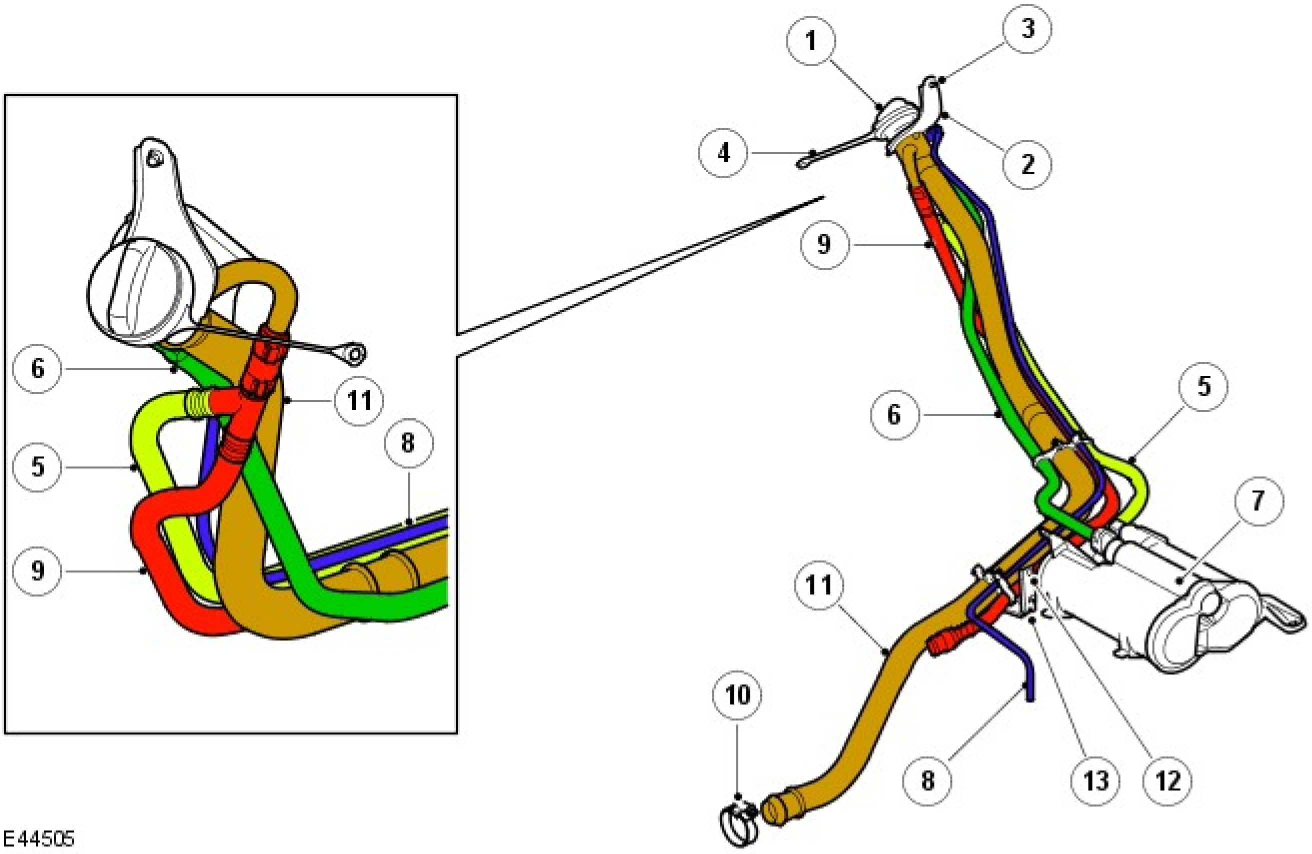
The rear jet pump is located in the swirl pot below the fuel pump and picks up fuel at the rear of the tank. The jet pump operates on a venturi effect created by the fuel at pump output pressure passing through the jet pump. This draws additional fuel from the tank through ports in the jet pump body, delivering additional fuel to the swirl pot. The rear jet pump has a jet nozzle diameter of 0.47 mm.

Roll Over Valves (ROVs)

Four ROVs are located on the carrier and are connected via pipes to a liquid vapour separator. The separator, which is also attached to the carrier, is connected via a pipe to the tank breather outlet in the pump module flange. The ROVs contain non-return valves which close in the event of the vehicle overturning, preventing liquid fuel escaping from the tank via the breather pipe.

FUEL FILLER PIPE ASSEMBLY

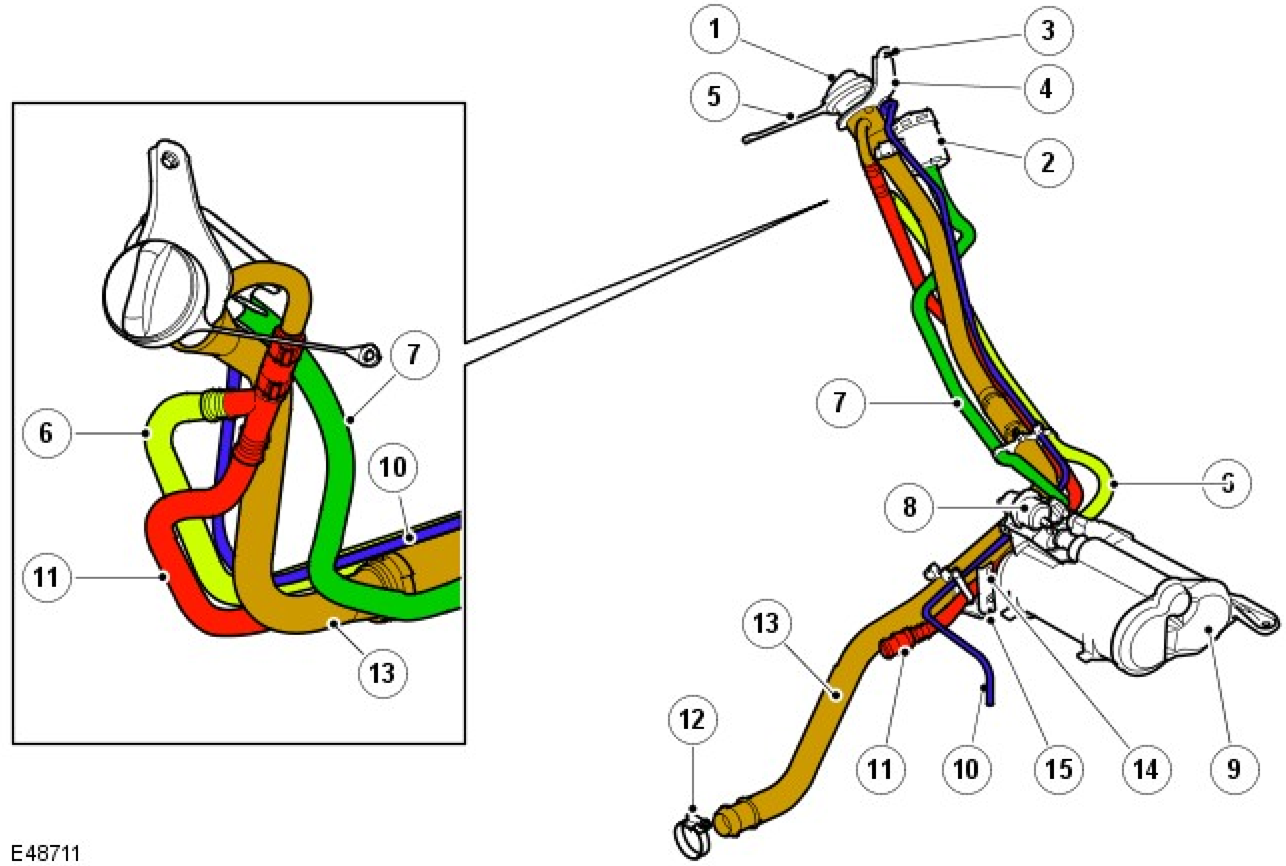
Fuel Filler - ROW



Item	Part Number	Description
1	-	Filler cap
2	-	Bracket
3	-	Screw M6
4	-	Filler cap lanyard
5	-	Charcoal canister breather hose
6	-	Charcoal canister vent hose to atmosphere
7	-	Charcoal canister (ROW)
8	-	Rear differential breather pipe
9	-	Tank breather pipe

10	-	Clamp - filler hose
11	-	Fuel filler pipe
12	-	Screw M8
13	-	Lower mounting bracket to EPB bracket

Fuel Filler - NAS



Item	Part Number	Description
1	-	Filler cap
2	-	DMTL pump filter
3	-	Screw M6
4	-	Bracket
5	-	Filler cap lanyard
6	-	Charcoal canister breather hose
7	-	DMTL pump vent hose to filter
8	-	DMTL pump
9	-	Charcoal canister (NAS)
10	-	Rear differential breather pipe
11	-	Tank breather pipe
12	-	Clamp - filler hose
13	-	Fuel filler pipe
14	-	Screw M8
15	-	Lower mounting bracket to EPB bracket

The fuel filler head is positioned at the rear of the vehicle, above the right hand rear wheel. The filler head is covered by a moulded plastic cover which is electrically locked when the vehicle is locked. The filler cap is a conventional screw in type which is secured to the vehicle with a lanyard.

• NOTE: The fuel filler head plastic cover does not lock on NAS vehicles.

The filler head is a stainless steel fabrication. Two brackets provide for the attachment of the filler head to the vehicle body and the chassis electronic parking brake bracket.

Connections on the rear of the filler head allow for the connection of the fuel tank breather pipe from the fuel tank flange, the fuel filler pipe to the tank and the charcoal canister breather pipe.

The fuel tank breather pipe has a quick release fitting and connects to the breather pipe from the fuel tank flange.

The fuel filler pipe locates in a short flexible hose attached to the tank and is secured with worm drive clamps. The canister breather pipe is routed alongside the fuel filler pipe and attaches to the canister with a quick release coupling.

A fourth pipe is also routed alongside the fuel filler pipe and provides air ventilation for the charcoal canister. On all petrol vehicles, except NAS vehicles, the pipe is connected to the air pump port on the charcoal canister with a quick release coupling and connects to an insect trap at the fuel filler head. On NAS vehicles fitted with a DMTL pump, the pipe connects to the pump vent port and is also connected to a filter which is attached to the filler head.

A smaller pipe, which is not associated with the fuel system, is attached to the side of the fuel filler pipe. This pipe connects to the rear differential and provides breathing for the differential case. The pipe terminates near the fuel filler head.

Fuel Tank and Lines - V8 4.4L Petrol - Fuel Tank and Lines

Diagnosis and Testing

Overview

For information on the system operation, refer to section 310-01 - Fuel Tank and Lines in the workshop manual.

Inspection and Verification

- WARNINGS:

⚠ Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠ If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

⚠ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

- CAUTIONS:

⚠ Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠ It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

1. **1.** Verify the customer concern.
2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Fuel level ● Fuel contamination/grade/quality ● Fuel filter ● Fuel leaks ● Damaged fuel lines ● Damaged push connect fittings ● Fuel filler cap ● Fuel tank filler pipe ● Roll over valves (ROVs)	● Battery charge and condition ● Fuse(s) ● Inertia fuel shutoff (IFS) switch ● Loose or corroded electrical connectors ● Harnesses ● Fuel pump relay ● Fuel pump module ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step
4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - ○ Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action

Symptom	Possible causes	Action
Engine cranks, but does not fire	● Inertia fuel shutoff (IFS) switch ● Low/Contaminated fuel ● Engine breather system disconnected/restricted ● Ignition system ● Fuel leak ● Blocked fuel filter ● Fuel pump module fault ● Crankshaft position (CKP) sensor ● ECM fault	Check that the inertia switch has not tripped. Check the fuel level/condition. Check the engine breather system. Check for ignition system DTCs. Check the fuel system for leaks/damage. Check the fuel filter for a blockage/restriction. Check the fuel pump module operation. Check the CKP sensor. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Engine cranks and fires, but will not start	● Evaporative emissions purge valve ● Low fuel pressure ● Fuel leak ● Blocked fuel filter ● Fuel pump module fault ● Spark plugs ● HT short to ground (tracking) check rubber boots for cracks/damage ● Ignition coil failure(s) ● Harness	Check the evaporative emissions purge valve. Check the fuel pressure. Check the fuel system for leaks/damage. Check the fuel filter for a blockage/restriction. Check the fuel pump module operation. Check the spark plugs and ignition coils. Refer to the relevant section of the workshop manual.
Difficult to start after hot soak (vehicle standing after engine has reached operating temperature)	● Injector leak ● Fuel temperature sensor ● Intake air temperature (IAT) sensor ● Mass air flow (MAF) sensor ● Evaporative emissions purge valve ● Fuel pump module fault ● Ignition system	Check the fuel injectors. Check the fuel temperature sensor, check the IAT and MAF sensor circuits. Check the evaporative emissions purge valve. Check the operation of the fuel pump module. Check the spark plugs and ignition coil circuits. Refer to the relevant section of the workshop manual.
Engine stalls soon after start	● Breather system disconnected/restricted ● ECM relay ● Harness ● MAF sensor ● Ignition system ● Air cleaner restricted ● Air leakage ● Fuel lines ● Fuel rail pressure (FRP) sensor	Check the engine breather system. Check the ECM relay and circuits. Check the MAF sensor circuits. Check the spark plugs and ignition coil circuits. Check for a restricted air cleaner. Check the intake air system for leaks. Check the fuel lines for leaks/damage. Check the FRP sensor circuits. Refer to the relevant section of the workshop manual.
Engine hesitates/poor acceleration	● Restricted pedal travel (carpet, etc) ● Exhaust gas recirculation (EGR) valve stuck open ● Ignition system ● Air leakage ● Heated oxygen (HO2) sensors ● Fuel pressure ● Blocked fuel filter ● Fuel lines ● Fuel pump module fault ● Injector leak ● Throttle position (TP) sensors ● Throttle motor ● Accelerator pedal position (APP) sensor ● Transmission malfunction	Check the accelerator pedal travel. Check the spark plugs and ignition coil circuits. Check the intake air system for leaks. Check the HO2 sensor circuits. Check the fuel pressure. Check the fuel filter for a blockage/restriction. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the fuel injectors. Check the TP sensor, throttle motor and APP sensor circuits. Refer to the relevant section of the workshop manual.

Symptom	Possible causes	Action
Engine backfires	- Ignition system - Air leakage - Fuel lines - Fuel pump module fault - MAF sensor - HO2 sensors - APP sensor	Check the spark plugs and ignition coil circuits. Check the intake air system for leaks. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the MAF, HO2 and APP sensor circuits. Refer to the relevant section of the workshop manual.
Engine surges	- Fuel lines - Fuel pump module fault - MAF sensor - Harness - TP sensors - Throttle motor - Ignition system - ECM fault	Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the MAF sensor, TP sensor and throttle motor circuits. Check the ignition coil circuits. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Engine detonates/knocks	- Fuel quality - Fuel lines - Fuel pump module fault - Air leakage - FRP sensor - Knock sensor (KS)/circuit malfunction - MAF sensor - HO2 sensors - BARO sensor malfunction (internal ECM fault)	Check the fuel for contamination/grade/quality. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the intake air system for leaks. Check the FRP, KS, MAF and HO2 sensor circuits. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to section 303-14 - Electronic Engine Controls in the workshop manual.

DTC	Description	Possible causes	Action
P017100	System Too Lean (Bank 1)	- Air intake leak between MAF sensor and cylinder head - MAF sensor fault (low intake air flow) - Low fuel pressure - Fuel filter/system restriction - Fuel pump module fault - Fuel injector restriction - Exhaust leak (before catalyst) - Evaporative emission system fault	Check the intake air system for leaks. Check the MAF sensor condition and circuits. Check the fuel pressure. Check the fuel filter for a blockage/restriction. Check the fuel system for leaks/damage. Check the fuel pump module operation. Check the fuel injectors. Check the exhaust system for leaks, etc. Refer to the relevant section of the workshop manual. Check for evaporative emission DTCs.
P017200	System Too Rich (Bank 1)	- Restricted air filter - High fuel pressure - Leaking fuel injector(s) - Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) - MAF sensor fault - Evaporative emission system fault	Check the intake air system for restrictions. Check the fuel system for leaks and check the fuel pressure. Check the fuel injectors. Check for fuel system DTCs. Check the oil for contamination/grade/quality. Refer to the relevant section of the workshop manual. Check for MAF sensor and evaporative emission DTCs.
P017400	System Too Lean (Bank 2)	- Air intake leak between MAF sensor and cylinder head - MAF sensor fault (low intake air flow)	Check the intake air system for leaks, etc. Check the fuel system for restrictions, DTCs, etc. Check the exhaust system for leaks, etc. Refer to the relevant section of the workshop manual. Check for evaporative emission DTCS.

DTC	Description	Possible causes	Action
		● Fuel filter/system restriction ● Low fuel pressure ● Fuel injector restriction ● Exhaust leak (before catalyst) ● Evaporative emission system fault	
P017500	System Too Rich (Bank 2)	● Restricted air filter ● High fuel pressure ● Leaking fuel injector(s) ● Oil contaminated with fuel (too many cold starts with vehicle subsequently not getting hot enough for long enough) ● MAF sensor fault ● Evaporative emission system fault	Check the intake air system for restrictions, etc. Check the fuel system for leaks, DTCs, etc. Check the oil condition. Refer to the relevant section of the workshop manual. Check for MAF sensor and evaporative emission DTCs.
P030000	Random Misfire Detected	● ECM to ignition coil primary circuit faults (cylinder misfire detected DTCs also logged) ● Ignition coil failure ● Spark plug failure/fouled /incorrect gap ● Fuel delivery pressure (low/high) ● Fuel injector circuit fault(s) (injector DTCs also logged) ● Fuel injectors restricted/leaking ● Fuel injectors continuously open ● Fuel contamination ● Cylinder compression low ● Valve clearance adjustment ● Worn camshaft/broken valve springs	Check for ignition coil DTCs. Check the condition of the spark plugs and the gaps. Check the fuel pressure. Check for fuel injector DTCs. Check the fuel for contamination/grade /quality. Check the cylinder compressions, check the valve clearances, check the condition of the camshaft and valve springs. Refer to the relevant section of the workshop manual.
P046129	Fuel Level Sensor A Circuit Range/Performance	● Fuel level sensor circuits intermittent short circuit or high resistance ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P04612F	Fuel Level Sensor A Circuit Range/Performance	● Fuel level sensor circuits intermittent short circuit or high resistance ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P046200	Fuel Level Sensor A Circuit Low	● Fuel level sensor circuits intermittent short circuit to ground or high resistance ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P046300	Fuel Level Sensor A Circuit High	● Fuel level sensor circuits intermittent short circuit to power ● Fuel level sensor failure	Refer to the electrical guides and check the fuel gauge sender unit circuit. Repair/renew as necessary.
P062800	Fuel Pump A Control Circuit Low	● Fuel pump control circuit short circuit to ground ● Fuel pump control circuit high resistance ● Fuel pump relay fault	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.

DTC	Description	Possible causes	Action
P062900	Fuel Pump A Control Circuit High	- Fuel pump control circuit short circuit to power - Fuel pump relay fault	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P131500	Persistent Misfire	- ECM to ignition coil primary circuit fault (cylinder misfire detected DTC also flagged) - Ignition coil failure - Spark plug failure/fouled /incorrect gap - Fuel delivery pressure low - Fuel injector circuit fault(s) (injector DTCs also flagged) - Fuel contamination - Cylinder compression low	Check for ignition coil DTCs. Check the condition of the spark plugs and the gaps. Check the fuel pressure. Check for fuel injector DTCs. Check the fuel for contamination/grade /quality. Check the cylinder compressions. Refer to the relevant section of the workshop manual.

Fuel Tank and Lines - V8 4.4L Petrol - Fuel Pump Module

Removal and Installation

Removal

- WARNINGS:

⚠ Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

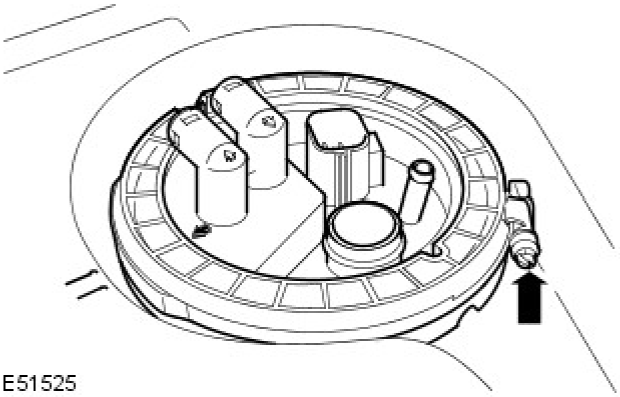
- NOTE: The fuel pump module comprises of a rear fuel level sender, filter and a fuel pressure regulator. These components cannot be serviced separately.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

3. Remove the fuel tank.
For additional information, refer to: Fuel Tank (310-01B Fuel Tank and Lines - V8 4.4L Petrol, Removal and Installation).



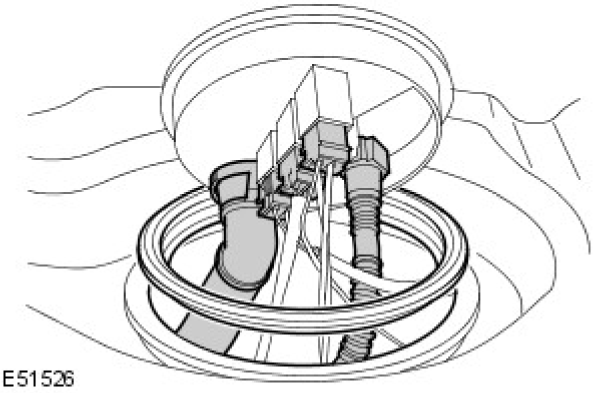
E51525

4. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

- NOTE: Note the fitted position.

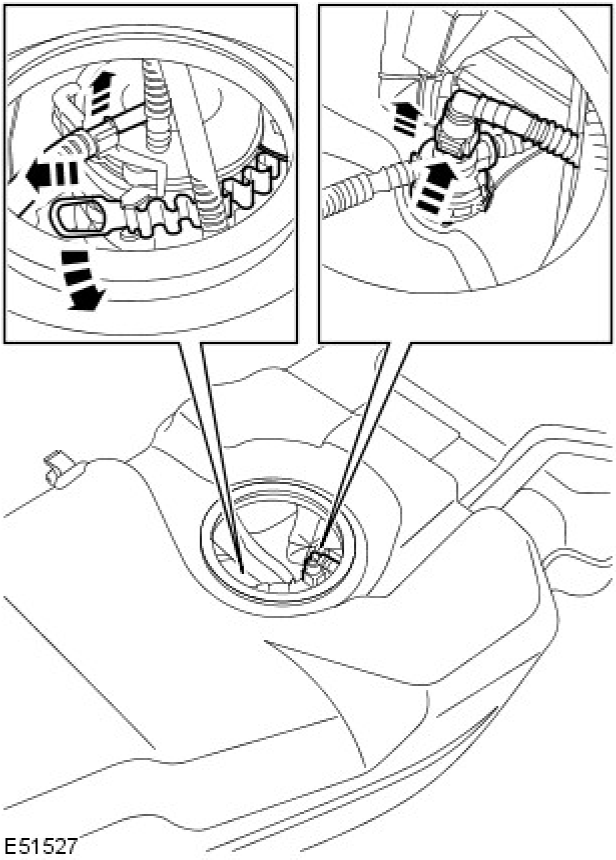
Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.



5. Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.



6. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.

Installation

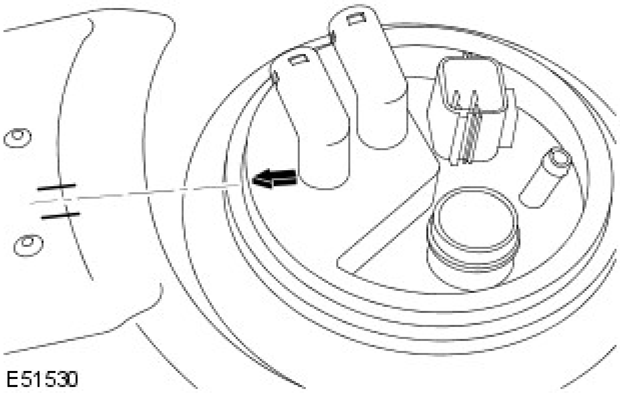
1. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

2. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.

- Connect the fuel supply line.
- Connect the vent line.



E51530

3. ⚠ CAUTION: Make sure the seal is correctly fitted.

• NOTE: Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

4. Install the fuel tank.
For additional information, refer to: Fuel Tank (310-01B Fuel Tank and Lines - V8 4.4L Petrol, Removal and Installation).

5. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

⚠ The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

⚠CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

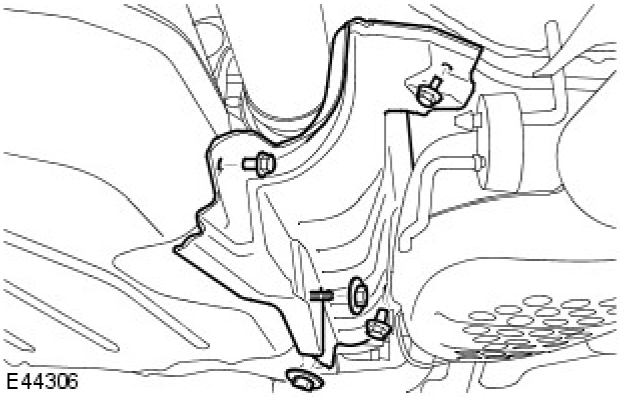
2. Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

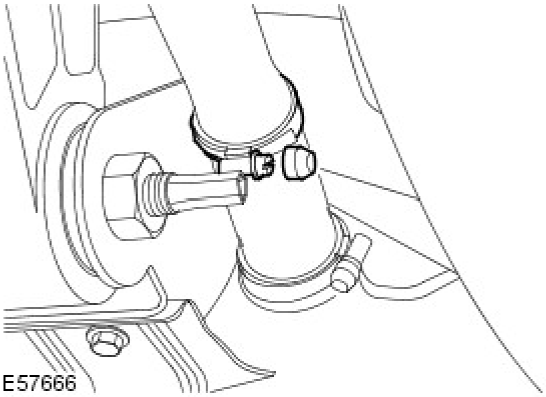
3. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

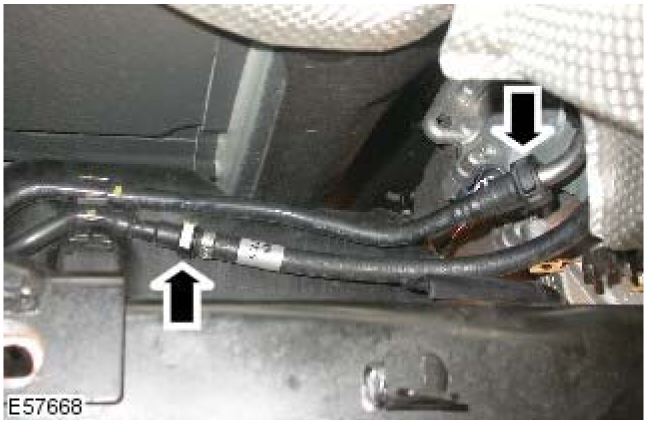




5. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

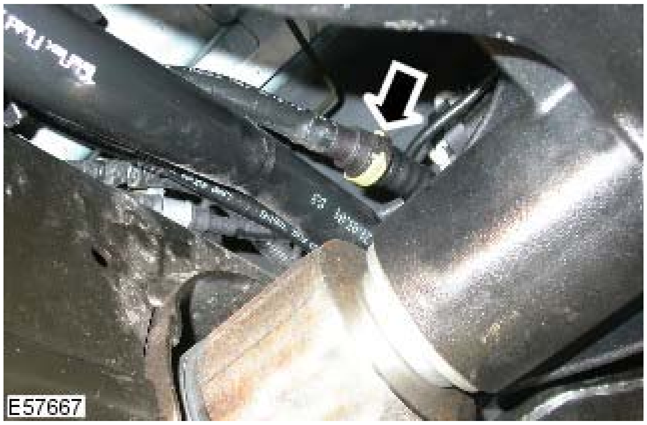
Disconnect the fuel filler neck from the filler neck hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



6. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel supply and purge lines quick release connections at the front of the fuel tank.



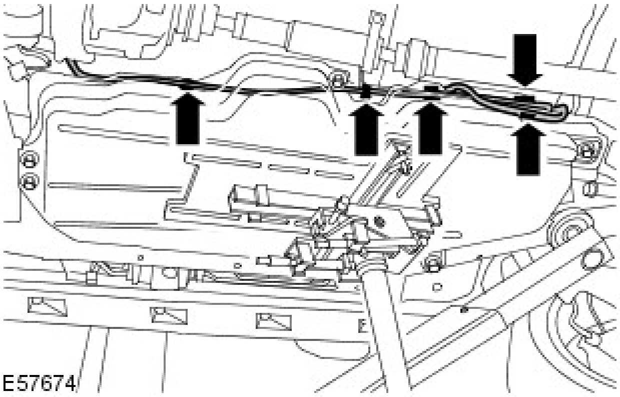
7. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel tank vent line.

8. Release the fuel tank harness.

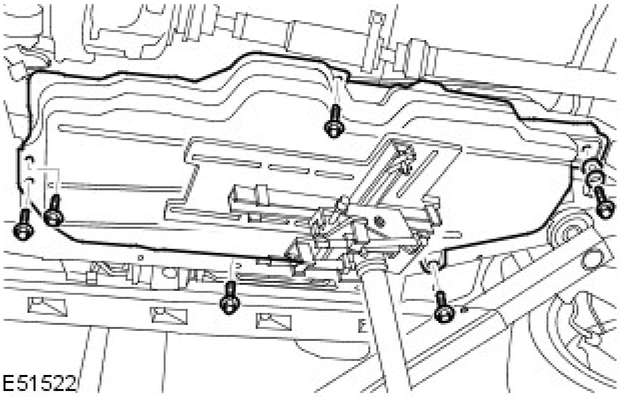
9. Release the parking brake emergency release cable.

- Release from the 4 clips.



E57674

10. Remove the 2 emergency release cable clips.



E51522

11. ⚠ WARNING: Secure the component to the transmission jack.

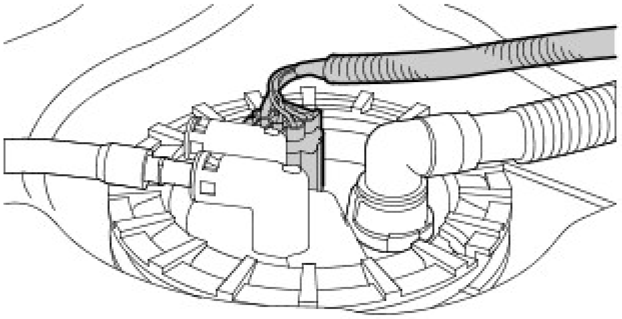
• CAUTIONS:

⚠ Do not lower the fuel tank more than 250 mm (9.75 in)

⚠ Note the rear bolt is fitted with 2 washers.

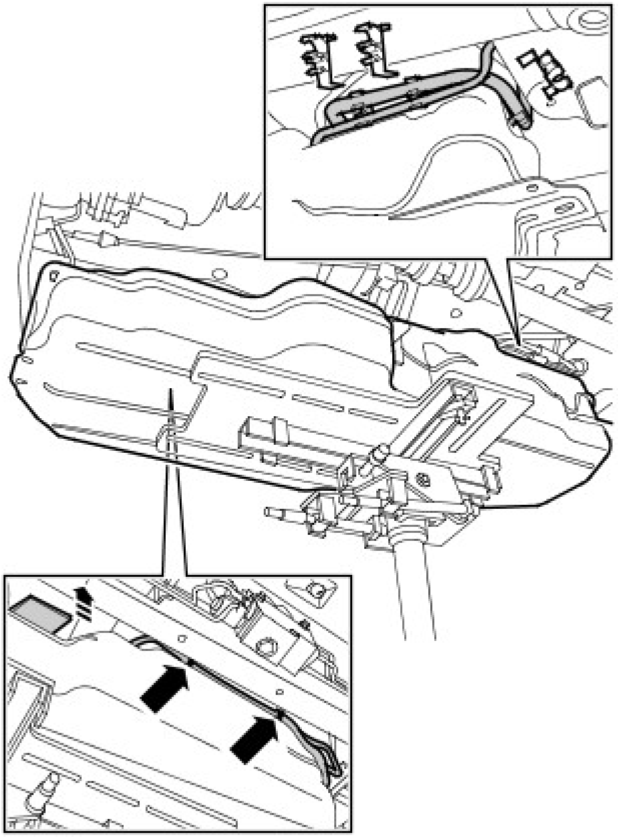
Using a transmission jack, lower the fuel tank sufficiently only to access the top of the fuel tank.

- Remove the 6 bolts.



E57673

12. Disconnect the fuel pump module electrical connector.



13. Release the purge line from the top of the fuel tank.

- Remove the adhesive pad.
- Release from the 5 clips.

14. Remove the fuel tank.

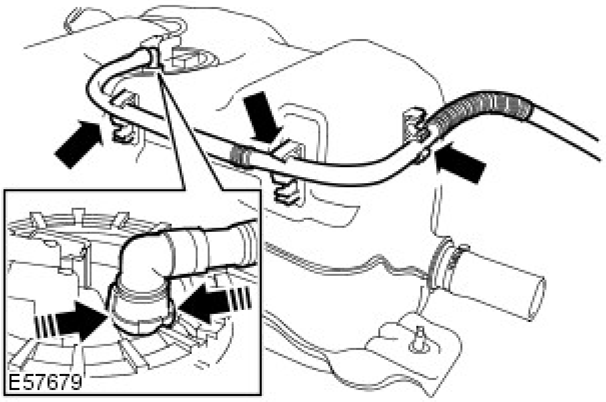
15. NOTE: Do not disassemble further if the component is removed for access only.

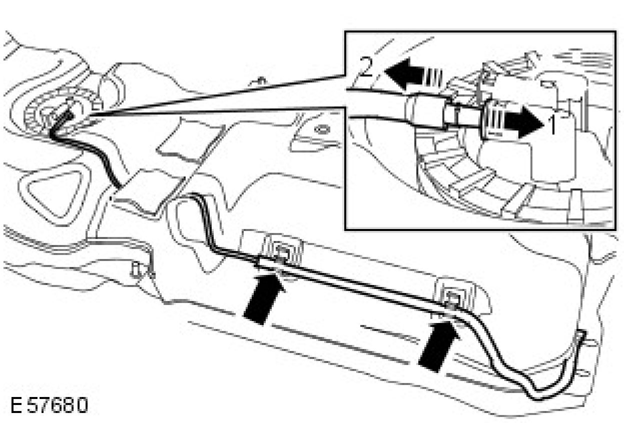
With assistance, remove the fuel tank from the transmission jack.

16. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the fuel tank vent line.

- Disconnect the quick release connector.
- Remove from the 3 clips.



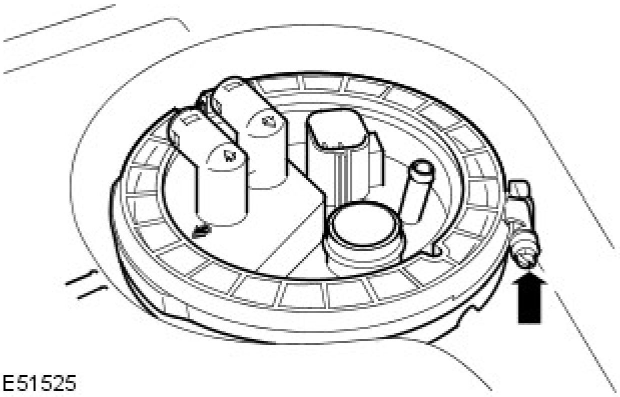


E57680

17. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Remove the fuel supply line.

- Disconnect the quick release connector.
- Release from the 2 clips.



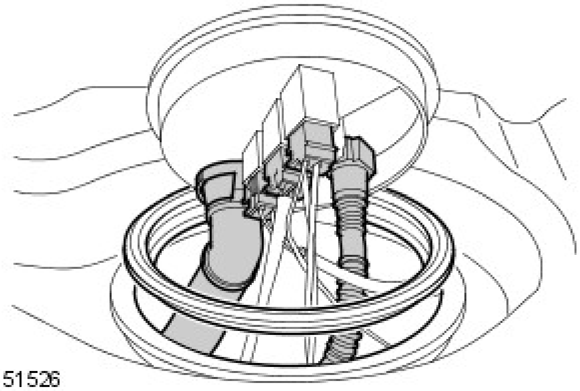
E51525

18. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Note the fitted position.

Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.

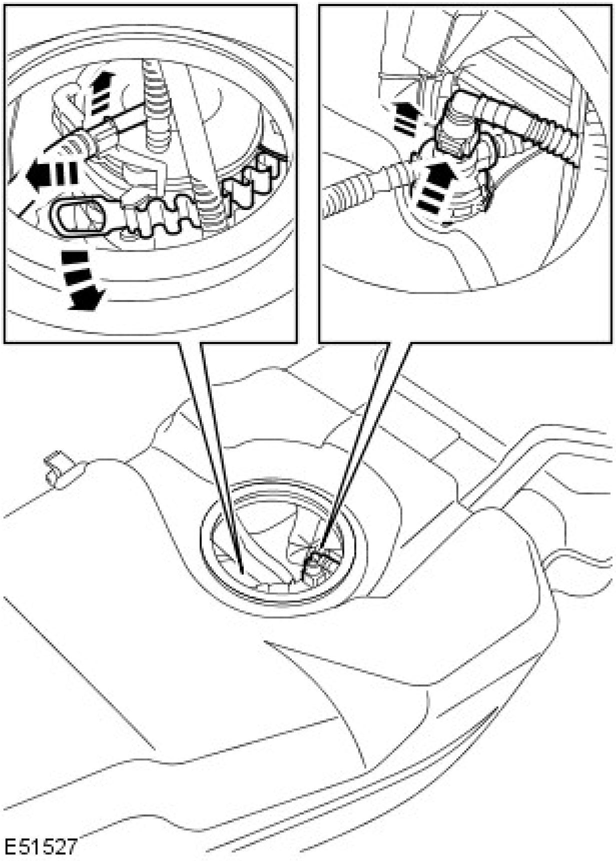


E51526

19. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

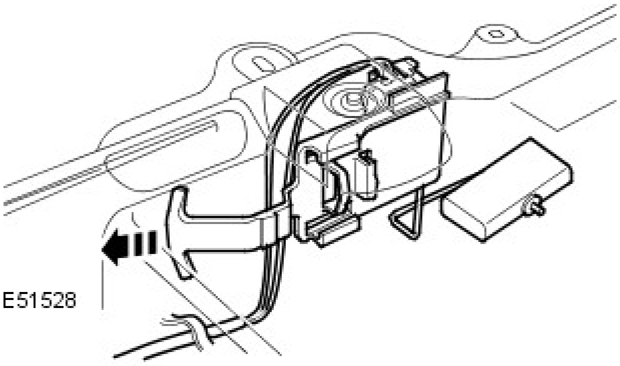
Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.



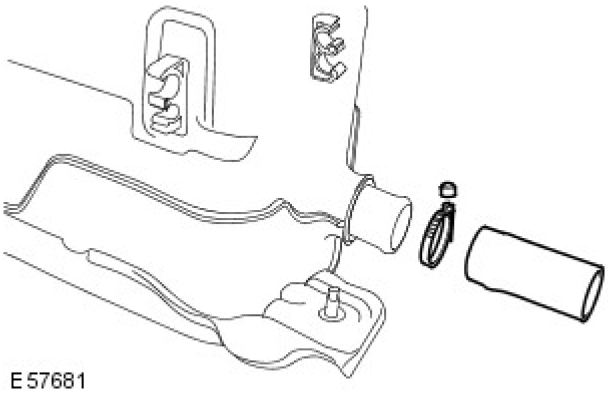
20. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.



21. Remove the fuel tank front fuel level sender unit.

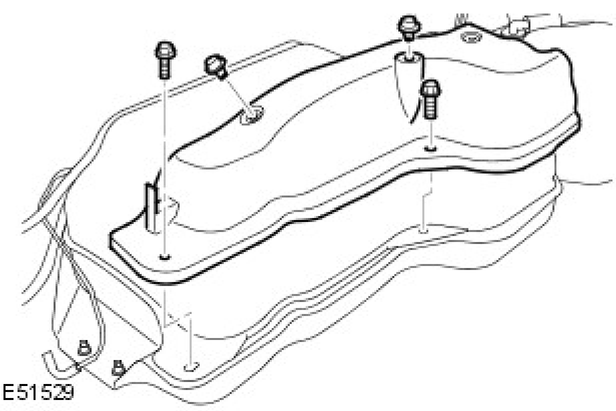
- Release the lead.
- Release the clip.



22. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Remove the fuel filler hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



23. Remove the fuel tank bracket.

- Remove the 2 clips.
- Remove the 2 bolts.
- Remove the retaining plate.

Installation

1. Install the fuel tank bracket.

- Install the retaining plate.
- Install the clips.
- Tighten the bolts to 3.5 Nm (2.5 lb.ft).

2. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Install the fuel filler hose.

- Install a new retaining clip.

3. Install the fuel tank front fuel level sender unit.

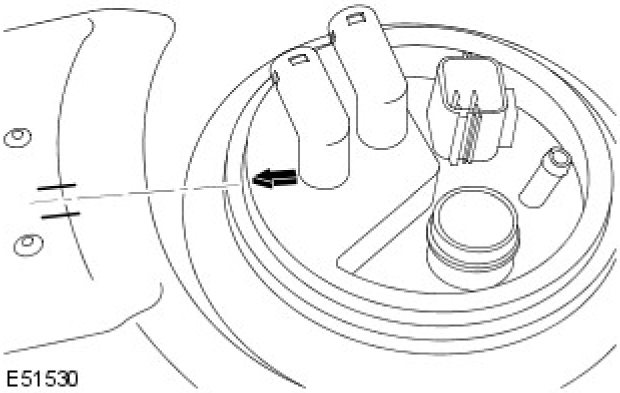
- Secure the clip.
- Secure the lead.

4. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

5. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.
- Connect the fuel supply line.
- Connect the vent line.



6. ⚠ CAUTION: Make sure the seal is installed correctly.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

7. Install the fuel supply line.

- Connect the quick release connector.
- Secure in the 2 clips.

8. Install the vent line.

- Connect the quick release connector.
- Secure in the 3 clips.

9. With assistance, install the fuel tank to the transmission jack.

10. Position the fuel tank to the vehicle.

11. Secure the purge line to the fuel tank.

- Secure with the clips.
- Install the adhesive pad.

12. Connect the electrical connector.

13. ⚠ CAUTION: Note the rear bolt is fitted with 2 washers.

Install the fuel tank.

- Tighten the bolts to 45 Nm (33 lb.ft).

14. Install the 2 emergency release cable clips.

15. Secure the parking brake emergency release cable.

- Secure in the 4 clips.

16. Secure the fuel tank harness.

17. Connect the vent line.

18. Connect the fuel supply and purge lines.

19. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

20. Install the fuel tank heat shield.

- Tighten the bolts to 6 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

21. Refill the fuel tank.

For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

Capacity

Fuel tank	84.0 litres (18.5 gallons) (22.19 US gallons)

General Specification

Item	Specification
System type	Mechanical - returnless
Fuel delivery module	Located in the fuel tank
High pressure fuel pump:	
Location	Located at rear of engine between the cylinder heads, belt driven from the camshafts
Maximum operating pressure	165000 kPa (1650 bar) (23925 lb/in²)
Advance delivery fuel pump:	
Location	Located in the fuel tank
Operating pressure	50 kPa (0.5 bar) (7.35 lb/in²)
Maximum output @12.3 volts	70 litres/hour (15.4 gallons/hour) (18.4 US gallons/hour)
Fuel pressure regulator:	
Type/location	In-line, within fuel tank
Operating pressure	50 kPa (0.5 bar) (7.25) lb/in²
Fuel filter	Remotely mounted on the inside of the longitudinal member - fitted with a renewable element and having a 178 cc (6 fl-oz) water separation capacity
Fuel tank sender units	Two - Front and rear - Front unit is mounted remotely within the fuel tank, rear is mounted on the body of the advance delivery fuel pump

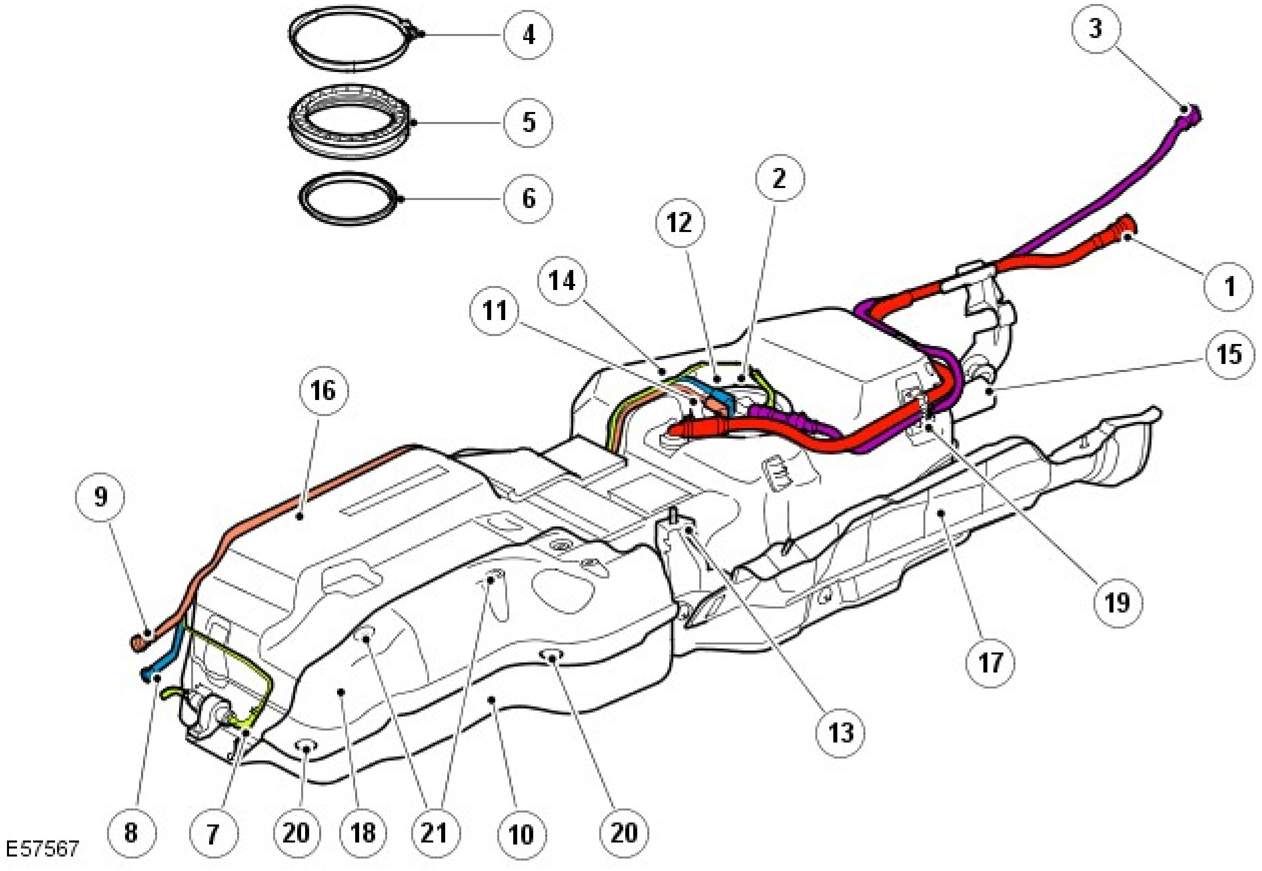
OVERVIEW

The major components of the TdV6 fuel system comprise a fuel tank, a fuel pump module, a fuel filter, a fuel cooler, a fuel filler pipe and cap assembly and two fuel level sensors.

On vehicles from 2007MY a new fuel filter assembly is fitted. This filter is the same as used on the TdV8 fuel system.

The TdV6 fuel system is a high pressure common rail system. This system uses an engine mounted and driven high pressure pump to deliver a uniform level of pressure to the common fuel rail which supplies all fuel injectors.
For additional information, refer to: Fuel Charging and Controls (303-04C Fuel Charging and Controls - TDV6 2.7L Diesel, Description and Operation).

FUEL TANK ASSEMBLY



Item	Part Number	Description
1	-	Tank breather pipe
2	-	Fuel pump module assembly
3	-	Vent pipe
4	-	Pump module clamp

5	-	Pump module collar
6	-	Pump module seal
7	-	FFBH pump feed pipe (if fitted)
8	-	Pipe - Fuel return
9	-	Pipe - Fuel feed
10	-	Cradle
11	-	Fuel feed pipe connection
12	-	Fuel return pipe connection
13	-	Mounting bolt (6 off) and washer (7 off)
14	-	FFBH feed pipe connection (if fitted)
15	-	Fuel filler hose
16	-	Fuel tank
17	-	Heat shield
18	-	Cover
19	-	Clip (2 off)
20	-	Screw M6 (2 off)
21	-	Scrivet (2 off)

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank has a useable capacity of 84.0 liters (22.19 US gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front right hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

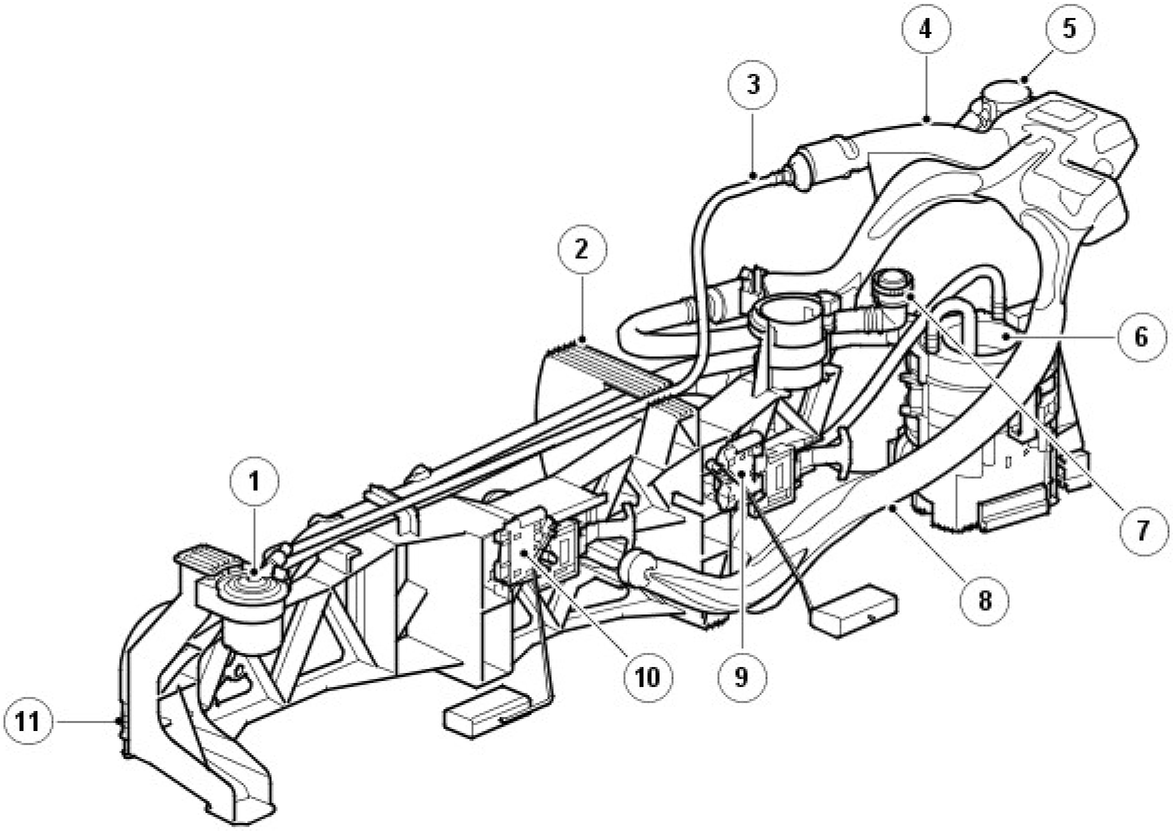
The flange assembly comprises a pump module flange which contains all external pipe and electrical connections for the tank internal components, a collar and a clamp. The flange is fitted with a seal which locates in the tank aperture. An arrow on the flange must be aligned centre of the fuel tank breather connection with the tank, to obtain the correct orientation. The collar is located over the flange and is secured with the clamp.

The flange has a five pin external connector which provides for electrical connections for the level sensors, the level sensors common ground and the fuel pump. This connector is wired to three push fit connectors on the underside of the flange. Two quick release connectors provide for the connection of the fuel feed and return pipes and the vent pipes. The fuel return connection contains a non return valve which prevents fuel escaping from the connection in the event of a vehicle roll over and the pipe becoming detached. On vehicles with a fuel burning heater, a third connection provides the connection for the fuel feed supply to the fuel burning heater.

A tank carrier assembly is attached inside the tank and is used to locate the internal tank components. The carrier provides location for the fuel pump module, the front and rear level sensors, the Roll Over Valves (ROVs) and the front jet pump.

The fuel pump module comprises the fuel pump, the rear jet pump, the pump inlet filter and the fuel pressure regulator which is mounted in a manifold on the carrier. Only the pump module assembly and the fuel level sensors are available as serviceable components, the individual assembly components are not available separately.

Fuel Tank Internal Components



E58415

Item	Part Number	Description
1	-	Front ROV
2	-	Carrier assembly
3	-	Front ROV corrugated tube to Liquid Vapor Separator (LVS)
4	-	Liquid Vapor Separator (LVS)
5	-	Rear Roll Over Valve (ROV)
6	-	Fuel pump module
7	-	Tank breather connector to underside of fuel pump module flange
8	-	LVS carrier
9	-	Rear fuel level sensor
10	-	Front fuel level sensor
11	-	Front jet pump

The TdV6 vent system is different to the system used on the petrol models. The TdV6 vent system comprises:

- Two Roll Over Valves (ROV)
- One Liquid Vapor Separator (LVS)
- Breather spout.

The vent system is mounted on the fuel tank internal carrier which is assembled outside of the tank and inserted into the tank during the blow moulding process. None of the internal tank venting components are serviceable.

The rear ROV is mounted in the rear right hand corner of the fuel tank. It is mounted directly onto the LVS with a rubber grommet and secured with a clip.

The front ROV is located in the front left hand corner of the tank. It is attached by a moulded clip to the main beam of the carrier. The ROV is connected to the LVS by a corrugated tube.

Both ROVs vent directly into the LVS. Any liquid fuel is separated from the vapor in the LVS and drains back into the tank via the front ROV.

The LVS vent outlet is connected to the underside of the tank flange. The vent line is then routed from the flange to atmosphere at the top of the filler neck. This line allows for pressure and vacuum relief during normal tank operation. It also allows air to enter the tank as fuel is used.

The main purpose of the tank breather connection is to control the fill volume of the tank. During filling, vapor exits the fuel tank via the breather connection and the breather tube to the filler neck. When the tank reaches its full level, the liquid fuel closes off the breather connection by filling it with fuel. The closure of the breather connection causes the back pressure in the tank to increase, which in turn causes the pump filling nozzle to turn off.

Fuel Pump Module

The fuel pump is attached to the carrier and is located at the bottom of the swirl pot. The pump and the fuel level sensors are connected to the external electrical connector via the connectors on the underside of the fuel pump module flange.

The pump module has a rated flow of 70 liters/hour (18.5 US gallons/hour) at a voltage of 12.3V and an output pressure of 0.5 bar (7.25 lbf/in^2).

The fuel pump is energised by the fuel pump relay which is located in the Battery Junction Box (BJB). The relay is controlled by the engine control module (ECM) and energises the relay at all times when the ignition switch is in ignition position II.

A filter is attached to the pump inlet port at the bottom of the pump. The filter has a 'winged' section which is located vertically at the side of the pump to ensure that a portion of the filter is off the base of the swirl pot, to prevent premature blocking of the filter. The filter has two sections, a normal filter and a by-pass filter. The normal filter is a 31 micron fine mesh filter with a surface area of 70 cm^2 (10.8 in^2). The by-pass filter is a 300 micron coarse mesh filter which is closed in normal conditions and has a surface area of 4 cm^2 (0.62 in^2). In cold conditions, 'waxing' of the fuel can occur which can restrict fuel passing through the fine mesh filter. If this occurs, the by-pass opens allowing fuel to pass through the coarse mesh filter.

The top face of the fuel pump module has three pipe connections. One connection is the fuel pump outlet connection which feeds into the manifold. A second connection allows fuel at pump outlet pressure to flow back through the pump module housing from the manifold to the rear jet pump. The third connection allows fuel from the pressure regulator to return to the swirlpot when the regulator has opened due to excessive pump output pressure.

Fuel Level Sensors

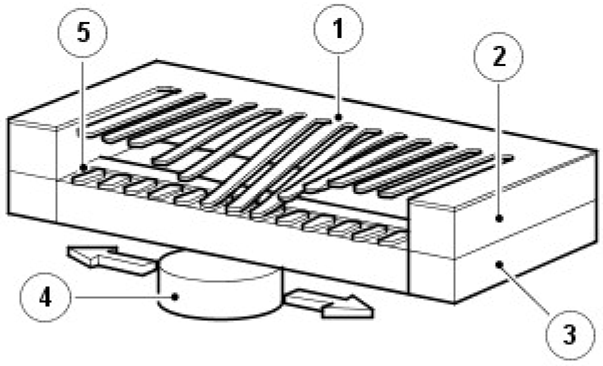
The sensor is a MAgnetic Passive Position Sensor (MAPPS) which provides a variable resistance to earth for the output from the fuel gage. The sensor is sealed from the fuel preventing contamination of the contacts, increasing reliability. The front and rear fuel level sensors are connected to the external electrical connector on the flange via the connectors on the underside of the fuel pump module flange.

The front and rear sensors are attached to the front of the carrier and are accessible via the fuel pump flange aperture.

- NOTE: When a service replacement tank is ordered the tank is supplied with the front and rear level sensors fitted

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

Sensor Operating Principle



E44417

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal is output proportional to the amount of fuel in the tank and the position of the float arm. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gage pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning lamp is incorporated in the instrument cluster and illuminates when the fuel level is at or below 14 liters (3.69 US gallons).

The fuel level sender signal is converted into a CAN message by the instrument cluster as a direct interpretation of the fuel tank contents in liters.

Front Fuel Level Sensor Resistance / Fuel Gage Read out Table

- NOTE: These figures are with the vehicle on level ground. Sensor readings will differ with varying vehicle inclinations.

Sender Unit Resistance, Ohms	Nominal Gage Reading

Fuel Pressure Regulator

The fuel pressure regulator is located in the manifold inside the fuel tank. The regulator controls the fuel pressure in the feed pipe to the High Pressure (HP) injection pump. If the pump outlet pressure becomes too high, the regulator controls the fuel pressure in the feed pipe by allowing some fuel to return to the swirl pot.

The regulator is subject to pump output pressure and constantly controls the pressure of the fuel delivered to the HP injection pump to 0.5 bar (7.25 lbf/in^2). The primary reason for the regulator is to protect the HP fuel injection pump from high fuel pressures.

Swirl Pot

The swirl pot is located at the rear of the fuel tank and provides for the attachment or location of most of the fuel pump assembly components.

The swirl pot acts as a fuel reserve, providing a constant supply of fuel to the fuel pump irrespective of fuel quantity or vehicle attitude. When the vehicle is level the swirl pot contains approximately 400 cm^3 (24.4 in^3) of fuel when the engine is running. The two jet pumps ensure that fuel is constantly supplied to the swirl pot to provide a sufficient fuel supply for the pump.

A one way valve is located in the base of the swirl pot. The valve allows fuel from the tank to enter the swirl pot, but prevents it from escaping.

Jet Pumps

The fuel system incorporates two jet pumps. The front jet pump is located on the carrier near the front of the fuel tank. The rear jet pump is located in the swirl pot below the fuel pump. Both jet pumps operate on a venturi effect created by fuel at pump output pressure passing through the jet pump. This draws additional fuel from the tank through ports in the jet pump body, delivering additional fuel to the swirl pot.

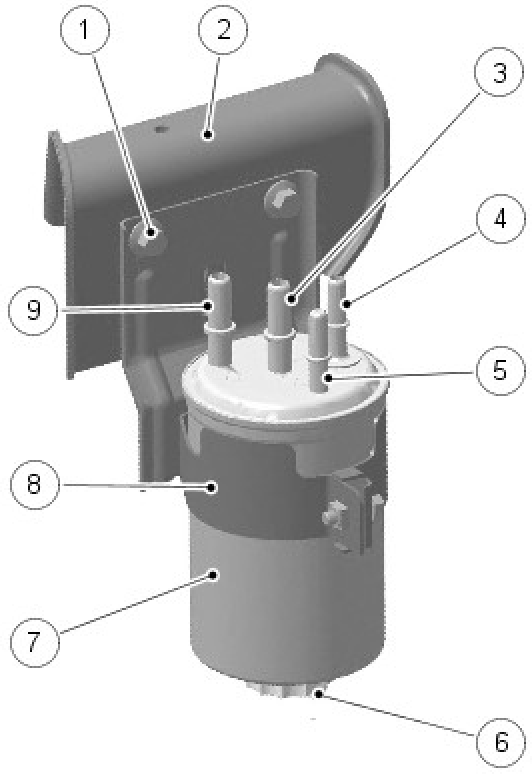
The front jet pump is mainly used when the vehicle is driving downhill. The jet pump is connected via a pipe from the fuel manifold and receives fuel at pump output pressure. Because of its location at the front of the tank, it collects fuel from the front of the tank and transfers it into the swirl pot, ensuring a constant supply of fuel to the pump. The jet pump has a jet nozzle of 1 mm diameter.

The rear jet pump operates at pump output pressure and delivers some of the fuel from the rear of the tank back into the swirl pot.

Roll Over Valves (ROVs)

Two ROVs are located on the carrier and are connected via pipes to a Liquid Vapor Separator (LVS). The separator, which is also attached to the carrier, is connected via a pipe to the tank breather outlet in the pump module flange. The ROVs contain non-return valves which close in the event of the vehicle overturning, preventing liquid fuel escaping from the tank via the breather pipe.

FUEL FILTER - UP TO 2007MY



E44418

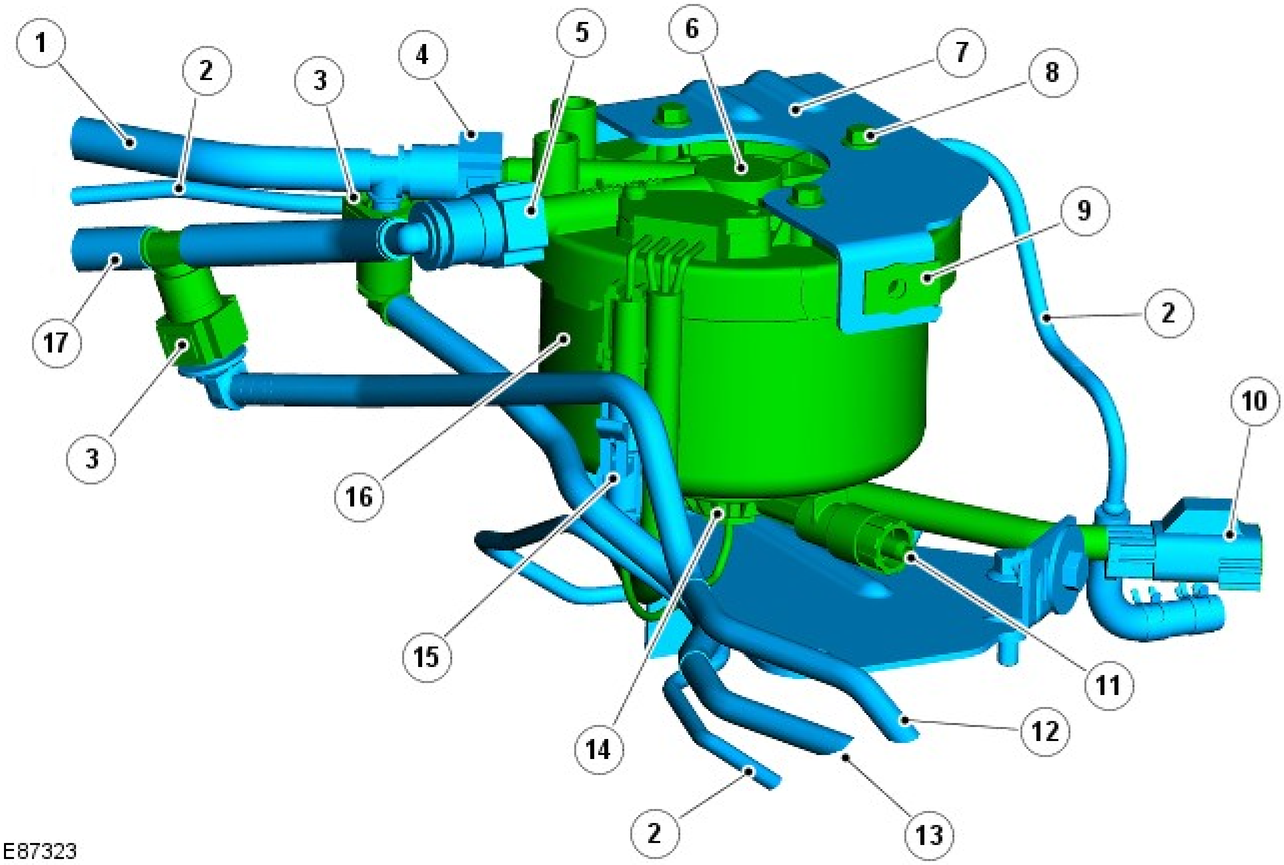
Item	Part Number	Description
1	-	Screw M8 (2 off)
2	-	Bracket
3	-	Fuel feed to engine (HP injection pump)
4	-	Fuel return from cooler
5	-	Fuel return/air bleed to tank
6	-	Water drain valve
7	-	Filter canister
8	-	Clamp bracket
9	-	Fuel feed from pump module

The fuel filter is located behind the fuel cooler, at the rear of the engine and is protected by the engine undertray. The fuel filter assembly comprises a bracket and the filtration element which is contained within a canister.

The filter canister is attached to a circular bracket which is clamped around the filter canister with a bolt and nut. The bracket is attached on the inside of the right hand chassis rail with two screws. Removal of the fuel filter requires loosening of the bolt and nut and removing the filter canister from the circular bracket.

The filter element has a capacity of 500 cm^3 (30.5 in^3). The filtration element can filter particulate matter larger than 2 microns. A water drain plug is located on the base of the filter. The filter can be purged of water by partially unscrewing the filter element plug and allowing fuel to drain into a suitable container. The plug must tightened to a torque specified in the Service Repair Manual.

FUEL FILTER - FROM 2007MY



Item	Part Number	Description
1	-	Fuel feed supply to filter from pump module
2	-	FFBH supply from pump module
3	-	Quick release connector
4	-	Fuel filter inlet
5	-	Fuel filter outlet
6	-	Filter housing
7	-	Mounting bracket
8	-	Filter attachment bolt (3 off)
9	-	Heat shield attachment (2 off)
10	-	Electrical connector
11	-	Water drain valve
12	-	Fuel feed to HP pump
13	-	Fuel return from HP pump and fuel cooler
14	-	Water sensor
15	-	Water sensor electrical connector
16	-	Filter element
17	-	Fuel return/air bleed to tank

The fuel filter assembly is located in front of the fuel tank and is mounted on a bracket which is attached to the top face of the transfer box chassis cross member. The fuel filter assembly comprises a bracket, filter housing and the filtration element. The filter housing is secured to the bracket with 3 bolts. The bracket is secured to the cross member with 2 bolts which are screwed into threaded holes in the cross member.

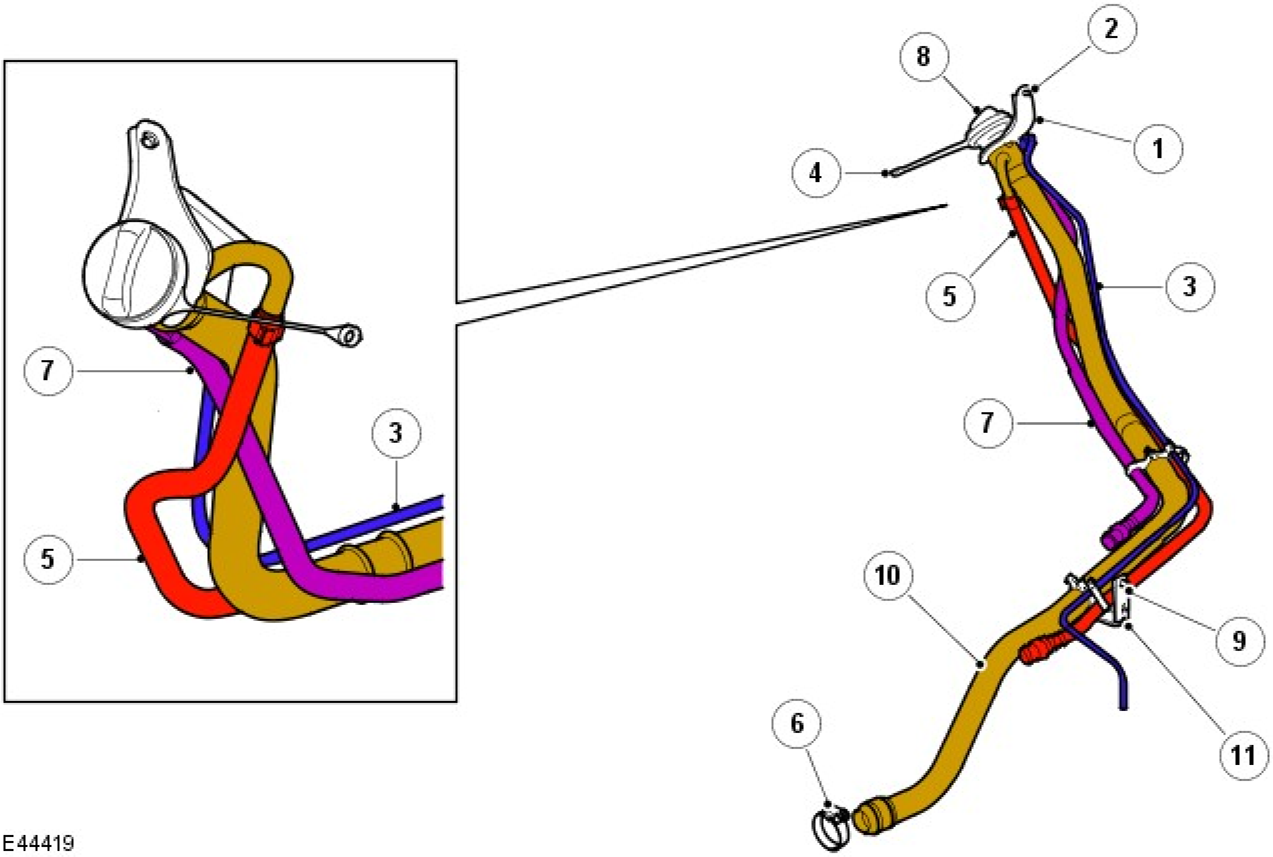
The filter housing has an inlet and outlet which allow for the attachment of hoses using quick release connectors. The filter element is located on the underside of the housing and can be removed by rotating one quarter turn to release from the housing.

The filter element has a capacity of 200 cm^3 (12.2 in^3). The filtration element can filter particulate matter larger than 2 microns. A water drain valve is located on the base of the filter. The filter can be purged of water by partially unscrewing the drain valve and allowing at least 84 cm^3 (5.12 in^3) of fuel to drain into a suitable container. The drain plug has a centre outlet which allows for the attachment of a drain hose.

The filter element also has a water sensor located in its base. The sensor is screwed into a threaded hole in the base of the element. When the filter is replaced at service, the sensor can be unscrewed from the element and installed in the new element. The sensor has an electrical connector located at the side of the element which can be disconnected to assist element removal.

The water sensor is connected to the ECM. When the water in the element reaches 64 cm^3 (3.9 in^3) the ECM issues a high speed controller area network (CAN) bus message to the instrument cluster to display a 'WATER IN FUEL' message in the message centre.

FUEL FILLER



Item	Part Number	Description
1	-	Bracket
2	-	Screw M6
3	-	Rear differential breather pipe (Ref. only)
4	-	Filler cap lanyard
5	-	Tank breather pipe
6	-	Clamp - filler hose
7	-	Vent pipe
8	-	Filler cap
9	-	Screw M8
10	-	Filler pipe
11	-	Lower mounting bracket to Electric Park Brake (EPB) bracket

The fuel filler head is positioned at the rear of the vehicle, above the right hand rear wheel. The filler head is covered by a moulded plastic cover which is electrically locked when the vehicle is locked. The filler cap is a conventional screw in type which is secured to the vehicle with a lanyard.

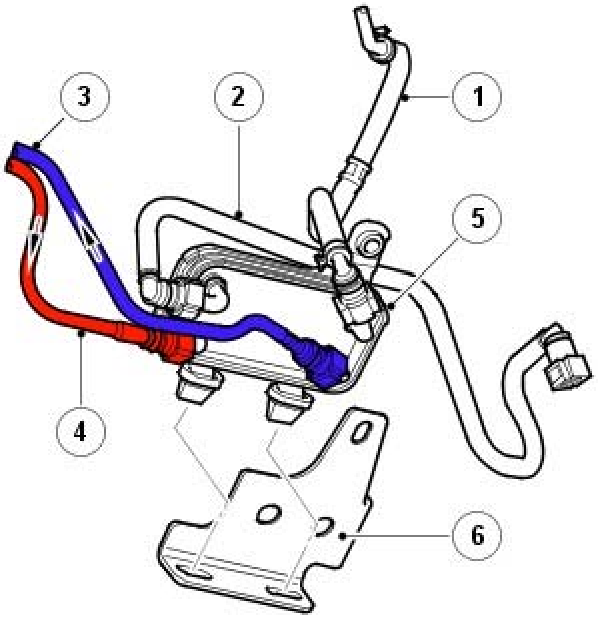
- NOTE: The fuel filler head plastic cover does not lock on North American Specification (NAS) vehicles.

The filler head is a stainless steel fabrication. Two brackets provide for the attachment of the filler head to the vehicle body and the chassis electronic park brake bracket.

A connection on the rear of the filler head allows for the connection of the fuel tank breather pipe from the fuel tank breather stub. The fuel tank breather pipe has a quick release fitting and connects to the breather pipe from the fuel tank breather stub. The fuel filler vent pipe from the tank is vented to atmosphere. The vent pipe incorporates an insect trap at its termination near the filler head. The fuel filler pipe locates in a short flexible hose attached to the tank and is secured with a worm drive clamp.

A smaller pipe, which is not associated with the fuel system, is attached to the side of the fuel filler pipe. This pipe connects to the rear differential and provides breathing for the differential case. The pipe terminates near the fuel filler head.

FUEL COOLER



E44420

Item	Part Number	Description
1	-	Pipe - HP pump to cooler
2	-	Pipe - cooler to fuel filter
3	-	Coolant outlet
4	-	Coolant inlet
5	-	Fuel cooler
6	-	Bracket

The fuel cooler uses engine coolant, direct from the lower part of the radiator, to cool fuel returning to the tank from the HP injection pump.

The fuel cooler is located on the right hand side of the chassis, at the rear of the engine, near to the starter motor. A bracket, which is attached to the right hand chassis rail, provides for the attachment of the cooler. The bracket has two slots which accept two plastic pegs which are attached to the cooler. A bolt is inserted through a hole in the bracket and screws into a captive nut on the cooler to positively secure the cooler to the bracket.

The cooler has four quick fit connector pipes which provide for the attachment of the fuel inlet hose from the HP injection pump, the fuel outlet hose to the fuel filter, the coolant inlet hose from the radiator and the coolant outlet hose to the coolant thermostat housing. The coolant pipes can be identified by their smaller diameter.

Fuel Tank and Lines - TDV6 2.7L Diesel - Fuel Tank and Lines

Diagnosis and Testing

Overview

For information on the system operation, refer to section 310-01 - Fuel Tank and Lines in the workshop manual.

Inspection and Verification

- WARNINGS:

⚠ Do **NOT** carry out any work on the fuel system with the engine running. The fuel pressure within the system can be as high as 1600 bar (23,206 lb/in²). Failure to follow this instruction may result in personal injury.

⚠ Eye protection must be worn at all times when working on or near any fuel related components. Failure to follow this instruction may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow this instruction may result in personal injury.

⚠ After carrying out repairs, the fuel system must be checked visually for leaks. This should be done after the engine has been run, but with the engine switched **OFF**. Failure to follow this instruction may result in personal injury.

⚠ If taken internally, **DO NOT** induce vomiting. Seek immediate medical attention. Failure to follow this instruction may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek medical attention. Failure to follow this instruction may result in personal injury.

⚠ Wash hands thoroughly after handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention. Failure to follow this instruction may result in personal injury.

- CAUTIONS:

⚠ Before disconnecting any part of the system, it is imperative that all dust, dirt and debris is removed from around components to prevent ingress of foreign matter into the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠ The fuel pipes between the injectors and the rail must be discarded after each use, and new pipes installed. Failure to follow this instruction may result in damage to the vehicle.

⚠ It is essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that the workshop area in which the vehicle is being worked on is as clean and dust-free as possible. Areas in which work on clutches, brakes or where welding or machining are carried out are not suitable in view of the risk of contamination to the fuel system. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that any protective clothing worn is clean and made from lint-free non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that any protective gloves worn are new and are of the non-powdered latex type. Failure to follow this instruction may result in damage to the vehicle.

⚠ Make sure that clean, non-plated tools are used. Clean tools using a new brush that will not lose it's bristles and fresh cleaning fluid prior to starting work on the vehicle. Failure to follow this instruction may result in damage to the vehicle.

⚠ Use a steel-topped work bench and cover it with clean, lint-free, non-flocking material. Failure to follow this instruction may result in damage to the vehicle.

1. **1.** Verify the customer concern.

2. **2.** Visually inspect for obvious mechanical or electrical faults.

Visual Inspection

Mechanical	Electrical
● Fuel level ● Contaminated fuel ● Fuel supply line(s) ● Fuel return line(s) ● High-pressure fuel supply line(s) ● Fuel tank filler pipe ● Fuel leak(s) ● Fuel tank ● Fuel filler cap ● Fuel filter ● Push connect fittings ● Fuel rail ● Fuel injection pump ● Exhaust gas recirculation (EGR) system	● Battery charge and condition ● Fuse(s) ● Inertia fuel shutoff (IFS) switch ● Fuel pump module relay ● Fuel pump module ● Electrical connector(s) ● Damaged or corroded wiring harness ● Fuel volume control valve (FVCV) ● Fuel pressure control valve (FPCV) ● Engine control module (ECM)

3. **3.** If an obvious cause for an observed or reported concern is found, correct the cause (if possible) before proceeding to the next step.

4. **4.** Use the approved diagnostic system or a scan tool to retrieve any diagnostic trouble codes (DTCs) before moving onto the symptom chart or DTC index.
    - Make sure that all DTCs are cleared following rectification.

Symptom Chart

Symptom	Possible causes	Action
Engine cranks, but does not start	● Inertia fuel shutoff (IFS) switch ● Low/Contaminated fuel ● Fuel pump module fault ● Low pressure fuel system fault ● Air leakage ● Blocked fuel filter ● Fuel volume control valve (FVCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Fuel injection pump fault ● Crankshaft position (CKP) sensor ● ECM fault	Check that the inertia switch has not tripped. Check the fuel level/condition. Check the fuel pump module operation, check the low pressure fuel system for leaks/damage. Check the intake air system for leaks. Check the fuel filter, check the FVCV and FPCV. Check the fuel injection pump. Check the CKP sensor. Refer to the relevant section of the workshop manual. Refer to the warranty policy and procedures manual if a module is suspect.
Difficult to start	● Glow plug system fault (very cold conditions) ● Low/Contaminated fuel ● Fuel pump module fault ● Low pressure fuel system fault ● Air leakage ● Blocked fuel filter ● Fuel volume control valve (FVCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated	Check the glow plug circuits. Check the fuel level/condition. Check the fuel pump module operation, check the low pressure fuel system for leaks/damage. Check the intake air system for leaks. Check the fuel filter, check the FVCV and FPCV. Check the EGR valves. Refer to the relevant section of the workshop manual.

Symptom	Possible causes	Action
	● Exhaust gas recirculation (EGR) valve fault	
Rough idle	● Low/Contaminated fuel ● Low pressure fuel system fault ● Air leakage ● Blocked fuel filter ● Fuel volume control valve (FVCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Exhaust gas recirculation (EGR) valve fault	Check the fuel level/condition. Check the low pressure fuel system for leaks/damage. Check the intake air system for leaks. Check the fuel filter, check the FVCV and FPCV. Check the EGR valves. Refer to the relevant section of the workshop manual.
Lack of power when accelerating	● Air intake system fault ● Catalytic converter blocked ● Low fuel pressure ● Exhaust gas recirculation (EGR) valve fault ● Turbocharger fault	Check the intake air system. Check for a blockage/restriction in the exhaust system, install new components as necessary. Check the fuel pressure. Check the EGR valves. Check the turbocharger condition and actuator operation. Refer to the relevant section of the workshop manual.
Engine stops/stalls	● Low/Contaminated fuel ● Fuel pump module fault ● Low pressure fuel system fault ● High pressure fuel leak ● Air leakage ● Fuel volume control valve (FVCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Exhaust gas recirculation (EGR) valve fault	Check the fuel level/condition. Check the fuel pump module operation, check the fuel system for leaks/damage. Check the intake air system for leaks. Check the FVCV and FPCV. Check the EGR valves.
Engine judders	● Low/Contaminated fuel ● Low pressure fuel system fault ● High pressure fuel leak ● Air leakage ● Fuel volume control valve (FVCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Fuel injection pump fault	Check the fuel level/condition. Check the fuel system for leaks/damage. Check the intake air system for leaks. Check the FVCV and FPCV. Check the fuel injection pump. Refer to the relevant section of the workshop manual.
Excessive fuel consumption	● Low pressure fuel system fault ● High pressure fuel leak ● Fuel temperature sensor leak ● Fuel volume control valve (FVCV) blocked/contaminated ● Fuel pressure control valve (FPCV) blocked/contaminated ● Fuel injector failure ● Exhaust gas recirculation (EGR) valve fault	Check the fuel system for leaks/damage. Check the FVCV and FPCV. Check for injector DTCs. Check the EGR valves. Refer to the relevant section of the workshop manual.

DTC index

• NOTE: Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).

• NOTE: For a full list of ECM DTCs, refer to section 303-14 - Electronic Engine Controls in the workshop manual.

DTC	Description	Possible causes	Action
P008700	Fuel Rail/System Pressure - Too Low	● Fuel rail pressure (FRP) sensor disconnected ● FRP sensor to ECM sensing circuit short circuit to ground ● FRP sensor supply circuit high resistance ● FRP sensor failure ● Fuel line leak ● Restricted fuel line ● Fuel pump module circuit high resistance ● Fuel pump module circuit short circuit to ground ● Fuel pump module failure ● Volume control valve fault ● Pressure control valve fault	Refer to the electrical guides and check the FRP sensor circuits. For FRP sensor tests, refer to the relevant workshop manual section. Check the low pressure fuel lines for damage or restrictions. Check the fuel pressure. Check the low pressure fuel pump module circuits and operation. Check for fuel rail and high pressure fuel line leaks. Check for VCV and PCV DTCs and rectify as necessary.
P008800	Fuel Rail/System Pressure - Too High	● Fuel rail pressure (FRP) sensor to ECM wiring (supply/sense): short circuit to each other ● FRP sensor to ECM sense circuit short circuit to power ● FRP sensor failure ● Fuel pressure control valve (FPCV) fault ● Fuel pump module circuit short circuit to power ● Fuel pump module failure	Check the FRP sensor circuits, check the FPCV. Refer to the relevant section of the workshop manual. Check the fuel pump module circuits. Refer to the electrical guides.
P062700	Fuel Pump A Control Circuit / Open	● Fuel pump module relay control circuit short circuit to power ● Fuel pump module relay failure	Check the fuel pump and circuits. Refer to the electrical guides. Activate the relay and listen for an audible 'click'. Refer to the relevant workshop manual section. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062800	Fuel Pump A Control Circuit Low	● Fuel pump module relay control circuit high resistance ● Fuel pump module relay control circuit short circuit to ground ● Fuel pump module relay failure	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P062900	Fuel Pump A Control Circuit High	● Fuel pump module relay control circuit high resistance ● Fuel pump module relay failure	Refer to the electrical guides and check the fuel pump circuits. Activate the relay and listen for an audible 'click'. Repair/renew as necessary. Clear the DTCs and test for normal operation.
P226900	Water in Fuel Condition	● Water in fuel condition ● Water in fuel sensor circuit short circuit to ground ● Water in fuel sensor fault	Drain the water from the fuel filter. Clear the DTC and retest. If the DTC resets, check the sensor circuit. Refer to the electrical guides. If no fault is found in the circuits, install a new sensor.

Fuel Tank and Lines - TDV6 2.7L Diesel - Fuel Tank

Removal and Installation

Removal

- WARNINGS:

⚠ Place the vehicle in a well ventilated, quarantined area and arrange ' No Smoking/Petrol Fumes' signs about the vehicle.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

⚠CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

All vehicles

1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

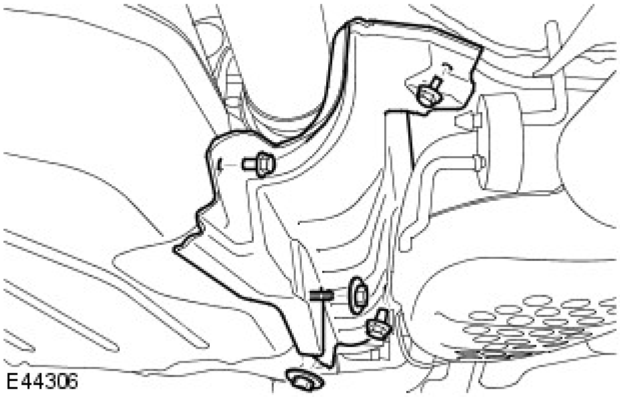
2. Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

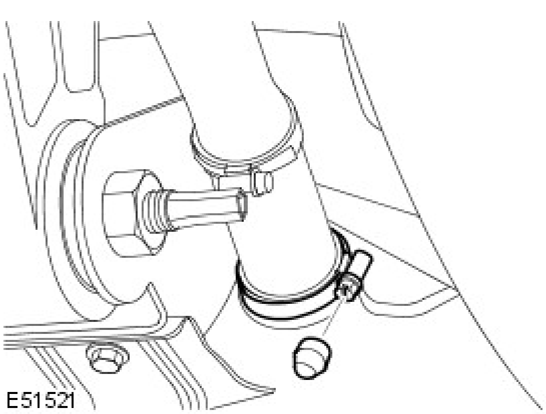
3. ⚠WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

4. Remove the fuel tank heat shield.

- Remove the 3 bolts and 2 nuts.

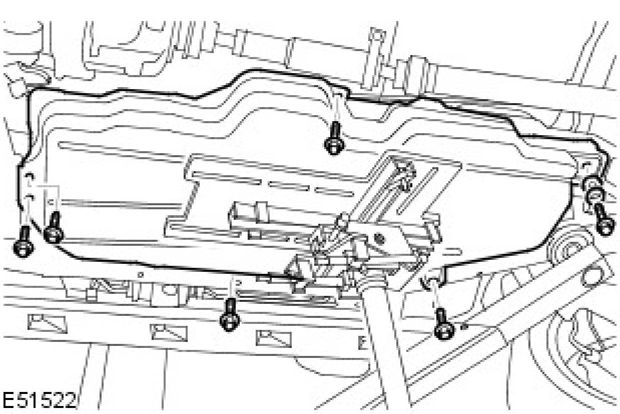




5. ⚠ CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

Disconnect the fuel filler neck from the fuel tank.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



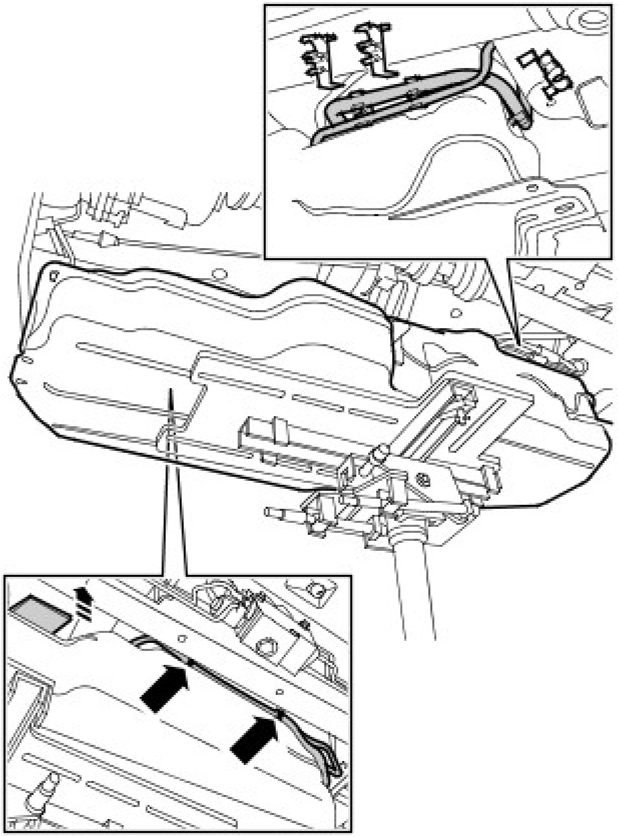
6. ⚠ WARNING: Secure the component to the transmission jack.

Using a transmission jack, lower the fuel tank.

- Remove the 5 bolts.

7. Release the parking brake emergency release cable.

- Release it from the 4 clips



E51523

8. NOTE: Note the fitted position.

Release the fuel tank vent and fuel lines.

- Remove the retainers.
- Release from the clips.
- Remove the adhesive pad.

9. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the 2 fuel tank vent lines.

- Release the clip.

Vehicles with fuel fired heater

10. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the fuel fired booster heater fuel line.

- Release the clip.

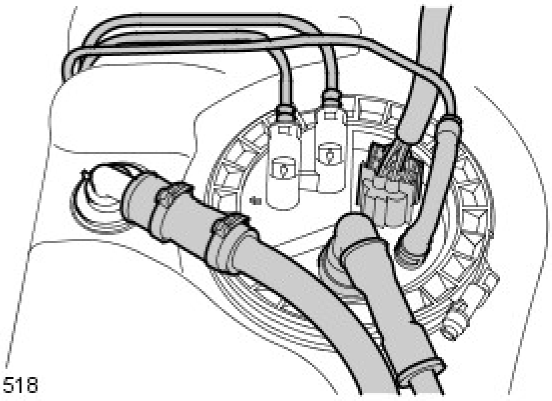
All vehicles

11. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

Disconnect the 2 fuel lines.

- Release the 2 clips.

12. Disconnect the fuel pump module electrical connector.

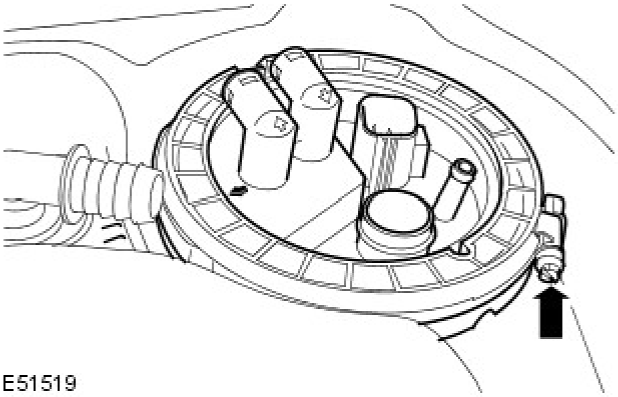


E51518

13. Remove the fuel tank.

14. NOTE: Do not disassemble further if the component is removed for access only.

With assistance, remove the fuel tank from the transmission jack.



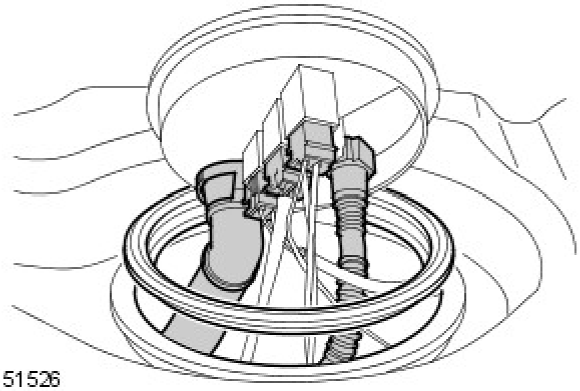
E51519

15. ⚠ CAUTION: Before disconnecting or removing the components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Note the fitted position.

Release the fuel pump module access flange.

- Loosen the screw.
- Remove the clamp.

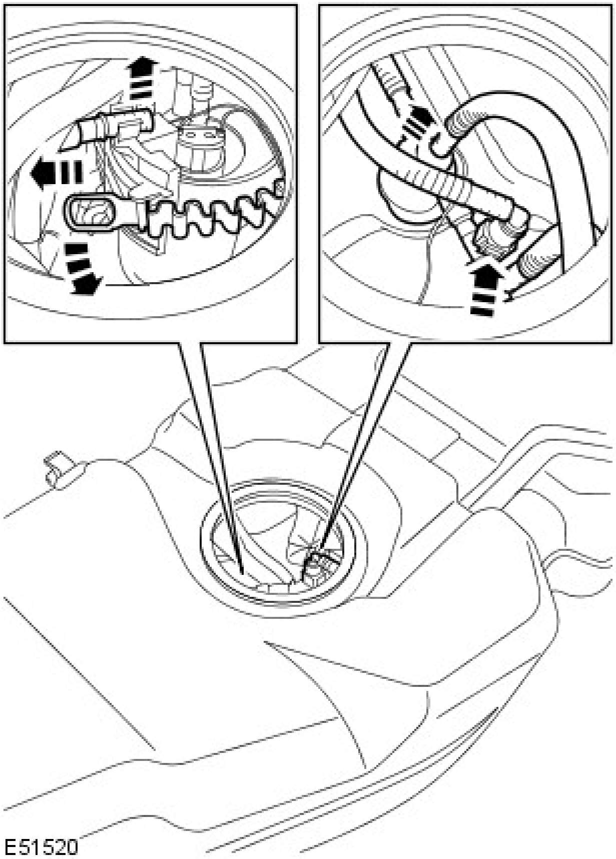


E51526

16. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

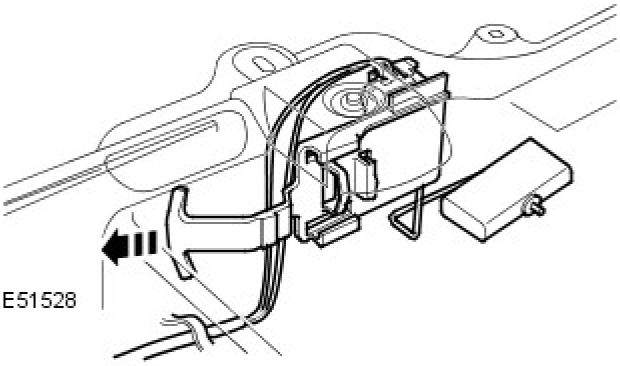
Remove the fuel pump module access flange.

- Disconnect the vent line.
- Disconnect the fuel supply line.
- Disconnect the 3 electrical connectors.
- Remove and discard the seal.



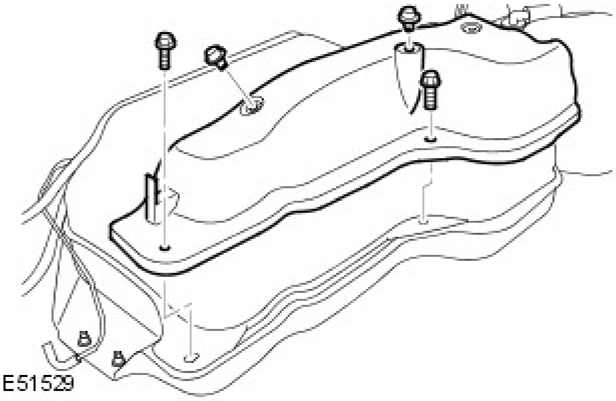
17. Remove the fuel pump module.

- Release the strap.
- Release the fuel pressure regulator.
- Disconnect the 2 fuel lines.



18. Remove the fuel tank front fuel level sender unit.

- Release the lead.
- Release the clip.



19. Remove the fuel tank bracket.

- Remove the 2 clips.
- Remove the 2 bolts.
- Remove the retaining plate.

Installation

All vehicles

1. Install the fuel tank bracket.

- Install the retaining plate.
- Install the clips.
- Tighten the bolts to 10 Nm (7 lb.ft).

2. Install the fuel tank front fuel level sender unit.

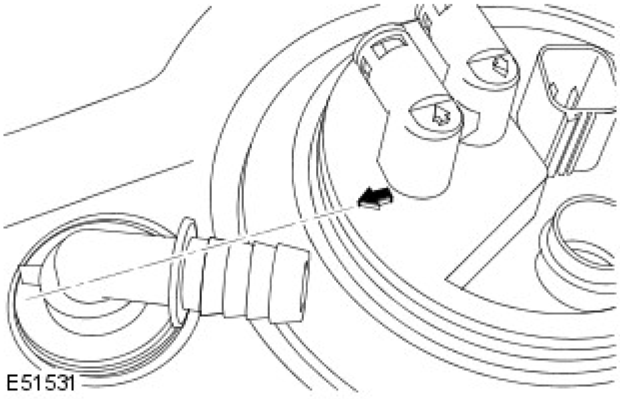
- Secure the clip.
- Secure the lead.

3. Install the fuel pump module.

- Connect the fuel lines.
- Secure with the strap.
- Secure the fuel pressure regulator.

4. Install the fuel pump module access flange.

- Clean the component mating faces.
- Install a new seal.
- Connect the 3 electrical connectors.
- Connect the fuel supply line.
- Connect the vent line.



5. ⚠ CAUTION: Make sure the seal is installed correctly.

• NOTE: Align to the position noted on removal.

Secure the fuel pump module access flange.

- Install the clamp.
- Tighten the screw to 4 Nm (3 lb.ft).

6. With assistance, install the fuel tank to the transmission jack.

7. Position the fuel tank to the vehicle.

8. Connect the fuel lines.

- Secure with the clip.

Vehicles with fuel fired heater

9. Connect the fuel fired booster heater fuel line.

- Secure with the clip.

All vehicles

10. Connect the vent lines.

- Secure with the clip.

11. Connect the electrical connector.

12. Secure the fuel and vent lines.

- Secure in the clips.
- Install the retainers.
- Install the adhesive pad.

13. Secure the parking brake emergency release cable.

- Secure in the 4 clips.

14. Install the fuel tank.

- Tighten the bolts to 45 Nm (33 lb.ft).

15. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

16. Install the fuel tank heat shield.

- Tighten the bolts to 5 Nm (4 lb.ft).
- Tighten the nuts to 3 Nm (2 lb.ft).

17. Refill the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

18. Bleed the fuel system.
For additional information, refer to: Low-Pressure Fuel System Bleeding - TDV6 2.7L Diesel (310-00 Fuel System - General Information, General Procedures).

Removal and Installation

Removal

- WARNINGS:

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ The spilling of fuel is unavoidable during this operation. Ensure that all necessary precautions are taken to prevent fire and explosion.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

⚠ If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠ Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

- CAUTIONS:

⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

⚠ Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

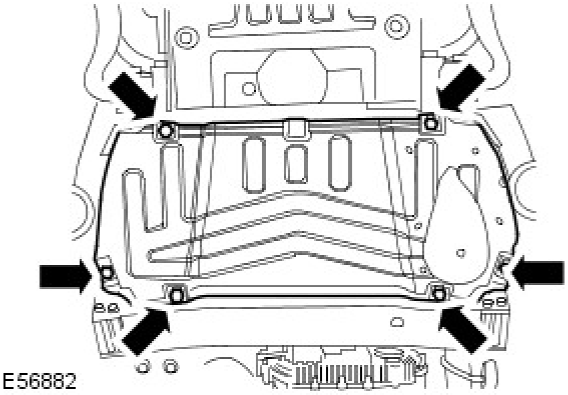
⚠ Make sure the fuel lines are connected to the correct fuel line connector on the fuel filter. Failure to follow these instructions may result in damage to the engine or fuel injection system.

- NOTE: Before disconnecting the battery, make sure all text and cautions in the battery disconnect section are observed.

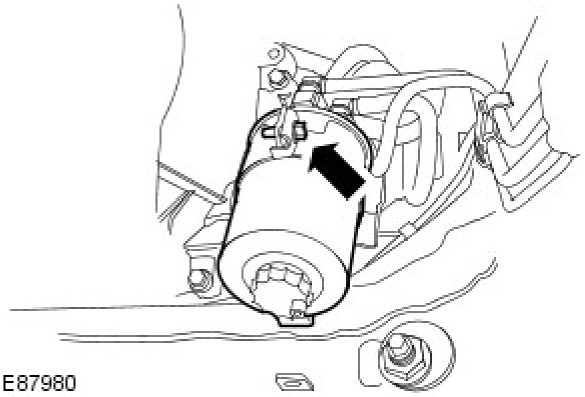
1. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

2. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

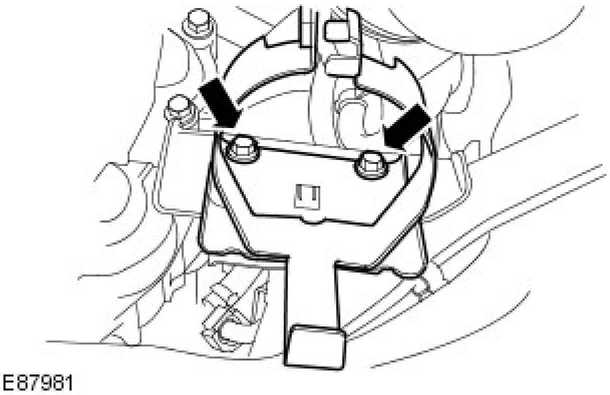
Raise and support the vehicle.



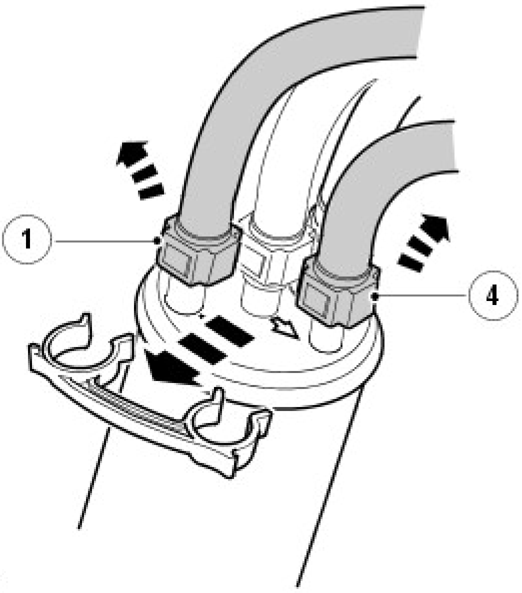
3. Remove the transmission undershield.
   - Remove the 6 bolts.



4. Release the fuel filter from its bracket.
   - Remove the bolt.



5. Remove the fuel filter bracket.
   - Remove the 2 bolts.



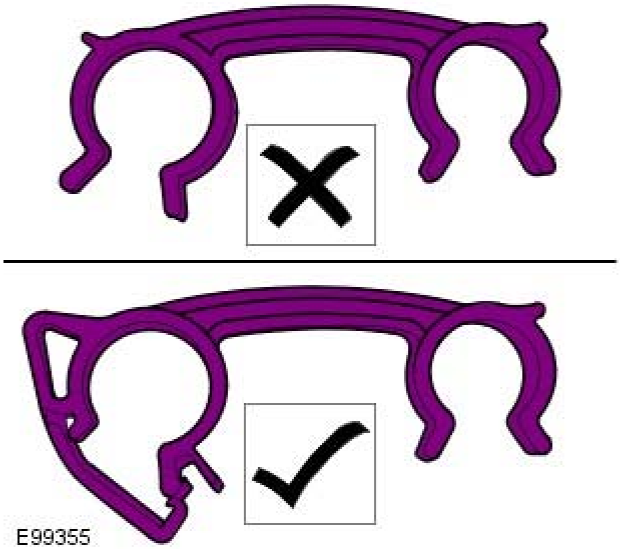
E87982

6. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Note the fitted position of the fuel lines to the fuel filter connections.

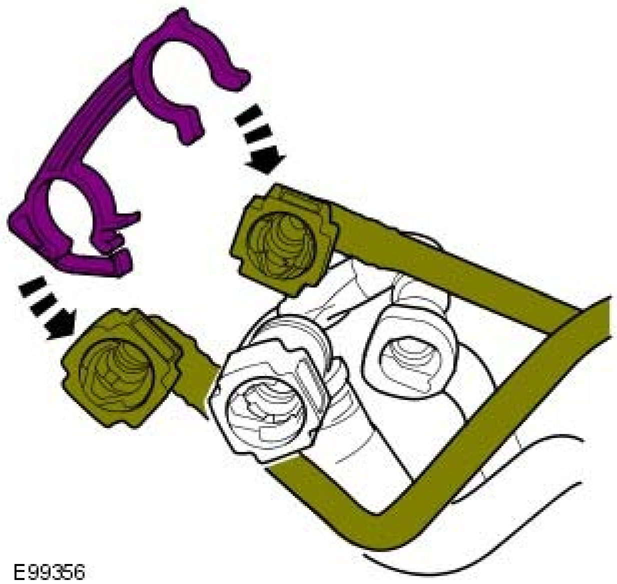
Release and disconnect the fuel supply line from the tank, (yellow connector number 1) and the fuel tank vent line, (small blue connector number 4) from the fuel filter.

- Position a container to collect the fuel spillage.



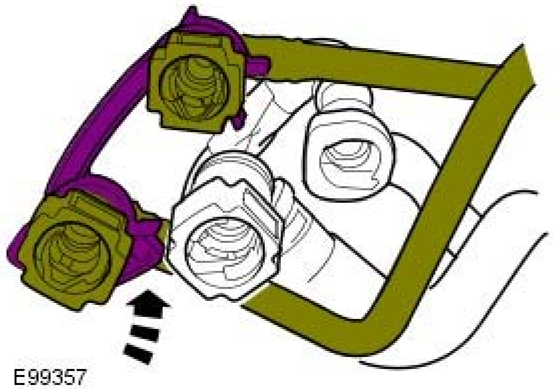
E99355

7. Remove and discard the clip.



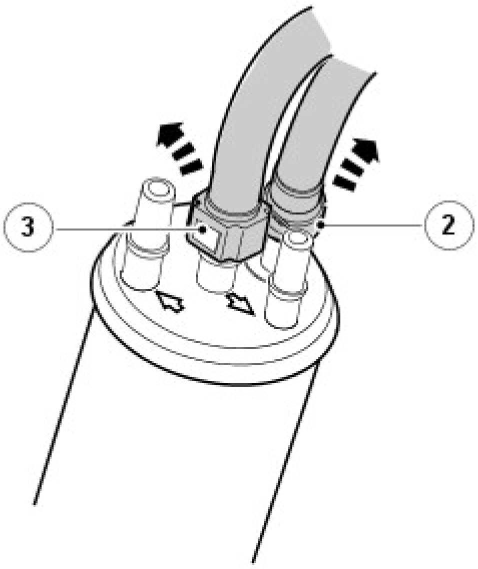
E99356

8. Install the new clip to fuel lines 1 and 4.



E99357

9. Secure the clip.



E87984

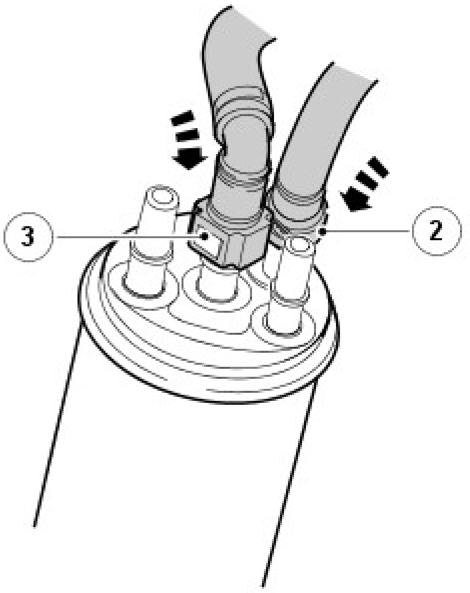
10. ⚠ CAUTION: Before disconnecting or removing components, ensure the area around the joint faces and connections are clean. Plug open connections to prevent contamination.

• NOTE: Note the fitted position of the fuel lines to the fuel filter connections.

Remove the fuel filter.

- Release and disconnect the high-pressure fuel pump supply line. (Large blue connector number 3).
- Release and disconnect the fuel cooler return line. (White connector number 2).

Installation

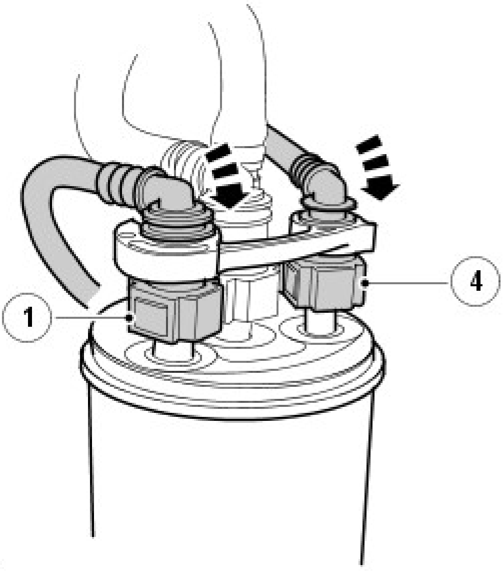


E99538

1. CAUTION: Make sure that the colors of the connectors match the colors on the disc supplied with the new fuel filter.

Install the fuel filter.

- Connect the fuel cooler return line. (White connector number 2).
- Connect the high-pressure fuel pump supply line. (Large blue connector number 3).



E99539

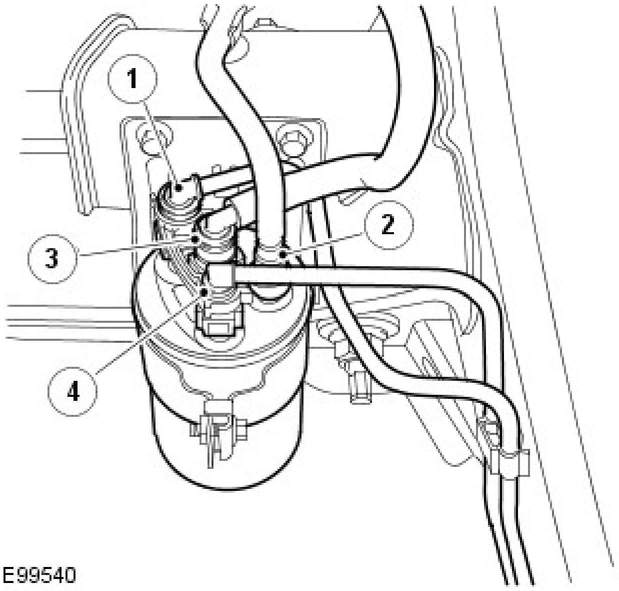
2. CAUTIONS:

Make sure that the colors of the connectors match the colors on the disc supplied with the new fuel filter.

Make sure that the clip is correctly fitted.

Connect the 2 remaining lines to the fuel filter.

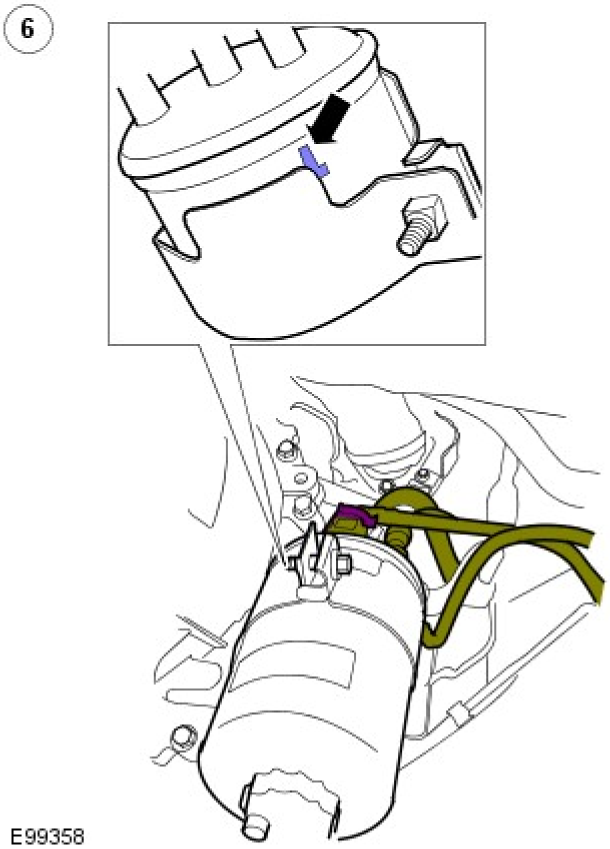
- Connect the fuel supply line from the fuel tank. (Yellow connector number 1).
- Connect the vent line from the fuel tank. (Small blue connector number 4).



3. Correct connector and line installation shown.

4. Install the fuel filter bracket.
   - Install the 2 bolts and tighten to 10 Nm (7 lb.ft).

5. Secure the fuel filter in its bracket.
   - Align the fuel filter to the bracket.
   - Install the bolt and tighten to 10 Nm (7 lb.ft).
   - Remove the container.



6. Install the transmission undershield.
   - Install the 6 bolts and tighten to 10 Nm (7 lb.ft).

7. Connect the battery ground cable.
   For additional information, refer to: Specifications (414-00 Battery

and Charging System - General Information, Specifications).

8. Bleed the fuel system.
For additional information, refer to: Low-Pressure Fuel System Bleeding - TDV6 2.7L Diesel (310-00 Fuel System - General Information, General Procedures).

1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Position the vehicle on a lift.

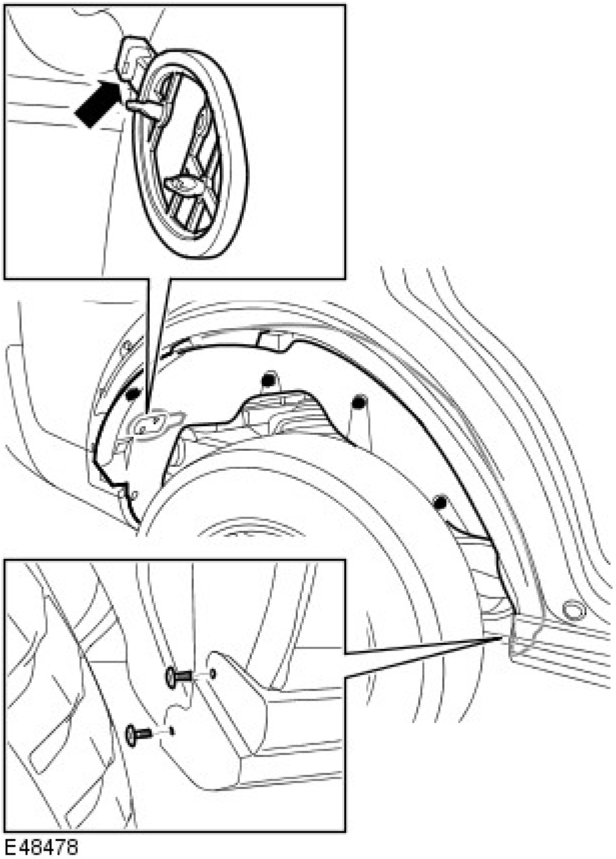
2. Disconnect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

3. Drain the fuel tank.
For additional information, refer to: Fuel Tank Draining (310-00 Fuel System - General Information, General Procedures).

4. Remove the RH rear wheel and tire.

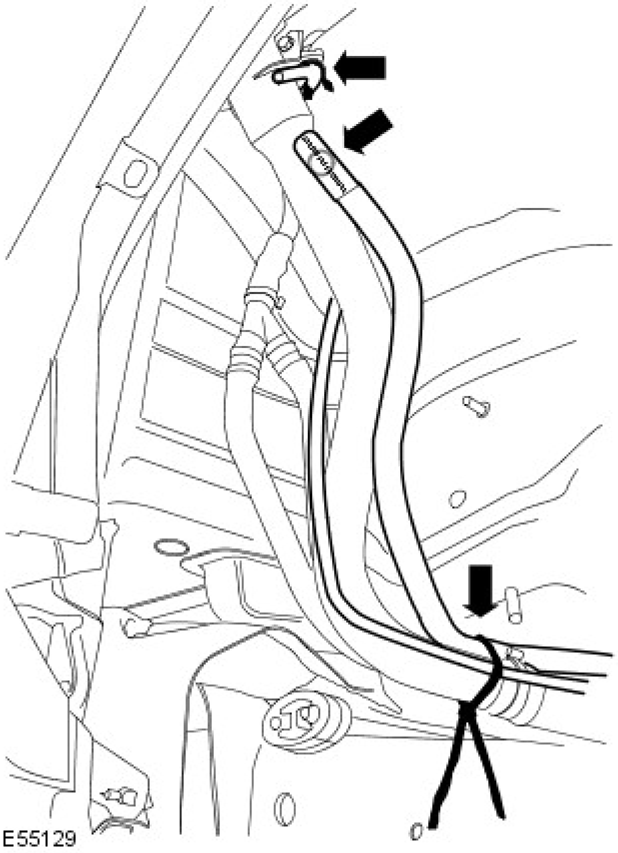
5. Remove the fender splash shield.

- Remove the 2 screws.
- Remove the 6 retainers.
- Disconnect the electrical connector.



6. Remove the fuel filler door.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

7. Remove the spare wheel and tire.



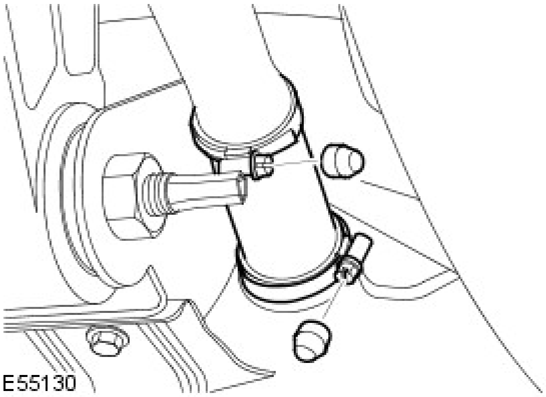
8. Disconnect the breather pipes.

- Remove the clip.
- Release the 2 clips.
- Remove and discard the cable tie.

9. ⚠CAUTION: Before the disconnection or removal of any components, ensure the area around joint faces and connections are clean. Plug any open connections to prevent contamination.

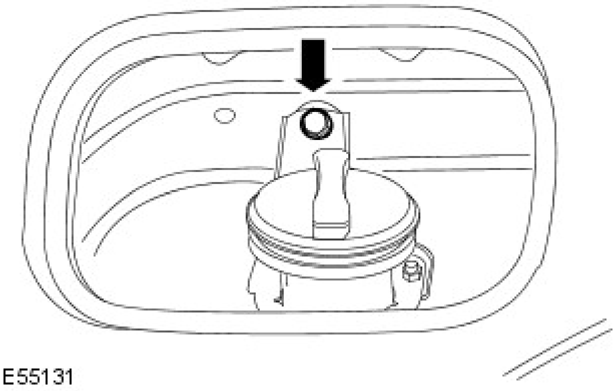
Disconnect the fuel filler neck from the fuel tank.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



10. Remove the fuel tank filler pipe connector hose.

- Remove the tamper proof cover.
- Remove and discard the hose clip.



11. NOTE: Note the fitted position.

Remove the fuel tank filler pipe.

- Remove the bolt.

Installation

1. Install the filler pipe connector hose.

- Install the new tamper proof clip.

2. NOTE: Align to the position noted on removal.

Install the fuel tank filler pipe.

- Install the bolt and tighten to 10 Nm (7 lb.ft).

3. ⚠ CAUTION: Tighten the new tamper proof clip until the hexagon shears.

Connect the fuel filler neck.

- Install a new retaining clip.

4. Connect the breather pipes.

- Secure the clips.

5. Install the filler door.
For additional information, refer to: Fuel Filler Door Assembly (501-03 Body Closures, Removal and Installation).

6. Install the fender splash shield.

7. Install the wheel and tire.

8. Install the spare wheel and tire.

9. Refill the fuel tank.

10. Connect the battery ground cable.
For additional information, refer to: Specifications (414-00 Battery and Charging System - General Information, Specifications).

Removal and Installation

Removal

- WARNINGS:

⚠ Do not smoke or carry lighted tobacco or open flame of any type when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ This procedure involves fuel handling. Be prepared for fuel spillage at all times and always observe fuel handling precautions. Failure to follow these instructions may result in personal injury.

⚠ Do not carry or operate cellular phones when working on or near any fuel related components. Highly flammable vapors are always present and may ignite. Failure to follow these instructions may result in personal injury.

⚠ If fuel contacts the eyes, flush the eyes with cold water or eyewash solution and seek immediate medical attention.

⚠ If taken internally, do not induce vomiting, seek immediate medical attention. Failure to follow these instructions may result in personal injury.

⚠ Wash hands thoroughly after fuel handling, as prolonged contact may cause irritation. Should irritation develop, seek medical attention.

⚠ The spilling of fuel is unavoidable during this operation. Make sure that all necessary precautions are taken to prevent fire and explosion.

- CAUTIONS:

⚠ Diesel fuel injection equipment is manufactured to very precise tolerances and fine clearances. It is therefore essential that absolute cleanliness is observed when working with these components. Always install blanking plugs to any open orifices or lines. Failure to follow this instruction may result in foreign matter ingress to the fuel injection system.

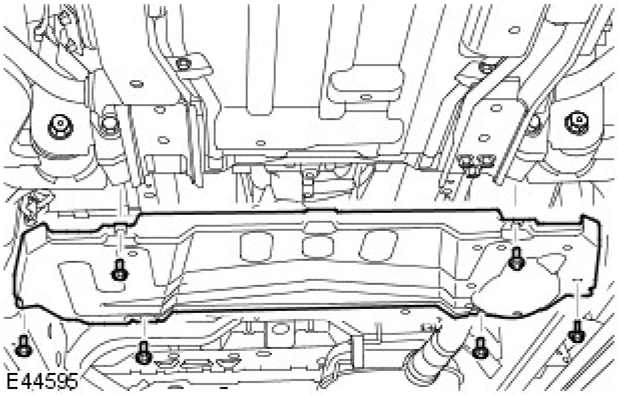
⚠ Make sure the workshop area in which the vehicle is being worked on is as clean and as dust free as possible. Foreign matter from work on clutches, brakes or from machining or welding operations can contaminate the fuel system and may result in later malfunction.

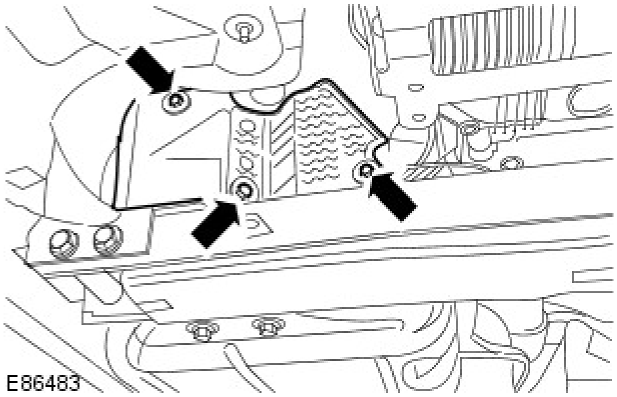
1. ⚠ WARNING: Do not work on or under a vehicle supported only by a jack. Always support the vehicle on safety stands.

Raise and support the vehicle.

2. Remove the transmission undershield.

- Remove the 6 bolts.

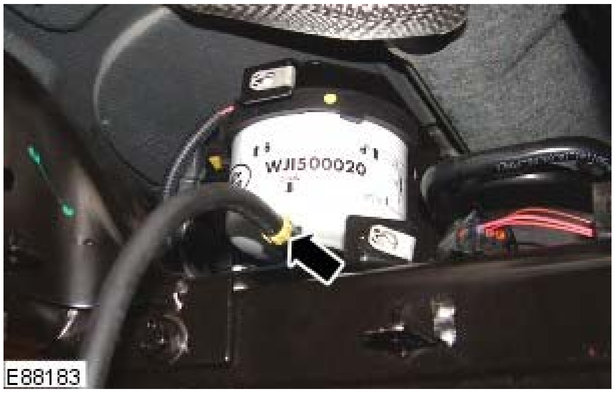




3. ⚠ WARNING: Observe due care when working near a hot exhaust system.

Remove the fuel filter heat shield.

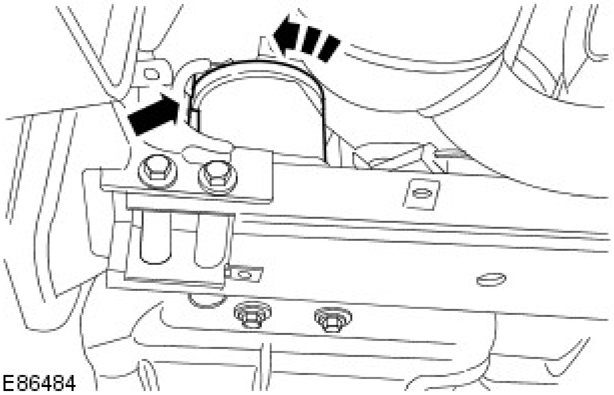
- Remove the 3 bolts.



4. ⚠ CAUTION: Make sure the water-in-fuel sensor remains in the aligned position.

Drain the fuel filter element.

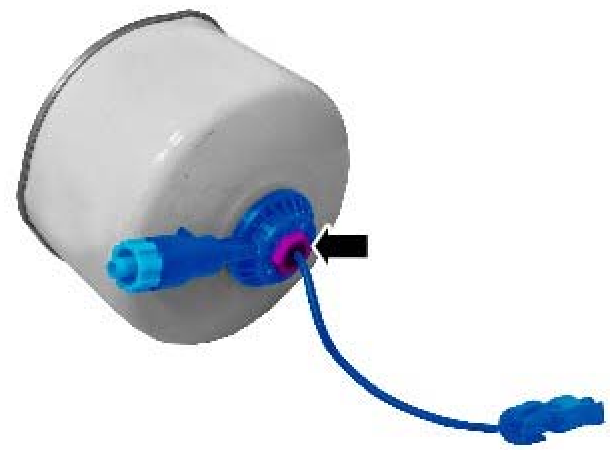
- Position a container to collect the fluid spillage.
- Loosen the nut.
- Attach a suitable drain tube to the water-in-fuel sensor drain port.
- Remove the drain tube.
- Tighten the nut.



5. ⚠ CAUTION: Make sure that the area around the component is clean and free of foreign material.

Remove the fuel filter element.

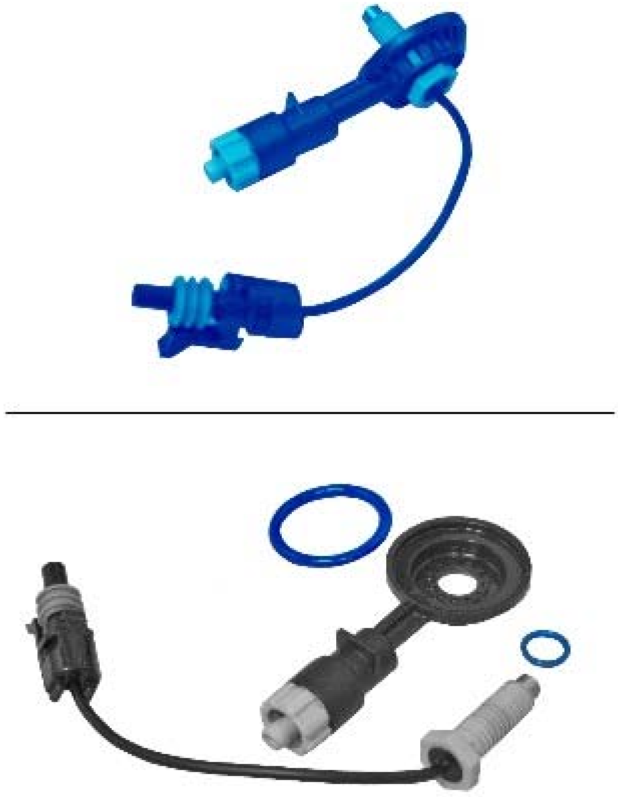
- Disconnect the water-in-fuel sensor electrical connector.



E138939

6. Remove the water-in-fuel sensor.

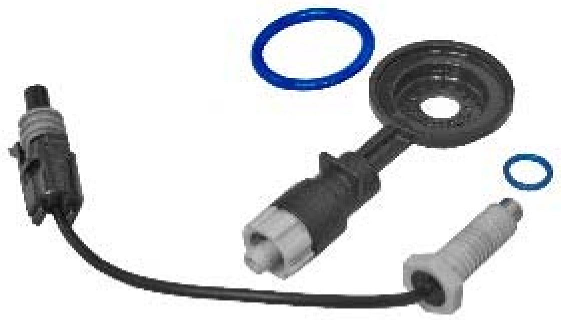
- Discard the fuel filter element.

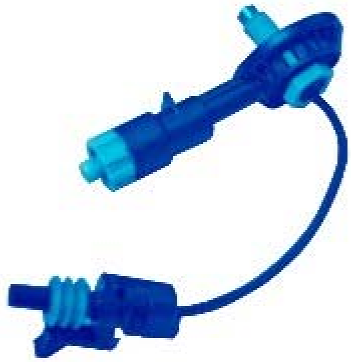


E138941

7. Remove and discard the O ring seals.

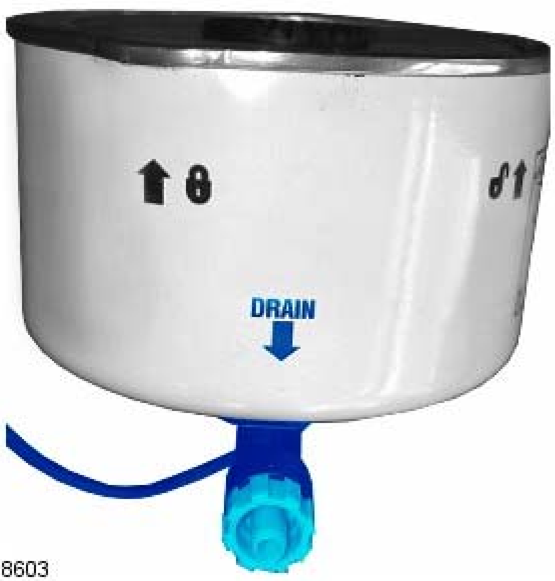
Installation





E138940

1. Install new O ring seals.



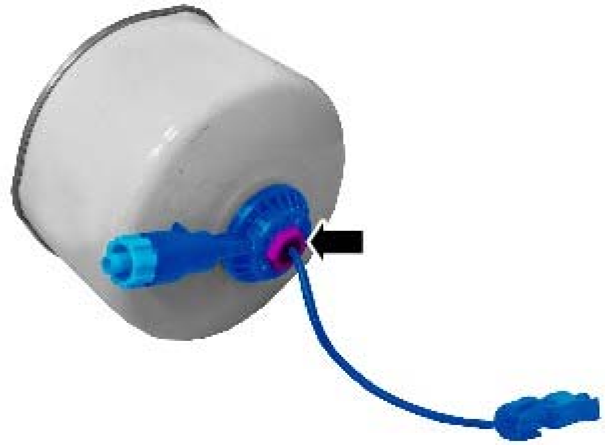
E138603

2. ⚠CAUTION: Make sure that the mating faces are clean and free of foreign material.

• NOTE: Make sure that the water-in-fuel sensor is aligned with the drain arrow.

Install the water-in-fuel sensor.

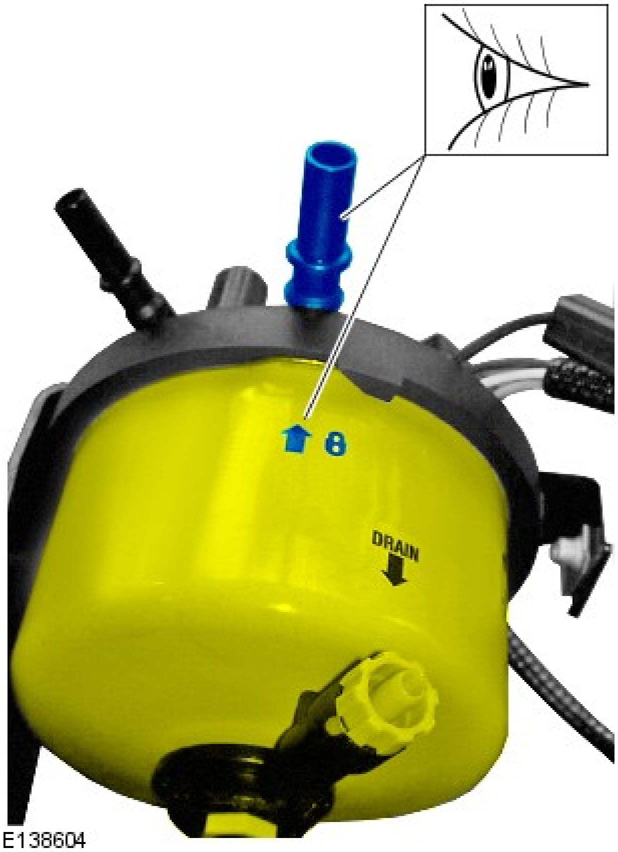
- Remove and discard the water-in-fuel drain plug from the new fuel filter element.



E138939

3. ⚠CAUTION: Make sure the water-in-fuel sensor remains in the aligned position.

Tighten the plastic nut to 1.6 Nm.

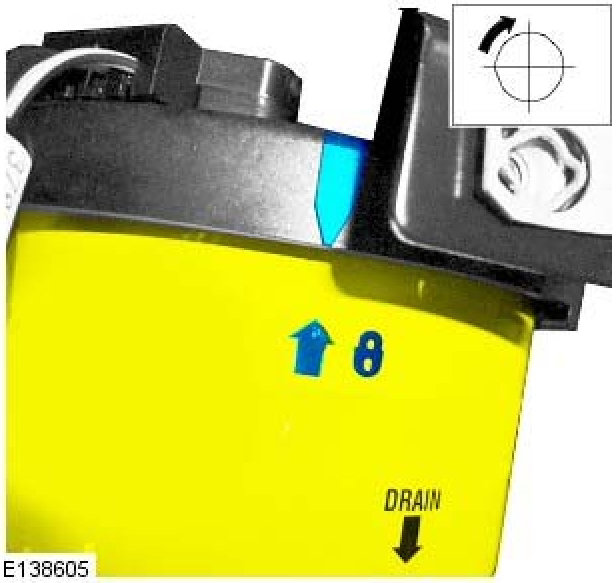


E138604

4. NOTE: Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Install the fuel filter element.

1. Insert the fuel filter with the the lock symbol arrow aligned with the inlet pipe on the fuel filter housing.



5. NOTE: Make sure that the fuel filter element is correctly aligned. Failure to follow this instruction may result in damage to the vehicle.

Rotate to tighten and seal the fuel filter element.

1. When tightened correctly, the lock symbol arrow should be aligned with the arrow symbol on the fuel filter housing.

- Connect the water-in-fuel sensor electrical connector.
- Remove the container.

6. Install the fuel filter heat shield.

- Tighten the bolts to 6 Nm.

7. Install the transmission undershield.

- Tighten the bolts to 10 Nm.

8. Carry out the low-pressure fuel system bleeding.

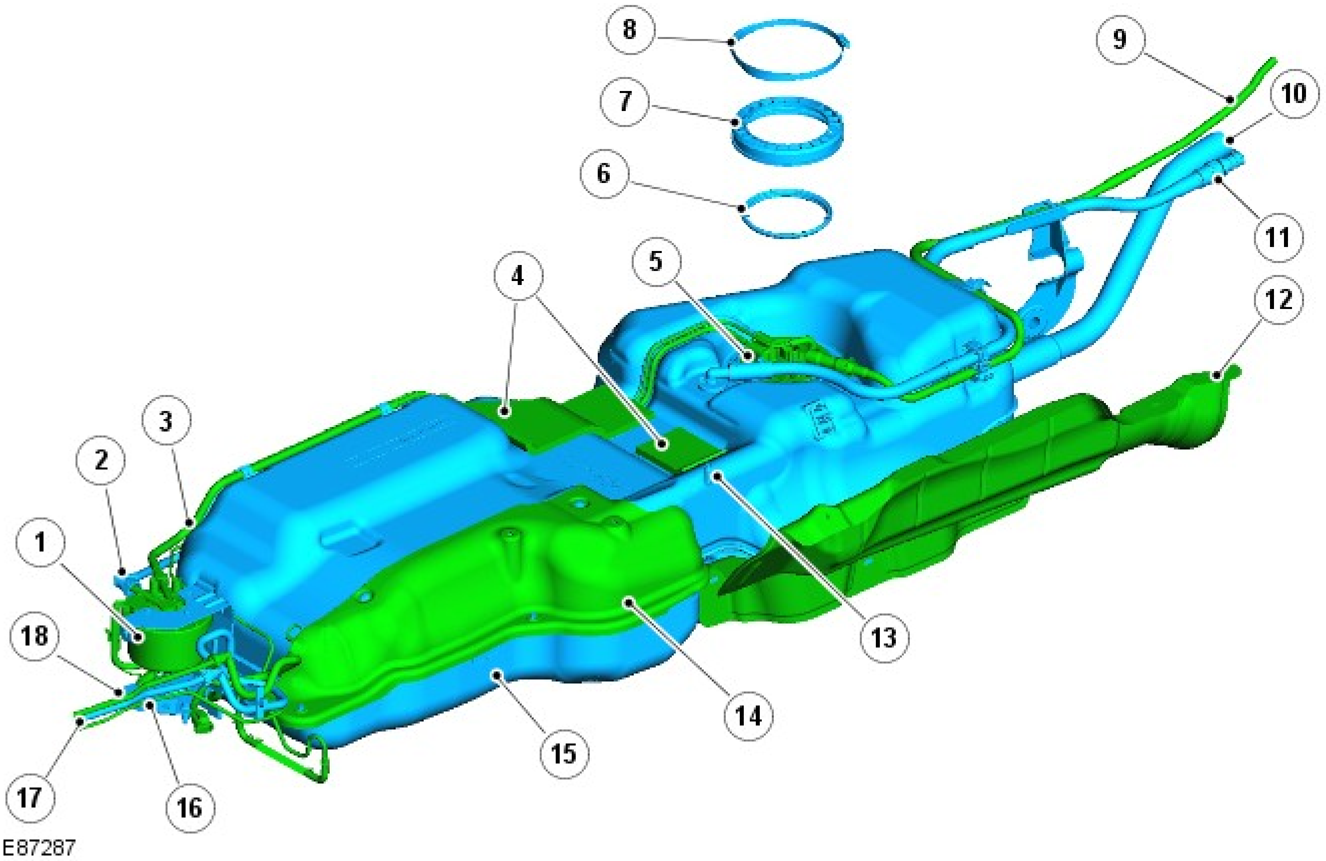
OVERVIEW

The major components of the TdV8 fuel system comprise a fuel tank, a fuel pump module, a fuel filter, a fuel cooler, a fuel filler pipe and cap assembly and two fuel level sensors.

The TdV8 fuel system is a high pressure common rail system. This system uses an engine mounted and driven high pressure pump to deliver a uniform level of pressure to the common fuel rail which supplies all fuel injectors.
For additional information, refer to: Fuel Charging and Controls (303-04D Fuel Charging and Controls - TDV8 3.6L Diesel, Description and Operation).

FUEL TANK ASSEMBLY



Item	Part Number	Description
1	-	Fuel filter assembly
2	-	Pipe - Fuel/air bleed return
3	-	Pipe - Fuel feed from Low Pressure (LP) pump
4	-	Foam pads
5	-	Fuel pump module assembly
6	-	Pump module seal
7	-	Pump module collar

8	-	Pump module clamp
9	-	Vent pipe
10	-	Fuel filler pipe
11	-	Tank breather pipe
12	-	Heat shield
13	-	Mounting bolt (6 off)
14	-	Fuel tank cover
15	-	Cradle
16	-	FFBH feed pipe
17	-	Hose - fuel return
18	-	Hose - fuel supply

The fuel tank is located on the right hand side of the vehicle, between the transmission and the right hand chassis longitudinal. The tank is located on a mounting cradle which secures the whole fuel tank assembly to the vehicle. The tank has a useable capacity of 84.0 liters (22.19 US gallons).

The cradle is attached to the chassis with six screws. When the cradle is attached to the chassis, the tank is positively secured via foam pads which bear against the central chassis cross beam. A protective cover is fitted to the front right hand corner of the tank and provides additional protection.

The fuel tank is manufactured from moulded plastic which is a minimum of 3 mm thick. The tank is a sealed unit with the only internal access being via the pump module flange aperture on the top of the tank.

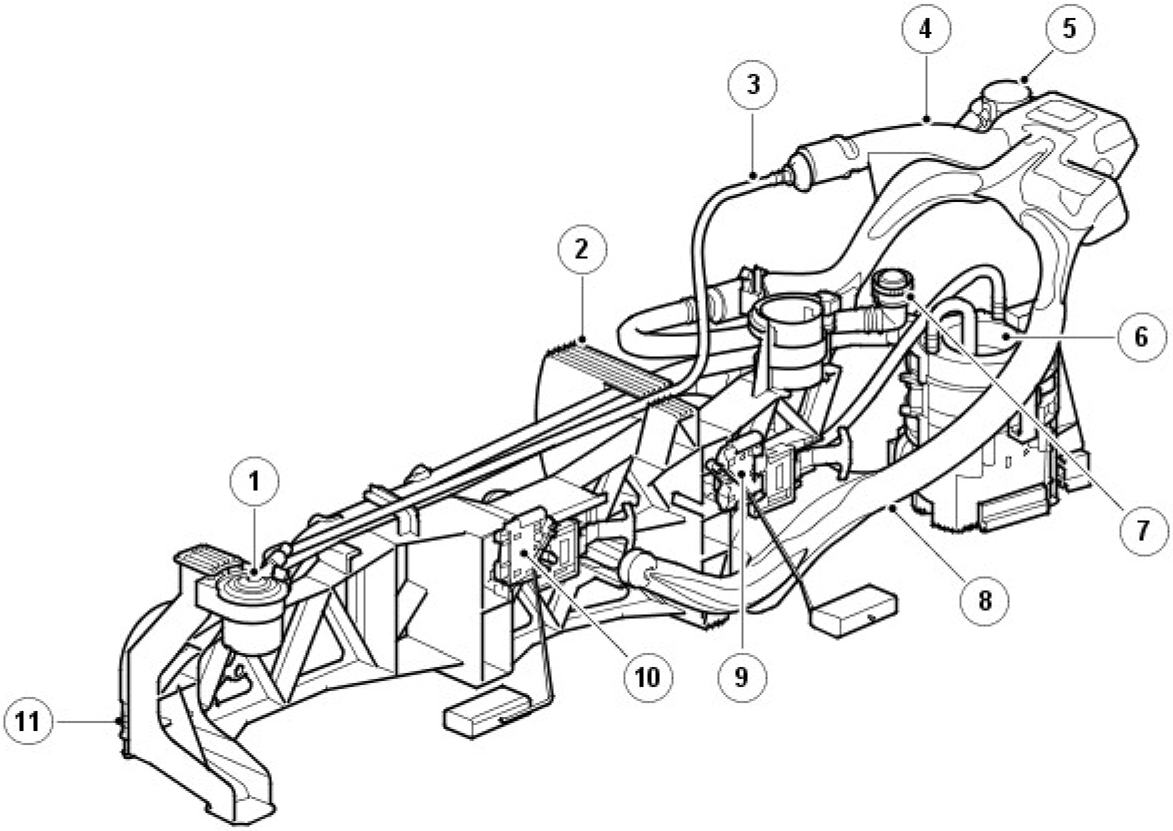
The flange assembly comprises a pump module flange which contains all external pipe and electrical connections for the tank internal components, a collar and a clamp. The flange is fitted with a seal which locates in the tank aperture. An arrow on the flange must be aligned centre of the fuel tank breather connection with the tank, to obtain the correct orientation. The collar is located over the flange and is secured with the clamp.

The flange has a five pin external connector which provides for electrical connections for the level sensors, the level sensors common ground and the fuel pump. This connector is wired to three push fit connectors on the underside of the flange. Two quick release connectors provide for the connection of the fuel feed and return pipes and the vent pipes. The fuel return connection contains a non return valve which prevents fuel escaping from the connection in the event of a vehicle roll over and the pipe becoming detached. On vehicles with a fuel burning heater, a third connection provides the connection for the fuel feed supply to the fuel burning heater.

A tank carrier assembly is attached inside the tank and is used to locate the internal tank components. The carrier provides location for the fuel pump module, the front and rear level sensors, the Roll Over Valves (ROVs) and the front jet pump.

The fuel pump module comprises the fuel pump, the rear jet pump, the pump inlet filter and the fuel pressure regulator which is mounted in a manifold on the carrier. Only the pump module assembly and the fuel level sensors are available as serviceable components, the individual assembly components are not available separately.

Fuel Tank Internal Components



E58415

Item	Part Number	Description
1	-	Front ROV
2	-	Carrier assembly
3	-	Front ROV corrugated tube to Liquid Vapor Separator (LVS)
4	-	Liquid Vapor Separator (LVS)
5	-	Rear Roll Over Valve (ROV)
6	-	Fuel pump module
7	-	Tank breather connector to underside of fuel pump module flange
8	-	LVS carrier
9	-	Rear fuel level sensor
10	-	Front fuel level sensor
11	-	Front jet pump

The TdV8 vent system is different to the system used on the petrol models. The TdV8 vent system comprises:

- Two Roll Over Valves (ROV)
- One Liquid Vapor Separator (LVS)
- Breather spout.

The vent system is mounted on the fuel tank internal carrier which is assembled outside of the tank and inserted into the tank during the blow moulding process. None of the internal tank venting components are serviceable.

The rear ROV is mounted in the rear right hand corner of the fuel tank. It is mounted directly onto the LVS with a rubber grommet and secured with a clip.

The front ROV is located in the front left hand corner of the tank. It is attached by a moulded clip to the main beam of the carrier. The ROV is connected to the LVS by a corrugated tube.

Both ROVs vent directly into the LVS. Any liquid fuel is separated from the vapor in the LVS and drains back into the tank via the front ROV.

The LVS vent outlet is connected to the underside of the tank flange. The vent line is then routed from the flange to atmosphere at the top of the filler neck. This line allows for pressure and vacuum relief during normal tank operation. It also allows air to enter the tank as fuel is used.

The main purpose of the tank breather connection is to control the fill volume of the tank. During filling, vapor exits the fuel tank via the breather connection and the breather tube to the filler neck. When the tank reaches its full level, the liquid fuel closes off the breather connection by filling it with fuel. The closure of the breather connection causes the back pressure in the tank to increase, which in turn causes the pump filling nozzle to turn off.

Fuel Pump Module

The fuel pump is attached to the carrier and is located at the bottom of the swirl pot. The pump and the fuel level sensors are connected to the external electrical connector via the connectors on the underside of the fuel pump module flange.

The pump module has a rated flow of 70 liters/hour (18.5 US gallons/hour) at a voltage of 12.3V and an output pressure of 0.5 bar (7.25 lbf/in^2).

The fuel pump is energised by the fuel pump relay which is located in the Battery Junction Box (BJB). The relay is controlled by the engine control module and energises the relay at all times when the ignition switch is in ignition position II.

A filter is attached to the pump inlet port at the bottom of the pump. The filter has a 'winged' section which is located vertically at the side of the pump to ensure that a portion of the filter is off the base of the swirl pot, to prevent premature blocking of the filter. The filter has two sections, a normal filter and a by-pass filter. The normal filter is a 31 micron fine mesh filter with a surface area of 70 cm^2 (10.8 in^2). The by-pass filter is a 300 micron coarse mesh filter which is closed in normal conditions and has a surface area of 4 cm^2 (0.62 in^2). In cold conditions, 'waxing' of the fuel can occur which can restrict fuel passing through the fine mesh filter. If this occurs, the by-pass opens allowing fuel to pass through the coarse mesh filter.

The top face of the fuel pump module has three pipe connections. One connection is the fuel pump outlet connection which feeds into the manifold. A second connection allows fuel at pump outlet pressure to flow back through the pump module housing from the manifold to the rear jet pump. The third connection allows fuel from the pressure regulator to return to the swirlpot when the regulator has opened due to excessive pump output pressure.

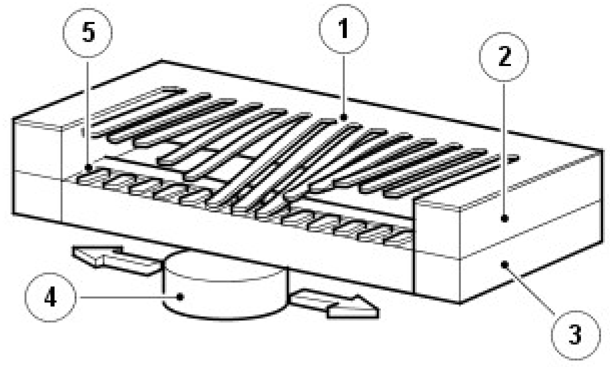
Fuel Level Sensors

The sensor is a MAgnetic Passive Position Sensor (MAPPS) which provides a variable resistance to earth for the output from the fuel gage. The sensor is sealed from the fuel preventing contamination of the contacts, increasing reliability. The front and rear fuel level sensors are connected to the external electrical connector on the flange via the connectors on the underside of the fuel pump module flange.

The front and rear sensors are attached to the front of the carrier and are accessible via the fuel pump flange aperture.

The sensor comprises a series of 51 film resistors mounted in an arc on a ceramic surface. The resistors are wired in series with individual contacts. A soft magnetic foil with 51 flexible contacts is mounted a small distance above the film resistors. A magnet, located below the ceramic surface, is attached to the sender unit float arm. As the float arm moves the magnet follows the same arc as the film resistors. The magnet pulls the flexible contacts onto the opposite film resistor contacts forming an electrical circuit.

Sensor Operating Principle



E44417

Item	Part Number	Description
1	-	Magnetic foil
2	-	Spacer
3	-	Ceramic surface
4	-	Magnet
5	-	Resistance film

The film resistors are arranged in a linear arc with resistance ranging from 51.2 to 992.11 Ohms. The electrical output signal is output proportional to the amount of fuel in the tank and the position of the float arm. The measured resistance is processed by the instrument cluster to implement an anti-slosh function. This monitors the signal and updates the fuel gage pointer position at regular intervals, preventing constant pointer movement caused by fuel movement in the tank due to cornering or braking.

A warning lamp is incorporated in the instrument cluster and illuminates when the fuel level is at or below 14 liters (3.69 US gallons).

The fuel level sender signal is converted into a CAN message by the instrument cluster as a direct interpretation of the fuel tank contents in liters.

Front Fuel Level Sensor Resistance / Fuel Gage Read out Table

Sender Unit Resistance, Ohms	Nominal Gage Reading
86	Empty
171	Low fuel level illumination (14L)
441	Half full
944	Full

Fuel Pressure Regulator

The fuel pressure regulator is located in the manifold inside the fuel tank. The regulator controls the fuel pressure in the feed pipe to the High Pressure (HP) injection pump. If the pump outlet pressure becomes too high, the regulator controls the fuel pressure in the feed pipe by allowing some fuel to return to the swirl pot.

The regulator is subject to pump output pressure and constantly controls the pressure of the fuel delivered to the HP injection pump to 0.5 bar (7.25 lbf/in^2). The primary reason for the regulator is to protect the HP fuel injection pump from high fuel pressures.

Swirl Pot

The swirl pot is located at the rear of the fuel tank and provides for the attachment or location of most of the fuel pump assembly components.

The swirl pot acts as a fuel reserve, providing a constant supply of fuel to the fuel pump irrespective of fuel quantity or vehicle attitude. When the vehicle is level the swirl pot contains approximately 400 cm^3 (24.4 in^3) of fuel when the engine is running. The two jet pumps ensure that fuel is constantly supplied to the swirl pot to provide a sufficient fuel supply for the pump.

A one way valve is located in the base of the swirl pot. The valve allows fuel from the tank to enter the swirl pot, but prevents it from escaping.

Jet Pumps

The fuel system incorporates two jet pumps. The front jet pump is located on the carrier near the front of the fuel tank. The rear jet pump is located in the swirl pot below the fuel pump. Both jet pumps operate on a venturi effect created by fuel at pump output pressure passing through the jet pump. This draws additional fuel from the tank through ports in the jet pump body, delivering additional fuel to the swirl pot.
